Q. They have to be of a peculiar construction?—A. Yes; they are practically refrigerator cars, and it would be dangerous to put any freight in that would be damaged by dampness. There is always more or less ice left in the boxes, so that it is a practical question. Then they are always in a hurry to get them back; they have a lot of beef waiting there. We could not have them around the line, so the result is that we would not probably load them.

Q. (By Mr. A. L. HARRIS.) Was the necessity of that in the beginning the cause of the dressed-beef men building their own cars?—A. I do not think the railroads ever built any dressed-beef cars to speak of. The fight was originally between the cattlemen and the dressed-beef men, and the railroads joined, as of course was their interest. The Northern lines could not get any cattle. The Grand Trunk, for instance, was interested in building up the dressed-beef traffic because it could not get any cattle; and then in time they forced the other roads to come in, because the cattle traffic was diminished to next to nothing, and the dressed-beef traffic became so large that all had to participate in it, or at least desired to participate in it, and the result is that we have to do just about as they tell us.

Q. (By Mr. FARQUHAR.) Is not your cattle traffic now confined just simply to exports?—A. Very largely to exports.

Q. Dressed beef takes the place now of the old markets of the East, where butchering was done?—A. Almost entirely; yes. The cattle traffic is practically out of the way except for export traffic, and in the West for range cattle, I presume—bringing range cattle in to the dressed-beef men. Chicago was originally the headquarters, but they have been working west all the time to Omaha and Kansas City, working west all the time, and that makes the transportation of cattle less and less every year.

Q. (By Senator MALLORY.) Have you ever considered the question of the legal right of railroads to transport cars owned by private individuals and not by the roads? Even if you did refuse they would pass over some other line.—A. We have generally wanted the business.

Q. Now, in the event that you should form a combine, could you refuse to take the dressed-beef men's cars?—A. I suppose we would have the right to do that if we were supplying cars of our own to these men. Of course we could not say to a man, "We will not take your freight;" but if we had our own cars there would be no law that would compel us to haul another man's car.

Q. (By Mr. PHILLIPS.) Does the running of these cars injure the railroads more, or the people, the public? You speak of it as being bad; now who is injured most by running the private cars over these roads?—A. The railroad, I take it. We pay a very large amount of money for the use of cars that we could supply ourselves at much less cost.

Q. Well, does it not also give them an advantage over other shippers that are engaged in the same line of trade, a very material advantage?—A. I think that question has practically been eliminated, because the arrangements are the same practically for all of them. I think that is pretty general now. I think that the arrangements that are made are generally made to cover all the shippers, large and small; but practically there are no small shippers of dressed beef; it requires such a large capital.

Q. But there are a great many cars for iron, steel, oil, ore, and coal; private cars owned by companies and individuals?—A. I think in most cases those cars come under our general rule. We only pay them 6 mills. We do not object to paying 6 mills, because we figure that is what it costs to keep our cars and pay the interest, and so long as they do not sidetrack our cars we do not object to running them. It is the excessive mileage we object to.

Q. (By Professor JOHNSON.) Speaking generally of running the private cars there, the owners of private cars have a force which, of course, compels the railroad to give

a concession, does it not?—A. I do not think that the ownership of private cars, so far as I know, except the cattle cars and the dressed-beef cars, came about by reason of the fact that the railroads were not able to supply the facilities themselves. We will get 500 or 1,000 cars down into our coal regions and distribute them to our shippers; and some shipper says, "I can not carry on my business on these cars that I get, and if you will run my cars I will build them." But those cars are unprofitable, and they lie along the roads, and we had just about as soon the shipper did build his coal car.

Q. Then, private cars are not the cause of concessions in rates at the present time?—A. I do not think so, with the exception of this contract that I named. That is known to all the railroads, and I think it has been eliminated to a certain amount. But these dressed-beef people and these large shippers have become very conservative themselves. They do not want very low rates; they want stable rates. They do not want somebody to get a better rate than they get. If some one got a 40-cent rate, somebody else would not be better off; I think the dressed-beef men would prefer to have the rates stable. To-day the rate is 40 cents, with extra mileage allowance, and that is made under contract and can not be changed, and is known by all the railroads.

Q. (By Mr. C. J. HARRIS.) Do you furnish the shippers all the cars they require?—A. We endeavor to.

Q. Suppose you do not furnish them and some one suffers on the line of your road; what do you do for them? Ought not the Government or some power compel a railroad to furnish enough cars to do the business?—A. Well, I would answer that by saying that if you are only going to give us business for a week in the year, it would not be fair to ask the railroads to supply all the cars that are needed for that one week. But railroads ought to be compelled to take care of their customers. It becomes pretty serious in times like these. For instance, last year we had cars lying on the side tracks everywhere. We have built 6,000 cars in the year that I have been with the New York Central road, and we are going to buy more, trying to care for the large amount of business. We can not do it in 1 day; we can not get cars now, and can not get them built before next year.

Q. (By Senator MALLORY.) I understood you to say that there are no complaints, so far as you know, on your road as to excessive rates?—A. If there are I never hear of them.

Q. There is a distinction, of course, between your rates between your terminals and intermediate points?—A. Well, of course, we generally try to make the same rates throughout. I think that has been the system that has been practically adopted on all the Vanderbilt lines. We take care of our intermediate customers on the theory that we can not build up local business and do our competitive business very much cheaper.

Q. The theory then, as I understand, of your road is to foster anything in the way of enterprise along the line of your road?—A. That is what we try to do. We may fail in some cases.

Q. Have you anything to say regarding the fact that rates from Chicago and New York for exportation are less than rates from Chicago to New York for domestic use, or inland rates as distinguished from export rates?—A. I have already stated that it is necessary to meet the competition abroad, and so enable the people of this country to get rid of a large amount of business that perhaps they otherwise would not be able to do. Now, how it hurts anybody I do not know. We undoubtedly do charge lower rates on export business than we do on business going to New York. The business that goes to New York is domestic and used there, and the lower rates enable us to take a lot of this stuff from the far west and transport it so cheaply that it comes into competition with Russia and India, and every other country in the world, when it gets abroad, and I do not see that anybody is injured by it very much. If we were compelled to make all other rates to meet the export rates, it is a question if we would not have to go out of the export business. The proportion of the export business is enormous. Take provisions: I suppose that about 80 per cent of the tide-water provisions go abroad. Practically all the grain goes abroad; there is no grain that stops at New York any more.

Q. How about flour?—A. Of flour the proportion that goes abroad is very large.

Q. Still there is a large consumption on the Atlantic coast?—A. I suppose there is. I have not the figures in regard to flour.

Q. Well, there is a discrimination between flour as against grain, to which attention has been called here. Do you know anything about that?—A. Well, we have had a great deal of discussion about that, as to whether flour will not bear a higher rate than grain. My judgment is that it will. That is the way we have generally done with all these questions. We have said, Now, we will refer this to the Interstate Commerce Commission. They are an intelligent body of men and they are

fair. And we have submitted the question to the Interstate Commerce Commission and they have generally found in our favor.

Q. But the discrimination, they think, is much too high. They put the limit, I think, at 2½ cents.—A. I think we complied with their finding, whatever it was. We nearly always do when the Interstate Commerce Commission makes a ruling or recommends anything.

Q. I know you do generally, so far as your road is concerned, but there are a great many other roads?—A. Well, the tariffs are generally the same on all roads. When I say our road, I mean these established tariffs. The competition on flour is very keen. It is probably the worst stuff we have to transport. It commences at Minneapolis, and originally the rate was maintained between Minneapolis and Chicago, at a certain figure, and then from Chicago eastbound. Then the "Soo Line" was built across there, making practically a line not any longer from Minneapolis to tidewater than from Chicago to tidewater, and they naturally took the position, "We are going to make the same rates from here as you fellows do from Chicago;" and the result was that the lines between Chicago and St. Paul commenced to scramble for this business and they adjusted the rates some way, I do not know just how, so that some of it goes to Montreal; but the water competition comes in there, and the competition from Duluth and Superior City and these Lake Superior ports to Buffalo, added to the canal rate from Buffalo to New York, makes the transportation almost nothing. We simply have to do the business the best we can. It has got down simply now as to how cheap we can do the business and make a profit. We can not extort anything out of anybody.

Q. (By Mr. FARQUHAR.) Have you a line of steamers from Buffalo to Duluth?—A. Yes. We have a line that we own entirely; the New York Central owns the entire capital stock of it. We have built 2 boats that carry 6,000 tons, and we are building engines to haul 3,000 tons from Buffalo to New York, and we take that stuff from Duluth to New York with 1 boat and 2 engines, 2 trains. Now, as to how the intermediate people are hurt, I do not see. They would not be any worse off if we said that we would not take this business at all.

Q. (By Senator MALLORY.) Well, with reference to this flour and wheat business, the millers complain that after you reach a certain discriminating point—a certain amount of discrimination against flour—they can not ship flour to Europe at all.—A. My answer to that would be that that will not continue. You know they have all sorts of theories about these things, but they continue to ship right along, and they all continue to make money. Now, if that is a fact, and we find that our local flour industries are being depleted, then we will reduce the rate—have to.

Q. Well, that would be done on wheat?—A. But we have had no complaints from anybody on our line, so I do not know. I have never looked into it any further than this investigation before the Interstate Commerce Commission. I said there myself that if they would investigate and make a recommendation we would carry out the recommendation. I think they became convinced that flour could stand a higher rate than grain. The fact is we ought to get a higher rate for grain, but we can not.

Q. (By Mr. CLARKE.) You make an inland minimum transit rate?—A. I can not answer that. Minimum transit rates are made very largely through the country, but I can not answer that. The matter has never come under my notice, and I can not say what has been done.

Q. (By Mr. RATCHFORD.) Referring to the subject of exports from Chicago, I understood you to state that those exports have to be shipped very cheaply in order to meet competition abroad. Are such exports shipped by the railroad companies, at present prices, at a profit for the companies, a reasonable profit?—A. I will say, in answer to that, that as an intelligent man I would not haul any traffic that I did not think paid us a reasonable profit. As to whether we could do all our business at that price I should say not. It would be impossible for us to haul all our business at the rate at which we are obliged to haul the export.

Q. Then it is not a reasonable proposition to say that you will haul all your business at that rate and make a reasonable profit?—A. That would depend on what you call a reasonable profit. We have to take the entire bulk of our business at an entire average per mile to produce a profit. For instance, the last statement I saw, we had 15,000 cars 24 hours east of Buffalo. Now, if you reduce that to 10,000 at the same price we could not probably live. If you reduce that to 5,000, we could not pay our wages to our employees. If you increase it to 20,000 we could probably do it at a little less cost than we do now; and that is what we are struggling to do all the time.

Q. The incentive in shipping these exports from Chicago at reduced rates over all the articles that are shipped for domestic purposes is what—in order to meet competition abroad?—A. Yes.

Q. That is the sole purpose, is it?—A. Yes, we have agents; export agents in Chicago, and export agents in New York, and they get the prices of these commodities in Liverpool every day, and they get the ocean freight. The whole thing has to be done as one; you must land that stuff in Liverpool. The rate on the ship and from the interior is added together to produce this result.

Q. Have you considered the general effect of that policy?—A. In what way?

Q. On the people of the United States generally?—A. I think it is very beneficial.

Q. Do you not think it is possible to export those goods so cheaply that they can be landed, for instance, in a European country cheaper than the European can raise them, and as a result, encourage immigration?—A. That is a force we can not control. We have a corn crop here of about 2,500,000,000 bushels a year. Now there is a very small portion of that consumed in the United States. What are you going to do with the surplus? How are you going to enable the farmer to sell it? The railroads come in and say, "We will help you to do this; we will enable you to compete with foreign countries; we will enable you to get this to Liverpool at a cheaper rate than we can take this stuff to New York City." Now that is the general theory on which we do this business. Whether it is right or wrong I do not know. I think if we were to stop it there would be a howl from the West that we would not get over very soon.

Q. (By Mr. PHILLIPS.) Is there any competition abroad with our corn?—A. Oh, yes.

Q. Any considerable amount?—A. I can not tell you, but it is quite considerable. It is growing all the time. We are interested all the time in getting our own corn over there and helping our own people; but what effect it will have, I can not say.

Q. (By Mr. RATCHFORD.) The point I wish to make is simply this: if we ship American corn, for instance, into the plains of Lombardy and Italy, is it not going to have the effect of starving the Italian who raises corn at home, or sending him to this country?—A. Well, I would not venture any opinion on that subject. We simply take the prices at Liverpool as the fixed value of that corn. We have no voice in making the value. We have to take facts as they exist.

Q. (By Mr. KENNEDY.) You said that of our corn crop of 2,500,000,000 bushels, only a small proportion was consumed at home. Do you not mean a small proportion of it is exported?—A. Oh, no; the export of corn is very large.

Q. It does not exceed half of the corn crop, does it?—A. Half would be quite large, of that enormous quantity. I am not speaking of corn particularly. Wheat, of course, is largely exported. You asked me why we were doing these things, and I am telling. That is our best judgment about it. We may all be wrong.

Q. (By Senator KYLE.) How do you estimate your rate in freight matters; do you consider your whole system together as one?—A. We know about what it costs to run a train.

Q. Sometimes you operate some lines of business even as low as cost, and you expect to make that up on something else?—A. I do not think I said that.

Q. Almost down to cost?—A. On a very small margin.

Q. Do you ever do that, run down to cost on some and make it up on others?—A. Well, it depends a good deal on circumstances. We would not naturally take business at a loss if we could avoid it.

Q. The cut is not on all articles, but on one of them?—A. The large bulk of business is the transportation of grain and provisions and dressed beef and coal. Of course, coal is a commodity that the rates are pretty well fixed on. They are very low and have been made low by competition, and they are pretty well fixed and determined. But the grain rates and the provision rates are fixed largely by the necessities abroad; and, as I say, they have gone down so low that there is nothing left; they can not get very much lower. We know at the end of the year, of course, what our profit per ton per mile is, and we know what our expenses per ton per mile are.

Q. (By Senator MALLORY.) Can you state whether or not, as a rule, the published freight rates are adhered to in all cases?—A. So far as our line is concerned, I think they are.

Q. Do you know anything about other lines?—A. I do not know anything about anybody else's road.

Q. (By Senator KYLE.) You would have an opportunity to know in regard to them, would you?—A. Oh, no; except as I give orders about those things.

Q. On your own line you are positive they are adhered to?—A. I am.

Q. (By Senator MALLORY.) Do you think it would be practicable for a uniform freight rate on through freight to be established from Chicago to the different seaboard cities—New York, Boston, Philadelphia, Baltimore, and Newport News?—A. Well, that depends. I would like to have it. I do not know whether the other fellows would or not.

Q. Is it practicable to have it done?—A. But whether the Chesapeake and Ohio and Baltimore and Ohio could flourish under such a system I do not know. My own opinion is that the present differential rates are too high—that is, the facilities of those ports have so increased, they so approximate New York now, that the differences, which were established 20 years ago, when the rates were twice or three times as high as they are now, are too high.

Q. Is it practicable to make a uniform rate, under existing conditions, with competing roads running to all these different ports that I have mentioned?—A. I would not like to say that it was. If you ask me if it can be done, I would say that we have been working at it a long time and have failed to do it on account of the opposition of our competitors. Whether a system of that kind would not result in giving the Northern ports an excessive share of traffic I do not know. We would have to try it to find out.

Q. Well, if pooling were permitted and sanctioned by law—pooling of traffic, for instance, by railroads—could it be done, in your judgment, under that system?—A. Then it could be done undoubtedly, because the traffic could be assigned to the different roads.

Q. If roads were allowed, by the repeal of the pooling clause of the interstate-commerce law and by sanctioning contracts made for pooling, to do that, do you think that the discriminations, concerning which there are a great many complaints now, would be lessened?—A. I think they would.

Q. (By Mr. FAIRQUHAR.) Do you think that freight rates would be raised by a pool?—A. I think not. I do not think that they can raise freight rates.

Q. Will you give a reason for that?—A. When I say raise them I mean to any extortionate extent, because the waterways control that, and the present competition, as I have said, and the price of the commodity and labor. I will give you an illustration. When I was on the Union Pacific we had a large copper concern start up at Butte. Now, you would naturally think that a railroad out there could extort a very high rate from a corporation at Butte. But when you had to deal with it practically you would find that in order to make that copper concern flourish at Butte, Mont., you had to meet the competition and traffic in Chile bars at Liverpool that fixed the price that they could get for copper. The Chile bars in Liverpool were gotten out by cheap labor and very cheap water transportation, and the Butte copper was produced by the very highest paid labor in the world. They were paying \$5 or \$6 or \$8 a day out there at that time. What was the result? Mr. Haggins would come down to my office in Omaha and say, "Here is the price that I can sell my copper in Liverpool for. We can pay you so much for coal, coke, salt, and for fluxing material, and we pay you so much for ore over to the smelters, over to water, and we will pay you so much to take this stuff to New York." And then we had to figure out how nearly true that was, and we had either to close out Mr. Haggins entirely or we had to take his own rate. And the same thing to a greater or less extent exists all over this country. You can not take a man by the throat and say, "You have got to do so and so." If he can not pay that, you close him up; if you do that, you close your road up.

Q. So you do not think pooling would make any difference in the rates?—A. Not the slightest difference. Now, the trouble with pooling before was distribution of the business, so that it never amounted to anything. When we would meet at Chicago we would say, "We will take so much, and so and so will take so much," and we would have a jangle over that for two or three months perhaps, and then the fellow that had 10 per cent—he perhaps had a new road and increasing facilities—would say, "I am not going to stay here on 10 per cent any more," and he would go out and go to cutting rates and cut every other fellow that had a big percentage. And then one road would run ahead 100,000 tons and it would not pay up, and we would have a row and the whole thing would break up. Now, if the distribution of the business could be made legal, so that these traffic rates could be enforced, that class of competition that I have spoken of in reference to the dressed-beef business as between the railroads would be done away with. But we still have the commercial conditions and the competition of the waterways, which control very largely the transportation of this country.

Q. (By Mr. CLARKE.) If pooling were legalized, you would not consider the desire of the shippers to have their freight go over some particular line?—A. I think that would have to be done by money distribution.

Q. Need it be done that way?—A. Oh, yes; for instance, if the New York Central was assigned 25 per cent of the traffic out of Chicago and could not limit its carriage to 25 per cent, it could pay over a certain percentage of the excess to the railroads of the division, deducting the cost of operation and collecting and all that sort of thing.

Q. You see no necessity for legislation to that effect?—A. No; nor do I see what benefit legislation of that character would be.

Q. In your judgment, would there be any serious objection to it?—A. I could not answer that question. That would be a question for the board of directors on our road to answer. As far as I am concerned, we have nothing on the books that all the world might not see; but I would not like to give an opinion on the subject without consulting my fellow-directors.

Q. (By Senator KYLE.) You fear your competitors might get hold of some information?—A. Yes. We used to have on the Union Pacific a six-monthly examination, and our competitors got away with everything we had most effectually.

Q. (By Mr. C. J. HARRIS.) The great objection on the part of the railroads would be the great publicity it gave to their rivals; but if all had to do that, would not that objection be more or less removed?—A. I think the affairs of the railroads are practically public now. The New York Central annual report has in it everything we do and earn. I do not know any more information that a man could want than he could get in that book.

Q. These issues of stock are matters of public record?—A. They have to be. They brought in statements for me just before I left; books piled up to that high [indicating] for me to swear to for different commissions and for gentlemen over here at Washington, and I think they practically contain everything we have ever done. I do not think anybody ever looks at them.

Q. (By Senator MALLORY.) There has been considerable argument urged that it was desirable for the Government, the Interstate Commerce Commission, at least, to have officials, as we have bank examiners, to look into these matters to see that certain railroads—not the New York Central; not these good railroads that do not violate the law—A. (Interrupting.) They are all the same. When one railroad violates the law the other has to. I am not claiming anything exceptional.

Q. (By Professor JONSSON.) Some years ago the Atchison road was discovered in discriminations amounting to several millions of dollars, and it is claimed by those who advocate this public accounting of railroads that the discriminations practiced by the Atchison never could have been made if the publicity of accounts had been in effect.—A. I do not know anything about the Atchison road. I saw the statements in the papers; I never heard anybody claim they were true.

Q. The examination of an accountant would clearly show just what had taken place?—A. As I understood the thing at the time, I did not understand it was a matter of discrimination, but of making false entries, and making a better showing of the earnings than actually existed.

Q. (By Mr. A. L. HARRIS.) Might it not, to protect the public against these false statements of earnings, be a good idea to have a public auditor to go through their accounts as they do through banks, to prevent fraud, you might say, on the public?—A. My only answer to that is, we make this statement under oath, and if any stockholder or anybody has any desire to examine the books, I do not think there will be any objection.

Q. Suppose in some of the railroads there might be mismanagement, as there might be in a bank that fails, would it not be advisable in a case of that kind to have some public auditing of accounts subject to the Government?—A. I have no views on that subject at all.

Q. (By Senator MALLORY.) Is there anything you would suggest as amendments to the interstate commerce law?—A. I think an amendment to divide the business in some way between the roads would be an advantage to both the railroads and the public.

Q. (By Senator KYLE.) A pooling clause?—A. You can call it a pooling clause or a division of the business. I think a majority of the commission think that way themselves, if not all of them. It would limit these abuses that I have shown here, and enable the railroads to make long-time contracts in which they could more materially reduce their expenses. In New York to-day the expenses of the Broadway offices must be enormous; they are of no particular use to the public or the railroads except as they are fighting each other for business.

Q. Some prominent railroad persons of the United States are opposed to the legalizing of pooling. What are their objects?—A. I do not know as I would like to say anything about our associates; but many people are interested in keeping the railroads fighting so as to help their own business. That must be very patent to everybody. No, there are certainly very strong railroad men that are opposed to the pool. If they keep the trunk lines east of Chicago and St. Louis fighting, they can get their own business transported lower. Practically they are large shippers.

Q. That is probably the whole of the opposition?—A. You asked me what I thought of it, and I have told you what I thought of it.

Q. (By Senator MALLORY.) There is, also, in connection with this Interstate Commerce Commission question, much complaint arising from the fact that the Interstate Commerce Commission is entirely emasculated as far as any power to enforce its decisions is concerned. It can not enforce anything. Practically the individual can only get a recommendation, and the railroad may observe it or not, just as it pleases. This Industrial Commission has had considerable testimony on that subject. Have you any suggestions on that point as to an amendment of the interstate-commerce law?—A. I presume you can not take away from the railroad companies their rights under the Constitution. In fact, I suppose there is no power that can compel railroads to carry freight for nothing; and if the findings in court were unjust or unreasonable, I suppose the railroad would do anything it could to protect itself; but we have never had any trouble with this commission, and I think we have carried out every recommendation they have made.

Q. The commission itself in its report calls attention to the fact that it can not enforce its decisions, and it is desirable that it be empowered by some method different from what now exists to see that its decisions are observed. That was a question I thought you might have some views upon.—A. What would you suggest?

Q. I have my own opinion, of course, and I tried to advocate it some years ago in the House of Representatives, and that was to make their decision go into effect and let the railroads who did not think they were just give them an appeal before somebody, either a court or other tribunal.—A. I do not think we would object to that.

Q. Have you ever given any thought to the subject of Government ownership of railroads; the feasibility of it aside from the desirability of it?—A. I suppose the railroads would have to be managed by experts—men who have been brought up with the railroad business and understood it—and I do not see that they would act any different from what they do now. It would become a large political factor. I do not think we would want it. We have practically a million of men in our employ to-day, nearly all voters. It has never been a great success where they tried it. They tried it in Canada and gave it up. They had a road and it went to seed. Nor do I understand where you are going to get the money to pay for them. It is a thing I have never given any consideration, because I did not think it was a very live question. We have live questions to consider most of the time.

Q. (By Mr. FARQUHAR.) You said your road owned a line of steamers from Buffalo to the upper lake ports?—A. Yes.

Q. In framing rates of part rail and part water, do your rates usually conform or are they agreeable to other trunk lines that own steamers on the lakes, too?—A. The lake line is managed entirely separate and the manager of that line endeavors to get his competitors to agree with him as to what the rate shall be; but the tramp steamers have a large influence. For instance, last year and the year before the rates on the tramp steamers became so low that we practically tied up our boats for a time. This year the fact is just the opposite; the tramp steamers have gone after ore and are making the rates so high we are practically getting the same rates over the lake as rail lines.

Q. What class of freight do they carry?—A. Copper, flour; all those coarse freights that come here.

Q. Carry any package freight?—A. Yes.

Q. Between Chicago and Milwaukee?—A. We run to Milwaukee, Chicago, and Duluth.

Q. Your own line of steamers would then come in competition with the open rates declared at Chicago, Milwaukee, Duluth, Detroit, Cleveland, and elsewhere, would it not?—A. Yes.

Q. You would not have an exclusive rate of your own but you would have to compete with the open rate at these harbors?—A. Yes; we have to meet, practically, a tramp rate. A vessel will come in there and make a rate to Buffalo, and it makes our through rate the same as the tramp rate. That is the practical effect of meeting that competition.

Q. And you think among the lines on the lakes there is somewhat of an agreement of a common rate for all?—A. Yes; they endeavor to adjust these rates. Of course, we could not make Chicago rates apply from Minneapolis or Duluth because it would ruin these intermediate rates, and so they make an agreement among themselves, on lake lines, to maintain a higher rate from Duluth than Chicago, though the distance is practically the same.

WASHINGTON, D. C., October 9, 1899.

TESTIMONY OF MR. FRANK BARRY,

Secretary of the Millers' National Association of the United States.

The commission met at 2.30 p. m., Chairman Kyle presiding. Mr. Frank Barry being duly sworn, testified concerning transportation as follows:

Q. (By Mr. C. J. HARRIS.) Will you give the commission your name, occupation and place of business?—A. Frank Barry, secretary of the Millers' National Association of the United States; residence, Milwaukee, Wis.

Q. How long have you been employed in this capacity?—A. Eleven years.

Q. Were you connected with the milling business previous to that?—A. I was.

Q. (By Mr. FARQUHAR.) When was this millers' association organized and what are the objects of the association?—A. The Millers' National Association was formed June 17, 1873. The object of it at that time was to provide protection from patent litigation which was very general, owing to a change in the system of milling from the old form of grinding by stones to the Hungarian roller process. The fact that the Patent Office of this country was not up in the state of the art had caused a large number of patents to be issued which resulted in an immense amount of litigation. I do not suppose any industry was ever so oppressed with litigation over patents as the mills of those days. There were several sectional and State associations, and finally they all came into one national association, which handled test suits on all these conflicting patents bringing general results for the miller as a matter of economy in handling these troubles. The association continued in that field strictly until 1890, and at that time, having produced a condition of peace and quiet in patent matters, it was decided to continue the organization for the general benefit of the trade. The association has since that time interested itself not only in patent matters which have arisen, but has acted for the trade in other directions, such as the enactment of the pure-flour section of the war-revenue act. We endeavored to get this law through as special legislation, and failing in that, we tacked it onto the war-revenue act. We are now working on a pure-food law in general, and legislation of that nature. As tariff bills come before Congress, there are matters which interest millers vitally, which we promote their interests in. The national organization has never and never can have anything to do with prices, either of raw material or of the products, for the reason that interests are so diversified throughout the country that it is and would be impossible, if desired, to have anything to do with questions of prices. We never have had anything of that kind. That is the nature, as nearly as I can state it, of the work of the association.

Q. (By Mr. C. J. HARRIS.) Will you state what adulterations have been made in your line of goods, and what has been the effect on the trade?—A. The adulteration of flour was produced by the same general causes as the adulteration of all other food products, unscrupulous people endeavoring to reduce the cost; and as we showed the last Congress, the adulteration of flour with a by-product of glucose or starch had been going on until it had reached a percentage as high as 40 and 50 per cent. Then adulterators had gone still further and used even white earth. The condition was such that the integrity of our flour had been seriously injured abroad and was being injured, especially in the Southern States, here. We showed that this must result in time disastrously to the milling interests of the country. I will say the mixed-flour law, as it is called, has entirely put a stop to that.

Q. We would like to-day to bring out, so far as possible, the transportation questions connected with your association, the questions of freight discriminations, and ask you to say anything in regard to that which you have in mind?—A. I will say, in answer to that, it is a question which is of vital interest to us at present, and with your permission I would like to call your attention to one or two points in regard to the milling interests of the country. It is to-day the largest and most important manufacturing industry of our country. There are something over 18,000 flour mills in operation, and not above 400 of them, I believe, have a daily capacity of 500 barrels, showing that the larger number of the mills are broadly scattered and of small capacity. My reason for referring to that will appear. The amount of capital invested exceeds \$250,000,000, and the annual product is about \$600,000,000; the wages paid are above \$28,000,000 a year. There have been estimated to be about 40,000 employees, and a large number of them are skilled workmen. The raw material which we use is the farmer's product, wheat; and the product of our mills is of probably more direct interest to every man, woman, and child in the country than any other manufactured article of this country.

When we consider the transportation feature, as looked upon by millers, there are several points I would like to speak of. We have attained in flour milling in this country a condition of overproduction which, I think, very few people realize. It is estimated at the present time that the flour mills of this country, by grinding to their full capacity, can within 90 days make into flour every bushel of wheat raised in the United States in a year. This condition of overproduction has not been occasioned by capital seeking investment in a very profitable line of manufacture, but has been occasioned principally by the fact that competition has driven millers to attain as large a capacity, as large a production, as possible, in order to reduce the cost per barrel; and they have forced their capacity far beyond what they should have. The condition of overproduction has been warranted to some extent by the fact that there has been a strong and growing demand for our product abroad. Almost all of the European countries furnish a steady demand—require flour made from our wheat. They do not require our wheat, it is the flour made from it. If they could get the wheat and have their millers grind it into flour, they would prefer to do so; but if they can not do that, experience and statistics will show you they will buy the flour and must have it to mix with their flour. The published rates of railroads, their tariffs, for the past 25 years, until within a period of less than 2 years, have shown a parity of rates on wheat and on flour not only for domestic use, but for export. These rate sheets will show universally that they have been at the same rate. During the past 1½ years or 2 years there has been a gradually growing discrimination in the rate charged for export wheat as against flour. I can show you by some figures the result that this is having on flour manufacturing.

Q. (By Mr. CONGER.) Have these discriminations been in the way of an increased rate on flour or a decreased rate on wheat?—A. A decreased rate on wheat.

Q. The flour rate remaining the same as before?—A. The flour rate has remained practically the same.

Q. (By Professor JOHNSON.) What has brought down the wheat rate?—A. That is something difficult to state positively, but my belief is, the principal factor has been that the railway lines of this country have found it expedient in the conduct of their business to establish elevators, which, although they may be conducted in the name of elevator companies, are owned and conducted by the railroads or their directors. They have gathered the wheat into these elevators and they have had to move it. Since the interstate-commerce act has been in force they have had to publish the rates on which they move all merchandise, and that merchandise has been moved on these published rates. These published rates have been cut down to meet the desires of the railroad people for wheat, without a like reduction for flour. I believe that is the principal factor in this reduction of the wheat rate. We have had a case before the Interstate Commerce Commission this summer and have had repeated hearings, in New York, Chicago, St. Louis, and in Washington, where we went into this subject very exhaustively, and where we showed to the satisfaction of the Interstate Commerce Commission, according to their decision, that the railways of the country could carry export wheat to the seaboard practically as cheaply as flour. The Interstate Commerce Commission has held that public policy would dictate that wheat and flour for export should be carried at the same rate. We satisfied them of that. As to these points in detail, I would like an opportunity to touch upon them in a written argument; I can refer better to the points.

Q. (By Mr. C. J. HARRIS.) I would like to ask you if in this millers' association the members are scattered throughout the whole United States, or does it apply more especially to the Northwest?—A. No; we have a membership extending through 24 States of the Union, and the capacity of our membership is about 120,000 barrels a day. All of the larger, more progressive mills are members.

Q. (By Senator KYLE.) Do you have organizations in the several States?—A. Nearly every milling State has an association, and they are practically, although not formally, allied with the work of the national association.

Q. (By Professor JOHNSON.) Can you tell what percentage of the milling is done by Minneapolis, or mills in that vicinity?—A. Of the entire milling of the country, I could not state. I could get you the figures.

Q. Have the Minneapolis mills been crushing out the smaller mills to any extent recently?—A. I do not think so, any more than that any large center of manufacture in any line has advantages, especially in transportation rates, etc. Naturally, smaller mills, when they go up against a large mill, which can manufacture so that the cost per barrel is less than the smaller mill—can sell cheaper—they feel it is an oppression; but I have not noticed any disposition on the part of the Minneapolis mills to oppress. They may lose export trade which they have acquired and have had heretofore; if they lose that trade they must find a market for their product so as to maintain their standard of daily capacity. They then will ship two or three carloads

down into Tennessee or Arkansas; they will send it to some point where it is thickly settled. The little miller who has had that trade can not supply it at the same price per barrel as such mills as the Pillsbury's and others. He thus indirectly feels the loss of export trade materially; though he does not export himself, he will feel the result of the loss of export trade on the part of the large mill in that way.

Q. (By Mr. C. J. HARRIS.) Unless the surplus is taken by export trade it must crowd down the home market?—A. Yes.

Q. (By Mr. FARQUHAR.) You have in your trade the so-called millers' trust. What are the views of that organization? What is its relation to the trade generally?—A. I assume you refer to the United States Flour Mill Company, recently organized by McIntyre. I think that has had no effect as yet on the milling trade. It was an organization formed to buy up these different milling plants, and is operating them. I have been inquiring and watching very carefully to see if there were any indications of cutting prices by that company. The assurances I have received are that they have maintained prices, and show no inclination to reduce them.

Q. How many mills are in that organization?—A. I think 24 at present.

Q. What capacity do these 24 bear to the whole milling capacity of the country?—A. I could not say.

Q. Ten per cent?—A. Oh, no. They can not make over 50,000 barrels a day, and in our association we make about 120,000.

Q. Does this organization seek to control merely the domestic trade, or does it have anything to do with the foreign trade?—A. They are very large exporters. I should say at a guess nearly 60 per cent of their product is exported now. I think they have been looking very largely to the export market.

Q. Could you give the commission an idea as to what brought about the formation of this organization among the millers; what particular thought is there in their association? What do they desire to conserve in the formation of an organization of that kind?—A. I think the sole reason for combining the mills was the idea of obtaining a very large capacity located in scattered, advantageous localities, where they would not be dependent on local conditions, so that if the mills could run advantageously in the Northwest, when they could not in the East, they would run strong there, and vice versa; so as to obtain the benefit of a diversified wheat market, and reduce the cost of management and cost of selling their products. That was stated to me.

Q. (By Mr. PHILLIPS.) What is the capital stock of the organization?—A. I believe \$15,000,000 at the present time.

Q. Do you know on what basis they went into it? In estimating the value of each property, was it estimated on the capacity of the mill, number of barrels?—A. No. The mills were bought on a basis of the appraisement of the value of machinery and plant by a special committee, and also a price agreed upon for the good will of the concern, and that was the expensive part of it.

Q. Was the capitalization much larger than the real value of these plants?—A. So far as I know, they paid a fair price for every property they bought.

Q. Did they pay an exorbitant price?—A. I could not say; it depends on a man's valuation of the property. They paid more for some plants than I would consider them worth.

Q. (By Mr. FARQUHAR.) Is that organization in its growth absorbing other mills?—A. I think not. Since they organized they have bought only one company, the Northwestern Consolidated Company of Minneapolis, comprising five mills there.

Q. (By Mr. KENNEDY.) Have any mills in the combination been shut down?—A. Yes.

Q. How many?—A. I could not say. In the Northwest several of these mills were not in operation, and I heard recently they were going to start them up.

Q. (By Mr. PHILLIPS.) Did they, as a rule, take stock or money in payment?—A. I think that was purely optional with the men that went in; I think they were permitted to do as they pleased. One friend of mine that went into the combination, I know took cash. He took some bonds, but did not take stock.

Q. Did they have both common and preferred stock?—A. Yes.

Q. Do you know the amount of each?—A. I could not say, just now.

Q. (By Senator KYLE.) Will this institution work in opposition to the national association?—A. They are most of them members. There could be no question of antagonism against the national association, because the national association is working for the good of the trade, and there is nothing to fight about there. It is simply a question of whether a miller is willing to spend his money to help along the work we are doing.

Q. Are all the mills usually identified with your association or the State associations?—A. No. Some States have no millers' association.

Q. The millers are not alive?—A. There is no such organization of millers in this country as there is in most every other country where milling is a prominent industry. In France a very large proportion of their mills are organized, and their association has become such a power in national legislation that they have been able to so legislate that they receive our wheat, which they must have, from this country free of duty, and impose a prohibitive duty on our flour; and then the French Government pays a bounty on every barrel of flour exported by its millers.

Q. There are certain advantages to be gained in every State by belonging to this association?—A. Yes, in the way of assisting in the work we are doing for the good of the trade.

Q. You have legislative advantages to be gained also, State as well as national?—A. State as well as national, yes. In Germany they have over 4,000 members in their national millers' association. Other countries are better organized for protective and advantageous work for millers than the United States.

Q. (By Mr. C. J. HARRIS.) You have milling-in-transit rates I suppose. Have you any remarks to make about that?—A. I think that railroads generally, throughout the country, where there are any considerable milling centers, or in States where milling is a prominent industry—I think they make, pretty generally, milling-in-transit rates. Take a load of wheat from a point West to a point East, as through wheat, and they will allow it to be milled at any point between these two points for an additional rate of two cents, the cost of simply stopping, unloading, and loading the car.

Q. What effect does that have on the smaller millers, is it advantageous or otherwise?—A. It is an advantage to any mill.

Q. Is it not an advantage to the large millers especially?—A. It is equally advantageous to the small miller in the territory where they get milling-in-transit; and the small miller can get it as well as the large one. Otherwise he would have to pay the local rate on wheat and the local rate on flour out. That is an illustration of the necessity for the same rate on flour as on wheat, which we simply asked to have maintained in our case before the Interstate Commerce Commission, and which is not allowed on export business. We are suffering from the discrimination of foreign governments in assisting foreign millers; but we can overcome that by the quality of our flour if we are not discriminated against by our freight carriers in this country; but not when they will carry our wheat and get it to the foreign country cheaper than we can get the flour into the market. The condition is shown very readily by a letter which I have here from a leading London flour dealer.

(Reading:)

LONDON, 41 SEETHING LANE,
September 2, 1899.

MESSRS. THE C. MANEGOLD MILLING CO.,
Milwaukee, Wis.

DEAR SIRS: The flour trade continues to drag heavily and a week's fair business is followed by a long interval of abstention from buying. There is no confidence in present prices among consumers and they are simply purchasing from hand to mouth as circumstances necessitate.

The freight discrimination against flour is no doubt working very prejudicially against the trade and is a fine thing for the English miller. It amounts to the same as if our Government placed a duty of, say, 6 cents per 100 pounds on flour and allowed wheat to come in free. This is what every miller here has been agitating for for years, in order to keep American flour out of the market. It hardly seems possible that such an anomaly will be permitted by your Government to last for any length of time. Other countries are paying their manufacturers bounties in order to encourage trade.

Yours, truly,

FOR JOHN J. CARTER,
HENRY EASTWOOD.

Q. (By Mr. CONGER.) How long ago was that letter written?—A. The 2d day of September, 1899.

Q. The Interstate Commerce Commission made an order that the difference should not exceed a certain amount?—A. They have. Their order reads so that anybody may know what it means exactly. It reads that public policy demands that a rate on export wheat and flour should be the same, but that no greater differential than 2 cents should be allowed under any circumstances. With our business we maintain that there should be a parity. I do not know why any difference is allowed.

Q. Well, the difference in years past has been greater than 2 cents?—A. It stands to-day on Mississippi points and inland points—say in Wisconsin, where there is a difference, as high as 7½ cents per hundred.

Q. (By Mr. CLARKE.) Should not there be a greater difference on account of the greater ease in loading wheat, and because it can be gotten into a smaller space?—A. We went into that subject quite extensively. I will show that in a written argument. We showed conclusively that railroads do handle flour as cheaply as they can handle wheat. Now, it is a fact that the railroads do supply larger cars for wheat. Their large modern cars which they build for the wheat business are of 70,000 pounds capacity. When you order a car for export flour they will send you a car of 20,000 pounds capacity; and when they come to talk about this the railroads claim that wheat is loaded heavier than flour, and they will show a lot of cars loaded with wheat at 70,000 pounds, and a number of cars loaded with flour at 20,000 pounds. But why? We showed conclusively that we did load flour to the limit when we got the cars. That is the reason why on export-business they can show that we have shipped a lower average carload weight of flour than is customary to ship of wheat.

Q. Does that statement apply to vessels as well as cars?—A. No; there is no trouble about tonnage of vessels, I think, in anyway.

Q. Do they not prefer to carry wheat?—A. I think they do, but then the discrimination, so far as we are concerned, does not occur after it leaves the seaport. This discrimination which we are suffering from is on the part of railroads between points from which they are moving the flour to the seaboard.

Q. Most of these rates are joint rates between the carriers?—A. No; they make a rate to the seaboard, and then from the seaboard the rates are made from day to day by conditions governing.

Q. Practically it is a through rate, is it not?—A. No; the rates on which we ship export are usually not based upon the through rate to destination. The basis on which we figure is the domestic rate entirely, and then, added to that, the ocean rate.

Q. (By Mr. CONGER.) But is it not true that owing to the fact of the railroads having these large elevators and in the elevators storing the wheat, and carrying on their roads at their own convenience, they can handle wheat more economically than the flour, because the millers want the flour transported at their convenience rather than at the convenience of the carrier?—A. I claim and I believe we showed, that this very point is one where the advantage lies on the side of flour. The flour goes steadily for export the year through. Wheat as a rule moves most abundantly just after harvest, and it is a fact that all railroads carrying large amounts of wheat do have to devote nearly all of their cars to the wheat service, and there frequently results a gorging of traffic, shutting out the use of these cars to any further purpose, and requiring a large number of cars to return westward empty; that costs money. Now, so far as concerns the storing of wheat, the railroad, or whoever owns the elevators, must buy that grain and make an investment in the elevator property, and the interest on such investment ought to be counted in this calculation, it seems to me, but it is not.

Q. If the differential had been 4½, as you stated, and the order of the Interstate Commerce Commission is obeyed, so in the future it will be but 2 cents, that order will give you a great deal of leeway, will it not?—A. Yes. Now, you are coming to the point I want to speak about particularly. Whenever we encounter difficulties in regard to discrimination against us, we go to the traffic manager of the railroad that we are dealing with and state our case to him. He says, "Yes, there is a seeming injustice in that. Now I would be glad to do something for you, but this is a rate which is agreed to by our traffic association and I am powerless, personally, to assist you, but I would refer you to Mr. So-and-so, who is chairman of the traffic association. Take that matter up with him." We go to Mr. So-and-so and take the matter up with him and he says, "Yes, that is a discrimination; that is wrong and bad, but I am powerless to do anything in this matter. That is an agreed rate, and unanimously agreed to by all of these railroads, and without a unanimous agreement to change it nothing can be done." We find that there is no recourse there. We have gone before the Interstate Commerce Commission with our grievance at a considerable expense and effort. We have submitted our case to it and have got a favorable decision from the Interstate Commerce Commission. We are now confronted with the problem of whether the railroads will or will not comply with that decision. We have been afraid that they will not.

Q. Have any of them as yet put the new rate in force as a result of the order? In other words, have any of them reduced the differential?—A. Not to my knowledge.

Q. We have had testimony to the effect that the New York Central was obeying all of the orders of the Interstate Commerce Commission—that is, was following out all recommendations or orders. Do you know if that road has reduced the rate?—A. I think not. I have received no notification of it. If it had I probably would have known it.

Q. If the New York Central shall obey that order, is it likely, in your opinion, that other competing railroads will have to follow, and reduce differentials?—A. If the New York Central, independent of the traffic association, will do this, every road of that traffic association will do the same thing. There is no question about that.

Q. Do you know, or have you any knowledge, what the reason is on the part of the railroads for charging more for flour than for wheat?—A. They have not done so at any period until comparatively recently—a year or two—and in that time the influences brought to bear on railroads have caused them to charge less for wheat than for flour.

Q. (By Senator KYLE.) I think it has been stated before the commission here that they could get a consignment of wheat more easily than flour, in large quantities at certain times; that they have flour for export purposes all the time, and therefore could afford to make better prices on wheat. Is that not true?—A. Unquestionably. Immediately after harvest, at that time of the year when I suppose the consignments are very acceptable to railroads, and later, when merchandise has not commenced to move—after harvest, of course, the wheat is there, and they can on that account obtain larger consignments of wheat than they can of flour, but I believe that to be really a disadvantage to the railroad.

Q. (By Mr. FARQUHAR.) Did you state that your product of flour is about even the 12 months of the year, which gives a very uniform tonnage for the road?—A. Yes.

Q. Can you, as secretary of this National Association, give a miller's reason, or a farmer's reason, or any producer's reason, why this differential should not be as it is?—A. We are firmly convinced it should not exist.

Q. Do you think there is a catering to drive the grain to Europe instead of the flour, so that the by-products may be had there instead of here?—A. We believe so, and we believe it is to the interests of railway owners and companies to move the wheat rather than to move the flour. That is what we have maintained and endeavored to show. My belief is that the discrimination against flour in favor of wheat has not been occasioned by ocean carriers to any extent. They would not have been affected in any way, so far. I believe they could affect us if they had a mind to exercise their power in rates for the benefit of their foreign miller; they could, but I have never yet seen any evidence of their having done so. The discrimination under which we suffer is from the rate of the American railways between the West and the seaboard.

Q. Is it not pretty generally the fact that the parties to a bill of lading, or the consignor and consignee, are the same parties?—A. On flour?

Q. On the grain shipped.—A. Well, I think that is a matter of business form.

Q. Well, independent of the form; I mean in the matter of ownership?—A. I do not know. In other words, as I understand it, you want to know whether the American shipper is his own consignee abroad and that wheat is sold to his interest there?

Q. Yes; and whether the consignor here is not the foreigner on the other side?—A. No; I am positive of that. The exporters of wheat in this country are comparatively few. There are a mere handful of them in number. The bulk of the wheat shipped, or practically all of the wheat exported from Chicago, is exported by 5 firms, and these 5 firms have, of course, great influence with the railroad companies on account of the bulk of the stuff they ship, and they obtain advantageous rates so as to be able to sell to the foreign demand as cheaply as possible. When it goes over there they get practically a commission on what passes through their hands.

Q. You think that the ownership really changes at tide water?—A. I believe so.

Q. (By Mr. A. L. HARRIS.) Will you please name these 5 firms?—A. I can not do it at present.

Q. (By Professor JOHNSON.) Those 5 firms get a special rate from the railroad by being able to consign their freight in train loads to the line of their choice, do they not?—A. Yes.

Q. It is an advantage that the millers do not have?—A. Yes.

Q. Then it is a very obvious reason, it would seem to me, for the concession on the part of the railroad.—A. Yes.

Q. The millers would like to have that made illegal, would they not? In other words, they would like to have the ratio between wheat and flour right, would they not?—A. Yes. We believe a parity should be maintained, as it was in former years.

Q. (By Mr. FARQUHAR.) Is it not a fact that in the milling business as well as others, the great centers of manufacturing or milling have advantages over all small places, and the great men, firms, and corporations, who control great bodies of products have an advantage over small owners all over the United States?—A. Undoubtedly.

Q. It is a rule of trade and has been a custom, and was the same before the great railroad corporations with their through systems came in, that large institutions do get better rates than small ones?—A. They do; yes.

Q. (By Mr. PHILLIPS.) Is there any discrimination in favor of any one of these 5 firms, or has there been, in freight rates?—A. That, of course, I am not prepared to say upon oath; I can not prove it. We are satisfied, however, that advantages have been obtained and are obtained. One of the largest dealers in Chicago export wheat is Counselman, and I believe he obtains advantages over some others.

Q. (By Senator KYLE.) Export wheat by the car?—A. Yes.

Q. (By Mr. PHILLIPS.) Has there been any complaint as between these firms in regard to one claiming discriminations against the other?—A. None that I know of.

Q. (By Mr. CONGER.) Is it your opinion that any exporter of flour has the same tonnage to offer the transportation companies that Mr. Counselman has in wheat? Do you suppose any exporter of flour has that tonnage to offer?—A. I do not think so; no. Now, one point I would like to call attention to, is in regard to the effect that discrimination is having on our export business, which is shown very plainly, as before stated, and which has been comparatively recent. A fair comparison would be to take the shipment of a number of barrels of flour exported, say, from Minneapolis or Duluth, which are two of the largest exporting centers of the country. Take the month of September, 1898. In the first week of September, 1898, from Minneapolis there were exported 112,358 barrels. For the first week of September, 1899, there were exported 87,600 barrels; showing what effect this discrimination is having upon us—a steady and marked change. The second week in September, 1898, there were 128,595 barrels, and the second week in September, 1899, there were 93,760 barrels. The third week in September, 1898, it was 127,841 barrels; the third week of September, 1899, it was 84,600 barrels. You see it is going down. In the fourth week of September, 1898, ending October 1, 1898, it was 116,640 barrels, and in 1899, the same week, it was 96,850 barrels. There was a total in 1898, in the month of September, of export shipments from Minneapolis of 485,534 barrels, against 362,810 barrels for the month of September, 1899, a net decrease of 122,624 barrels.

Q. (By Professor JOHNSON.) What was the decrease of wheat?—A. The wheat has shown a greater proportion of increase.

Q. Is it not due to better crops?—A. No.

Q. A better demand?—A. No. It is, I believe, because you can do better with your wheat than with flour, on account of the transportation rates.

Q. (By Mr. CONGER.) Do you know whether the Minneapolis millers manufacture as many barrels of flour this year as last?—A. Yes. They have been running very heavily this year.

Q. On account of the local markets?—A. And the little miller is the fellow that must squeal. Now, I will not carry the thing out by giving week by week the shipments from Duluth. The total shipments from Duluth in September, 1898, were 173,135 barrels against, in 1899, 79,295, a net decrease of 93,830 barrels.

Q. (By Professor JOHNSON.) In your written statement could you include a table showing the exportation of wheat and flour since 1896?—A. Yes; I will do that. I refer you to the Government Bureau of Statistics for these figures. Now, this will give you an idea how this great industry is suffering. After thinking the whole matter over, we have concluded to endeavor to obtain an amendment, if possible, in the next session of Congress, to the interstate-commerce act which will give to the findings of the Interstate Commerce Commission a mandatory effect, as of a court of record, which shall stand until reversed by the United States courts. We are acting to that end. The interests which we will gather together, the millers and farmers, and like interests, will support that measure. I have recently taken the subject up with some fifty national commercial organizations, and I have heard from probably two-thirds of them so far, they heartily enter into the spirit of this movement; and there will be an effort made in the next session of Congress to do one or two things—to make that interstate-commerce law what it was originally intended to be and to give the findings of that commission some effect, or else wipe it out so that it may not fool us any longer. We want it amended so that when decisions are made they will have some effect.

Q. (By Mr. FARQUHAR.) Have you derived, from the millers' association, any benefit from the Interstate Commerce Commission's investigation, so far?—A. No; I believe not.

Q. (By Mr. CONGER.) Have you had any cases before the commission previous to this one?—A. Oh, we have had several cases which have not been entered in the name of our association, but which we have assisted in, and they have been to some extent beneficial in their results. The first case we have acted in, as an actual association case, has been this one of discrimination.

Q. Then you mean to say that not in any one of these cases has the commission been of any service to you?—A. Never in any case that the association has handled. It remains to be seen what will come in regard to this case, whether their decision in this case we have just had before them will result in anything.

Q. (By Professor JOHNSON.) I want to ask if you intend to urge that the Interstate Commerce Commission be given authority to prosecute railroads to compel them to obey this order?—A. Yes; it is that form of amendment we desire, with some few changes, to the Cullom bill of the last Congress.

Q. Are you going to urge the Interstate Commerce Commission to prosecute for the enforcement of this order of August 7?—A. That has not been decided yet. We will cross that bridge when we get to it.

Q. You say that order has been disregarded as far as you know?—A. I understand it will be. I have been told so by the traffic manager of one road. The bill which was introduced in the last Congress by Senator Cullom for the amendment of the interstate-commerce act is about what we want, with some few changes, which will not be material. The spirit of that bill is in accordance with our ideas.

Q. Please make a little fuller statement with regard to the cooperation which the millers' association expects to give the Interstate Commerce Commission.—A. The cooperation we expect to give them, you mean, in our effort to secure the enactment of the amendment?

Q. Yes.—A. I have been in consultation with some of the commissioners, and I think that their ideas for an amendment of the act are going to meet with ours very closely, and, unless something should come up which has not yet appeared, we shall indorse the bill which is approved by the commission.

Q. Do you know whether the lumbermen are going to cooperate, too?—A. The National Lumber Association has indicated its intention to do so.

Q. For this coming session, as I understand it?—A. Yes.

Q. That would give a pretty powerful force, would it not, these two associations?—A. There are so far 23, I believe, of the leading national commercial associations that we have been in correspondence with, that have indicated their desire and intention to work with us to secure this amendment by Congress. If the desire of the manufacturing public may have any effect on Congress, I think we will succeed.

Q. So far as you observe, the manufacturing and producing public are in support of the position taken by the association?—A. I think so.

Q. It is too early for you to say to what extent the railroads are agreed in their opposition, I suppose?—A. I do not anticipate very strong general objection on the part of the railroads to the amendment of this act. There will be some pretty strong opposition on the part of a few.

Q. In the southwest territory would that be?—A. Yes; there will be some opposition there, and my impression is there may be some from the East.

In regard to the matter of pooling, our view of it is that, under existing conditions, with the act as it is now, we certainly do not approve of so amending the law that railroads may be permitted to pool. When they show an inclination to obey the spirit of the law and to comply with it, and the law is in such shape that they will have to do so, then we have no objection whatever to pooling, provided the pooled rates be made subject to the approval of the commission, when they have mandatory power; but with the law as it is now, we will fight against that.

Q. (By Mr. C. J. HARRIS.) Well, without the existence of a pool do you not find that discriminations may be made to certain parties that are detrimental to the general body of your association?—A. But it would not be so difficult to overcome as discrimination made by a pool existing under approval of the commission. We figure that a pool would simply strengthen the railways under the present law in whatever position they might take, and until they have some distinctly controlling power over them in such matters, we do not believe in giving them any greater power than they have now. As I said a while ago, we go to the general traffic manager of a road and he refers us to the chairman of the traffic association, and we go to him and he throws us back again; so there is no recourse. We have no satisfaction from them, and yet they claim that they should be strengthened in their position by the power to pool. They are strong enough for us now.

Q. It has been stated here that the railroads had to regulate their price of transportation by the price of wheat in Liverpool; that they were governed almost entirely by that. Now, would that same rule apply to export flour?—A. I can not understand that the price of flour in Liverpool can regulate the cost of transportation and does affect the price of flour and wheat there, but I can not reverse the order of things.

Q. (By Professor JOHNSON.) If I remember, it was testified that the price of grain was not fixed in the Liverpool market for this country.—A. The assertion was made. I do not think there was any proof of it.

Q. What is your opinion; do you think the price at which grain is sold, for instance, on the Chicago market for export, is determined by the Liverpool quotations?—A. I think it very largely is.

Q. Well, do you think that the Liverpool quotation is, to any great extent, affected by the American transportation rates?—A. Yes, I think so. Of course where there is a published rate it becomes a part of the basis on which they figure to make the price. I am satisfied of that.

Q. Well, suppose the agitation which you are interested in, in connection with wheat and flour rates, should result in the raising of wheat rates, let us say, 10 per cent or 8 per cent, would that lessen the sales particularly?—A. I think it would lessen the sales of American wheat, and largely increase the sale of that wheat ground into flour. I think that it is not the wheat they want, but what is made out of the wheat that they must have; and I believe that if wheat is not shipped the flour will be, from this country, when conditions are such that it can be.

Q. You think if they could not get wheat they would have to buy our flour?—A. They would buy our flour; that has been shown. The wheat which they obtain from Argentine and India, to grind that alone, does not satisfy the demand there. They want flour made from our American hard wheat. There is a demand for it, and if they can not get it in the form of wheat, they will take it in flour, and I believe the loss in tonnage of wheat will be compensated for by the increase in tonnage of flour.

Q. If that is true, then the way to keep up the price of American wheat is to keep up the rates on wheat, transportation rates, is it not?—A. I do not know. We are not complaining on the rate on flour. In fact—and it is the peculiar condition of affairs—when we get before the railroads we do not ask for any lower rates on our product, but do ask for a higher rate on the raw material. It is a reasonable proposition.

Q. It would be much better for the American grain grower if the rates on export grain could be higher?—A. An advantage, certainly.

Q. It forces that grain into flour, and American flour abroad has such a strong position that it is able to fix the price?—A. Yes. Now, you will find, and I think I could prove to you, that if you leave it to the grower of the wheat he would rather find a regular market; and he would get a higher average price for wheat if he found that market in this country at the mill. You do not have to depend on the prices abroad for the exportation of it. It is collected to go into the elevators of the buyers, and these elevator companies offer a man so much money. Now, if he has no home market, in many cases if a milling business is cut down, and they can not buy his wheat, he must sell that wheat to the buyer for an elevator company, and when it is pushed forward he does not get the money out of the wheat that he would from his steady customer right there, from some miller who is grinding it and exporting what flour he does not sell in this country. The farmers understand it throughout the West and they would very much rather sell their wheat to the mills. I can point to cases where wheat has been sold for less money to the mill than the grower would have sold it to an exporting buyer.

Q. (By Professor JOHNSON.) Does the grain that is now shipped from our Pacific seaboard for the European markets reach there at approximately the same time that the grain reaches those markets from our central West, this side of the Rocky Mountains?—A. Well, I do not think there is any, except in Montana; not beyond Montana.

Q. Can the grain from California reach the European market as quickly as it can from Montana?—A. No.

Q. I saw in an article recently that with our present means of transporting from the Pacific to the European markets the Western cereals reached the European markets at approximately the same time that the cereals of the Eastern and central part of the United States were reaching the same markets, and the result was that a considerably lower range of prices for American cereals was realized than would be if the Western cereals would reach those markets considerably earlier. I would like to ask if this is a fact or not?—A. Well, I am not familiar with conditions except in wheat and flour. I do not think—in fact, I am positive that no wheat or flour from the Pacific coast States can reach Europe as quickly as flour that is shipped from east of the Rocky Mountains.

Q. (By Mr. FARQUHAR.) Is not a great deal of the grain of the coast now ground into flour and sold in the Orient?—A. Yes.

Q. (By Professor JOHNSON.) Is there not just as much variation in the freights from the Danubian principalities to Liverpool markets and from India to the Liverpool markets as from New York to Liverpool?—A. I am unable to answer that question; I do not know about it.

Q. (By Mr. KENNEDY.) I believe you stated that the cost of transporting the wheat across the water did not affect the price of wheat and flour and did not affect the price of transporting to the seaboard in this country?—A. No; I meant to say that the export rate through from a Western point, say to a European port, is almost invariably figured on the basis of the export rate from that point to the seaboard, and

then the rates from the seaboard are very frequently quoted from day to day by export agents there, as they can be obtained. The ship, for instance, will be ready to sail; if she can get so much more cargo within a certain time she will make a lower rate of export, and the agent will quote West his ocean rate. Now, that added to the regularly established rate to the seaboard, will be the export rate on that shipment, and if a request comes for a price on flour—a European request for the price of flour—it is quoted on the basis of the rate made by this steamship, sometimes a tramp and sometimes a regular steamer, plus the regularly established American railway rate.

Q. The gentleman who was here on Saturday as a representative of the city of St. Louis gave us an illustration which seemed to show why wheat was transported cheaper than flour. He said that a steamship might be at Newport News waiting for a cargo, and that it could easily get a cargo of grain when it could not get such a cargo of flour.—A. Yes; I have heard Mr. Vanlandingham say that. But I had agents for some years at every one of the Atlantic ports, watching and hastening forward our export business, and I have never yet seen a time when the docks of the transportation lines were not pretty well lined with flour, so that a flour cargo could be had if they wanted it; but they frequently let it lie there and made a bid for more flour, and if they happened to get it, they would take on the flour from the West; if not, they will load the flour on the dock. But I have never seen the time when they could not get flour for export to fill up a cargo. I have never experienced that. I do not mean to say that it has not occurred, because I do not know that.

Q. (By Mr. C. J. HARRIS.) I would like to ask you if this rate on wheat to New York would not work very materially in the interest of the seaboard towns as against the Western millers—this low rate on wheat to the East?—A. I have been talking entirely about the export wheat. Now, then, when wheat is shipped at the export rate it can not be unloaded at the seaboard; it must go abroad.

Q. That is the theory?—A. That is the theory.

Q. And the practice, probably?—A. And the practice, probably.

Q. So that does not enter into it at all?—A. No.

In regard to this matter of rates, I have another communication, that I picked up yesterday, that shows something of it. Now, the rate has been, from the Mississippi River to Chicago and Milwaukee, $7\frac{1}{2}$; then from Chicago and Milwaukee to New York, 17 cents, making $24\frac{1}{2}$ cents, the sum of the 2 local rates. I do not mean to say local flour rates; I mean the sum of the 2 export flour rates; that is, flour for export, $7\frac{1}{2}$ cents from the Mississippi River to Chicago and Milwaukee, and 17 cents from Chicago to the seaboard, making $24\frac{1}{2}$ cents. The railroads make an export rate from the Mississippi River to the seaboard of 12 cents, putting those millers east of the Mississippi River—for instance, we will say, of Milwaukee—at a disadvantage of 12½ cents. I have a letter from the Stern Milling Company, which says [reading]:

“SEPTEMBER 30, 1899.

“GEO. A. SCHROEDER, Esq.,

“*Mgr. Ch. of Com. Frt. Bureau, Milwaukee, Wis.*

“DEAR SIR: On 'change yesterday morning we had a very vivid illustration of how the proportions of the cheap through rate from the Mississippi River on export wheat works to our detriment.

“There were several cars of wheat for sale at $71\frac{1}{2}$ cents. The millers did not see their way to pay this price for the same, when they were sold to an exporter at 70 cents; and the seller of the wheat expressed the opinion that it paid him better to sell the wheat at 70 cents to the exporter than to sell at $71\frac{1}{2}$ cents to the miller.

“The above illustration will show you how hard it is for us to buy wheat in competition with the exporter. We should like to have bought those 3 cars of wheat, but of course we could not buy them with so much advantage in favor of the exporter.

“Please submit the above to the proper officials for their enlightenment, and oblige,

“Yours, very truly,” etc.

That is simply an illustration of where discrimination works against us on local business. I think that is all in regard to rates that I have to offer.

Q. (By Mr. A. L. HARRIS.) When this case was heard before the Interstate Commerce Commission, were the railroads named in your petition present?—A. Yes.

Q. Now, as I understand from the law, as it now stands, no order is issued, but a mere notice to the railroads that such a finding was made?—A. The order has been issued—a formal order, as I understand it.

Q. The railroads may or may not pay any attention to that?—A. Yes.

Q. Then, you or the Interstate Commerce Commission have to take it to the circuit court?—A. Yes.

Q. When that gets there is it tried on the case you made in the Interstate Commerce Commission, or is it tried de novo, letting the railroad bring in all the evidence?—A. I have not taken a case that way to the court yet from the commission, but my impression is that it is tried de novo. I may be wrong about that.

Q. Up to that time you have no relief?—A. No.

Q. And the case being tried anew it may be a different case than the case you tried before the Interstate Commerce Commission?—A. Practically makes useless the effort that we originally made.

Q. Now, what you desire is to have an amendment to the law so that the Interstate Commerce Commission can enforce the orders they make, and if the railroads desire to take it to the circuit court they are to have that privilege?—A. That is the idea, yes.

Q. And then it is proper to open the case, maybe, in the circuit court?—A. Yes.

Q. And not a new case?—A. Yes; not a new one.

Q. One excuse that has been made for railroads charging more for wheat than for flour is that they are able to put a greater tonnage in the same car than they can of flour. Is that practical?—A. That is not true. They can load a car of flour to the same capacity that they can a car of wheat, but as I explained a while ago, when a car is ordered for loading wheat, they send one of the new large capacity cars of 70,000 pounds gross. They will send one of these and it will be loaded to its full capacity. A miller goes to a road and orders a car for flour for export and they will send him a 20,000-pound car to load with flour, and it will go. Now, the railroads show by facts and figures that the average car of wheat exceeds in weight, very far, the average car of flour; but we claim that is so, simply because they do not give us those big cars; and we showed it to the commission by facts and figures. We can load a car to its capacity to just as good an advantage with flour as with wheat. There is really nothing in that claim.

Q. You were speaking about the elevators being owned largely by the railroad companies, or officials of the railroad companies; does that elevator ownership extend along the lines of railroad?—A. Yes.

Q. As well as in the cities?—A. Yes.

Q. Are you acquainted with the condition of affairs in Chicago?—A. Somewhat.

Q. How many of the elevators, if you know, in Chicago are public elevators or warehouses?—A. Well, I can not say how many, but, you know, the Armour system of elevators there is a very prominent and strong system, and you know Mr. Armour's connection as a director of railroads would indicate that certain of the railroads may indirectly, if not directly, be interested in his system of elevators.

Q. How many railroads is Mr. Armour interested in?—A. It would be difficult for me to say that. I know he is a director of the Chicago, Milwaukee and St. Paul.

Q. How many railroads is Mr. Counsellman interested in, or rather elevators on the particular lines of railroads?—A. I can not say.

Q. The railroads, or those in sympathy with the railroads, controlling the elevators out along the line of railroad—does not that work against the miller who wants to buy grain?—A. Well, I think it does. It would against the small miller, but some of the large millers have their own elevators, and they are interested in elevators to the extent that it makes them independent of control that would be injurious to them by the roads.

Q. Do the railroads give the millers an equal advantage—the miller's elevator—equal to the elevator owned by the firm in sympathy with the railroad?—A. I have not known anything to the contrary.

Q. Is there danger that such might be the case if the condition continued to spread, as now appears to be indicated?—A. Well, I think so, although, as I say, many of the small millers do get their wheat from farmers that bring it right into the hopper. The larger mills have their own elevators or have their interest in elevator systems that supply them, where they are sure of getting enough grain to run. I do not think there are many large mills that are dependent for their grain upon elevator systems owned and controlled by independent companies or railroads.

Q. Then, so far, the combination between the elevator firms and the railroads is not hurting the larger millers?—A. Only so far as the favoritism shown in the export rates on wheat has militated against the interests of the millers.

Q. Do you think that the elevator system as it now exists is beneficial to the farmer; is it conducive to his getting the highest price for his wheat?—A. Well, the general elevator system of the country, which is not connected directly with flour mills, I do not think is conducive, as conducted, to the profit of the farmer.

Q. (By Mr. RATCHFORD.) Do you include in that the elevators owned by independent companies?—A. No; I do not include them in that.

Q. (By Mr. C. J. HARRIS.) What I wished to bring out was this: Does he have any open market or is he in a pocket and forced to sell to these railroad elevators?—A. You will find that in the farming districts where they raise the wheat the prices are controlled largely by some elevator system.

Q. (By Senator KYLE.) If the farmers of the country possess their own elevators that will give them the means of carrying on their own business independently of them?—A. Yes.

Q. Do you know whether they ever entered into a combination with the elevator men of the West regulating the price of the grain?—A. No; I have never known of anything of that kind.

Q. (By Mr. KENNEDY.) In reply to a question by Governor Harris you stated that you could load a car of given capacity as full of flour as you could with grain. Last week one witness explained to the commission how the car was filled to its utmost capacity with grain. I would like to have you explain how you place the same amount of flour in a car that you do of wheat?—A. The export flour is sacked exclusively; no barrel flour is ever exported; it is all sacked flour. Those sacks of flour will fill the car up to greater than the gross capacity at any time. It can be packed in.

Q. (By Mr. C. J. HARRIS.) Wheat never fills more than half the car?—A. No; it is filled up to the top of the grain doors. If you have more than that the running gear will break down; it will not stand the test. If you attempt to fill that car higher you will overload the car. Now when you put sacked flour into the car you can stack the sacks regularly within two feet of the roof, if necessary, putting it high in the ends and then coming toward the center doors and piling it up very easily.

Q. (By Mr. KENNEDY.) I think this gentleman explained that men will go into the car and shovel the wheat into the corners and fill it up completely?—A. They do not fill the car anything like full to the top. They shovel the grain back, but they can not get above these grain doors or grain sides; otherwise the car would leak.

Q. (By Mr. C. J. HARRIS.) The grain doors are furnished by the railroads?—A. They are put to the expense of buying these grain doors in order to handle the wheat. There is another expense to them.

Q. (By Mr. RATCHFORD.) Can flour be loaded and shipped as cheaply by water as grain can?—A. I have no figures on that subject, but my belief is that it can not be handled as cheaply as grain.

Q. Do you believe there should be a slight difference by water?—A. I believe that, all things considered, it may cost a little more to handle flour by water than wheat.

Q. (By Mr. FARQUHAR.) Does this country ship much of the by-products of milling to Europe?—A. That has fallen off very largely.

Q. Is the reason that the American miller can not compete with the European miller in the by-products?—A. Yes; to some extent, there is a surplus of it.

Q. Can you find a market for all your by-product in this country?—A. It is sometimes difficult to.

Q. For instance, in the case of bran—have you not improvements now in your bran packers by which you can send, relatively, a great deal more than you used to to the European markets?—A. Yes.

Q. And yet you are not able to compete with the foreign miller?—A. The association which I have the honor to represent some years ago offered a prize for a bran packer which would produce certain results, and there was quite an effort made for a time to get such a packer, and it has been obtained and we can pack bran now, so far as weight and bulk are concerned that it can be shipped very advantageously; but the trouble is that we have no good export market for it now, owing to the fact that the wheat is carried over cheaper than our flour, and in that is carried our bran, etc., for the foreign miller to put on the market against us.

WASHINGTON, October 10, 1899.

TESTIMONY OF MR. GEORGE J. KINDEL.

Manufacturer, Denver, Colo.

The commission met at 2.30, Chairman Kyle presiding. Senator Kyle introduced the witness, Mr. George J. Kindel, of Denver, Colo., manufacturer of bedding, who, being first duly sworn, testified as follows concerning transportation:

Q. (By Senator KYLE.) Will you state your full name and address?—A. George J. Kindel; address, Denver, Colo.

Q. And your business?—A. The manufacturing of bedding.

I would say that my complaint is that my city, Denver, and State, Colorado, and all the territory embraced in the one hundred and fifth meridian section is violently discriminated against by the railroads and express company; that we are denied commercial equality, which forbids the development of our resources and the sacred right and duty of making ourselves sustaining. Our freight rates are anywhere from 100 to 300 per cent higher per ton per mile than those of our Eastern and Western competitors.

My first complaint of railroad discrimination to the Interstate Commerce Commission was filed in February, 1892. In the spring of 1895 I learned that the Colorado Fuel and Iron Company had also filed a complaint, which was set for hearing in 30 days. I came on to Washington to learn why my complaint was not given a hearing. Judge Morrison, then chairman, called up the secretary and learned from him that for some reason or other it was pigeonholed. Judge Morrison suggested that I make an amended complaint and that both the Colorado Fuel and Iron Company and my complaint be heard at the same time.

The trial was held in May, 1895, in Denver. The result of the Colorado Fuel and Iron Company hearing was a ruling by the Interstate Commerce Commission that the railroads be made to carry their products from Pueblo to San Francisco for 75 per cent of the Chicago rate. Previous to the hearing, rails were carried from Chicago through Pueblo, or even via New Orleans, to San Francisco for 60 cents per hundredweight, while they were charging the Colorado Fuel and Iron Company \$1.60 per hundredweight, notwithstanding the 1,000 miles shorter haul.

In my case, in behalf of Denver City, I was never given a ruling by the commission. On my product—comforters—I was obliged to pay \$3 per hundredweight, Denver to San Francisco, while my competitors at Missouri River points—Chicago, St. Louis, and New York—were paying only \$1 per hundredweight. At the hearing in Denver the traffic managers of the transcontinental lines wished to appease me, and gave me the \$1 on comforters to San Francisco and southern California points without any order or ruling from the Interstate Commerce Commission.

My blanket complaint to the Interstate Commerce Commission covered the rates and classification to and from Denver, east, west, and south. In my opinion, the interstate law is an expensive farce, and unless the commission is given powers, as was suggested in the proposed Cullom bill, it will continue to simply be a subterfuge to railroads, who now fear it about as much as a bad boy would a cast-iron bulldog. The interstate law should be either strengthened and enforced or abolished. As it stands to-day it is simply an expensive statistical bureau. Of the personnel of the commission I take pleasure in saying (of those whom I have met, notably Judge Clements, of Georgia) that they are brainy and honorable men. The best address on transportation I ever heard was delivered by Judge Clements in Denver about 2 months ago. It would profit every American citizen to read it. By the way, he had a thing in point there, an extract from a speech of ex-President Harrison on the enforcing of the act or giving the commission power to act, in which he said: "In the Senate, when the bill was under consideration, ex-President Harrison, then a Senator, with great force and clearness stated the public grievance and the necessity for a remedy. He said:

"What is it that the people complain of? What is the just grievance at the bottom of this great popular clamor against the railroad companies? I think, as both these bills admit, just two things: First, extortion, the charging, especially for local freight, of unreasonable rates, thus unduly burdening the local traffic for the maintenance of the railway; and, secondly, and chiefly, discriminations between shippers of the same class.

"Mr. President, I do not stop to prove the existence of these evils. They are confessed of all fair men. I do not stop to prove—for proof is not needed—that the railroad companies, by these discriminations between individuals and between localities and by the unrestrained exercise of the power to establish rates, have assumed and do now exercise a most dangerous and unwarranted control over the commerce of this country.

"I would regard it as an utterly futile piece of legislation if we should pass here a bill simply declaring the common law upon this subject.

"What is the trouble? It is that the shipper needs to be reinforced in his contest with the railroad company. If some should ask me why it is, if the exaction of an unreasonable rate is now unlawful and the excess may be recovered back, that shippers do not recover it back; or if one should ask me why it is, if discriminations are illegal, that shippers do not expose them and recover their damages, my answer would be that it is an unequal contest to which the shipper is invited.

"I think, then, I may declare, with the approval of those who listen to me, that legislation upon this subject to be efficient must reinforce the shipper in his contest with these great railroad corporations."

In this same address Judge Clements stated that statistics prove that the entire volume of money in the United States was only \$24.70 per capita, while the railroad earnings amounted to \$16 per capita per annum; also, the earnings of the railroads amounted to over \$1,200,000,000, while the entire income of Government dues amounted to but \$500,000,000; in other words, the income of railroads exceeded that of our Government by 140 per cent.

As to my individual railroad experiences, I would say that I was driven out of the manufacturing of upholstering goods in Denver, and later that of spring beds, and more recently had to start the manufacturing of a silk album in Chicago because of discrimination in freight rates. The reason of that was, the rates were, books, Chicago to San Francisco, \$1.75 per hundred; Denver to San Francisco, \$3 per hundred. Paper and raw material, Chicago to Denver, 97 cents; making, to be added together, deducting the Chicago rate, a handicap of \$2.22 per 100 pounds; and therefore I started the plant in Chicago. I intended to annex it to my mattress factory—the steam plant I have there—but I did not see how I could do it. Reversing the proposition, from Chicago to New York books are 75 cents per hundred, while from Denver to New York they are \$2.72 a hundred. This explains that freight rates, and not demonetization of silver, have lost us our manufactures, a few of which I enumerate. Denver once had prosperous woolen mills, powder mills, nail factory, shoe factory, saddle factory, glass works, cement works, cooper shops, implement factory, hardware manufactory, car shops, rolling mills, envelope factory, match factory, mattress factory, white lead works, paper mills, etc.

Q. (By Mr. PHILLIPS.) Are they in existence now?—A. No; they are all idle buildings. Denver is perhaps the only town where so much could be lost and never missed. I want to emphasize here that our Senator Teller recently made a statement—I picked it up in New York; a copy of the Republican of September 23—in which he goes on to say that the silver question is not a local matter. We can see its application in Colorado in that our industries are lessening daily, and it is naturally a question vital to us. But I will say here that if silver was 16 to 1 or even 6 to 1, if you please, that with the discriminatory freight rates of 100 to 300 per cent higher than anybody else pays, you can not establish any manufactures. That stands to reason. Now, in this case of the Colorado Fuel and Iron Company, rails at that time were 60 cents, iron bars 60 cents, iron billets and blooms 50 cents, while from Colorado and Pueblo, at which we have our great Colorado Fuel and Iron Plant, they were \$1.60; and the railroads in that case, I remember, under oath stated that they had to carry the freight from Chicago to New Orleans, thence via the southern line to California, for 60 cents. They were making a profit. When you remember and reflect that after the rails got to New Orleans from Chicago they were 130 miles farther from their destination than at the initial point, it seems preposterous. But the commission in this case did make a ruling, and it was upheld by Judge Hallett of the United States court. In my case I have not had a ruling.

Q. (By Mr. KENNEDY.) What was the ruling?—A. The Interstate Commerce Commission made a ruling and the judge upheld it. It was 75 per cent of the Chicago rate. That is the ruling. It is 45 cents now, instead of \$1.60. They have reduced it that difference.

Q. (By Mr. C. J. HARRIS.) I do not think you understand the gentleman. This ruling was not in regard to your product, but in regard to the Colorado Fuel and Iron Company's product.—A. Oh, yes; it was that.

Q. They made no ruling in your case?—A. Not in my case, and I am here to find out why I am not getting a ruling.

Q. (By Mr. KENNEDY.) That is what you came to Washington for?—A. Well, that and to come before you here.

Q. (By Representative LIVINGSTON.) Have we general prosperity now in this country?—A. I think we have in every place except Colorado.

Q. Have discriminating freight rates brought about that general prosperity?—A. I do not know whether any place is discriminated against like us.

Q. You are representing your local city?—A. Yes; Denver.

Q. Have you general prosperity at Denver?—A. No.

Q. Nobody prospering out there?—A. Yes; I am prospering to-day.

Q. Who is it that does not get a fair show in Denver?—A. All these different mills.

Q. What are they manufacturing?—A. The woolen mills that we had there have gone, and we have lost them, and to-day one of the great complaints we have to make is that the railroads charge a higher rate for the raw material than they do for the manufactured product.

Q. (By Mr. C. J. HARRIS.) Some of these concerns have been gone a long time, have they not?—A. In the past 10 years or more; gradually going.

Q. (By Mr. KENNEDY.) Do you get rebates or have you any discriminations made in your favor by the railroad companies?—A. Yes; and everybody that is prosperous.

Q. Will you explain to the commission how you secure such favoritism from the railroads?—A. By comparison of rates. For instance, one of the products I use is palm fibre from Africa.

Q. (By Representative LIVINGSTON.) You mix that with the wool?—A. No; mix it with cotton.

Q. Is not that a fraud on the consumer?—A. No; we brand it to you. We tell you on the face of it.

Q. That is adulterated stuff?—A. No; it is not adulterated at all. It is pure palm fibre (a plant).

Q. Why do you put that in with the cotton?—A. We advertise a palm fibre cotton-mattress, and we sell it to you as such.

Q. You put it in because you get it cheaper than cotton?—A. The people want it. You come to me and want an all-fibre mattress, and I will sell it to you cheaper than I would a palm fibre cotton top.

Q. (By Mr. KENNEDY.) Please explain why it is that you get these favorable rates, and why these industries that were knocked out of Denver could not have gotten the same favoritism from the railroad companies?—A. I can not answer any more than that we had large jobbing houses, and they are gone.

Q. Tell us how you get the favoritism?—A. I told you, by comparison of rates. I will take New York as a basing point. I ship by Galveston to Denver, Omaha being relatively the same distance. From New York to Galveston they get a 59-cent rate, and we have a tariff that gives a \$1.17 rate. I can not compete because the Omaha man comes back into my territory with these same goods and undersells me.

Q. You can bring these goods around by water and up from Galveston cheaper than the rate across the country from New York?—A. Oh, not necessarily that. There are these dispatch lines which run over all the roads, or nearly so, all over the country. There are the Lake route, the Newport News route, and the Kanawha dispatch, and the Cumberland. There are 6 of them; I can not recollect the names of all of them.

Q. (By Mr. RATCHFORD.) Do other shippers to and from the same points receive the same rates?—A. In Denver?

Q. Yes.—A. I do not know.

Q. You do not know whether they are paying a higher rate to the same points?—A. No; I do not know what others are paying. I know that the tariff is \$1.17. I know I am not paying the tariff, and I feel that I am a rebater, subject to the law, and I dislike that sort of thing; I deprecate it.

Q. (By Mr. PHILLIPS.) Do you or do you not get rebates as against other people in Denver engaged in the same industry that you are?—A. Perhaps; I do not know. I presume I must, because the tariff is \$1.17, and I am not paying the tariff.

Q. You have reason to believe that others engaged in the same line of business with you are paying the tariff?—A. I do not know of anything different. There is the tariff. They may be all alike. They may get a better rebate than I do for all I know.

Q. (By Representative LIVINGSTON.) Well, if they give you rebates, how can you complain of their rates?—A. I complain of the tariff they have in effect.

Q. If you get all the rebates you want, why do you complain?—A. I do not get all I want.

Q. You want more?—A. I want simply fair freight rates, so that I can compete with other people in my section. As I told you a while ago, I manufacture a book in Chicago. The rate from Chicago to San Francisco is \$1.75, while from Denver to San Francisco it is \$3 a hundred. Now I would like to see those rates just. I can not see why Denver, being 1,000 nearer the Pacific coast, should pay \$1.25 more than does Chicago, 1,000 miles further off.

Q. (By Mr. RATCHFORD.) What is the rate from Denver to Chicago?—A. \$2.05.

Q. It would be cheaper almost for you to ship your material from Chicago by way of San Francisco?—A. Yes. We have done that on oil. Coal oil has been shipped from Chicago to San Francisco and back again.

Q. (By Mr. C. J. HARRIS.) Have you made a proper representation of these differences to the railroad authorities?—A. Yes, indeed; I have for the past 10 years.

Q. How many different lines have you in Denver?—A. I believe there are 12.

Q. How many to the coast?—A. To the coast—the Santa Fe makes a pretense to that business, the Rio Grande, the Midland and the Union Pacific. I guess that is all.

Q. You have 3 at least?—A. Yes.

Q. Do you mean to say that, after consultation with these 3 lines to the coast, they refused to take your business at a rate less than this same classification is carried from Chicago to the Pacific coast?—A. Until I made complaint to the Interstate Commerce Commission and had them there at the hearing. Then they offered to make me a dollar rate on comforters. I was paying \$3.

Q. (By Senator KYLE.) On that one article alone?—A. Yes.

Q. How did they explain their extortionate charges before?—A. They do not try to make any explanations.

Q. (By Representative LIVINGSTON.) Do they not offer this explanation, that their train is made up at Chicago for the Pacific coast, and that they can haul through loads from Chicago on a much less tariff than they could stop at your place and take on additional cars and an additional amount?—A. Their chief explanation has always been water competition, but I have exploded that theory. They allege that water competition is the controlling factor. I recognize water competition as a controlling factor, but I deny that if the rate is 75 cents from New York, all rail overland to the Pacific coast, that Missouri River points should be given a 50-cent rate. The only argument I can see that they might advance is because of its proximity to the Pacific coast. But they also alleged that the ships did actually absorb the inland freights to the Atlantic coast and carried them around by the Horn. I then assumed that the railroads should raise their rates, add the 30 cents, if you please, that the ships absorbed, to the Missouri River rate of 75 cents, and the New York rate, and that would make it \$1.05 instead of 50 cents. And we proved at the hearing that they actually had 75 cents from New York and 50 cents at Omaha, but when you struck Denver, it was \$1.60 to Pacific coast points on the same articles. So your train making would apply to Missouri River points. It ought to affect them more seriously there than at Denver. There, you understand, they make it less.

Q. You can not ship by water at Denver?—A. No; not unless down the Platte River, and that is not very big.

Q. (By Mr. CONGER.) You are on water competition on the Missouri River practically?—A. They have had 3 steamboats. One burned up, and another sold out, and I do not know what became of the other.

Q. (By Mr. C. J. HARRIS.) If you can show these railroad companies that there is a profit in handling your business—these railroads are not overrun with other business, are they, at the present time?—A. No; not too much.

Q. Why is it that they are not anxious to build up industries and increase the freight on their lines?—A. I presume it is because the directors of the roads do not live in Denver; they live east. And the traffic managers in Denver, I will say, are my best friends. We have often argued the question why it should be. It is incomprehensible.

Q. (By Senator KYLE.) What is the eastern terminus of the Denver and Rio Grande?—A. Denver.

Q. So that the trains to the Pacific coast are not in competition with Chicago in that case?—A. I believe most of their freight goes by Pueblo; the B. & M. brings it to the D. & R. G. at Denver, and they take it on and pull it through.

Q. That one road is interested in building up Denver; it should be, in the nature of the case?—A. Yes.

Q. Where do the stockholders of that road live?—A. New York.

Q. (By Mr. C. J. HARRIS.) Have you been discriminated against, in comparison with people in the same line of manufacture?—A. Yes; I believe so, though I do not know exactly what the other people got. They brag on it, that they were keeping their heads shut and were getting the better of Kindel.

Q. (By Representative LIVINGSTON.) How about the Pacific Traffic Bureau; do you belong in Denver to it? Do you know anything about it?—A. No; any more than the St. Louis people invited me to intervene in behalf of Denver. That suit is substantially the same as I brought before the commission.

Q. Are you in that suit, of the St. Louis Traffic Bureau?—A. No; I am not in the Traffic Bureau, but they have invited me to participate or intervene on behalf of our section, in this suit.

Q. (By Mr. C. J. HARRIS.) Are there any other manufacturers of the same line of goods as yours in Denver?—A. Yes.

Q. How many others?—A. There are two of nearly equal size, and there are several smaller ones; that is, small shops.

Q. Do they complain of rates?—A. Yes; they necessarily see that they are damaged.

Q. Do they unite with you in this general demand?—A. No.

Q. Is your statement that they have better rates simply hearsay?—A. It is repeated to me from them; that is, through a third party. I will say this, that our chamber

of commerce, that ought to look after this thing, even went so far as to petition the Interstate Commerce Commission to grant the petition of the railroads to abrogate section 4, Colorado westward, and that I was the only mortal man out of all the community west of the line from Duluth, Minn., to Sabine Pass, Tex., on which the transcontinental lines draw their arbitrary and imaginary line, who protested, and I am glad to say I won.

Q. (By Mr. KENNEDY.) Is there any business similar to yours at Pueblo, Colo.?—A. Yes.

Q. Do they complain that they are discriminated against in the interest of building up Denver?—A. I guess they do, to an extent.

Q. Do not the people of Pueblo complain that your railroads discriminate in favor of Denver generally, for the purpose of retarding the growth of Pueblo?—A. Yes; as we do at Denver. For instance, Pueblo gets a minimum rate of \$1 on some products, while we are paying \$2.00 from Denver to the Pacific coast. Now, that looks remarkable.

Q. Do you believe Pueblo is discriminated against in the interest of Denver?—A. Yes; in the same ratio that Denver is.

Q. Well, in the interest of Denver?—A. In some sections, yes; on some products.

Q. This is the idea: Do they not complain that the railroads desire to build up the city of Denver, and therefore discriminate against the city of Pueblo?—A. I have heard that statement made by shippers and manufacturers of Pueblo.

Q. Do you believe that is true?—A. Not to any great extent.

Q. (By Mr. PHILLIPS.) In some articles Pueblo gets an advantage over Denver, as I understand you?—A. No; it is not on the articles, but it is in some of the total rates. For instance, the first-class rate, Denver, off 125 miles, is only 15 cents, while the regular rate is 52 cents, I think. In that way they get the better at the nearby points of Pueblo westward.

Q. (By Mr. FARQUHAR.) Mr. Kennedy asked you a question there that you did not hardly answer as fully, I think, as the commission would like. Is there any discrimination in respect to State commerce; discriminating on local rates, as between Pueblo and Denver?—A. No.

Q. You know of nothing of that kind?—A. No.

Q. And the question of discrimination lies in interstate commerce?—A. Interstate.

Q. (By Mr. RATCHFORD.) You know that the citizens of Pueblo make complaint to that effect, do you not?—A. Yes; they make complaint. They reduced the regular first-class rates from 52 cents to 15 cents to meet Pueblo on the line westward.

Q. Is that regarded by the shippers of Pueblo as being a discrimination against their city?—A. Yes.

Q. Do the shippers from Denver get that 15 cent rate?—A. Yes.

Q. Is it uniform between them?—A. Yes.

Q. No discrimination between shippers from that point?—A. Not that I know of; never heard of any.

Q. (By Mr. KENNEDY.) Are you a member of the chamber of commerce of Denver or any other commercial body out there?—A. I used to be.

Q. Not now?—A. No.

Q. Is it composed of representative business men of the city of Denver?—A. Yes.

Q. Are they making any complaint similar to yours?—A. No; because they are all rebated. General Irving Hale, who gained fame in the Philippines, said of the railroads—

Q. (By Mr. C. J. HARRIS, interrupting.) What would be his ground for knowing much about the railroad situation?—A. He lived there. He was the manager of the General Electric Company. I quote him as a very exceptional man. He is the man that took the highest graduate per cent at West Point college. He is an authority on many things. He said: "With our wonderful variety of raw materials, manufacturing should be the foundation of Colorado's prosperity. Freight discriminations, the great barrier against manufacturing development and the worst obstacle to our general progress, not excepting silver demonetization, should be removed." He is a man of broad views.

Q. (By Representative LIVINGSTON.) He disagrees with you then?—A. No.

Q. He does not say that the demonitization of silver had nothing to do with it?—A. No; I did not say it had nothing to do with it. I say in the same manner, in the same sense, I mean, that it is freight discrimination and not free silver that has knocked out these factories. And I repeat that if silver were 16 to 1, or even 6 to 1, if there could be such a thing, that with the freight rates as they are, you can not build up manufactures in Colorado.

Q. (By Mr. C. J. HARRIS.) I should like to ask you if, as a manufacturer, you would say that Denver is well adapted as a manufacturing and distributing center for the rest of the United States?—A. At least westward.

Q. Are you not too far removed from the markets to bring your raw material out there and manufacture it and send it back to the centers of population? Can you hope for anything of that kind?—A. No; I do not hope for that.

Q. Is it the railroads or is it your geographical position that prevents it?—A. It is the railroads. Understand me, I do not mean that we should bring our hardwood from the East or iron from the East, or such materials as that, to manufacture implements in Colorado. That would be out of the question. But I do contend that where we have wool and coal that we ought to be able to manufacture woolen goods. We ought to be allowed to ship those goods out in competition with others and not at a higher rate per ton per mile.

Q. Are not your wages higher there in proportion to other parts of the country?—A. Necessarily they have to be higher, because railroad rates make everything else higher. I will give you another illustration. Sugar is carried from San Francisco to Denver at 75 cents; to Loveland it is 93 cents; but on farther, to Omaha, it is only 50 cents. There is another thing we complain of. Rates between St. Louis and Galveston. I will just mention the first class are, either way, \$1.30 a hundred. Denver to Galveston is \$1.30, but from Galveston to Denver is \$1.80. And when you come down to the lower classes, say to the third class, Denver pays \$1.10 from Galveston and 97 cents to Galveston. St. Louis, in either direction, has 97 cents.

Q. (By Mr. KENNEDY.) Is not Denver an exceptionally favored city as far as railroad rates are concerned?—A. No.

Q. Do you not say that they are all rebaters out there?—A. Well, I do not call that favorable if a man has to violate the law to live in the land. I stand self-confessed, but I deplore that condition.

Q. Are all the rest of them criminals, too?—A. Yes.

Q. (By Mr. FARQUHAR.) What is your transcontinental line from Denver?—A. They are part of all these running from New York through. Twenty-one roads (or lines) make up the transcontinental tariff.

Q. Now, is there any difference between your classification and your rate on the Santa Fe and what it would be if you took the Union Pacific up to Greeley?—A. No; the same thing. They are pooled.

Q. What effect has the Southern Pacific on your rates?—A. None East and North, but to Pacific slope and Gulf of Mexico the Southern Pacific practically controls rates.

Q. You can not get a better Pacific slope rate by reaching Texas and then coming up from Galveston on the Southern, can you, than you have by the through line?—A. No; because our railroads have seen fit, even when the war was on between the Mallory and the Lone Star lines, to fix an arbitrary rate onto the prevailing rate, say, of 25 cents a hundred; so we got no benefit. And in answer to your last question I would say that the Southern Pacific is a factor, and it has destroyed many of our rates. For instance, gloves from San Francisco to Denver, \$2 a hundred. You ship the same packages back from Denver, which has 5,000 feet of elevation, to San Francisco, at the sea level, downhill, like a toboggan slide, and it is \$3 a hundred downhill, to \$2 up. So we can not begin to compete.

Q. (By Mr. C. J. HARRIS.) Well, there are two large mountain ranges more to cross, are there not, in going from the coast to Denver?—A. Yes, you must cross four; but the proposition remains the same. The initial point, Denver, is at 5,000 feet elevation, while San Francisco is at the sea level.

Q. You can not figure the rate on a mountain railroad that you can on the New York Central, that is down grade from the lake right down to New York City?—A. Oh, no. But under those circumstances I deny the right of the railroad to make a higher charge to Denver than they do to other points beyond.

Q. (By Mr. PHILLIPS.) Will you go on in your own way and state the discriminations against yourself and against others specifically? Have you any information that you could give the commission along that line?—A. I could give you a number of articles here to show you a comparison of rates. For instance, Chicago to California terminals, a 2,500-mile haul, boots and shoes, \$1.50 a hundred. Chicago to Colorado common points, which include Denver, Pueblo, and 200 other stations, from Trinidad to Cheyenne, it is \$2.05. If we want to ship those boots and shoes from Denver again to California points, we pay another \$3, making \$5.05. That is the proposition. I see you have a map here and the best way is to illustrate it on that [indicating on wall map of the United States]. Here is Chicago, Denver, and St. Joe; that would be a Missouri River point. Chicago to St. Joseph, Mo., the freight rate is 80 cents a hundred. From St. Joseph to the Pacific coast it is \$1.50, the same as it is from Chicago. And this will illustrate why Marshall Field and Farwell and some of the larger jobbing houses we had in Denver had to withdraw from Denver and fall back to the Missouri River and east of that. The shipper on the Missouri River from Chicago can get his goods there for 80 cents and reship them to San Francisco for \$1.50, while from Chicago to Denver it is \$2.05, and from Denver to

San Francisco it is \$3. We have had it to Galveston, Tex., and El Paso, Tex. Our first-class rates were, when I got Kindel's A. B. C. on freight rates out, from here to there, a 781-mile haul, \$2 a hundred, while from Chicago to El Paso it was \$1.62 a hundred.

Q. (By Mr. KENNEDY.) With your rebate, what did you actually pay?—A. I did not happen to ship to El Paso, and I was not subject to rebates, because I was fighting too hard. I was not in position to get rebates. Now I will just illustrate this, if you will allow me, in the old kindergarten fashion [pinning paper over Colorado on map]. We will assume that represents the State of Colorado; just follow it now. This is a large ranch, we will call it, inside of the State. We will assume that Denver is here. I come along to you gentlemen, and I say, "Gentlemen, I would like to build a toll road through your ranch." You agree on condition that I pay the expense, which means taxes, for keeping up the barbed-wire fences, and that I give you reasonable and fair rates. After having opened the toll road, I carry goods from your neighbor, Chicago, to Denver and charge you \$2.05. I carry the same goods right on through to San Francisco for \$1; the whole haul for \$1.

Q. (By Mr. PHILLIPS.) Clear through to San Francisco?—A. Yes. Now, you complain to me and say, "Kindel, this is not according to agreement. I have given you this right of way through my ranch. Why do you do it?" Well, I will tell you it is water competition, some changing of the haul, or something or other. And I say, "I do not want any of your Populist ideas." You are for a time pacified. After a little you get overloaded on the goods you have been shipping in from Chicago and you wish to dispose of them. You find a market at San Francisco, and you come to me and say, "Kindel, what are you going to ask me for getting these goods on through to 'Frisco?" I tell you \$3 a hundred. That makes \$5.05. You begin to howl about this time and ask me what I mean by such an outrage. You say, "I have paid you \$2.05. Now you charge me \$3, while you carry the same goods from Chicago to San Francisco through my ranch for \$1." And you get mad and say, "You take up your old road and get out of here, and I will put up a barbed-wire fence myself." That is the whole situation. I have given you one of the most violent cases. There are things just like it out there. It is just like that book freight case I was showing you. The rate from Chicago to San Francisco is \$1.75. I pay 97 cents for the paper. When I want to ship from Denver to San Francisco I pay \$3, making \$3.97 against \$1.75. Now, how can I manufacture books in Denver when I have to pay this double rate, as against Chicago paying \$1.75? Going from Denver to New York I pay \$2.72, and I pay from Chicago to New York only 75 cents. I just threw up my hands and started up my plant in Chicago. That is the reason why our factories are leaving us.

There is another remarkable thing here. There is one thing we are denied in Colorado, and that is commodity rates. There is a distinction between class rates and commodity rates. They give it any sort of a name to suit their convenience—terminal points, common points, and all other points, and God knows what not. The commodity rates on cotton piece goods from Boston to the Missouri River is 52 cents a hundred. From the Missouri River to Denver it is \$1.25; 250 per cent higher freight rate for one-third of the haul. These same goods going through Denver to California are \$1. If you stop them in Denver it is \$1.75.

Q. (By Representative LIVINGSTON.) Have you a railroad commission in Colorado?—A. No; I am sorry to say that we are the only State out of 37 or more States that have had commissions that has allowed the railroads to repeal the act; and I was very much amused this summer to see that the railroad commissioners of the several States had their convention in the city that is paying one-third higher freight rates than any other city of its size on earth.

Q. Is not your remedy to go back and get your State commission organized there?—A. Yes; but you can not do it. I have lost hope. I simply mean to plod on the best I can and sell out and go to Australia. I am getting tired. I can not stand it much longer.

Q. Do the railroads handling the through traffic of Colorado and the West take any part in politics, as corporations?—A. Not as corporations.

Q. Do the officers take part in politics?—A. Yes.

Q. Has that had anything to do with the discriminations against your people?—A. I think so. They have elected officers that will do their bidding.

Q. (By Mr. PHILLIPS.) Have they been known to lobby against or in favor of them?—A. Against.

Q. (By Mr. RATCHFORD.) Are they ever known to defeat candidates opposed to their interests?—A. Decidedly.

Q. Can you give the commission any specific cases?—A. No; I only know I was in politics; got into it by this very presentation of discriminative freight rates.

Q. (By Representative LIVINGSTON.) If you should harmonize yourself with the politics of the railroads would they not stop these discriminations against you?—A. Well, I guess I have harmonized myself. That is why I am living on rebates.

Q. (By Mr. KENNEDY.) You say they are all harmonized; they are all rebaters?—A. All the prominent people and prosperous people. The thing is, it stands as a disgrace to the Government of the United States to allow the poor people to bear the brunt and the burden of taxation, whether railroad or otherwise. There is no sense, no logic, no consistency in the rates they make. You take coal oil. We have coal-oil fields in Colorado, and yet our coal oil costs 100 per cent more to-day in Denver than it does in Chicago. Take gasoline. I got fooled on it this spring. I bought a gasoline engine, figuring out the cost per hour, what it would be at a price of 7 or 9 cents per gallon. I bought the engine and attached it to my waterworks. To my surprise, the first gasoline I bought—I expected to pay 5 or 10 per cent more, but I did not expect to pay a hundred per cent higher. Our freight rates to the Standard Oil Company on oil from Colorado common points to the Pacific coast are 96 cents, while from Chicago right through our oil field there, it is 78½ cents; and the oil wells are controlled by the Standard people.

Q. (By Mr. C. J. HARRIS.) They control the Colorado output?—A. Yes. They buy the oil, for instance, from the several owners, and pay them so much, and they refine it.

Q. (By Representative LIVINGSTON.) Is it not true that between San Francisco and New York there is a wonderful competition in trade?—A. Yes; I guess there is.

Q. Is not that one reason why, going through to San Francisco, these cheap rates are given from Chicago; trying to divert the trade to the Pacific slope instead of going to the Atlantic coast?—A. Yes; it is competition all the time.

Q. It is competition between California and New York which oppresses you, and water transportation rates?—A. I will not say that at all. I will show you a sample where water competition had nothing to do with it at all. Machinery manufactured at Chicago is shipped to Denver at 80 cents a hundred—carload. The same thing goes through Denver to Salt Lake for 80 cents a hundred.

Q. What is it the other way?—A. I do not know; it is less usually. Let me point out. The point I want to make is that the paralleling of railroads is not the remedy to get fair rates.

Q. Not if one company owns all of them?—A. No; they are separate, decidedly separate. Their earnings, I know, are always pooled, but they are hostile to each other in every other way. We will assume one of you is a jobber of Chicago machinery at Denver; we will assume that another gentleman is a jobber at Salt Lake; we will assume I live at Grand Junction, Colo., here [indicating]. I want to buy 5,000 pounds of machinery. Where shall I get it? Certainly, with the patriotic spirit we all should have, I would like to buy the goods at Denver, but I am barred. Why? Because I should pay \$1.75 from Denver to Grand Junction [indicating], while from Salt Lake back I pay only \$1.10; 65 cents higher than for the farther distance. They have to carry through Grand Junction and back again, and yet I save 65 cents. In this case they have only the Western Rio Grande, but here we have the Midland and the Denver Rio Grande. Yet many people in our State believe the whole remedy lies in paralleling railroads. We have another here [indicating]. We have the foolishness of three railroads between Denver and Pueblo; three lines and five railroads operating over the lines. Rates have been reduced time and again, but they have not been reduced in the last 15 years or more between Denver and Trinidad; and yet we have three lines doing a starvation business.

Q. (By Mr. PHILLIPS.) Are there any companies or individuals refining oil near Denver, where you have a considerable oil field?—A. No; they have been knocked out by the Standard Oil Company.

Q. How?—A. By reducing the price of such and such a product. They did sell oil for 5 cents, and it lasted until they had them all out, and now it is 100 per cent higher than any other section of the country. It was so the last time I investigated it.

Q. Is there any competition there in the petroleum business?—A. Not that I know of; it is all controlled by the Standard Oil Company.

Q. Not among yourselves or from abroad?—A. No. The prohibitive freight rates bar anybody from coming in. You can not ship in.

Q. Do the Standard Oil Company or not ship oil from a distance; or do they refine the oil produced in your own field?—A. They produce most of it there.

Q. And refine it there?—A. Yes.

Q. Do they own the wells?—A. No; some of our wealthy men own the wells and sell the supply to them. I do not know but they do own some of the wells. I know Senator Hill is represented as being a large owner of oil wells. He does not refine anything, but produces it, and they refine it, and they control the market

price. I complained of the excessive price of the oil to the Standard Oil managers, and they gave me this statement I have just made, that they had to buy the oil from Senator Hill and refine it: "Why don't you kick about them as well as us?"

Q. Have you any local directors on these lines of road living in Colorado?—A. We did have one; he is dead.

Q. You have none?—A. I do not know of any.

Q. Has there not been a great deal of complaint in the handling of petroleum in your section by the Standard Oil Trust?—A. Yes. The Pueblo people tried to interest me in a fight on the rate on oil, in which they proved they were denied the rate from Pueblo to the Pacific coast points that the Missouri River points had. They quietly made a price to compete with the Missouri River, and when the Standard Oil Company found that the oil emanated from the Florence wells they refused to receive it. I have a bunch of correspondence on that matter; but I could not take it up because I was too busy with other things. I have the correspondence yet.

Q. (By Mr. C. J. HARRIS.) How long has your State railroad commission been abolished?—A. Since 1893.

Q. Has there been any effort to reestablish it?—A. I tried it, but the railroads outdid me.

Q. Is there anything further you would like to testify to?—A. I have some rates here if you would like to go into the matter more extensively. Here are some of the things that catch Denver hard. I was an importer of metallic beds. I could ship metallic beds from Liverpool via Gulf to Denver \$75 per car cheaper than I could ship from New York or Birmingham, Conn., via Gulf to Denver. I pleaded with the traffic managers to let me buy those goods in this country. It was the \$75 per car more that stood in my way, but I could get no hearing until I finally failed in business and suffered the humiliation of an assignment through excess of freight. To-day I think that this is true. Crockery from Trenton, New Jersey, to San Francisco is 95 cents; Trenton to Denver, \$1.53; from England via Gulf to Denver, \$1.22. The crockery we are getting is chiefly from England. On oilcloth and linoleum—here is where they catch us on most of the commodity rates—Missouri River to Colorado common points, third class, 80 cents; Missouri River to Utah common points, third class, \$1.55; but a Utah man ships his goods in under "commodity" tariff, and instead of paying \$1.55 he pays \$1.09. They have no "commodity" tariff to Denver. In the western classification oilcloth and linoleum are third class, but here they make it a "commodity," and instead of charging the class rate from Missouri River to California common points, third class, \$2, they are shipped Missouri River to California common points, "commodity," 75 cents. So, you see, in that case the Missouri River rate to California common points is 75 cents, while from the Missouri River to Colorado common points it is 80 cents; 5 cents higher than if it went on 1,500 miles farther.

Since my agitation of this question they have advanced the rates on the transcontinental class from \$2.40 to \$3 a hundred, so they are the same in the first and second class as the Denver rate. We have no reduction; but they have advanced them in a way, while on the other class our rate is \$2 as against \$2.20; \$1.75 as against \$1.90; then \$1.60 as against \$1.50; \$1.40 as against \$1.45; \$1.20 as against \$1.25, and so on diminishing.

Q. (By Mr. KENNEDY.) I will ask you if you can state whether the people of Colorado suffer any discrimination against them in shipping out the products of the State, the metalliferous products and fruit and cattle?—A. There has been quite a little complaint, but they are adjusting that of late. I think it is more satisfactory to-day than it has ever been.

Q. Is it comparatively satisfactory to the people of Colorado?—A. I have heard no complaint, but I have been very busy.

Q. (By Mr. C. J. HARRIS.) I would like to ask if the tendency of rates has been down in the last five or six years?—A. Oh, yes; but not in proportion to other lowerings.

Q. Have they been reduced as much as one-half in the last five years?—A. No, they have not been reduced one-half. For instance, furniture rate was \$1.85; I got it down to \$1.45. I found they were shipping furniture from Chicago to Salt Lake City at a tariff of \$1.05, and made the kick on it, and we were granted it. It was only after making an exposition of the discrimination. They generally give me what I need in my line. Since then it has been raised in maximum car lots from 12,000 pounds to 16,000 pounds, and \$1.10 instead of \$1.05.

Q. (By Representative LIVINGSTON.) Is your chamber of commerce making any effort to correct this evil?—A. Not that I know of. On the contrary, they have petitioned the Interstate Commerce Commission to abrogate the long and short haul clause, justifying and legalizing these terrible rates that are now in effect.

Q. Now, if your chamber of commerce have taken that position, what hope have you to correct the evil?—A. Through the law—interstate-commerce law—or through this Industrial Commission.

Q. You would like us to override the chamber of commerce of your own town?—

A. Oh, no; I did not say that, because I would not consider it worth riding over or under.

Q. (By Mr. PHILLIPS.) Have you any remedy or any law to suggest to the commission that would be effective in remedying this evil?—A. Yes; I think the Interstate Commerce Commission ought to be given greater powers and that they should enforce the law.

Q. (By Senator KYLE.) Along what lines; have you thought of any particular amendment?—A. I studied carefully at that time the Cullom bill, and could not conceive of any reason why that was not all right.

Q. (By Representative LIVINGSTON.) What was your remedy?—A. The Cullom bill was the nearest approach to anything I could suggest.

Q. (By Mr. A. L. HARRIS.) The original or the amended one introduced a couple of years ago?—A. The one the Interstate Commerce Commission sent out. I think it must be the amended one.

Q. (By Mr. PHILLIPS.) You think that would be effective in preventing this discrimination?—A. Oh, yes; the whole interstate law, to my mind—the foundation of it—is section 4, that the shorter haul within the longer shall not be charged more than the long haul under similar circumstances and conditions.

Q. (By Senator KYLE.) It would be all right to strike out the one clause, "Under similar circumstances and conditions?"—A. Leave the whole thing.

Q. Make it mandatory?—A. Yes; you have got it.

Another point: The railroads assumed a few years ago, before the Interstate Commerce Commission, that they were carrying goods at 2½ mills per mile and making a profit. They put Mr. Smur on the stand as an expert witness, and I made him my witness and asked him: "What, in your opinion, would be a fair and reasonable rate to Colorado on my product?" He refused to answer. I asked him: "Would 100 per cent or 200 per cent be satisfactory; would 300, 400, 500, 600, 700, 800, 900, 1,000 per cent?" And Mr. Smur still refused to answer. Then I turned to the commission and said: "Your honors, I will relieve Mr. Smur of his embarrassment. We are not paying 1,000, but we are paying 2,000 per cent—91 mills per ton mile; and all the intelligence and energy in the world can not overcome that." That is why we are a one-lunged hospital and globe-trotter station.

Q. (By Mr. C. J. HARRIS.) To be just, have not some industries you mention failed from other causes than transportation rates? Did not the powder factory, for instance, burn up or blow up?—A. It did, I believe, after it was abandoned, so far as I remember. I know that the powder station quit. I am not satisfied with the rates.

Q. I simply wish to ask if some of these industries had not been financial failures from other causes than freight rates?—A. Primarily it was freight rates. We did have four glass works there run by different men. Each in turn thought he would make it go; and yet the railroads would bring in the stuff the minute the plant was started at such a price that he had to throw up his hands. We have a million-dollar paper mill there now and it has gone through bankruptcy twice. It is now in the hands of a receiver. Prior to the building of the paper mill they asked for a reduction of rate, which was excessive, and they refused to make it until after it had started, and then put in force a 25-cent rate, and of course it went up.

Q. (By Mr. A. L. HARRIS.) Where did the paper mill get its raw material?—A. There in Colorado; the wood—a very fine plant.

Q. What distance did that have to be shipped to Denver?—A. It is right handy, on the border of the mountains.

Q. How near do they get their coal for motive power?—A. About 20 miles. They could get it farther, the southern coal, but they have got good steam coal.

Q. The disadvantage of raw material was not the cause?—A. Oh, no; freight rates, positively.

Q. (By Mr. C. J. HARRIS.) Is the wood suitable for pulp?—A. Yes. They have made paper and they make it now, only for local use there. They can not get out; that is their complaint.

Q. (By Senator KYLE.) How about your smelting works for the reduction of ores? How about discriminations in that line as against Salt Lake City and Missouri?—A. I do not know. They seem to be satisfactory. I do not hear any complaint. They are smelting right along. It is the only industry we have. If you should take away mining we would not be in it at all. Our farming industry is the same way. They raise cereals but can not ship. Community after community comes there to locate and moves out again.

Q. I know that is true about your agricultural products, but I understand most of your mines are over west, about Grand Junction, Gunnison, etc., where you are nearer to Denver than to Salt Lake City, and yet I believe ore comes this way to Denver. They evidently do not make a distinction in favor of Salt Lake City in that line.—A. No, I guess not. Denver makes a great bid for the smelting works.

Q. Does Denver make the bid, or the railroads?—A. The railroads. They do not discuss rates in the Denver Chamber of Commerce, I suppose, the whole year through as much as we have here to-day.

Q. Are the directors of the road interested in the mining stocks?—A. They are all interested to a greater or less extent. It is contagious to be interested in mining, more or less.

Q. Personal interest may be a consideration in that industry?—A. Possibly.

Q. (By Mr. PHILLIPS.) Could agricultural products be raised profitably in Colorado provided you had fair freight rates?—A. Yes; if we had fair rates.

Q. And you are not so far from the markets of the world as to prevent it, if you had fair rates, and that is one reason why the agricultural interest is blighted in your State?—A. Yes.

Q. Is that the chief reason?—A. It is the only reason I know of.

Q. (By Mr. KENNEDY.) Did you not state just a moment ago there was no complaint made on account of freight rates out of the State on agricultural products, cattle, etc.?—A. No, I did not state that; I said mining, metalliferous ores.

Q. I asked if there was any discrimination against the people of Colorado in getting its production out, and you said no.—A. I take that back and most emphatically answer yes; on cattle, I know, and agricultural products, yet the Denver market is becoming better, satisfied because they are making some differential rates there. One of the things that surprised me was that the Colorado Fuel and Iron Company asked for a differential as against Chicago, and I only contended for the relative rate. [Reading]: "If Chicago ships through to the Pacific coast for \$1, give me the \$1 from Denver." I never got a ruling and the Colorado Fuel and Iron Company got 75 per cent of the Chicago rate.

Q. (By Mr. RATCHFORD.) Regarding the smelting subject in Denver—you have a smelting trust there?—A. Yes.

Q. The bullion is shipped at a favored rate?—A. I could not say; I do not hear anything about it.

Q. Have you any opinion in the matter?—A. I have no opinion in the matter. I know this: some men have always contended for it, but I claim some credit from my agitation of the railroad question.

Q. You have smelters operated by independent concerns or individuals, have you?—A. We have 1 that I know of.

Q. Is there lots of complaint on the part of its managers against the transportation charges?—A. I have heard of none from them.

Q. (By Mr. CLARKE.) Is the population of Colorado increasing or declining?—A. They claim it has increased, but they are mostly one-lungers and consumptives. We have now too many of that kind of people.

Q. What is the fact as to Denver?—A. They claim it has grown about 10,000.

Q. Is there a larger output of the mines from year to year?—A. Yes; it is increasing very rapidly.

Q. Is there a larger output from the farms from year to year?—A. They claim that for it in the annual reports of the Denver newspapers. How correct the statistics are I do not know.

Q. Is there a larger output of the manufactures of the State from year to year?—A. In certain directions, certain lines. Mining machinery is doing wonderfully. They are building up large plants of mining machinery; and our steel works, which has been favored with 75 per cent of the Chicago rate, is an immense institution; about twenty-odd million dollars incorporation.

Q. (By Mr. PHILLIPS.) Can they ship that mining machinery to other places, or is it used principally in Colorado?—A. The majority, I presume, is used in Colorado. Having lower rates to El Paso and Mexico points, they are now shipping that way largely.

Q. (By Mr. FARQUHAR.) Do you raise enough agricultural products to keep up the home consumption in Colorado?—A. I do not know. I presume so, because they ship out lots of flour.

Q. How long have you lived in Denver?—A. Since 1877.

Q. Before the people of Colorado went into farming, where did they get their produce from?—A. I presume—I never observed closely—from Utah and Missouri River points—Kansas and Nebraska.

Q. Were you not for a great many years entirely dependent on these two States

for your eggs, butter, flour, and everything that enters into household consumption?—A. I would not be able to say yes or no, because I was interested only to the extent of finding them on the table.

Q. Would you say, now, that in the course of 10 or 12 years you have raised sufficient agricultural products to take care of your population?—A. I believe that is right. I know there is lots of produce brought in from Nebraska and Kansas now.

Q. Is there not a possible reason in that fact that quite a number of your manufacturers have had to go out of business, independent of railroad discrimination?—A. I think, as I said before, that is primarily the cause.

Q. (By Representative LIVINGSTON.) Have you a cotton factory there?—A. Yes, we have a cotton factory there.

Q. (By Mr. FARQUHAR.) Could you not get cotton goods cheaper from other places than you could manufacture them, and pay the wages?—A. I scarcely believe that. We are near Oklahoma and Texas and get now an 80 cent rate on cotton up. Our cotton fabrics would cost us from the Missouri River \$1.25.

Q. They would cost you less from New England, the manufactured fabrics. At any time in your cotton manufactures, did you ever approach competition with eastern and southern manufacturers?—A. They do approach it by shipping to Missouri River points on some special rate. They are not paying the tariff.

Q. So you have to have an accommodating tariff to make the competition?—A. Yes. I had been shipping my goods into Utah for \$1.15, when, if I stopped at Grand Junction, half way, it was \$1.75. I simply met the competition.

Q. (By Mr. A. L. HARRIS.) Cattle and sheep are about the only commercial export you ship out of Colorado?—A. Yes, and some horses, too.

Q. (By Representative LIVINGSTON.) We eat your muskmelons and cantaloupes here now in Washington.—A. We have some fine ones. Our cantaloupes, coal and other mines are all right.

Q. Do you not ship potatoes?—A. Yes.

Q. Is it not true that ever since 1876 you have raised all your people want to consume?—A. No.

Q. Is it not true that Colorado has produced her own cereals and things of that kind since 1876?—A. No; I do not think so. It is competition of other points; Nebraska, Kansas, and perhaps some comes in from Wyoming.

Q. (By Mr. CONGER.) I want to ask you why your chamber of commerce does not take up this question of rates or differentials against Denver, if they are of the vital importance you consider them?—A. The only explanation I can make is that they are the greatest shippers; men like Charles Triel, the Moray Merchantile Company, and the Colorado Milling Company, each and every one of whom is satisfied with the rates they have. They do not care to discuss the question; they are satisfied to have it as it is without any newcomers in the field. The newcomers can not prevail under the published tariff rates. They have told me so.

Q. It must be then a majority of these big shippers are getting a rate that is satisfactory?—A. Colorado is controlled by a few men, who are favored by the railroads.

Q. In that case it would seem to me your complaint is one of discrimination between individuals rather than against Denver?—A. It is against Denver and individuals.

Q. (By Senator KYLE.) Do we understand from your testimony a large class of small dealers are discriminated against?—A. Yes; they are paying tariff rates while a few are paying related rates.

Q. (By Mr. CONGER.) Have you many wholesalers in Denver?—A. We have about 2 dry goods, 3 grocery, about 2 hardware, and 4 lumber concerns.

Q. They are satisfied with the rates they get?—A. Yes. We do not hear any complaint.

Q. Are they able to supply the retailers in surrounding towns in Colorado and the neighboring States, or are they supplied from Chicago?—A. They supply them from Denver.

Q. (By Mr. FARQUHAR.) Do the Chicago houses have branches in Denver?—A. Yes. One concern is called the Chicago Lumber Company. But the Chicago houses have withdrawn house after house that used to be there, and now the Missouri River shipper and the Chicago shipper will come to Colorado, travel over the interior of the State and make up a carload, for instance, of furniture and mattresses at 20 different points, and he will get enough orders to make a carload, and he brings out a carload, and a "one-hoss shay" performs the functions of the jobbing house. If it had to deliver to the several depots—that would be impossible. The freight is not collected until it reaches its destination, so that the Colorado shipper can not compete against Chicago and Missouri River shippers. That is why Marshall Field and Farwell and the larger houses have pulled out from Denver. There was no use

doing business there and paying expense of storage, insurance, and the outlay of money for freight. They would have to pay the freight when shipped to Denver, but in the other case it is not collected until at the destination.

Q. (By Mr. CONGER.) Are these wholesalers members of your chamber of commerce that have to pay these excessive rates to which you refer?—A. They are members of the chamber of commerce.

Q. They are satisfied with the rates, you say?—A. Yes. They went so far as to be the only body west of a line from Duluth to West Sabine, Tex., when the railroads asked to abolish section 4, to beg the commission to grant the petition of the railroads.

Q. This chamber of commerce must have in its membership a large majority of the representative business men of Denver?—A. Yes.

Q. If the majority is satisfied, what shall we do?—A. The majority of wealth holders; that ought to cut no figure; what we want is individual justice.

Q. You stated a little while ago that after the establishment of the paper mill the railroads made a rate on incoming paper of 25 cents a hundred?—A. Yes.

Q. From what point, Chicago or New York?—A. I forget the location, but I remember the amount.

Q. You do not know from which point?—A. I do not know. It was on the B. & M. Railroad.

Q. What was the rate on incoming paper before the establishment of that mill?—A. About \$1.55. I am not sure about that rate. I remember they did complain very much of the excessive rate, and when they would not reduce it they built the paper mill; and after the mill was built it was reduced to 25 cents.

Q. What is the rate now?—A. I have not looked it up, but they will periodically bring in such loads of paper that this paper mill can not make a living.

WASHINGTON, D. C., October 11, 1899.

TESTIMONY OF MR. SAMUEL SPENCER,

President of the Southern Railway.

The commission met on Wednesday, October 11, 1899, Vice-Chairman Phillips presiding. Mr. Samuel Spencer, president of the Southern Railway Company, appeared at 10.40 a. m., and being duly sworn, testified as follows:

Q. (By Senator MALLORY.) What is your name?—A. Samuel Spencer.

Q. Where do you reside?—A. New York City.

Q. What is your occupation?—A. President of the Southern Railway Company and other collateral companies in that system.

Q. What territory is embraced by the Southern company, generally speaking?—

A. Generally speaking, the territory south of the Potomac and Ohio and east of the Mississippi River. There are only three States within that territory not reached by the system, namely, Louisiana, Florida, and West Virginia.

Q. The Southern owns and operates its own lines and also operates leased lines, does it not?—A. Yes.

Q. How long have you been engaged in the railroad business?—A. About 30 years.

Q. Are you in any way connected with any other systems than the Southern?—A. Yes.

Q. Will you mention what they are?—A. I am director in the Erie, the Chesapeake and Ohio, the Chicago, Milwaukee and St. Paul, and the Northern Pacific.

Q. Can you state about how many employees the Southern Railway has in its employ?—A. A little under 20,000, I think.

Q. Can you state about the average remuneration which these employees receive? I am speaking now with respect more to the subordinate employees—railroad train employees and clerks.—A. It would be difficult to give an average, they are of so many classes. I have not the average figures in my mind. They are paid substantially, in the various grades, what other railroads in that and other sections of the country are paying for the same service.

Q. Are they paid by the month, by the week, or how?—A. By the month or by the day or by the amount of service performed. The higher ranks of officers are paid by the year.

Q. Your locomotive engineers and firemen are paid by the run, are they not?—A. They are paid by the trip or run; yes, almost entirely. A few on small branches and unimportant runs are paid by the month, where the service is exactly alike for each day.

Q. Have you any rule on your road regarding indulgence in intoxicating liquor?—A. The rule is absolute that no man indulging in the use of intoxicating liquor is allowed in the train service to our knowledge.

Q. At any time, or when on duty?—A. At any time. I do not mean to say that the rule can or does extend to the point that no man ever, under any circumstances, takes a drink, because that is, of course, beyond our power to know; but if he is known to drink habitually, whether on duty or not, he is not allowed to remain in his position.

Q. In your system is there any system of keeping a list of men who are discharged and exchanging that list with other roads, commonly known as blacklisting?—A. No. We make no such exchanges. We keep a list of men that we discharge for cause, of course, but we do not exchange that list with other companies.

Q. Do you know whether this is done by any other systems?—A. I have not been for a number of years in close contact with these questions. My impression is that that system is dying out. It is not pursued because there is no reason for it. I do not think it is general. We feel that we have done our duty and treated our employees as they should be when we decide the question whether or not they shall remain in our service. We have no reason for pursuing the man or undertaking to decide for some one else whether that person shall employ any particular man. That is a question that should be left to them.

Q. What, in general, are the usual hours exacted of your different classes of employees?—A. It is according to the work. The ordinary laborer, of course, performs duty for more hours and can perform duty for more hours than a man who is engaged in such responsible duties as locomotive engineer, for instance. There is a nervous, mental strain on the man running an engine that is not on a man swinging a pick on the track.

Q. Locomotive engineers, how long are they employed each day?—A. The outside limit, except in cases of accident or something of that kind, is 12 hours, and the hours run on down to 3, 4, 5, or 6 per day.

Q. Runs are arranged with reference to giving them not exceeding 12 hours constant work?—A. Yes; for instance, if a run is prolonged more than 12 hours in the ordinary course we pay extra time on it. Of course that puts a practical prohibition on it.

Q. I suppose you also exact Sunday work from them?—A. When necessary.

Q. Are they paid extra for Sunday work?—A. On the regular runs they are not paid extra. Where they perform Sunday work they have to perform it at the regular rates, is my impression.

Q. (By Mr. FARQUHAR.) What is your rule with respect to Sunday runs, passenger and freight?—A. The passenger trains when scheduled for Sunday run regularly, and that applies to the long, through runs. A great many of the local passenger trains do not run on Sunday, as they perform a local service and there is no question involved of accommodating persons who are traveling long distances and laying them over at unexpected places. The long-distance trains run 7 days in the week.

Q. How with respect to freight?—A. In some States we are not allowed to run freight between certain hours on Sunday.

Q. What States?—A. Georgia is one of them; North Carolina, I think, is another. I can not undertake to exhaust the list from memory. When not restricted by law in respect to freights the policy is to do as little freight work as possible on Sunday consistent with keeping the perishable freight that must be moved promptly. We avoid Sunday work of the freight men where it can be done without serious detriment to the transportation.

Q. (By Senator MALLORY.) Certain seasons of the year you have more perishable freight than others; I assume?—A. Yes.

Q. What is your opinion, if you have any, as to the desirability or advisability of such laws as that of Georgia which prohibits the running of freight trains on Sunday?—A. I think that is very objectionable.

Q. (By Mr. FARQUHAR.) Would you care to give your reasons for saying that it is objectionable?—A. No; not at all. In the first place, it is more expensive a good deal to the railroads to do the business that way. If they have a large volume of business—for instance, if freight is to be stopped at a fixed hour—it may be necessary to provide additional facilities, yards, roundhouses, and things of that kind, at some point where otherwise it would not be necessary if the runs could be regularly completed. In the next place, in the interest of the men themselves, our experience is that men are thrown away from their homes on Sunday to a very large extent by such a law by reason of their inability to complete a run and get back, and when they started away from home it was so far from Sunday that the trip could not be omitted so as to leave them at home. That is a pretty serious question with some men, because they are at greater expense when away from home than when at home,

and if the railroad will watch the question and avoid running freight when it is practical to do so on Sunday, I think that the effect both on the men and upon the service to the public is beneficial by not having arbitrary restrictions as to certain days and certain hours.

Q. (By Mr. KENNEDY.) Are there at certain seasons of the year large volumes of perishable freight running through the State of Georgia that is affected by this law?—A. Yes; at certain seasons there is a great deal of perishable business going through Georgia. We are allowed to run certain classes of perishable freight, because the freight would otherwise spoil and become valueless.

Q. (By Mr. FARQUHAR.) Does the law detrimentally affect Georgia itself—the business of the State?—A. The effect would be remote. There might be some effect, but I think that would be secondary.

Q. (By Mr. KENNEDY.) Is there any possibility of evading the Georgia Sunday law?—A. I do not know. I have never studied that subject. I could not say.

Q. So many laws are evaded, I thought perhaps there might be some system of evading that law. . . . A. That is a question that I can not answer. I suppose it is possible. I do not recall the Georgia statute exactly. I have had knowledge of some cases where one car of perishable freight would be used, for instance, to take an entire train of nonperishable freight through along with it. I suppose it is something like that you had in mind. Let me follow that up a moment. Suppose the law was stringent enough that if perishable freight had to be hauled nothing that was nonperishable could go along with it, and suppose there was one car of perishable freight, a railroad would at once say, we do not want that freight, because we cannot afford to run a freight train a long distance for one car. A peach grower, for instance, of the State of Georgia must send his peaches long distances in order to get good prices, because they must go to a section of the country where peaches do not ripen at that period. If he had to lose the shipment of a car of peaches that ripened and were gathered on Saturday, because they could not move on Sunday, the loss of a carload of high-priced peaches to the farmer might be a very serious question.

Q. (By Mr. CONGER.) Do you know whether there have been any prosecutions against any road for violation of the Georgia statute?—A. I do not.

Q. (By Senator MALLORY.) Has your system any objections to your employees belonging to labor unions?—A. No; we make no objections.

Q. Does your system make provision at all for relief and aid to the sick and disabled employees?—A. No; not directly in the way that some companies do; not systematically. We frequently provide for relief in individual cases.

Q. Some companies have a system of deducting so much a month from each man's pay to accumulate a fund?—A. I am familiar with some such systems. The Southern does not do that.

Q. (By Mr. KENNEDY.) Are the employees of your road—conductors, firemen, engineers, and trainmen—organized?—A. I think so. Most of them are members of unions, I think.

Q. Are there colored firemen on your system?—A. Yes, a great many.

Q. Is there any trouble between the white labor and colored labor on that account? Do the white firemen object to the employment of colored firemen?—A. They may have some objections. These objections do not take any serious form; but the question is sometimes discussed, though there has never been any organized or real opposition to it.

Q. No objection of the firemen against the employment of colored labor in that capacity?—A. I do not recollect such. That thing may have taken place in the general manager's and general superintendent's offices without my having personal knowledge of it; not reached a point where action was required. My impression is that it has not, however.

Q. (By Mr. PHILLIPS.) In what other capacity, if any, are colored men employed on the system?—A. We employ them on the train as trainmen, what corresponded before the days of air brakes to brakemen.

Q. Are they employed as switchmen?—A. As a rule, not. There may be some exceptions, but, as a rule, not.

Q. (By Mr. KENNEDY.) The colored fireman can never hope to be an engineer in your system, can he?—A. Our policy is now not to make an engineer of him. What the future may develop I do not know, but we certainly do not now.

Q. (By Mr. RATCHFORD.) Are they promoted as conductors on your line?—A. No.

Q. Can not rise above the condition of firemen or trainmen?—A. Not in train service.

Q. Is there any discrimination in wages for the same class of labor, regardless of color?—A. Regardless of color? I am not sure that I know what you mean by that.

Q. The colored firemen, for instance, and white firemen—do they receive the same

wages?—A. No; but when you said "regardless of color," I did not know that was what you meant. The colored fireman is paid less than the white fireman. That would naturally follow from this circumstance, if no other: There are white firemen always on the road who are candidates for promotion to engineers. These white firemen outrank, so to speak, the colored firemen, and we keep that line of white firemen moving up all the time, and they get the higher wages as firemen.

Q. They receive higher wages for their labor and also have the chance of promotion as against the colored men?—A. Yes.

Q. Is the same true with your trainmen?—A. Yes.

Q. How much difference is there in the wages of firemen and trainmen?—A. As compared with white, about 10 per cent.

Q. Are the different classes of labor on the Southern Railway paid about the same schedule of wages as paid on the other lines with which you are connected?—A. Substantially the same. There are differences in some particulars. The wages in a great many classes North rate higher than they are in any of the Southern States, on any railroads in the South.

Q. How do you account for that?—A. There are several reasons for it; market conditions may be one; the trainmen are running a much more complicated system in the North on the great railroads than in the sparsely settled country of the South. The running of a train on the railroad, to give an extreme illustration, which has one train a day is quite a different thing and quite a different responsibility on the part of the engineer and conductor from running a train on a railroad where there are 150 trains a day, and they are paid accordingly.

Q. So far as the actual labor and hours are concerned, they are about the same as on the other road?—A. Substantially so; not always same labor, either; approximately the same on hours. Of course, there are differences of detail on every railroad. The amount of labor in running an engine on a little branch road where probably there is not over a half train load to haul is a different thing from running a modern consolidation engine with 75 loaded cars behind it. The labor of the engineer is necessarily greater; the fireman's, too, because the fireman has to handle enough coal to haul 1,000 or 1,500 tons of freight, while the other man handles coal enough to haul 300 tons of freight.

Q. There is a contention among the railroad men of the South that the colored man is used to keep wages down; is that contention correct?—A. I do not think it is.

Q. Is it your opinion or experience that his working for less money than the white man has the tendency to keep wages down?—A. No; I do not think so.

Q. (By Professor JONSSON.) In regard to the question of wages, I want to ask you a question in regard to the wages in the South. Is the cost of living for a considerable percentage of your employees appreciably less there than they are north of the Potomac and Ohio?—A. Undoubtedly.

Q. And I presume you would agree that that would probably affect the rate of wages?—A. I intended to embrace that in the general statement first made, that the market conditions, supply and demand, govern it; the climate, amount of clothing, and amount of fuel used, make a difference in the expense of living, not only for railroad men, but for everybody.

Q. (By Mr. FARQUHAR.) Does the labor supply enter into it?—A. The labor supply enters into it to a certain extent; but the labor supply, when you come to the skilled work of the engineer and the conductor, I do not think enters very much, because those men are built up to their positions, and if there are not enough there they soon come in from somewhere else. The ordinary laborer would be affected of course; but the ordinary laborer does not move about so much from place to place in response to calls of what you might call market conditions for labor.

Q. Have you or not at the South a greater demand for the places than you naturally would have in the North?—A. A greater demand?

Q. Is there not a larger supply for the market of labor in comparison with the positions?—A. In comparison to the amount of labor to be performed, yes.

Q. And the possible willingness on the part of the men in the South, where they have opportunities for only one kind of work, like those on a railroad—they are pretty apt to underbid among themselves, are they not?—A. Yes. That is what I attempted to describe previously, as the market condition of labor. Labor throughout the South is lower than in the North, taking the general average.

Q. (By Senator MALLORY.) Farm labor is lower, is it not?—A. Yes.

Q. Is that what you mean by labor being lower in the South?—A. Yes.

Q. Has it been your experience that there has been considerable complaint from the employees of your system because they do not receive enough wages? Have there been any strikes?—A. No; there is no general complaint among our employees. We have had occasion in the last 15 months to increase their pay, and that was follow-

ing reductions which were made in 1892 and 1893, during the very depressed conditions. On the revival of business we have substantially restored those wages, and prior to that restoration this question was discussed, and always discussed with us in perfectly good temper, and there was never any real disagreement between us.

Q. Have there been any strikes on any of the roads of your system since you have been superintendent on account of a demand for an increase of wages?—A. No.

Q. (By Professor JOHNSON.) Do you have, as some lines have, contracts with the Brotherhood of Locomotive Engineers regarding hours of labor or other conditions of employment?—A. No; we have no contracts with them.

Q. (By Senator MALLORY.) You deal directly with them?—A. We deal directly with the men. When I say that I do not mean to say that we will not recognize the Brotherhood officers. I have had consultation time and again with the Brotherhood officers, and we treat them as the representatives of our men, and as long as the discussion is reasonable and fair we discuss the question of relations with our men with anybody that they choose to have represent them. As a rule they represent themselves, and it is only occasionally that we have come in contact with the Brotherhood chiefs; but when they request it, we say, Yes, we are glad to see them.

Q. (By Mr. KENNEDY.) Would it be a matter of economy to recognize representatives of the men in a given line, for instance, instead of consulting individually with every employee?—A. Where there are a large number of employees it is impracticable to discuss with everyone, and they have to be grouped as to rates of payment, and then, no matter who comes to the front, if it was one individual we would not discuss with him his wages alone; we would discuss the wages of the group to which he belonged.

Q. (By Senator MALLORY.) To what extent has the Southern system complied with the requirement that it shall put automatic couplers and airbrakes on its freight cars?—A. The hand holds are all attached. That was out of the way sometime ago. Our situation to-day is, as to airbrakes, about 77½ per cent.

Q. On freight cars 77½ per cent?—A. Yes; 77½ per cent. As to automatic couplers, 91 per cent is about where we stand.

Our equipment will be completed on the 1st day of January, substantially, except some old cars that are probably not worth putting the improvements on; and they will be used on local short runs.

Q. (By Mr. KENNEDY.) That is the date of extension granted?—A. That is the date of the extension granted by the Interstate Commerce Commission—the 1st of January, 1900. Our work has been going on ever since that extension was granted at such a rate per month as would complete it. That is where we expect to stand on the 1st of January.

Q. (By Senator MALLORY.) What style of coupler do you use?—A. We use the Janney chiefly.

Q. The master car builders'?—A. The master car builders' vertical plane. We used a variation of some others, but we had to give them up, and we took the master car builders' vertical plane standard.

Q. In the course of the operation you have to use cars that are equipped with the automatic coupler in conjunction with cars that are still equipped with the old link and pin, do you, constantly?—A. Yes.

Q. The effect of that, I suppose, is to really nullify any advantage from the improved type, the men having to go in between the cars as they did before?—A. In making that particular coupling, an automatic coupler on one side is of no advantage at all.

Q. Do you know whether there has been any decrease in casualties on your system since your cars have been so largely equipped?—A. I can not give you figures as to that. Yes; there has been some improvement, undoubtedly.

Q. Do you think when the cars of the country, the freight cars, are generally equipped, that there will be a very considerable decrease in casualties?—A. That is a matter of opinion. I assume it is safe to say that casualties will be diminished; that they will be done away with I have not the slightest idea. You can not eliminate from that question the carelessness of the individual, and a very large percentage of the accidents come from the carelessness of the men, growing out of the habitual use of a dangerous implement.

Q. What was the cause of the delay in complying with that requirement, particularly on the part of the Southern railroads; I mean roads of the South?—A. The want of money, chiefly, I think.

Q. They simply did not have the means?—A. Did not have the means.

Q. (By Mr. FARQUHAR.) When you are entirely equipped with this new appliance do you think there will be any economic advantage in the appliances themselves as far as the labor is concerned?—A. You mean in the amount of labor employed?

Q. Yes.—A. Practically none.

Q. Then it just simply amounts to a matter of safety, if there is safety in it?—A. Safety and economy in other directions; the economy of efficiency. There is a very marked economy in that.

Q. What I wish to get at is whether the amount you expend in these appliances would be reimbursed in the running expenses of the road?—A. Well, the interest on them would probably be reimbursed. That is a very rough statement. I do not know, but I thought your question was directed to the point as to whether there would be less labor employed on those trains.

Q. Both questions, both as to numbers and then to the other?—A. The amount of labor employed will substantially not be diminished. When we began some years ago in applying the air brakes to passenger trains, long in advance of any thought of putting them on freight cars, 15 or 20 years ago, it was thought that the passenger trains would be run with less brakemen. The practical effect was that the same number of men were employed on the train except for a short period. There was a theory of economy, and they were dropped off; but they were soon put back, for the reason that the exigencies of modern travel require so many men on a train to look after the travelers and to protect them at the stations and keep the ice-water coolers supplied, and all that sort of thing. Practically the same number of men were employed on a train. The same experience has followed on the freight trains. The engines are getting more powerful, the tracks are getting in better condition, the cars are getting very much heavier, and therefore the handling of one of these trains requires a good deal more than the mere putting down of brakes, and these other things required will compel the employment of substantially the same number of men on trains as before.

Q. (By Mr. PHILLIPS.) Does this automatic coupler save you any men?—A. Oh, no. There must be a man present when a coupling is made to see that it is done. It is merely a question of whether that man goes in between the cars or whether he does not.

Q. (By Senator MALLORY.) Have you had occasion in your experience to consider the law recently passed by Congress, the last session or the session before last, I think it was, regarding the arbitration of disputes between railroads and their employees?—A. I read it after it was passed. I have never read it since.

Q. Do you know of any instance of its being appealed to to be applied in the settlement of difficulties?—A. Not one; not in my experience; I do not know of a case.

Q. Have you considered the question of the abolition of ticket brokerage by an act of Congress?—A. Yes.

Q. On interstate roads?—A. Yes; frequently and continuously.

Q. What is your opinion as to the desirability of that?—A. I think it is very desirable.

Q. With reference to the public as well as the railroads' interest?—A. I think it is desirable from both standpoints.

Q. In what way is it injurious to the railroad interests?—A. It results in a diminution of their revenue; it results in the misuse of their tickets, and therefore in their facilities afforded to the public for travel. It is the basis practically for frauds upon their treasuries.

Q. Do not some railroads—I will not say all—utilize ticket brokers for the purpose of selling their tickets and their books, mileage books?—A. I am sorry to say they do.

Q. Well, there must be some motive inspiring them to do that?—A. Yes.

Q. What is it?—A. It is the motive of securing an illegitimate agency for getting business.

Q. Competition, in other words, is at the bottom of it?—A. Well, yes. Competition is a very dignified name to apply to it.

Q. The struggle between railroads for passenger traffic is so intense that some of them have to adopt that device in order to get a ticket sold?—A. No; I do not think they have.

Q. You think not?—A. I admit they do resort to it, but I do not think they have to.

Q. (By Mr. KENNEDY.) Are not the railroads themselves responsible for the ticket brokerage system?—A. I do not know what you mean by "responsible for it." Some railroads, as I have just stated, do countenance it, and do sell their tickets through these agencies, and therefore they are responsible to that extent.

Q. I mean is not such a volume of business given to brokers by the railroads themselves as to enable them to continue in business, and without that recognition from railroads they would not be able to do enough to remain in business?—A. I am not sufficiently acquainted with the ticket-scalping business to answer that question. I do know that it does have an influence on that business, undoubtedly, but whether

they would stay in business or go out of it in case railroad patronage should be withheld, I am unable to state.

I would like to add to the last question, asked by Senator Mallory: The fundamental objection to that system of doing business I think is its illegality. Some of us are obeying the law under a statute which requires that a rate shall not be reduced without 3 days' notice and shall not be raised without 10 days' notice. Now, if a railroad under the stress of competition, or anything else, sells a batch of its tickets at a figure sufficiently below the published tariff, which it is bound by law to observe, to enable a ticket broker to sell those tickets afterwards at a reduction, and that railroad uses that means of securing business, it is using a means which is forbidden by law, and therefore the railroad which obeys the law is at a serious disadvantage in comparison with the competitor who is willing to resort to that illegal means of doing business. I think fundamentally this whole question of transportation, like everything else, should be based upon a recognition of law as it exists.

Q. (By Mr. PHILLIPS.) Is that a State or national law to which you refer?—A. That is the interstate commerce law, and in most States where they have commission laws it is State law also that there must be public notice of reduction of rates.

Q. (By Senator MALLORY.) Then, the principal reason, in your judgment, is, as I understand it, that it is immoral; that it is a flagrant violation of law, and that a flagrant violation of law has a necessarily deleterious effect on the public and everything else?—A. Yes; and, moreover, it puts the law-abiding citizens at a disadvantage. It has a business aspect as well as a moral one. An injury is being inflicted upon him because of the fact that he obeys the law.

Q. Do you not think that the generally recognized violation of any law has a bad moral effect on the community in which that violation is practiced?—A. I think so, undoubtedly. It weakens the moral force of the community at large.

Q. That being so, can you state to the commission to what extent the free-pass system, or free-transportation system, is practiced? I will not ask in reference to your railroad, but railroads in general in this country.—A. I will be very glad to have you specify.

Q. Well, your railroad.—A. The policy of the Southern is that its whole business shall be public to one and all. I have no objection to answering generally or specifically if you want it. The pass system has grown to be an abuse throughout the entire country, and it is an abuse on the Southern just as well as it is on other roads, but I hope not to the same extent; but it is an abuse, and one which at the moment we can not throw off.

Q. It is just as much prohibited or more prohibited than the ticket-brokerage system?—A. No; not so specifically provided for as the public notice of reduced ticket rate that I have spoken of. The language of the interstate commerce law upon that subject is such that the prohibition of passes is covered by a general clause. There is no specific law in regard to the free-transportation system only in the question of discrimination.

Q. It is included in that?—A. It is included in that, undoubtedly. But you can not put your finger on it with quite the same specificness as you can the other provision.

Q. You say it is generally abused. You mean by that that passes are given without consideration?—A. Without really a proper consideration, yes.

Q. Legitimate consideration?—A. Yes.

Q. And you think it is a general abuse?—A. I do. I think it is widespread all over this country.

Q. Do you not think it would be well, if it is feasible, to have legislation enacted that will prevent it?—A. I would like to see a statute passed that there should not be one issued to anyone. I should like, with others, to be made to pay my railroad fare over railroads everywhere the same as I pay my hotel bills. I have on several occasions voted in meetings on that question, and I have gone so far as to endeavor to bring about the abolition even of the exchange system of passage between railroads of their officers. If an employee of the Southern Railroad Company is traveling on the business of the company over another railroad he can pay his fare just as he pays his hotel bill when he gets at the end of the journey, and if it is a legitimate expense of the Southern he can get the amount back from the treasury of the company. That is the basis to which that thing ought to be reduced. That is very radical, but sometimes to make reforms you must take very radical steps, and I am thoroughly of the opinion that is one that ought to be taken.

Q. (By Mr. FARQUHAR.) Whether on the ticket or on the pass, there are certain conditions that the railroads have printed on there which exempt the company from liability for damage in case of accident or otherwise. Do you regard the printed matter on the tickets or passes there as a contract?—A. I do.

Q. Suppose, in case of an accident, you find the passenger has a scalper's ticket; do you think that your road is liable to the second party to that contract as much as to the first party of the contract?—A. That might involve a law question and I am a layman in respect to law. Our claim would probably be, if we could sustain it, that if the man bought the ticket illegitimately from a scalper, or if the company had never received proper consideration, there was no liability.

Q. Is not that one of the greatest contentions as to the desirability of a railroad ticket, bought out of a regular railroad office, and not bought illegitimately, that that railroad ticket shall carry the safeguard in it that the common carrier shall carry the passenger with safety as to life and limb; is not that contention made by railroads?—A. Yes, that would be one feature of it.

Q. That you would give the full insurance in fact on your ticket, and that you claim the broker or the scalper can not do that?—A. Yes. I do not know how much that would amount to. Possibly I may answer your question in stating it this way: I do not know that we would raise an objection to transferring that contract legitimately to any other individual at the same price. That is, if we sell John Smith a ticket, we have no particular objection to John Smith's transferring that contract to Bill Jones, if he does not do it in a way that is detrimental to us in that or other particulars. Now, the mere transfer of that one ticket, if we know of the transaction, would not affect us very much; but if transferred at a lower rate, and that results in demoralization of future business, there is another danger and another damage, and it is that damage which is the chief one to us. The mere transfer of a ticket from one passenger to another is of no great consequence to us.

Q. (By Senator MALLORY.) Well, is not the point made at the beginning, that is, that it is so unjust to these roads that will observe the law, a very strong argument? The road that observes the law does not raise rates or decrease rates, whereas another road, naturally indifferent about the law, undersells it.—A. That is where the damage is.

Q. Before leaving this point I would like to ask what rule you have in your system in regard to this ticket brokerage, these scalpers' tickets, as they are commonly called, when they are discovered in the hands of a passenger?—A. We do not recognize them; we try not to recognize them. I can not say that is absolutely so in all cases. We might get ourselves in a position where a decision in court would go against us on that, and, sometimes, it is not worth while for us in every case to put ourselves in a position to suffer damages in order to protect against one ticket.

Q. Well, there have been cases in court, to which attention has been attracted, in which roads have claimed the right to take away that ticket, take it up and put the traveler off the train, if he does not pay his fare; in other words, treat it as an absolute nullity. Does that rule prevail generally among railroads, do you think?—A. In practice I do not think it does on the regular unlimited ticket. If it was a limited ticket and the date had been altered, or something like that, that would be a clear case of fraud, and we would resist it. Or if a pass, for instance, had been issued to one person and sent into a ticket office or sold, and turned up in the hands of another individual, we would resist accepting it, of course, where we had good legal ground.

Q. (By Mr. KENNEDY.) Do the railroad men contend that if the ticket brokerage system were abolished they could give cheaper rates to the traveling public?—A. That may be an argument. I do not think there is any certainty or any concerted action or any obligation that that would follow. I do not know that it has ever gotten to that particular point. The practical effect might be as you suggest, if our revenue should be thus protected for a long series of years. The natural tendency of rates is always down.

Q. Is ticket scalping an evil of such magnitude as to compel you to keep rates up to assure revenue?—A. I do not think that is the reason that rates are kept to present level. I think the reasons are commercial. I do not think any one of these reasons would govern them. If the abuses were done away with I think the tendency might be, under the natural order of things, toward reduction. There are a number of things that happen all the time to reduce rates. Every railroad in this country almost will show year after year that the average amount received per passenger per mile is slightly diminished. The abolition of abuses is only one of the things that might have its effect in that direction; but there is not that intimate relation between the two things that your question would indicate. That is, if the abuses of scalping and passes were suddenly shut off, I do not think that the next day the rates would go down in consequence.

Q. In replying to Senator Mallory you spoke about the railroads not observing the law. Suppose two lines from New York to Chicago, one line 150 miles longer than the other, and the longer line seeks to get some travel by giving some business to scalpers, what law is thereby violated?—A. They have sold those tickets to a scalper

at less than the published rate, otherwise the scalper would not buy them, and their rate is published under the interstate-commerce law, which requires that the rate shall not be reduced without 3 days' notice to the public.

Q. (By Mr. C. J. HARRIS.) If you have transportation to sell, and a person buys so much of it and does not use that part of it, what is the objection to that man selling the remaining portion? That is done through ticket brokers oftentimes; but is that any hardship to your railroad?—A. Yes; it is a distinct hardship to the railroad and the railroad is perfectly willing to meet the position of the man you speak of by giving him a return of his money if he does not want to use the balance of his ticket.

Q. Yes; but that is a rather difficult thing to do, and a rather roundabout process, and it may take two or three weeks to get his money back, whereas he can step into a broker's office and sell his ticket at once?—A. At a discount, and not at what the railroad would give him—that is, so far as remuneration is concerned; and it is not probable that he would be in need of money to the extent that he could not take the legal way to have it properly done, and the difference would not weigh against the matter being illegally done.

Q. Is there anything illegal or bad morally in a man selling transportation he has already paid you for?—A. Yes; it is wrong, as it injures unnecessarily an existing business. Now, if the ticket business were confined to that and it had no other effect than that which you describe, I do not think you would find railroads objecting to it very much. But the man who bought that ticket, bought it and made a contract for transportation from point A to point B, and he either intended to go that whole distance or he did not.

Q. Well, I spoke of mileage—1,000 or 500 mile ticket?—A. That is certainly wrong, because we make a contract with that man for the use of that mileage ticket on the theory that that man is to use it.

Q. Your road pursues that policy, but the northern roads do not.—A. I am not discussing the difference between our policy and that of someone else; I am discussing what is a good fundamental principle for the conduct of this particular kind of business.

Q. You stated you considered it illegal and immoral, whereas the New York-New Haven permits it.—A. I did not intend to say that that particular transaction was illegal and immoral, as you limit it in your statement, but I stated the use of tickets by the brokers as they do use them is illegal and immoral. When I referred to the illegal and immoral point I was talking about the railroad companies selling their tickets to the brokers, and that was the point that was objected to at the time I made that answer. I was not referring to the scalping of a partially used ticket. But I did not finish my illustration with you. Now, this man buys a ticket to go from "A" to "B" and he stops at "X" and sells the rest. The railroad will sell him a ticket to "X" at a certain price, and it will sell him a ticket to "B" at an entirely different price, and there may be perfectly legitimate reasons for the difference in rate per mile between these 2 points. Now, if the man is only going to "X" he may be perpetrating a fraud upon the railroad company by not buying a ticket to "X."

Q. (By Mr. CLARKE.) I would like to inquire, for the further elucidation of this point in regard to selling the unused part of a through ticket: Suppose I should buy a ticket from Chicago to Boston and use it to Albany, then for perfectly good reasons and in good faith should not wish to use the remaining portion, is there any rule among railroads by which I could get back money in proportion to the whole distance?—A. Not probably in proportion to the whole distance, and there is no such rule that can be said to exist universally. What a great many railroads do do, and what I am sure all roads under proper regulation of this kind would do, would be to give you back the difference between the rate from Chicago to Boston, and the rate from Chicago to Albany. That is, they would put you in the same position as if you had known before leaving Chicago that you were going to stop at Albany and bought an Albany ticket only.

Q. That often happens, I suppose, to passengers?—A. It does happen; we do it constantly. We sell constantly round-trip tickets, and the man goes to the end of his destination and says he is not going back within the limit we gave him; say 10 days or 2 weeks. We say, Then the consideration for giving you a round-trip ticket is at an end, because the consideration was you would make a round trip within a given time, but if you wish to consider it a one-way trip we will refund to you what you paid in excess of what the cost would have been for a one-way trip.

Q. Do you consider that difference perfectly equitable to the passenger?—A. Perfectly so. That is what we would have done if he had gone to the ticket office at first and said, I want a ticket to go one way. We would have sold him a ticket, and we put him right back and gave him the benefit of that, assuming that his change of mind was for proper reasons.

Q. What method is provided for giving money back? Must he correspond with

the general traffic agent?—A. As a rule he must put his ticket in at the office where he is, and ask them to correspond with the general ticket agent. Of course we must do it in some regular way. We would be perfectly willing to let any ordinary agent do it if the machinery for such a transaction could conveniently be placed in every agent's hands, but it can not.

Q. (By Mr. KENNEDY.) Is it not true that a large element of the public have discovered that they can cheapen their railroad rates in just the way that Mr. Clarke has illustrated, by buying a ticket farther than they intend to go and selling it to the scalper?—A. Yes; that is one of the fundamental abuses of the scalper's system.

Q. Particularly traveling men?—A. Men who travel a good deal have that advantage, because in this, like everything else, experience teaches them how. They find what they can do by traveling. A man who sits in his office and does not travel does not see these things.

Q. (By Senator MALLORY.) We will pass on now to the head of unjust discrimination and undue preferences by railroads. Can you say whether or not to your knowledge unjust discrimination in favor of individuals is practiced now by railroads?—A. I certainly think they are.

Q. Do you know in what shapes they are practiced, such things as rebates, for instance, and concessions and commissions?—A. There are various forms.

Q. What is the cause, in your judgment, of this discrimination?—A. To get business without the other fellow finding out how they get it.

Q. (By Mr. PHILLIPS.) What forms do they generally take in discrimination?—A. I claim not to be an expert in that business. Senator Mallory has named the chief ones. They are rebates and commissions on business, allowances for car mileage on cars owned by shippers, underbilling in weights, billing the goods at less weight than the actual weight, which has same effect as reducing the rate, and also billing to wrong destination—that is, beyond the destination really required and stopping the goods short, or billing to one destination and then diverting to another destination to which the rate is higher.

Q. (By Mr. FARQUHAR.) In other words, the variety is limitless—the methods of giving preferences to individuals over the general public?—A. I suppose there is no end to the catalogue of ingenuities that can be devised to evade the law, but the power to evade applies not only to transportation law, but to criminal law and every other.

Q. You think that is due to the desire to get traffic?—A. Yes.

Q. And not let the other fellow know anything about it?—A. Yes; because if the law was obeyed and the rate made known by 3 days' notice, the competitive carrier would have the same opportunity to reduce, probably only a few hours behindhand, but before the shipment could be made, which would be quite sufficient.

Q. The other fellow does not find it out at all?—A. He finds out after a while. He finds out that something is going on, but frequently does not find out specifically what it is.

Q. He finds out that somebody is shipping at less rates than the published rates?—A. Yes.

Q. And the effect of that is to cause the other fellow to reduce to special rates?—A. Yes.

Q. And that thing is going on generally?—A. Yes; in many cases.

Q. Is it not a very serious abuse?—A. The most serious of all that are known in the transportation business.

Q. We have had testimony here as to various kinds of discrimination, and I will not trouble you to go over the details of them—such as the discrimination by reason of the use of the elevators under the control of the railroads; discrimination by the mileage paid to special car owners, the dressed beef people—refrigerator cars generally. This has been testified to here as being a source of a very considerable abuse that is, abuse in that they enable certain individuals to get their freight carried at less than published rates, and as such are reprehensible. Now, is there any suggestion you have to make which you think would meet this difficulty and do away with it in the way of legislation?—A. Suggestions as to preventing illegal action by additions statute are very difficult of accomplishment. I think that the great desideratum in this whole question, the thing that underlies the whole of it, is an enforcement of the law which requires absolute publicity in everything that is done in respect to rates, and I think that everybody's hand ought to be turned to accomplish that special purpose, because that will do away with more abuse, more evils than any other on thing that can be done, and I think a good rule, where you have quite a large problem ahead of you, is to see what one stroke will accomplish the most good, to begin with, where there must be a series of strokes at the best, and address yourself to the one. In this case the great point is, that the published rates shall be the rates at which all the business moves.

Q. Well, that is the law now?—A. I know it is the law now. I am speaking of the enforcement of that law, and any steps that can be taken to aid in the enforcement of that, should be taken.

Q. Well, it has been suggested here that it would be beneficial for the Government to provide for railroad inspectors—as it provides for bank inspectors for national banks—whose duty it would be to go at any time and examine the records of railroads for the purpose of ascertaining whether they comply with the law or whether they violate the law in their rates. Do you think that would be feasible?—A. It would do some good in reaching results, and I have no objection to that plan. I have said to the Interstate Commerce Commission, on one occasion, that I should be perfectly willing to have all of the traffic business of the Southern inspected by licensed inspectors. These inspectors should be men who would not reveal what they saw in the books of any company to a competitor. These inspectors must be subject to the law and must be men of character, and the books must be examined just as banks are examined, and the railroad companies must feel that there would be ordinary business respect shown as to what is the private part of their business. Now, the difficulty about it would be to devise by statute a means of avoiding violations of law. This is a very difficult thing to accomplish, not only in transportation law, but in criminal law or any other. Now, suppose you have an inspector and he goes into a railroad office to inspect; he sees whatever is there. Of course he does not see what is not there. Suppose that particular railroad, if it is determined to violate the law, has an understanding, not recorded on the books, with some large shipper that in 12, 18, or 24 months hence, it will take this question up with him and make settlement. The inspector does not detect that. Of course, in time he may get around to the point of it after there is a payment made to that shipper. The inspector will then see that something of the kind has been done, but the transaction will then perhaps be 2 years old. I am merely pointing out one of the difficulties of meeting the evil by inspection. I do not know any way to finally compel the obedience to law except to punish the criminal. For that reason I have taken the ground—and my colleagues differ with me—that the criminal section of the interstate-commerce law should not be taken out of it. I think it ought to be enforced and not repealed.

Q. You mean punish the individual?—A. Punish the individual as well as the corporation.

Q. It is very difficult to locate who is responsible.—A. It may be that it is very difficult sometimes, as in the Whitechapel murders in London, to find out who stuck that knife, but nevertheless you do not repeal criminal law on that account.

Q. The objection that has been raised, in my experience, as to the infliction of personal punishment on individuals, is that there is only one head and all the rest of the railroad employees are subordinate agents, from the general manager down, and it is pretty hard to punish a man for obeying a superior officer, the man himself possibly not knowing it is a violation of law, the same being the orders of a superior, when if he does not obey the order of the superior he will lose his place; and for that reason it has been contended that it is a great deal better to let the penalty apply to the road itself, and hold the road as indictable, and let it be tried and fined.—A. With a \$5,000 penalty; that is the present law. Now, there are plenty of shippers in the United States who have enough business for the railroads to warrant some railroad in paying 25 such penalties in 1 year, and if that fine were the whole question they would pay it willingly to get the business and care nothing about it. Now, I do not agree at all in the view that it is a hardship upon a subordinate or upon a superior that he shall be required to obey the law even when he is face to face with the crucial point, "Must I obey the law or lose my situation?" The law does not recognize the right of a man to make a living illegally or criminally, and I do not see how he should be allowed to do it in the railroad business when he is not in any other. I am willing the penalty should be applied wherever it fits. There may be difficulties in reaching the right man, but the man who is responsible can be reached if sufficient effort is made. If you are the right man, or I am, no distinction should be made, whether it is the president or a subordinate.

Q. (By Senator MALLORY.) I do not think they would ever miss it if they hit the president.—A. Well, then, I am willing that it should be the president. If I can not choose properly whether I shall become a criminal or shall go out of business, I do not know as I deserve much sympathy.

Q. In the matter of long and short haul, I believe your road and all the other roads have different rates for terminal points and for intermediate points?—A. Yes.

Q. What is a just basis of the distinction between long haul and short haul rates, these short-haul rates being largely in excess pro rata of long hauls?—A. The basis or the fundamental principle is that the short-haul rate shall be a just and reasonable

rate. With that fact established, if it is established, it is proper that the railroad should take the similar business from a longer distance at a less rate, because otherwise it might not get it at all, and there is no good reason why it should not be allowed to do that additional business.

Q. The intermediate rates being fair and just to the other rates?—A. The other rates are a question of commercial conditions of whether the railroad can secure the haul or not.

Q. In your judgment is that absolutely necessary in very many cases?—A. Yes; it is in sparsely populated countries and where railroads have cost a good deal in comparison with the amount of business that that country affords. The principle has been very aptly illustrated by this sort of a statement: You build your house on the shore of the Potomac River in a level flat country. To get to and from your house you drive, and you haul your provisions at less cost than a man who builds his house on a neighboring height, probably 1,000 feet up, but not very far away, because he prefers the view and the elevation and surroundings. Now, he has necessarily to pay more in the matter of cost of transportation up to his house than you have to yours in the valley, but it is his choice, and if he wants his house upon a hill he pays the penalty of having to walk up to it or be hauled up at an increased cost of exertion or of money, as the case may be, whenever he goes to it, as compared with the man who prefers to locate on the level. A set of men come to a place where there is no water competition at all and they build a town. Another set of men build a railroad through that town to some interior and elevated point beyond that has probably cost twice as much as if built on the level of a water course. In addition, it costs a large percentage more to operate to the higher level, and those who require the moving of the freight up that height should pay the increased cost. The people in the valley suffer the disadvantage of being down in a low flat country as compared with the man who built up on the height, but they save in cost of their transportation. The man on the height finally complains to the railroad that it will haul cheaper for the man in the valley, and why not for him on the hill? The railroad says, simply because it can not afford it and it is not reasonable. If the railroad had been asked to do these things at exactly the same rate at the beginning and before the railroad was built it would have said, "No, we do not care to build under those conditions. We will stay where we are on the low level and let these people on the hill do without a railroad." This is the fundamental principle of the whole thing. There are exceptions and modifications and variations of that idea in a thousand ways, but the fundamental idea of it is the same.

Q. In your judgment, then, this difference between long and short haul rates is essential to railroad management?—A. In certain localities.

Q. It is governed to a great extent by the conditions of the country through which the road runs?—A. Through which the road runs, and the water conditions as recognized by the interstate-commerce law.

Q. Germane to that then comes the other question as to passenger rates in different sections of the country. I believe it is a fact that in the South passenger rates are higher than in the North?—A. Yes.

Q. What would you ascribe that to?—A. Sparse population; the small amount of business for the passenger trains.

Q. I believe in my State they charge 4 cents a mile.—A. That is above the average for the South. Florida is one of the highest. We have none that are as high as 4 cents, but all are gradually diminishing. Our average rate for the whole Southern system, 6,000 miles of railroad, was 2½ cents for the last year.

Q. There is a matter to which I would like to call your attention and hear your views on, and that is the complaint that is made as to the difference in the South of the rates for produce going north and for merchandise coming south. On vegetables and fruits from Florida, and, I suppose, from South Carolina and Georgia, going north the rates are considerably higher per 100 pounds than for merchandise coming south from New York or Philadelphia or Baltimore. So much difference is there that it is regarded as a very great discrimination against our products going north. Why is that?—A. For certain classes that is true.

Q. Well, take fruits and vegetables.—A. Fruits and vegetables in the first place must be run at very high speed, they are so perishable; and in the next place they must have a special class of equipment, and with a good deal of it there must also be hauled a large amount of ice free. The rates include that. Trains must be shorter on account of high speed. We get fewer tons behind 1 engine and in 1 car than we do with other classes of freight. Then there is a very large item of insurance in it. Running those articles at high speed the bill of damages in case of accident is very different from what it is with other classes of freight. All these things go to make up the necessity for the difference in rate per 100 pounds.

Q. Is there anything in the consideration that the trains coming south would come empty if they did not bring those freights?—A. No. On the contrary, I think you would find that that argument applied in the opposite direction.

Q. The reasons you have assigned us, then, you think are the principal reasons?—A. I think those are the governing reasons. Whether the dominating load goes one way or the other depends very much upon seasons of the year and upon a particular locality, as to what their products are. You go into a busy district and, whether it is North or whether it is South, the tonnage coming out of that district to the four points of the compass probably dominates over every other. Those cars have to go back empty, so your question could not be answered in any general way. Each case would have to be taken up specifically.

Q. Can you briefly state the reason why rates from the West to the seaboard, for export goods or export products, are less than on products in that direction for domestic consumption?—A. We need to meet a foreign market. It is a wider application of the principle of the long and short haul clause, as I announced it. If the rate from Chicago to New York is a reasonable one for the New York consumer, considering all the circumstances, and if the railroad or the grain merchant or the flour merchant in the West can put an additional amount of business through New York for Liverpool or Hamburg or Antwerp, there is no reason from the railroad standpoint and from the shippers' standpoint, or from the standpoint of New York consumers, why the rates should not be so adjusted, if possible, as to send that product abroad. If, in making the general adjustment as to price, it is found that the railroad must take less than its New York rate, then the railroad is simply doing its part in that general combination to forward the American product to a foreign market, and the New York consumer is not injured.

Q. I believe rates to-day are lower than they ever have been, are they not?—A. Well, I can not speak specifically of the trunk-line rates at the moment. Taking the year as a whole, I have no doubt they are lower.

Q. Have you had occasion to consider the effect of the development of the grain trade through Galveston and New Orleans upon the rates from Chicago to the Atlantic seaboard?—A. Only in a general way. I have not had any personal part in that question. I have to watch it more or less.

Q. It has been testified here that it has had a very modifying effect on the rates from Chicago and St. Louis to the seaboard.—A. Well, I have no doubt that it has had some. My own impression is that the effect of it has been much exaggerated.

Q. Your experience in the railroad business has been through pretty nearly all the various spheres of it?—A. Yes; substantially the whole.

Q. Do you believe that it is practicable for one central authority to establish rates for the whole United States? Suppose Congress should vest the Interstate Commerce Commission with power to fix rates for the United States at large, do you think it would be practicable for a body of men here in Washington to do that?—A. I do not. I am very sure it would not; that is, to do it with any wisdom. They can issue a military order on any line, but rates can not be adjusted arbitrarily.

Q. I mean with justice to the railroads and with justice to the public?—A. With justice to the railroads and the commerce of the country, it is certainly impracticable.

Q. Why is that?—A. In the first place, it is too large a problem for any five men or fifty men to handle the business of making those tariff rates. It would be impossible. Tariffs are the result of the constant friction of commerce. Now, nobody but the people who are engaged in the business can do it thoroughly. You can not do it by any central power. If every railroad in the United States was owned by one man and he attempted to make one rate bureau that would look after all of his rates, he would fail. He would be compelled to subdivide it for each section of the country, or for different commodities, and for different conditions, and place the responsibility for each group on those to whom the authority was delegated. There are railroads in this country to-day that are so large that no one man undertakes to make the tariffs. He does, in a measure, decide as to whether alterations of the tariff shall or shall not take place, but as to making it, he can not do it.

Q. Now, conceding it to be a fact that it is a physical and moral impossibility for any central authority here in Washington to make tariff rates for the United States, do you think it would be practicable for such an authority, such a body, to consider the question of correcting, amending, or rectifying rates that are already established, but which may be sources of complaint, upon hearing the complaints?—A. Oh, yes; that is practicable, but I do not think it would be wise; I do not think it would be productive of good.

Q. You think, then, that the best authority, the one which can be relied on to do justice to the public and the individual, is the railroad itself?—A. The railroad itself, with absolute publicity in everything it does. That is, the people who have spent

their lives at that business and have grown up in it know what the real problem before them is.

Q. There seems to be much complaint, at least, as to the diversity of classification. I understand that there are three different classifications in the United States. Do you think it would be practicable for a central body like the Interstate Commerce Commission to classify freight for the whole United States?—A. No; scarcely. But I think there ought to be more uniformity of classification than there is.

Q. You think it practicable?—A. Yes; I think it would have to be done for different sections of the country probably, and with reference to the different conditions in those sections. I do not think a uniform classification for the United States would be just either to the public or to the railroads, because classification at last is a means of making rates, you know. That is all.

Q. What may be said to be the general rule underlying the making of classifications?—A. It is simply a means of classifying several articles into one group, so that in naming a rate you are not naming a separate rate on every commodity, but you are naming a rate upon a group of commodities for purposes of convenience; that is all.

Q. Some railroads will have a great deal of one particular group to deal with in transportation; others will have very little of that particular group. Does the fact of having more or less of that particular group exert an influence in its classification, as to its being class 1, 2, 3, 4, or 5?—A. Not so much in its classification, because that would be governed more by the question of the rate; but classification would enter into it, of course.

Q. It has been testified here that where you have a very large amount of a particular product which is handled by a particular road, that that necessitates that road making a different classification for that particular product than is made by another road which has very little of that particular product to handle?—A. Well, it might be necessary or it might not. The practical effect of that would be this: If a road has a very small amount of it, they do not care very much about it and do not want to be bothered with it as an exceptional thing, and they simply place it in some general classification, because there is not enough of it to cut any figure. These questions arise frequently when new developments take place in a particular section of the country. In a State very near you, Alabama, before there was a ton of pig iron made there, the probability is that if you had looked at the tariffs, you would have seen pig iron in some class. Of course, there was very little of it to move. If somebody had shipped 10 tons of it for some particular need in manufacturing, it did not cut any figure; but the moment the blast furnaces were established, it became a special product for that country. It could not go under a general class, and the question became what should be the necessity in the way of rates to put that pig iron into the markets of the world. That probably required several adjustments, and finally it did not take the form of classification at all. They simply made what they call a commodity rate and said, pig iron so and so, and there is nothing else in that class. That is a system of evolution. I am not speaking with knowledge, of course, as to Alabama iron. I had nothing to do with the Alabama tariff and had never seen one at that time, but that is probably what occurred. There was an evolution there working out by reason of a new industry and a very large one, which compelled the giving of a new rate on pig iron. For such reason, you can not make your classifications absolutely uniform. You may open a mine of a particular mineral that has never been known in that section of the country before; it is a new development and if you turn to the tariff sheet of the road, that mineral may not be mentioned at all, or it may be just arbitrarily placed in some classification, fixing a rate for it that would be absolutely prohibitory in moving it. Then the railroad man must take up the question as to where it can go and at what price, and to what extent he can lower the rate by changing the classification or by making a commodity rate, in order to start shipments.

Q. In making the classification in tariff rates, do the railroads, as a rule, follow the practice of imposing all the traffic will bear?—A. They probably did in the beginning.

Q. Do they continue to do it?—A. It is now done by a general whittling away of rates under constantly changing conditions. The thing has settled itself down to commercial conditions covering everything. The real problem of the railroad manager in rates is to meet new conditions and prevent making violent disturbances; I mean, if he is pursuing a legitimate business.

Q. You recognize the fact that there is a steady trend toward consolidation of railroad interests in this country?—A. Undoubtedly.

Q. That it is rapid?—A. Very rapid of late.

Q. What will be the effect of that on rates, do you think?—A. I do not think it

will have any material effect on rates, unless it retards the ratio of diminution in rates. It may do that to some extent.

Q. The tendency undoubtedly is to do away with competition?—A. Yes.

Q. Well, if competition is done away with, then the incentive to reduce rates will not longer exist?—A. Well, I say it may retard that process of reductions, but part of the reduction of rates which is going on constantly in this country is the result of commercial conditions, of getting more products to market all the time, and that of itself is putting down the average rates, and will continue to do so.

Q. Without reference to competition?—A. Without reference to competition. Now, added to that is, of course, this irregular illegal action of which I have already spoken, where one man comes in and makes a private agreement with the shipper. The other road finds it out and thinks it is incumbent upon it to do the same thing, and the first thing you know you have a lower published rate than you had before. I do not think that the consolidations that have taken place already have increased rates. The steadiest rates in America to-day, where the interstate-commerce law is more rigorously observed in respect to fighting secret rates, is in the place where the consolidations have taken place.

Q. (By Mr. C. J. HARRIS.) If this consolidation continues will it not be necessary, for the protection of the public, that the Interstate Commerce Commission have more power, and will not the regulation of rates by legislatures be more necessary than it has been hitherto?—A. I do not think so.

Q. You think the railroads will take care of the public without that interference?—A. Yes; I go further than that. I think, if by any means, by consolidation or by statute or otherwise, you can do away with secret rates, the complaints upon the part of the public will almost entirely disappear simultaneously. I think there are numerous illustrations of that tendency in support of that statement.

Q. Well, suppose, with competition entirely done away with and the tendency on the part of all the railroads or any other corporations to make everything they can for their stockholders, the rates become burdensome to the public—they have been so in some instances—is there any way out of that but by this governmental interference that I have suggested?—A. Well, I should go back of what you say. It all depends upon what you mean by "burdensome to the public." Now, admitting your premises for the present, I should have to answer but one way: If these rates did become burdensome in the true sense, or if these railroads were disposed to take advantage of that condition of affairs and squeeze a lot of people out of business and all that, I think there should be some regulation, because no one recognizes more than I do that a railroad is a quasi-public corporation. It ought to have some regulation, but I think the best regulation of any business that is intended to serve the public is that it should be absolutely free from concealment. You will not have such abuses if everything that any railroad officer does is known. The corporation could not sustain itself. But as to burdensomeness of freight rates, those rates in this country now are cheaper than in any part of the world. Therefore you can not consider that the general level of rates in this country is unreasonable or burdensome. Now, we know that where consolidations have taken place rates have not been raised. The Southern Railway Company is probably as good an illustration of consolidation as exists in this or any other country. What is now the Southern Railway Company was, five or six years ago, something like 35 or 36 corporations. The rates have not been raised. The facilities I think every man who knows that country knows have been very largely increased. The properties are in better condition. Therefore I do not think the condition that you suggest will arise at all, and I think the logic of past events goes to show it. It is not so much what the shipper pays, provided it is not exorbitant, of course, and does not keep him out of the markets, as it is that the rates are so adjusted that no one has a better rate than another, and that no other community or locality that furnishes the same product has a relative advantage. If you will get the discriminations out of the way, I therefore say that nine-tenths of the whole problem of governmental supervision of railroads will disappear. You have two prominent illustrations of that to-day in this country, and I had occasion to say this to the Interstate Commerce Commission, and they assented to my two illustrations at that time. I said to them, and I venture the statement to you, that there are two sections of the country now from which there are fewer complaints than any others, namely, New England and those States south of the Potomac and Ohio and east of the Mississippi rivers. They all assented and said, "Yes, that is true." The reason for that is that in those two sections secret rates have largely disappeared.

Q. As a matter of fact have you not, since your consolidation there, materially lowered rates?—A. No, it has not materially lowered them, because we found those several properties in the hands of receivers, unable to earn anything to pay interest,

and not a single one of them keeping up the properties over which these people had to ride or do business. Now, that was not a condition from which to lower rates at that time. The Southern has been in operation 5 years. During that time the average rates obtained have decreased about 7 per cent, notwithstanding that.

Q. (By Mr. RATCHFORD.) Referring to the subject of governmental ownership and operation, what, in your opinion, would be the result of that? Would it prevent discrimination?—A. Well, I do not see, if the roads were honestly managed by the Government, why should they discriminate. It would not do away with charges of discrimination; it would not do away with this community and this State petitioning the Government that another community and another State had an advantage. That relative adjustment between the different sections of the country would be a very serious problem unless the strong voice of the Government said, "Those are the rates and they will not be changed." If you get, so to speak, an imperial sort of government of the railroads, under governmental ownership, it might say arbitrarily what should be charged. That is what they do in Germany.

Q. Is it your opinion that under such management and operation the railroads of the country might be managed to the satisfaction of the whole people, or more so than they are to-day?—A. You mean by governmental ownership?

Q. Yes?—A. No.

Q. You do not believe it?—A. No; my opinion is—of course it is simply an opinion—that you would find a rigidity that would prevent the rapid improvement in transportation facilities that has been going on in this country for a quarter of a century or more.

Q. Are you referring to the present prevailing rates in this country when you say that they are the cheapest in the world? Is it not a fact that the short-haul rates in this country are among the highest in the world?—A. No.

Q. It is not?—A. No, it is not. We may have some short-haul rates that are as high as anywhere, where the roads are doing a very small amount of business. If you will analyze it you will probably find a very small amount of business hauled on such roads at a very high rate, in comparison with larger amounts moved by the long haul. But the average freight rates in America are the cheapest of any important civilized country in the world.

Q. Is it not by reason of the fact that the long hauls give an opportunity for cheaper rates, and are more prevalent here than elsewhere?—A. That is one reason they are more prevalent. Undoubtedly the long hauls of the American roads are one element that has enabled them to make these cheaper rates; our long distances have been a large element in that result.

Q. (By Mr. PHILLIPS.) Have you looked into the governmental ownership in Germany, for instance?—A. In a measure, yes. I can not say that I have been a close student, but I have watched it.

Q. Do you think it has been quite satisfactory in the German Empire?—A. I do not. Certainly when you travel over the German railroads you do not get anything like the promptness, or the efficiency, or the courtesy, or the luxury that you do in America; and as for the prompt movement of freight, why they do not know anything about it. It frequently takes longer to get a ton of freight across the German Empire than it would from here to San Francisco.

Q. (By Mr. CLARKE.) Do you not think that the introduction of politics into the management of railroads would be an evil greater than most of the evils from which the public suffers now?—A. It would be a tremendous evil.

Q. You have testified in regard to discriminations being practiced up to the present day. That is true on your system, as I understand, as well as on others?—A. No, I do not think we are discriminating. The rule has been laid down by our Southern officers strictly that we make no secret concessions to anybody. If anyone wants to ship over the Southern Railway he must ship at the published tariff, and we have lost some business by that, but we find by experience that in the end we get that business back.

Q. Is there no discrimination through the mediumship of commodity tariffs?—A. No; because the commodity tariff is open to anybody. If we make a commodity tariff it is for anybody who ships that commodity, not for any single individual.

Q. Do I understand that you carry pig iron or a highly finished product at the same rate?—A. Oh, no; it is not a discrimination to charge more for a piece of finished steel than it is for a ton of pig iron.

Q. You misunderstood me. Do you charge the same rate to any individual for the same article?—A. Yes; under like circumstances and conditions, from the same point of origin to the same point of destination.

Q. It applies to the petroleum industry as well as any other?—A. It applies to everything.

Q. Do you know how that is on other roads in the South?—A. Well, the rates as a rule in the South are very uniformly maintained now, and that is ascribable to the fact that a condition of confidence has grown up there which has done away almost entirely with the discriminations between individuals. The shippers do not expect that other shippers are getting an advantage, and therefore they do not complain and do not apply for such advantages. This was a very difficult thing to bring about. It did not exist 5 years ago.

Q. Are there not preferences given to a large shipper through the mediumship of his making some preparations for handling his goods or for receiving or storing them?—A. None out of the road; no. If a man builds his own warehouse alongside of the track we do not give him any less rate by reason of that. If it facilitates his business he is at liberty to do it, but we do not give him anything off the rate for it.

Q. And you give every other shipper and any other shipper the same rate?—A. The same rate precisely. The only distinction as to the amount of his business is, that there is a carload rate on some things and a less than carload rate, and if he ships 100 carloads he pays the same per car as if he ships 1; and the tariff shows the difference between the carload and less than carload; it is all on the bulletin board and posted, and he can inform himself as to what it is.

Q. As a matter of fact, has any large company, like the Standard Oil Company, for instance, any advantage in getting the business of the people along the line of your road over any other company?—A. No, unless they have superior advantages within their own business; none so far as the railroad company furnishes them.

Q. (By Senator MALLORY.) Are the rates charged for hauling those tank cars the same as are charged for hauling like cars for anybody else?—A. Yes. If a man owns his car, under the present car mileage system, we pay him the established rate of mileage on his car; but we do that for any man who furnishes his car. I should like to see that done away with, but we can not do it. The cars are there and everybody takes them and takes them at the established rate. We have to do the same thing or go without the business.

Q. (By Mr. PHILLIPS.) Then the different discriminations to which you alluded before do not exist in the South, so far as you know?—A. I will not say that. I say positively they do not exist on the Southern Railroad, and they do not exist to any considerable extent in the South.

Q. But you do believe that they do exist?—A. Oh, I think there are some, but I think they are very small in the South now.

Q. (By Senator MALLORY.) On the subject of pooling contracts—legalizing them—it has been proposed and urged in Congress that the provision of the interstate-commerce law inhibiting the pooling of traffic and profits by railroads be done away with, and that such contracts be legalized. What do you think would be the effect of that on the question of discrimination that we have just heard so much of?—A. I think it would tend to diminish it; that it would necessarily do away with it I do not believe.

Q. There are several propositions in different forms. Among them is one which seems to have met with more favor than others, and that is that power should be given to the railroads to make such contracts as they please concerning their traffic and profits, but that it should be subject to supervision by some constituted authority, and the Interstate Commerce Commission has been suggested, to approve of such contracts or disapprove of them. Have you thought anything on that subject?—A. Yes; a great deal.

Q. What do you think of that?—A. I think that if the legalizing of pools is to be done, it will be necessary to provide for some power or authority to decide whether such pool would result in excessive or unreasonable rates. I should be entirely willing to have that done so far as the pool contract and the pooled traffic was concerned.

Q. You think, then, if that were permitted, that there would immediately be a perceptible cessation of this abuse of discrimination?—A. I think so. In certain localities it ought to have a good deal of effect in that direction.

Q. (By Mr. A. L. HARRIS.) What effect would that have upon through rates compared with the present?—A. I do not think it would affect them materially. It might affect them in trunk-line territory to some extent, in respect to the very low rates that have obtained there of late; but as to the average of those rates I do not think it would affect them materially. At all events, that would place it where, if it did affect them, the Interstate Commerce Commission could annul the contract at once, and that would be a protection against any undue increase of those rates.

Q. (By Senator MALLORY.) What is your experience with regard to the taxation of your railroads by the States? Have you any suggestions to make regarding that? Do you find that it is oppressive?—A. No; I have no suggestions. The taxation is very high.

Q. Generally is oppressive?—A. In some cases it is oppressive.

Q. (By Representative LIVINGSTON.) There is no way of avoiding it, is there, where you run through the States?—A. I do not know of any way that has been devised.

Q. In some of the Southern States they have a railroad commission?—A. Yes.

Q. You have no trouble with them?—A. I can not say that.

Q. No serious trouble over the question of discrimination?—A. No; I do not think we do. We do not have any trouble on the score of discrimination anyhow. We have almost ceased to have discriminations in the South.

Q. If you were discriminating?—A. (Interrupting.) We would hear from it; we ought to.

Q. These State commissions would interfere?—A. If we were discriminating between individuals under like conditions we ought to correct it or pay the penalty. As common carriers we have no right to do it and we endeavor not to.

Q. (By Mr. RATCHFORD.) Does the same apply to localities?—A. Yes. But I said individuals in that case for this reason, that I have never seen two communities yet that had a question up between them that did not feel that they were discriminated against. Not that they intend to be unjust about it, but charges of discrimination between localities involve so thoroughly the question of like or unlike conditions that no two men look at it alike. If two men are shipping goods from A to B those conditions are exactly alike and there is no room for disagreement on conditions. But it is very much more difficult—the most difficult problem in the United States to-day—to adjust the rates between communities.

Q. It has been stated here that a ton of freight shipped from Chicago to Salt Lake City or to the Pacific slope will be shipped at a great deal less than the same ton of freight shipped from Denver to the Pacific coast. Now, the illustration that you make with reference to elevation, etc., hardly applies in that case. The distance from Chicago is in the neighborhood of 1,000 miles longer than it is from Denver. I should like to have you explain.—A. Well, I should hesitate to take up in detail a case of that kind in a country where I am not familiar with the rate conditions. Personally I have no knowledge of Salt Lake City and Denver or that section of the country and the rates that apply to it, and I have had no occasion to look into it, and therefore I should hesitate to give an opinion with regard to a specific case of that kind.

Q. I only referred to that for illustration.—A. Well, where the conditions are not essentially different I think the long and short haul clause of the interstate-commerce law ought to apply. That is, I do not think a railroad ought to arbitrarily charge more for a short distance.

Q. Do you know of any good reason why a ton of freight from a given point in the West, Chicago for instance, that is being shipped for export purposes, should be hauled to the Atlantic seaboard for a less price than a ton of the same freight that is used for domestic purposes?—A. In New York?

Q. Yes.—A. Yes; I can conceive that it can be very reasonable and very just to the community to do it.

Q. Why?—A. It might resolve itself into a question as to whether that ton of freight went abroad at all. Suppose the rate from Chicago to New York on that ton of freight for New York consumption is a perfectly reasonable rate; that is, not more than a reasonable compensation to the carrier for transporting it there. That is a sufficient reason for that rate being in existence. Now, suppose the price of that particular commodity at Antwerp is such that the man who has that ton of freight at Chicago can not sell it at Antwerp unless he can get something off the ocean freight and get a little off from the railroad freight, and then he gets his own profit down to a mere bagatelle for the purpose of starting the business in Antwerp. The combination of railroad rate to New York and ocean rate to Antwerp thus made is such that he can sell that ton of freight in Antwerp. Now, suppose on that ton of freight it has been necessary from Chicago to New York to name a less rate than was named the same day on a similar ton of freight from Chicago to New York for New York consumption. The New York man is not injured, because he has been paying a reasonable rate. It does not affect anyone else in America except that New York consumer. The article is going to Antwerp. This condition is a market condition entirely. Nobody has been injured. The man who shipped it has been benefited, because he has been able to market a ton of freight that he could not otherwise market, there being no market for it in this country at the moment, assuming that this market is supplied. The railroad is benefited to a very limited extent probably. It may make a very little, and it could not have hauled that freight except at the reduced rate, but it is willing to do that in order to get the additional ton of freight, and besides it aids in putting the American merchant or farmer into a market that they would not otherwise reach. Now, under all these circumstances I do not think there is anything unreasonable in taking that ton of freight at a less rate than they would take it from Chicago to New York.

Q. I take it that the cost of transportation is measured by the value of the article after it reaches its destination?—A. That is one element.

Q. That is the main element, is it not?—A. No.

Q. In both cases, both for foreign and domestic consumption, is not that the main element?—A. The main element deciding whether it would go or not?

Q. No; in determining the cost of transportation.—A. It has nothing to do with determining the cost of transportation, because the cost of transportation is fixed regardless of it; the cost of transportation would be the same if you doubled that rate.

Q. (By Representative LIVINGSTON.) Suppose you hauled that ton of freight from Chicago to New York and charged nothing for it; is anybody hurt?—A. Yes; the railroad is hurt.

Q. Anybody outside of the railroad?—A. No; I think not. I should think the railroad would have the entire burden in that case unless the shipper agreed to give up his ton of freight as well. He might do that.

Q. (By Senator MALLORY.) To go back to this question of the taxation of railways by the States, can you state what is the basis of the State taxation of railways, as far as the Southern road is concerned, or whether there is any particular system that is practiced by all the States, or whether they differ among themselves?—A. They differ more or less. In general terms, it is based upon the assessed valuation of the properties. The properties are valued by some constituted board, usually at the rate of so much per mile, and then the taxation rate is applied. Now, that system of assessment of valuation differs in almost every State.

Q. In some you think it is too high?—A. Oh, in some it is entirely too high.

Q. (By Representative LIVINGSTON.) Is the property divided into real estate and rolling stock?—A. It is divided into the roadbed and the personal moving property. Those are the two classes; that is, the roadbed, depots, etc., are in one class and the rolling stock and moving property in another. That is the general rule.

Q. (By Mr. C. J. HARRIS.) The tax is by the mile?—A. By the mile usually. The valuation of the road in different sections is valued per mile. They take up one section of the road and usually that follows the line of demarcation of the old chartered corporations, even if they have been consolidated into combinations. This plan is usually adhered to because it has become a habit or custom coming down from the old times.

Q. (By Senator MALLORY.) Do you think that the Interstate Commerce Commission is of any service at all?—A. Yes.

Q. In what respect?—A. Well, they have accomplished a good deal in respect of publicity of rates and action; they have accomplished a good deal in the way of systematization of accounting and records, so that the work of all the railroads can be very much more intelligently examined; and then they have accomplished some good by their prosecution of people who are violating the law. They have not done a great deal of that.

Q. Do you think it would be advisable for them to be empowered to enforce their decrees on questions of discriminations and unjust tariffs?—A. On discriminations between individuals, yes; as to tariffs, no.

Q. The original intention of the interstate-commerce law, I believe, so far as the public understood it, was that the Interstate Commerce Commission would have the power to determine that a thing was contrary to law and that that would be observed until set aside by some superior judicial authority?—A. I do not know what your opinion was. I was very actively engaged in railroad traffic at that time, but I must say I never thought so, in respect to rates or tariffs.

Q. You do not think it would be advisable to give them power to see that their decrees are observed and their findings followed until an appellate court sets aside their decision?—A. No; I think if there is a controversy on that question it ought to go to court for decision.

Q. Would it not be better for Congress to say: "You are simply an advisory body," or to give them the power to see that their findings are put into effect until some appellate power sets them aside?—A. What is to protect the railroads? Suppose the court should finally decide that the rate was not unjust or unreasonable? The question of discrimination is different from the question of an unjust rate. A discrimination is a distinct offense under the law, and should be followed by punishment. I have no objection to the commission being given any power you please for such punishment, but when it comes to deciding a question as to whether a certain rate is reasonable or unreasonable, unless that tribunal is constituted as a court, with all the responsibilities of a court, instead of a commission, with its decisions subject to appeal to higher courts—in fact, put on the same footing of permanency as a United States court—I do not think that they ought to have such authority. Suppose that

question is finally carried to court, and it is decided by the courts of highest jurisdiction that the rate which was reduced was a reasonable rate, what becomes of the railroad and its revenue in the meantime? It has suffered during the trials an unreasonable reduction of its rates, and these trials may occupy 2 or 3 years.

Q. That argument may be answered by just shifting positions. I do not know as it is an answer, but it is one of the cases where somebody has to suffer, and suppose the court itself sustained the Interstate Commerce Commission's finding?—A. Then the shipper can collect from the railroad company.

Q. Four or 5 years after the thing has transpired.—A. Damages are usually collected only at the end of lawsuits, are they not?

Q. In each case the matter is generally so small individual people are not disposed to go into lawsuits?—A. That is one of the necessities of business you can not undertake to provide for by statute. If a man on account of the smallness of the debt is not going to take the trouble to collect it, it is no reason why I should pay to him what is not due as a means of keeping him safe while he sues. I do not think that will follow.

Q. Going back to the matter of discrimination, which you say is a violation of law—not a question of judgment, but simply a question of fact—do these corporations discriminate or not between individuals? Would you give them the power in that case to enforce their decision?—A. Yes; I should have no objection to that, because I do not think any railroad company should be in a position to discriminate between individuals at any time or for any length of time, but I think they are entitled to the protection of common law as to whether their charges are reasonable or unreasonable, and if you constitute the Interstate Commerce Commission as a court, with all a court's powers and limitations and with life members, or constitute it as the English commission is, I have no objection to submitting that question of reasonable rates to such a United States court especially constituted for that purpose.

Q. What is there about a court that gives it any more ability to determine rates—an ordinary United States district judge sitting as a circuit judge in determining whether it is reasonable or not?—A. He is supposed to be a trained jurist.

Q. It is simply a question of fact, and that fact must be determined by information that covers a multitude of subjects, whether a rate is unreasonable or reasonable, and in my mind a railroad man is the only man who can settle it, an experienced railroad man. Our judges are not appointed because of a knowledge of railroad matters. I am surprised that you will let a judge decide it when you will not let a railroad commission decide it, a commission supposed to be constituted of men familiar with the subject. But I do not wish to argue the subject.—A. I will not prolong the discussion. I think there is a very marked distinction between the two cases.

Q. (By Mr. C. J. HARRIS.) You have been railroading in the South a long time. We have in North Carolina and other States samples of railroads owned and run by the State—government ownership. As a railroad manager, will you tell us what has been the result of such ownership of railroads?—A. I do not know. I have personal knowledge of but one case of railroad run by the State of North Carolina. I think there was another in former years, but I do not think it was successful, and certainly the one run by the State of North Carolina now is not successful.

Q. (By Representative LIVINGSTON.) Do you know anything about the running of the Georgia State Railroad for a long time—30 or 40 years?—A. It has not been run by the State within my recollection. Twenty or 25 years ago the State leased it. It was leased to Joe Brown and his associates first. I did not know much about railroading in the days when the State ran that road. After running it they leased it; they preferred to get out of it.

Q. I was going to suggest that if you knew the history of that it would answer the question.—A. I do not know the specific history. I know the fact that it has not been run by the State for a number of years. The State of North Carolina owns another railroad to-day that is leased to us.

Q. (By Mr. C. J. HARRIS.) Have you any knowledge as to the Cincinnati Southern, owned by the city of Cincinnati?—A. Yes, a very intimate knowledge of it.

Q. What success did Cincinnati have?—A. Very bad success running it themselves. It built it through a board of trustees, and then attempted to run it for a little while; then some organization of some sort other than the trustees was formed, and then it was leased. Those people who leased it have been paying the bill ever since. I happen, unfortunately, to be one of them.

Q. (By Senator MALLORY.) You think that was due to the fact that it was owned and constructed by the city of Cincinnati, or a rather poor investment anyhow?—A. The fact is it cost a great deal of money; they built an enormously expensive road, and it is now getting up to the point for the first time where, at a reasonable rate of interest on the cost, it will pay its way; but for nearly 23 years it has not been making the

interest. The city of Cincinnati has been losing at the rate of \$400,000 a year. They leased it for \$400,000 a year less than the interest on the cost.

Q. You would not consider that as being a parallel case with the railroad run by the State itself?—A. No; that was a business venture, and it never had any political effect. The city never managed the property in the sense of having its own employees for any length of time. It never got into politics. There was and is a nonpolitical board of trustees in charge of the property.

Q. (By Mr. KENNEDY.) Has there been a remarkable revival of business along the Southern system during the last year?—A. Yes; there has been within a year, but it began about a year and a half ago.

Q. Does it compare with the revival of business along the roads running east and west into the great, growing States of the West?—A. Not quite so large relatively, probably.

Q. Have you a car famine on that road?—A. Yes; we are taxed to the uttermost for every car we can command, and we are not promptly supplying all the demands.

Q. (By Mr. FARQUHAR.) While you are on the Government ownership of railroads, what is your opinion as to whether the interests of the general public would be better conserved under the control of the railroads by the Government, or by the competition that we are having now, as far as rates are concerned?—A. Well, that I could not answer so far as rates are concerned. That would depend entirely on what the Government desired to do in the management of the road. If it desired to increase the revenues of the Government very largely, it might do it temporarily by putting the rates up.

Q. Supposing that in the Government ownership there would be a maintenance of reasonable rates, do you think that would be of advantage to the whole commercial community—a maintenance of reasonable rates rather than the competition we are having now between traffic lines?—A. No; I think, under Government control, while you might and probably would get absolute maintenance, you might get a rigidity of rates that would not meet the commercial conditions of the country anything like as well as they are met now. I do not think America would grow in internal or foreign commerce with the roads under Government control as it is growing now.

Q. You think, under natural conditions the natural growth of commerce would be better conserved than it would be under Government ownership?—A. I do.

Q. Your idea as a railroad man, as widely as you know the whole system here, is that many of these discriminations have been in the advancement of new products, and also of the growth of communities, in certain classes of commerce?—A. Yes.

Q. That has been the custom of all railroad men, to meet these conditions and, as much as possible, to promote the enlargement of traffic by rates and otherwise?—A. Yes.

Q. In other words, you take the more general proposition that the larger the shipper and the larger that corporation—the more beneficial rate will go to the party that sends the most traffic?—A. Yes, that is the natural tendency.

Q. There is an advantage to the great shipper and the great city?—A. Undoubtedly there is; but that advantage should not take the form of discrimination. Undoubtedly the large city always has an advantage in dealing with any large problem over the small one, the same as accumulated capital has an advantage over individuals. The railroads that have a business going out of large cities can get their properties in shape to do that business better than if serving small communities producing small revenues.

Q. More economically?—A. More economically and with more facility and dispatch, and therefore they can meet the conditions of the market better.

WASHINGTON, D. C., October 16, 1899.

TESTIMONY OF MR. MELVILLE E. INGALLS,

President of the Cleveland, Cincinnati, Chicago, and St. Louis, and the Chesapeake and Ohio Railroad Companies.

The commission met at 10:40 a. m., Vice-Chairman Phillips presiding. Mr. Melville E. Ingalls, being first duly sworn, testified as follows:

Q. (By Senator MALLORY.) What is your name?—A. Melville E. Ingalls.

Q. Where do you reside?—A. Cincinnati.

Q. What is your occupation?—A. I am president of the Cleveland, Cincinnati, Chicago, and St. Louis Railway, and of the Chesapeake and Ohio Railway; those two systems, one north of the river and one south.

Q. How long have you been connected with the railroad business?—A. With the management of railways since 1871.

Q. Were you connected in any other way before that?—A. I was attorney for them; I was practicing law in New England previous to that.

The witness submitted the following written statement:

In legislating in reference to railways three things must be considered: First, the accommodation to the public (and the prime condition in this is safety) and after that facility. Last year over 500,000,000 people traveled over the railways of this country, and nearly 1,000,000,000 tons of freight were shipped. These figures are so immense that their presentation at first staggers the mind. The first thing, as I have said, is to see that this immense travel is handled with safety and dispatch, and that this immense tonnage is carried with regularity. To do this requires good tracks, good equipment, terminal stations, all costing large sums of money, and to-day much more than ever before, on account of the development of the country and the growth of cities and the increase in the price of terminal property. The revenues of the railways must be sufficient to provide for this, and any legislation which limits that revenue below this safety point is unwise and against the interests of the people.

The second consideration must be the prompt payment and welfare of the employees of the railways. Leaving out of consideration the vast number of people who incidentally are supported by the railways as manufacturers of supplies and producers of raw material, the men actually on the pay rolls of the railways of this country to-day are about 1,000,000, and they support a population of 4,000,000 or 5,000,000. The railways, in addition to the revenues for maintaining their property, as previously stated, must earn sufficient to pay this army of employees. More than \$500,000,000 were paid out last year by the railways for wages. Any legislation which affects the welfare of 5,000,000 of your people should not be hasty nor in anger, but conceived with the greatest care. If you reduce wages you reduce the character of your service. The lives of thousands of your citizens are in the hands of even the humblest trackmen. No one, unless he reflects and has studied the situation, understands how the duties of the employees of a railway are all interwoven, and how the lives and safety of passengers and the protection of freight depends upon the intelligence and character of the employees, from the highest to the lowest. It is vital, therefore, to the interests of the service, to the interests of this country, that the railways should earn sufficient to pay their employees and pay them well.

The third interest to be considered, after having provided for the maintenance of the property and the payment of the employees, is to see that all its patrons are served fairly and well, and at as reasonable a cost as is consistent with the previous statements, and a fair sum to be returned to the proprietors for their investment. Too little consideration has been given in this country to the latter fact. There has been a feeling among many people that the railways were built by stock jobbers, managed for these purposes, and that the capital invested had not much claim to consideration. In many cases the courts have interfered, and I think the sober, honest, sensible people are at last coming to a point where they wish to do justice to the proprietary interests.

To sum up, therefore, legislation in reference to railways should be such as to allow revenues sufficient (first) to maintain the property and the service, (second) to pay the employees, and (third) to provide a sufficient return on the investment. When these three conditions are attained you will have placed this large interest, representing through its employees and its purchases at least one-tenth of the population of this country, in a sound and safe condition, where as citizens they can perform their duties to the Republic and become useful members of society.

For half a century the railways have been going through a species of development. At first every community was anxious to secure a railway, and all manner and sorts of inducements were given. It was a hazardous enterprise to undertake, and nearly all the early promoters failed in their undertakings and capital could not be induced to enter the field without large inducements; therefore, speculators and promoters seized upon the field, charters were obtained, aid solicited from State, city, and town, bonds and stock issued without much regard to values, and all sold or turned over to contractors to build the railway. These contractors and promoters sold the securities to the public. In most cases they were lost—wiped out by foreclosure. The new owners and proprietors of the reorganized companies endeavored to earn an income upon their investment in all ways possible, and this produced dissatisfaction with the public. The contest first began as to whether railway companies were like other business enterprises—-independent and free to pursue their business, charging what they could get from the traffic and making what they could. After many years of litigation the courts finally settled the question, which to-day is practically agreed, that railway corporations were public servants, receiving certain rights from

the people, in consideration of which the public had control over their rates and charges, always reserving the right, which the courts protected, that there should be revenue enough to pay a fair return upon the capital invested. State after State appointed commissions, who endeavored to control or influence railways in the interest of the public. The Massachusetts idea of the commission was that one should be appointed which should have authority to inquire and report, and their control of rates and the enforcement of their commands depended more upon moral suasion than anything else. Other States endeavored by legislation to absolutely fix tariffs and charges. As the country has progressed and improved the latter idea has been given up to a great extent, except in more ignorant communities and in cases where it is used for political capital. The wise and thinking people stood aghast at the thought that a few commissioners, selected usually for political qualifications, could make, manage, and control the tariffs upon which this enormous business depended for its safe and prosperous conduct. Finally, in 1886, the demand for legislation developed into an act of Congress creating what is known as the Interstate Commerce Commission, which, with some amendments, is substantially to-day as it was passed. The courts have decided that its powers do not extend to the making of tariffs, but in many other ways it has the broadest and most complete authority. This act prohibited the pooling or division of earnings, which had been the favorite method of maintaining tariffs previous to that act. After the passage of that law, however, by agreement and association rates were still fairly maintained. Later, however, the Sherman antitrust law was passed, which at the time was supposed by many people not to apply to railways, but since, by the decisions of the courts, it has been practically decided that it applies to nothing else but railways; and under the decision of the courts in the *Trans-Missouri* case it seems as if no agreement or arrangement or understanding of any kind can be maintained and that there is nothing left for the railways but anarchy. It left the railways in a most deplorable condition, and during the years 1897 and 1898 the practice of cutting rates and secret rebates seemed to run riot. Late in 1898 and early in 1899 the Interstate Commerce Commission took up the question with the leading railway managers of the country, for the purpose of securing a better maintenance of rates, to stop secret cutting, and especially to prevent the payment of rebates which it was supposed were being paid, although no legal proof could be obtained. This move upon their part was most commendable and has worked out with extraordinary results and has been beneficial to the railways and the public. So far during 1899 there has been greater freedom from secret rate cutting and rebating than probably has ever been known before in the history of railways. This has been done by the resolve of the controlling officials that there must be a change, and it has been made easier by the fact that there was a large amount of business offering, more, in fact, than the capacity of the railways to take care of. A pride has also grown up among managers in obeying the law and discontinuing such practices, and to-day where here and there a railway manager is supposed to be paying secret rebates he is not looked upon as in good standing in the fraternity. How long this condition of affairs can last without legislative aid is a grave question. It has also resulted in tariffs far below cost, in many cases, and unprofitable to the railways and not demanded by the public.

I think it is the belief of railway commissions, railway officials, and large shippers that there should be some legislation by which the agreements between railways could be legalized. It is usually called a "pool," but the term should be broader than that. It should be legislation authorizing railways to enter into agreements to maintain the published tariffs, with penalties and fines for breaking the same. In other words, this immense traffic should be made legal, rather than leaving it, as it is now, outside the law.

I am quite well aware that at present there are penal provisions for the punishment of violations against the present law. It is, however, this very provision that, in my judgment, renders the law ineffective. When you provide a punishment for an act committed by an official of a corporation in the way of business which is done every day by 90 per cent of the business men engaged in private affairs without punishment, you are making that a crime which the public conscience does not consider one, and therefore such a law has not the support of the public. The public will not support anyone, either a railway official or a business man, who gives information leading to conviction under such a law. The law should be changed making it an offense punishable by fine. You may make the fine \$500, or \$1,000, or \$5,000, if you please. It will then be supported, and you will have no difficulty in getting evidence, and the law can be enforced.

It is hardly worth while to treat agreements of railway corporations as more sacred than any other of the business affairs of men or to throw around them greater punishments and penalties. My judgment is that what is necessary in the way of legis-

lation is, first, that we should amend the interstate-commerce law as it exists by allowing railways to make agreements for the maintenance of tariffs and the division of business, all rates and tariffs under such agreements to be subject to the supervision of the Interstate Commerce Commission as to whether they are reasonable or not; that all violations of these agreements as between the railways themselves should be subject to damages by suits in the courts, like other ordinary affairs; that any shipper wronged could bring suit, or on any complaint of the public violations should be punished by fines. Then I should provide, further, for the greatest publicity of accounts and the affairs of these great corporations; that their accounts should be kept according to the rules prescribed by the Interstate Commerce Commission; that that commission should employ experts similar to those appointed by the bank examiner, who should at stated times, and at other times as the commission concluded wise, examine the accounts of all the railways and should make report of their affairs.

I would provide then, further, that no railway should be built except upon the approval of the commission, and no charter should be issued except a proper and sufficient capital was fully paid up. The time has gone by when it is necessary to allow what you might call "skylarking corporations" to be organized. Henceforth the railway business is to be a conservative, steady business, and if a new line is desired it should not be authorized unless capital is willing to take the risk. This will prevent the building of parallel and competing lines in the future which are of no use to the public.

The tendency with many writers and thinkers to-day is for the Government to own and manage these great highways. As the Government is at present constituted and managed, I should consider this a national calamity. To avoid it we should endeavor as far as possible to see that these corporations are treated fairly; that the public is also given proper consideration, and, above all, that the great army of employees is well taken care of. I am a believer myself in profit sharing as applied to railways, and that in the future it will work out the solution of the question between employer and employee and avoid strikes and friction. Many of the great corporations are working to this end by means of their pension lists, hospitals, etc.; but they can not make much progress in this line if they are to be hampered by legislation such as is applied to no other of the industries of this country.

It must be remembered that the great factor in the development and improvement of this country is the railways, and that anything that unjustly and unduly oppresses them hinders and retards the development of the country. It is time that we disregarded the cry of the demagogues against the railways and treated them like business corporations, necessary and essential to our progress and development. And, to repeat and sum up, it seems to me that for this purpose it is necessary that the present law should be amended by legalizing contracts between railways, subject to the inspection and approval of the Interstate Commerce Commission; that infractions of that law should be punished, like other business transactions, by a fine, and no attempt should be made to make it a criminal offense; that a more thorough inspection of the accounts of railways should be made and greater publicity given, so that the public may know what is being done, what they are buying and what they are getting, and that they should be protected from raids by speculators and blackmailers, and no rival line allowed except upon a hearing and a decision by the commissioners that such a line is needed.

Q. Can you state, Mr. Ingalls, about how many employees you have in service on your two systems?—A. We have a little over 20,000 names on the pay roll now.

Q. How often are they paid?—A. They are paid every month by a pay car that runs over the different divisions.

Q. What is the basis of payment? I expect it differs with the different character of employees.—A. It differs generally because, in the first place, there are different classes. There are the clerks and agents, who are paid by the month; the train men are all paid by miles; the machine men are paid by the month, but based on hours—so many hours a day; and the track men are paid by the month, but it is based on so many hours a day.

Q. Have you any limit as to the number of hours the men work?—A. Oh, yes. For the shop men the outside limit is 10 hours; it is more often 9, very frequently 8. The arrangement of the hours in the shops depends a good deal upon business. If business is pushing, we try to work 10 hours; moderately fair times, 9 hours; and very hard times we have got down to 8; and often in the winter, in the short days, we get down to 8. The track labor is supposed to be 10 hours the year round, but in the winter if they get in 8 hours they are very lucky; we are very lucky, rather.

Q. How about the train men, the engineers, and firemen?—A. Their pay is based on mileage, and we endeavor to keep our divisions so that the train men will make

good wages by going over the division. They are more apt in good times to double up; that is, to do more work and get much more wages than is calculated on; very rarely less.

Q. Have you any limit in the number of hours that a locomotive engineer must work or is permitted to work?—A. Well, the limit is hardly in hours, because sometimes a man may get laid out and it may take him a long time to finish on his division and get back. We expect him to finish his division; and then the rule, which we carry out strictly, is that he shall not go out until he has had an equal number of hours rest. Ordinarily we would like to get our passenger engines in not less than 6 or 5 hours, often in 2½. Our freight runs are all scheduled to run from 8 to 10 hours. Usually 10 hours is what we try to do.

Q. (By Mr. KENNEDY.) You say that the track men are supposed to work 10 hours a day. The track men of nearly all the systems in the United States have sent in complaints to the commission that they are the hardest-worked and poorest-paid laborers in the United States. That is the burden of their complaint; and that their hours are excessive. They have to work night and day, and they get no pay for overtime. Can you say anything as to that condition of affairs?—A. Well, if they had left their case with the first statement—

Q. (Interrupting.) Poorest paid and hardest worked?—A. I should be rather inclined to agree with them. They are the poorest paid and hardest worked when you take the two together. There are not many occupations harder; but in connection with the pay, I think the hardest-worked men all over the world are what I call the dollar-a-day men; that is, the ordinary laborer, who does not get above that. The track man, we will say, gets in 10 hours and he gets a dollar a day. I guess, in the hard times of 1895 and 1896, he got in a good many places down to 90 cents, and perhaps 75; but I think we always paid the \$1. But when you come to talk with them you will find they are the men who are at home every night; they have their own little houses; they can live cheaper, and their labor does not require so much skill as other men's; and it is as fair wages as are paid to ordinary rough labor in other walks of life. I do not think it is true of the long hours. I was telling, before I came in here, when I took the Chesapeake and Ohio Railway they had a rule there that the darkies who worked on the track should work from sun to sun. Well, of course, in the long summer days that made a very long day, but we changed to the ordinary 10 hours. Occasionally, if you have a wreck, the section men are turned out at all times of the night, and have to go out very often in stormy weather. I do not think he averages more than his hours; certainly not on our system.

Q. They claim that a great deal of responsibility rests upon them; that the safety of the traveling public is in a measure in their keeping, as it is in that of other railroad employees; and they claim that they ought to be better paid.—A. Well, of the 20,000 names on our pay roll you could pick out very few who did not carry the lives of the passengers in their hands.

Q. (By Senator MALLORY.) I was proceeding to ask you if you knew with regard to the existence of such a system as what is commonly known as the blacklisting of discharged employees; I mean the system that has given rise to considerable complaint in this country, whereby the name of the employee who is discharged is transmitted to some other railroad system and is there used to keep him from getting employment on that system.—A. I understand. We have nothing of that kind. That comes under the head of the general manager. I understand the only thing we have is that if 1 division discharges a man and his name is sent in to the superintendent no other division can employ him without the consent of the general manager. But I do not understand we have ever had anything like what is known as the blacklist system with other roads; not to my knowledge.

Q. Is there any difference between the Sunday labor and labor during the week days in your system; that is, do you have the same quantity done on Sunday that you have on week days, or is there a difference, only such work as is absolutely necessary being done on Sunday?—A. Well, we rarely open our shops on Sunday unless some extraordinary calamity has overtaken us. Our track men do no work on Sunday except, possibly, to inspect, or in case of a washout or accident. The only people who do Sunday work are the train men.

Q. Are they paid extra for that or do they receive the same pay?—A. No, the same thing.

Q. The Chesapeake and Ohio runs through what States; Virginia, West Virginia, Kentucky, and Ohio, does it?—A. Yes.

Q. Do either of those States prohibit transportation by rail on Sunday?—A. Virginia does.

Q. How about the other States?—A. There is no prohibition.

Q. What is your view about the interference with railroad traffic on Sunday by State laws; do you think there is any real benefit from it?—A. I think it is times.

I would like to explain that at a little length. In the first place, leaving out the religious side of the question, as a matter of getting the best results, a man who works men is very foolish to work them over 6 days in the week. In my judgment there should be 1 day of rest. Now, the question of absolutely prohibiting work on Sundays is very often more against the merchants than against the men. Over on the Chesapeake and Ohio, where we do an enormous business, we may get blocked up in the mountains by an accident. We come along on Sunday and our yards are full. Men want to get home; they can not leave. They can not put through the trains. And there is more complaint from the men over that than anything I have heard of on the road. The merchants and people fail to get their goods and they will complain. The only thing that I can see in its favor is where we run through communities or by churches. I believe in everybody conducting his business so as not to interfere with his neighbor; and if I want to go to church my neighbor should not be allowed to blow a locomotive whistle beside the church or a brass band be allowed to play there. That ought to be controlled; but it seems to me that it should be left to the local communities to make their local regulations. But if you have a State law as it is in Virginia, which, I think, has been declared constitutional, it leaves a chance for every little blackmailer to make a complaint and get your fine.

Q. But that law does not prohibit passenger traffic?—A. No, nor perishable freight; and the result is that you will see 49 cars of coal running down over the road and a car of hogs used to run them through; and we run our passenger trains and business through. There is a demand for passenger trains now.

Q. According to that, practically, there is not a great deal of observance of that law?—A. You might not have cars enough of hogs to go around.

Q. If you do have hogs enough to go around, you are very sure to run the trains?—A. As long as we can switch in perishable freight, I understand from our attorneys that we are safe. The Virginia people are the cleverest people in the United States. I do not know any State where property rights are so carefully observed as they are in Virginia; and we do not have any trouble, unless we strike somebody who wants to make a fine out of us. The people themselves are all with us; we do not have any trouble with them.

Q. What is your observation with regard to suits against your road for damages for injuring people, or any other kind of damage? Do you find that you have a fair show before the juries, as a general rule, or otherwise?—A. Well, we run through 11 States, and you can see the difference in almost every State. However, I have rarely heard of a complaint in Virginia or West Virginia. In Kentucky we never, except in the last year or two, have had any fair treatment. We settle everything we can, and what we can not settle we let go. The State is full of lawyers who take the cases on shares; and before the poor man's eyes get closed from an injury a lawyer has got hold of his widow and brings suit, and the juries do not have much regard for us. Sometimes we are able to take exceptions and save. In Ohio and the West we do not find very much trouble. We get treated much better to-day than we did 10 or 20 years ago.

Q. Is there any such thing as a limited liability law in any of the States through which your road passes?—A. Do you mean for death?

Q. Yes.—A. I think there is; I know there is in Ohio. I think there are in the other States. I would not want to state that. That is a matter of law which I do not carry in my mind. I feel quite sure there is, though.

Q. Is it better to have such laws with a limited liability as they have in New York, where, I think, \$5,000 is the maximum amount which can be recovered for the death of an individual?—A. Well, speaking as a railway manager, I should rather have a limited liability. Speaking generally, in the interests of the public, I should say it was a mistake.

Q. On your system now have you any such thing as a provision for sick and disabled employees provided by the railway?—A. On the Chesapeake and Ohio we have established a hospital system. We have had rather an interesting and successful result there. Our general manager got very much interested in it and he took it up with the heads of these different brotherhoods and their representatives, and they appointed committees who examined into the different systems, and they finally agreed to it and fixed a form of assessment on those that belonged. We gave them a hospital which cost us \$75,000, which, I think—at Clifton Forge—is as complete a hospital as there is in America, and everybody that can be sent there, and medicines are distributed from there. They have a good surgeon and they have trained nurses. It has been running now for 2 years, and we are establishing branches at other places. It has really been a wonderful success.

Q. How is it maintained?—A. By assessment on the men; we take it out; it runs down. It runs from my assessment, say \$6, down, I think, to 10 cents on some of the men.

Q. All the employees are assessed?—A. All the employees who will come in and pay. We let the men themselves settle that.

Q. That gives them the privilege of taking advantage of the facilities of the hospital?—A. They have the privilege of going to the hospital and being taken care of until discharged by the surgeon without any charge. They have the privilege of having medicines sent to them on the request of the local surgeons. If they are injured at a distance from this hospital, we have arrangements by which private hospitals take care of them and all is paid out of this fund. This fund is taken care of, and it has accumulated quite a little surplus.

Q. Do you know whether that feature of railroad management has become common at all in this country?—A. Well, I think in the last few years the managers are looking into it more and more. We hope now to add to this a pension system; our people are at work at it. I am a great believer in profit sharing as applied to railroads. That is one of the dreams that I hope to see carried out; but it can not be until the railroads get a little steadier business and have some profits to share.

Q. (By Mr. FARQUHAR.) Does the assessment take in the officers of the railway as well as the employees?—A. Yes.

Q. And they are all assessed, from the president down?—A. The assessment is a nominal thing. They assessed me and I commuted mine by sending check for the whole amount at once. The higher officials do not use the hospital.

Q. (By Senator MALLORY.) Do you notice any effect that this has in harmonizing the employers and employees at all? Has it any effect in the direction of pleasant relations?—A. We have never had any trouble over there in 10 years. We keep on pretty good terms with our men. We have worked out more satisfactory results on that railroad through the Young Men's Christian Association than anything else. We have established branches on our railway and the men have taken it up and have gotten interested, and it has been 10 years since they have been on the road, and it has been a revolution.

Q. (By Mr. FARQUHAR.) In the matter of profit sharing, or rather the investment of the earnings of your employees in the stock of the railroad, you say you favor that. Is that very much the same plan as the Illinois Central has, or is there any difference?—A. No; their arrangement was to get the men to buy the stock, and that is a little dangerous, because stocks go up and down. I have been on a railway where the stocks went up and they made money, and then afterwards everybody would get disgusted because the stocks would go down and they would lose. My theory of profit sharing—if you will have your secretary to get you the history of the Orleans Railway in France, before it was taken by the Government, it was the best exemplification of profit sharing that there has ever been in the world and the most successful. When the Government took it it stopped. But if railroads can be put upon such a basis that they can pay steady dividends like other business, so that the men will know about what they are getting, then you can let their wages represent certain capital by the side of yours and make a certain division every year. So long as you can keep that up you will have better feeling among the men, better work, and less trouble with strikes. The danger has been that so many of our roads are so poor that they may pay a dividend one year and the next nothing, and then we might have friction. That is what has kept so many railway owners and managers from the plan.

Q. Then your idea is more on the real profits than on stock investment?—A. Yes; I do not want any men in mine holding stock because then, if it goes up or down, they are satisfied or dissatisfied. But if a man says, on his engine, "I am earning \$2,000 a year; that represents so much capital invested; if the road get 5 per cent on its stock, I get 5 per cent on my wages in the year," he has something to work for and he is not going to have an accident if he can help it; neither is he going to strike and make trouble if he can help it.

Q. Do you not think really that that theory, if you may call it a theory, of labor capitalization, employees and capitalists being united as one in the interests of any corporation, whether a railroad or manufacturing concern, is the proper way?—A. I am a great believer in it; I think so.

Q. You think that goes a great way in solving a good deal of the strikes and difficulties and disputes between capital and labor?—A. I am quite sure of it. We have an institution in Cincinnati that has carried it on for several years, and it has been a perfect success.

Q. (By Senator MALLORY.) To what extent have your two systems complied with the requirements for automatic couplers and air brakes?—A. We are fully up to the requirements. On the 31st of December we will be all completed.

Q. Do you think there will be any appreciable beneficial effects from these automatic couplers and air brakes in the future, when all the roads get well supplied

with them?—A. Oh, I am quite sure so; I think it was a wise law. I was in favor of it when it was passed. The only thing I did, I came on here and saw Senator Voorhees. That was to get the time extended; it was a question of finding capital to provide for it; but I think the principle of the law was right.

Q. Until the freight cars get generally equipped, however, it is very difficult to determine what is the real benefit arising from that, I suppose, because you have to work the link and pin coupler in with the automatic coupler, and a man has to go in between the cars anyhow?—A. That has been the difficulty, and you will not get to the real test until after the 1st of January. But, of course, after the 1st of January we who are equipped will refuse to exchange with those who are not, and that will immediately enforce a compliance with the law. We can not work an exchange and do business.

Q. Has your road any objection to your employees belonging to organizations—employees' organizations—and associations?—A. We have been rather in favor of that within certain limits. There are some classes of employees which we think ought not to belong; but we are rather disposed to favor generally the organizations.

Q. (By Mr. KENNEDY.) What class should be excepted, in your opinion?—A. Well, there are some people who come into confidential relations with the corporation, and we think their duty should be to the corporation, and they should not, perhaps, belong to the orders.

Q. You mean clerks, I suppose?—A. Well, I see in the newspapers—it has not come to me just yet—that out on the Big Four there is a row with the telegraph operators. Our management there think that the telegraph operators should not belong to the organization. That is a matter like our agents and our clerks; they should be dealt with separately. I mention that because that is in the newspapers. Our trainmen—we have contracts with all of them. We recognize their orders and make contracts with them.

Q. (By Senator MALLORY.) You do not do that with the telegraphers?—A. No; we do not think there is any necessity for it; they are in such confidential relation, doing business through our contracts for commercial business. We are very ready to treat with them individually. There is not enough of them either. We are always open to conference with them individually, but with our trainmen we could not do it.

Q. (By Mr. KENNEDY.) How could they harm the railroad company on account of these confidential relations, if they were organized?—A. Instead of each man's settling what he should do, his order would settle it for him, you know. I have not been into the case thoroughly, and I only mention it because I have seen the newspaper talk about it. But I asked our general manager what he thought about it, and he said he thought there ought to be a limit or a different arrangement there.

Q. Do you not find your organized employees, as a rule, very fair and liberal in their dealing with you?—A. We have got along better since we had organizations than we did before. The engineers, the conductors, the brakemen, and the firemen—we never object to deal with them as an organization.

Q. (By Senator MALLORY.) Have you had any serious strikes among your employees, on either of your systems, in recent years?—A. Never.

Q. Have you had any occasion to think over this recent law passed by Congress providing for mediation, conciliation, and arbitration of disputes between railroads and employees?—A. I looked at it when it was passed. It never has arisen in the way of business and I have never had occasion to consider it. Anything that tends to moral suasion and mediation between two parties is always good.

Q. If it is at all practicable?—A. You will get some people—some employees—that are so mad sometimes that nothing will prevent them from striking; and you will get some managers that will be so bad that the men will have to strike. If you have not common sense and consideration on both sides, you will have strikes.

Q. Do you think that any railroad in this country would be willing to submit the question of the wages that it pays or will pay to its employees to arbitration? Do you think it could afford to do it?—A. There would have to be some limitations on that, I expect. For instance, I should not want to submit the limit of wages paid by our corporation, except that they should not be raised above the limit of our competitors. In 1894, on our railway, we came very near having a strike, but it was voted down by the men. We had to reduce our wages; they got so high we had to. We were willing to arbitrate with the limitation that the wages should be paid the same as our rival lines. You will find that the men do not want to arbitrate on those lines. They are good traders; better than the managers. They will work and they will gain a point here and a point there, and they will gain. They will always get a little ahead.

Q. Is it not a fact that there are so many considerations which go to establish and

determine the amount of wages that a road can pay to those different classes of employees, that the railroad can not afford to yield the question to the determination of anybody but its own directors?—A. I do not think they can afford to do that. I do not think as a good business proposition that we can afford to do that. They must keep within certain limits, if they are going to do business, and their directors ought to know that.

Q. Have you anything to say on the subject of arbitration at all, as between the men and employers of railroads?—A. I do not know that I have. Every man must take care of his employees.

Q. You are not impressed, then, with any immediate urgency for legislation on the subject?—A. The less outside influence there is, I think, the better I should consider it. Our men, I do not think, as a class, have any complaints, and we have none to make of them. We spend a great deal of time negotiating with them. I suppose probably an average of a month a year is taken up by our heads of departments negotiating with the men.

Q. What is your rule, if you have a rule, regarding men who are in the habit of drinking intoxicating liquors or drinking to excess?—A. Well, if a man drinks while on duty, we have no use for him. If he is a young man and drinks off duty, we do not promote him; we can not afford to.

Q. That rule is observed, is it, closely?—A. Absolutely.

Q. The fact that a man is a frequenter of bar rooms when off duty is equivalent to a black mark?—A. Yes; we are always watching for him to make a mistake.

Q. (By Mr. KENNEDY.) If he has reached middle life and drinks while on duty, does that interfere with his chances of promotion?—A. No; we keep him along. That is what we are trying to work out, a system of pensioning to take care of men who have been working for us a long time on our railroads. Now, we have a lot of old men that ought to be taken care of, and just how to do it we do not know.

Q. (By Senator MALLORY.) Is it generally understood among the men that the habitual indulgence in intoxicating liquor is against them and will ultimately result in their discharge?—A. Oh, yes; and then you will find that these unions all enforce that. They are about the best temperance lecturers there are. You take the Brotherhood of Locomotive Engineers, and if they find a man is drinking they will bring him up with a round turn.

Q. That is, practically, essential with the locomotive engineers and the firemen and the train hands generally; but how is it with the other employees?—A. You take the shop men, and we do not pay any attention to them when they are not in the shop. There is no need to watch them; they do not permit any accident. But a trackman that drinks we can not afford to keep, nor a switchman nor a trainman.

Q. (By Mr. CLARKE.) Do the laws of the several States through which you run prohibit the employing of drinking men on your railroads?—A. I think not. If they do, they have not been called to my attention.

Q. There are such laws in some States?—A. I think likely.

Q. (By Senator MALLORY.) What are the prevailing rates, first-class passenger rates, that you have?—A. Well, the local rates are all based on 3 cents, and through rates between the large cities will average about 2 cents.

Q. Is that local rate that you speak of common to the Chesapeake and Ohio and the other system also?—A. Yes.

Q. Three cents is higher than is usual in the Middle and New England States, I believe, is it not?—A. I think their local is based on that, but the system of commutation, round trip and half rates reduces it. Now, I think our average rate on the Big Four last year—I used the technical term for the Three C's—was a trifle under 2 cents; on the Chesapeake and Ohio it was a trifle over. But if a man comes along and asks for a ticket from one station to another on the road, 10 miles apart, for instance, it is always 3 cents.

Q. Why is it that the local rate is higher than it is in some other sections of the country?—A. I was not aware that it was.

Q. Take the New York Central, for instance?—A. New York State has a limit of 2 cents; that was the original law, I think. But you go down to New England and get on any of their local trains and then come down on to our road, and you will see why they ought to have a less rate. They are a bustling, thronging hive, and they fill up a train at one station and empty it at the next, and it is always full. You come down to the Chesapeake and Ohio railway and you will run 50 miles and never see anybody. It is the reverse of what it is in New England and New York. We have to give people a certain service. It is a remarkable thing on these roads. Our through trains make us the money and our local trains lose us the money; but we have to run a certain number of local trains.

Q. And what difference there is is due to the fact that it is a sparsely settled country and there is little travel and you have to run your trains anyhow?—A. That is it;

we have to run trains anyhow; and we have to charge all we can get; and it has been settled in the minds of passenger people that 3 cents is fair and as much as they can get.

Q. What is your idea on the subject of ticket brokerage and mileage books?—A. Oh, I think it is very bad; bad for the railways; bad for the public, and bad for the men. It is the greatest temptation in the world to ruin your men, because a conductor handles a large amount of tickets, if he is right in with the ticket brokers. There are some bad men in all classes. There are probably good ticket brokers and bad ones, but the bad ones have the greatest chance in the world to seduce your men. We have had a great deal of trouble, and good men are ruined by tickets purchased of them which they do not turn in. Then it prevents giving reduced rates to the public because these tickets which are not used are taken up by scalpers and sold to our regular customers. And I can not see that there is any benefit to the public providing you have a law that the railway companies shall redeem their tickets at any authorized agency.

Q. You then would favor the abolition by act of Congress of the ticket brokerage system in this country under interstate-commerce rules, and the establishment of a system whereby tickets not used can be redeemed?—A. I think it would be in the line of good morals and good business.

Q. Have you any idea to what extent that interferes with the profits of the railroads, this ticket brokerage system? Does it cut a large hole in the profits of the railroads of this country or otherwise? You base your objection on the ground of the immorality of it. Is there any other objection?—A. Yes; it cuts into your revenue very largely. You give a low rate, for instance, for a passenger from Cincinnati to Chicago for a special trip up and back. Now, if that ticket can be sold coming back and be used by the brokers for 5 or 10 days and the general public you have cut off so much of your general business, and therefore you have to be very careful when you give those low rates.

Q. What have you to say on the subject of passes, free transportation?—A. Well, I have voted for the last five years—every time it has been up in our associations—in fact, I think I was the originator of the proposal that all passes should be abolished. You will find that most of the managers will go so far as to say that they will abolish all except to railway officials and employees, but that leaves the door open and they will create many officials. I think every railroad should pass their employees over their own road, but if they want to travel on the other roads let them pay their way, and if it is on railway business, they will be repaid upon vouchers for their expenses; and if it is not then let them pay their way.

Q. The giving of passes without consideration, as is generally done—that is, without any money consideration—is a violation of the law as much as any other discrimination in favor of the individual?—A. I have always thought so.

Q. Have you any idea to what extent it exists as an abuse; is it large or small?—A. Well, very much less than it was. There has been a tremendous revolution in the last 10 or 15 years, so far as my observation goes; but yet I presume it is still very large.

Q. Do you know yourself or can you say whether to any extent passes are given to members of the legislature or members of Congress or Senators?—A. Well, our pass business is all run by one man. Our rule has been to give them to the people who live on our lines, during the session. We give that not as a compliment, but as a matter perhaps of right; it has grown up from immemorial custom.

Q. I did not exactly catch that. You give it to people living along the line?—A. For instance, if there is a member of the legislature—take Ohio; a member of the legislature lives on the line; we issue to him a pass good during the session of the legislature. It has been done, I think, for the last 30 years, and our people have concluded, I think, that it was a matter of custom; it had to be carried out until there was some general reform.

Q. Do you know whether that is done in Virginia or West Virginia?—A. There our local officials handle all those things and I can not tell you positively. I think the same principle generally prevails with all the railways all over the country. I think it is so general that the pass absolutely does no good; it is only the name of it. It would be just as well to wipe the whole thing out.

Q. (By Mr. KENNEDY.) You say that the ticket brokerage system cuts into your profits. Is it not a fact that the ticket brokerage system makes profits for some lines of railroads?—A. Well, I have never managed one that it has.

Q. Have you not knowledge of railroad systems competing with others, resorting to the ticket brokers for the purpose of getting trade?—A. A few years ago we had several lines which sold tickets to the brokers for the sake of getting some money, ready money. That was done very largely by one or two lines. They broke up soon afterwards, however, and have been foreclosed.

Q. Do not some of the lines in New York which can not compete on an equality with the Pennsylvania and the New York Central do a good deal of their business through ticket brokers?—A. Well, the only complaint I have heard is—the West Shore, which really is the New York Central—there is a great deal of talk about what they do with ticket brokers by opposition lines; but I do not know anything about it.

Q. Do you believe that the railroads themselves are largely responsible for the existence of this ticket brokerage system?—A. They could stop it in a moment if they would. For instance, if they would make all their tickets train limits on the short line and without limit on the 3-cent local there would not be any difficulty; but it is like all other evils in this world; you have to get unanimous consent to do that; and as it is impossible to get that therefore they have to appeal to legislation. But if the entire railroad management could get together and make an agreement, a ticket broker could not live a week; he would die.

Q. They make the necessity for good sound legislation on the subject, the railroads themselves?—A. Certainly, just as in every other case of legislation in this world for police or in the way of morals or anything else. There is always some one that will not conform, and you have to have legislation to protect the great majority.

Q. Would not this legislation that is spoken about protect the stronger lines against the weaker lines running in the same direction in the country?—A. I do not think so. If a weak line is not getting its share of the business, they can reduce their ticket rate. It is better to do it openly than through the brokers.

Q. (By Mr. FAIRBANKS.) Could the abolition of the ticket brokerage there result in the lowering of the price of tickets to the cash-paying passengers?—A. It would lower excursion tickets to the cash-paying passengers; it would not lower, I do not think, the general tariff, but it would make more frequent excursions and lower rates.

Q. Well, would the abolition of the pass system make any difference to the cash-paying passenger?—A. I do not think so.

Q. So that the two reforms, the abolition of ticket brokerage and the abolition of the pass system, are not inviting to the general public who are paying their way on all the railroads?—A. Well, I think the ticket brokerage would help the general passenger, as I say, because there are reduced rates made between all important points which it would help. When it comes to the question of passes, I can not see how the general public get any interest in it except as it would make it fair for everybody, but I do not think it would affect the rate.

Q. Now as to the general views of the managers of the railroads of the country on this question of passes—is it or is not a fact that they would as soon continue the pass system as not?—A. Well, the best answer to that is that I have no doubt that some railway managers would not think they made a success in life unless they could issue passes; but I think the great majority are tired and sick of it.

Q. Provided that it does not make any difference in the regular rate, do you not think that on the part of railroads discriminating as between the pass passenger and the paying passenger, that it is just as bad a discrimination as between the freight rates?—A. Where it exists, it is.

Q. Do you not think that it is an unjust discrimination against honest people who will pay, and in favor of the favored ones who will get passes?—A. Well, the language of the question being yours, I should answer yes. [Laughter.]

Q. Does your system of giving passes on your line extend down to members of the common council and officers of municipalities?—A. We never have issued those of late years.

Q. How long since you ceased to issue that class of passes?—A. I do not think we have issued any in 5 or 10 years, unless it would be on some special occasion, a matter where a local official wants to be interested. I know of one case where we took the common council of a certain city to another city to see an elevated road, to show what ought to be done; some special cases like that. Our passes are not over, I should think, one-tenth of what they were 10 or 15 years ago.

Q. Has it come under your observation that passes issued to aldermen of cities are not used by the aldermen themselves but used by any party that may need them or that can get them?—A. As we do not give them, I have not much observation on that. Our general rule is not to issue any of that class.

Q. Do you know of any cases on your road where your conductors take up a pass when they find that it is not being used by the party to whom the pass was issued by the passenger agent?—A. Generally there are passes bulletined all the time that are not in the hands of people entitled to them.

Q. What do you think of the plan of having all passes registered with the Interstate Commerce Commission?—A. It is much easier not to issue them; but I would not object to that.

Q. You think it would be a check on the pass system if they should make that law?—A. The register would be so large, taking 180,000 miles of railroad in this country, that nobody would ever look through it.

Q. Even if they did not, if there should be such a system of registry, would not that be sufficient to cause the legislators and members of Congress to take some action on it?—A. It might prevent some Congressmen or members of the legislatures accepting passes, if they knew that some reporter would be looking over the record and publishing it on them.

Q. (By Representative LIVINGSTON.) Could they not get that now if they wanted it?—A. Yes.

Q. Do you suppose any Congressman would hold a pass in his pocket a minute, if he knew any reporter would ask him?—A. I do not know about that. [Laughter.]

Q. (By Mr. CLARKE.) As far as your observation extends, do the roads which issue passes to members of the legislature living along their lines also issue passes to State officers and the judges of the courts?—A. We do not issue passes to the judges; we have discontinued that. The officers of the State, I think, always have their passes issued the first of the year when they are elected, without any question, and have had from time immemorial.

Q. You say you think it proper to issue passes to the employees of the road. Are attorneys considered employees?—A. If they are doing your work; working for you.

Q. Is it not a frequent practice with railroads to give a small retainer to a very large number of local attorneys all over the State?—A. I do not know what the general principle is. On our road we have one general attorney who manages all those matters; and his plan is to keep one man in every county who manages his business. He usually pays them a small salary and gives them transportation.

Q. Sometimes a large railroad system is very much interested in State legislation and State politics, I suppose?—A. Certainly.

Q. Through a large number of local attorneys a railroad can exert political influence, can it not?—A. Well, we have never tried it that way. I do not think there is enough that could be done in that line to affect legislation very much.

Q. You do not know of that having been done anywhere in this country?—A. No.

Q. You do not think it would be a common practice, then?—A. Oh, I think that would be too large a job for any railway to undertake. They may have one or two men who give them information and present their side of the case, but to control general legislation, I do not think that possible.

Q. In granting passes to the employees of the railroad, is it customary also to extend the privilege to their families?—A. That varies on different roads and different divisions. It is a sort of a feeling we have that it creates a better feeling with the employees to be rather liberal in passing them over your own line, and that it does not do any harm to have the employees on one division see the other divisions, and we are inclined to be very liberal with our own people.

Q. Would it be agreeable to you to see the entire pass system abolished, and whenever a railroad employee of any class rides on railroad business let him be reimbursed for the cost of his ticket?—A. Yes; I would be very glad to see that done; it would save us a good deal of trouble and a good deal of annoyance and criticism, which in many cases is unjust.

Q. On the whole, would not that be the most businesslike and useful system?—A. No question about it; instead of fussing with some judge or some members of Congress or some member of the common council that has a pass. The right thing to do is to pass a law prohibiting any passes, and then you will get at it.

Q. (By Senator MALLORY.) What is your opinion of the effect of discrimination by railroad companies, whether it is against individuals or in favor of individuals, in the matter of transportation of freight? Is it an abuse to-day of any considerable magnitude?—A. It is much less to-day than it has been, but I suppose it exists in some cases.

Q. Have you any reason to assign for its decrease as an abuse?—A. Well, these things go in waves. For instance, in the year 1885 there was a great discrimination; in 1886, the interstate commerce law was passed and for 2 or 3 years there was very little discrimination. It made a turning point around which the managers gathered. Then discrimination grew until, in 1894 and 1895, it was about as bad as it well could be. In 1896, there was scarcely any. The railways met in the trunk-line territory and made what was known as the joint traffic agreement, for which I had the honor to be responsible, which was initiated all over the country, and that steadied rates during 1896 and until in the spring of 1897, when in the trans-Missouri case the Supreme Court decided that the Sherman law, which the railways had supposed did not apply to them, applied to them and to no one else practically; then there was anarchy. That lasted until December, 1898, when the Interstate Commerce Com-

mission took up the matter by consultation with the various railroad managers, and there were a great many hearings held like these here in Washington, and the result was that the managers and officials decided the thing must stop, that it should not go on, and since the 1st of January, 1899, as far as my observation goes, I have never known less discrimination or published rates better maintained.

Q. Do you not think the fact that railroads have now about all they can do in the matter of transportation and traffic has something to do with the cessation of discrimination?—A. That is one of the reasons I was glad to come before you, and hoped we would get some aid from your report. My judgment is when this rush of business is over the railroads will gradually drift back to their old ways, and we must have some legislation to help us. I want to impress on your minds the gravity of the situation. It is such an enormous interest. Here are one-tenth of all your people supported by the railroads, one-tenth of your people dependent on the railways, and all of your people dependent on the railways for their comfort. Here are a million of employes whose happiness and welfare depends on the railways. All these can not be taken care of unless the railways get proper rates, and it seems almost impossible in dull times for the railways to get fair rates under the present law, as there is no way in which they can make an agreement, and it is such an enormous business that you can not expect as a matter of honor to have it all carried out, and I believe it is the duty of Congress to take the matter up. Originally the railroads claimed they were not amenable to law like other corporations. That took twenty years to settle, but it was settled in 1885 and 1886. Now, the people having won the fight that they have the right to regulate the railroads, it is their duty to do it, and to aid the railroads and furnish them something for that regulation. I believe it is their duty to pass a law so that if John Jones makes a contract with Peter Jones that he will maintain rates between two points it should be a legal contract. If either breaks it, the other should have the right to bring suit for damages. If the public is injured they should have the right to complain and get their damages. In other words, I see more danger to this country by leaving these large interests outside of the law than there can be in any proper legislation. If they are not controlled it is going to bring trouble to business and financial interests, and it is breaking down the largest interests in this country.

Q. Does unrestrained competition produce seriously injurious effects on railroads?—A. It produces injury to railway, shipper, and the public.

Q. If you have unrestrained competition, is there any danger of the railroads having to go into the hands of receivers, many of them, in this country?—A. Most assuredly. Look at the history of the last 10 or 15 years. The only roads which have made money have been reorganized roads. Look at the securities wiped out.

Q. Have you thought anything of the fact of the distinction between railroad enterprise and ordinary business enterprise being very marked, and what may be a theory applicable to the ordinary private enterprise is not applicable necessarily to the railroad; that while competition may be the life of business in a certain line of business, competition between railroads is necessarily disastrous; have you thought of that?—A. I have, and that is true. If this country had decided in the beginning that they would not attempt to control railroads at all but had left them like other enterprises, you could afford to stand still and see them fight and destroy each other, but you have said that they are subject to certain restrictions, and now when you take this enormous business, and say you shall not make any arrangements or agreements, you are outside of the law; you have produced a condition of affairs where reorganizations and bankruptcies will go on. Securities will go out of the hands of the people into the hands of Wall street speculators, and will be used exactly like counters in a game of cards to count the gains and losses in Wall street. You have destroyed one of the greatest industries of the United States, which employs more men than any other interest in this country, and you say all this shall be managed without any laws. That is the situation to-day. No one feels it more than the Interstate Commerce Commission. They have done all they could, but they have no authority. Take the export business of this country. Your grain and meats are sold abroad and sold in competition with all the world. Why should you limit the carriage of that in this country? It does not help your own people, your own farmers. It makes a market for your producers, and the question of selling your surplus product is one that concerns every farmer, especially of the great West, and that business ought to be left just as free as any business to be competed for.

Q. That subject was investigated by the Interstate Commerce Commission—the difference between export and inland rates—I believe?—A. I think they are going to make some report as to the modification of the law.

Q. (By Representative LIVINGSTON.) Are you not overcoming competition largely by consolidations and combinations?—A. In some ways, but not entirely. I should

like to answer that question at length. I have been somewhat a student of the problem for a number of years. I am not and never was one of the railroad managers who believe that they should be left to do their own sweet will without any legislation whatever. I think that some regulation is demanded because the railway enters so closely into the interests of all the people. At the same time, if the present situation should go on, it will result in the railways being owned and operated by the Government, which I believe will be disastrous to the progress of the country, to say nothing about the Government. Now, there must be something done to create more stability in the earnings of the railway. The interstate-commerce law, as first passed, I was in favor of. I believe it should be amended, insuring the greatest publicity in the world to the rates; that is your protection. The long and short haul clause has never interfered with our roads north of the river; south of the river they claim it has been disastrous, and there should be some consideration given to their complaints, I think. What I plead for is a law that will enable railways to make agreements for the maintenance of their published tariffs, agreements that can be enforced by the courts. It goes further and broader than the pool. The pool is a division of the business. I would go further than that, saying that the railways should be permitted to make agreements, for instance, between Baltimore and New York, that they would maintain this tariff. Now, these tariffs should be reasonable, and I would leave the question whether reasonable or not to some tribunal like the Interstate Commerce Commission, and if the railways made their agreement and a man should complain, the commission should hear and decide whether these rates were reasonable or not. Then I would abolish the criminal feature of the law, because I think you are trying to make a business transaction a crime, and the public will not support it. You can not get your evidence and it has not the sympathy of the community. It should be a question of fine. When the public is injured, a question of fines; and when the individual is injured, a question of damages.

Q. You say, "Making a business transaction a crime." Is that it, do you think?—A. A man selling goods is on the same basis as the railway man selling transportation. The public does not consider it a crime to sell the goods at a lower price to one than another. You have not educated your communities outside of the railways to the view that discrimination in selling transportation is a crime; therefore, when you hope to pass beyond what public opinion thinks is justified, you do not succeed. We have always thought, the greater majority of the railway managers have thought, if we could have a system of fines we could help ourselves to enforce them. These fines would be so burdensome as to aid in carrying out agreements.

Q. What you call a business transaction is the violation of law; it is doing something prohibited by law.—A. You have created the law yourselves.

Q. We have a right to create the law.—A. Certainly. It is only a question of policy, not of right.

Q. (By Mr. PHILLIPS.) How would you regulate these fines in case of large shippers? A fine of a few thousand dollars would not amount to anything.—A. I would put a fine on every bill of lading right along, and in that way you will break up any institution in the world in 6 months, if not stopped. As I was going on to say, you need some protection of law. I believe your present condition of affairs is building up your large shippers and large institutions and crushing out your small ones; it is so much easier dealing with one man than a hundred. You are crushing out all your small shippers. Your legislation is all for the powerful few. Keep the power in the Interstate Commerce Commission. I would go further. I would not have a railway built except when its location and plans are approved by the Interstate Commerce Commission, and the money put up to build it. I would not have any more stock jobbing and bonding.

Q. (By Mr. CEARKE.) You would not allow a local railroad to be built without applying to the Interstate Commerce Commission?—A. You can inside the State. They should go to the State commissions. I would stop these enterprises that are built for the sake of issuing securities. As I think one gentleman, a Senator in this country, said, the only use, to his knowledge, of a railway was to bond it and sell the bonds. I would stop that practice.

Q. (By Mr. C. J. HARRIS.) What is the mileage of the system that you represent?—A. We have about 1,500 miles south of the river and 2,500 north.

Q. What is your general bonded indebtedness?—A. We have about \$60,000,000 on each division—\$60,000,000 south and \$60,000,000 north.

Q. What is your idea, in a general way, of the capitalization of railroads in this country—is it excessive or not?—A. I think it is away below what they have cost, especially since these reorganizations have been made.

Q. As a matter of fact, is not the bonded indebtedness of most of these new organizations as much as the roads cost in the beginning, taking their increase?—A. Oh,

no; some of these reorganizations have been the most cruel things in the world on small investors—that have been reorganized on the basis of one-half or two-thirds of what they were worth.

Q. Could some of these roads be built to-day at less than their present bonded indebtedness?—A. I do not know of one. Take the lines that I represent; you could not begin to produce them for their bonded indebtedness.

Q. You spoke of their being crushed out by competition when business was slack. It is alleged by some that they have created so much capitalization that they are demanding more of the public than they ought to have. That is one of the great troubles with rates. I brought out this capitalization for that purpose.—A. If you will let me, I will answer that at length, reviewing the history. After our war ended everybody went to building railroads and it created a class of people called promoters and contractors. The people were anxious to get railways and they would grant charters, land, and other inducements. They would turn over all of these and as many of the bonds and stocks as the people cared to issue to these contractors, who would build the railroad. They would go to work and build the railroad maybe 100 miles or 1,000 and unload the stocks and bonds and securities for what they could get, usually at a profit, and the people who got these found themselves loaded up with a large amount of worthless securities. The people found themselves paying higher rates. That was the origin of the granger laws, which culminated back in 1870. From that time on there has been so much of that that there has been a reorganization of railroads. I suppose there never in the history of the world has been such wiping out of securities as there has been in this country in the last 5 years, and to-day I think your capitalization is below what your railroads would cost. The cost of lands in the cities is enormous. Take the Big Four railway, which run through the cities of Cincinnati, Dayton, Springfield, Columbus, Cleveland, Indianapolis, and into St. Louis and Chicago—why there are millions and millions in their terminal facilities. I suppose you could not get the new location they have in the city of Cincinnati under a great many millions of dollars. Then you attempt to build a new railroad, and you cut up the farmers' land, and it all costs so much money; and their equipment is enormous; we have to have an enormous equipment. A proof that the public are not paying too much is the fact that the rates of fare and the transportation of freight were never so low or lower in any other country on earth. Since the 1st of January we have had tariffs, but the tariffs have been so low that we can not go on with the increased price of labor and material with these tariffs. If we can not get an agreement to maintain better tariffs there is going to be bankruptcies and reorganizations; and securities will be wiped out, employees' wages reduced, or employees dismissed, which is the more modern way to do it—with less men. I think that is to the interest of the country, and I hope your commission will find some way to get proper legislation. Then I believe further the Interstate Commerce Commission or some proper body should have authority to examine the books of all these roads every month, three months, or any time they pleased, and stop all these scandals and false accountings. There is your protection. Do not let any stocks or bonds be issued except on their certificate. I am not pleading here for the railroads to be let alone. I want them to be regulated even more than they are now, but I want you in consideration of that to give us some legal rights and make us legal bodies.

Q. The shippers—we have discussed their grievances, and the grievances of railroads; now it seems to me the interests of the investors and owners of these stocks and bonds ought to be promoted in some way by some Government supervision of some kind.—A. I think so. There are 3 duties on the railroad; first, that the physical condition of the railways should be kept in such shape that they can do the business properly; they should be allowed income enough for that; second, they should have enough to take proper care of their employees; third, the investor should have a fair return for his money. No legislation will be supported by the great thinking community, when they get around to it, that does not take care of these three things.

Q. (By Senator MALLORY.) You recognize the fact that the drift and tendency of railroads in this country to-day is to consolidate, I believe?—A. Yes.

Q. That in the last 4 or 5 years there has been a tremendous impetus in that direction?—A. Yes.

Q. What effect will it have on railroad transportation in this country, if that is kept up?—A. The problem about that is this: Out in New England they have practically eliminated competition by consolidation and the people there seem to be very well satisfied with the present situation. In the South they have done substantially the same thing. There are two or three companies and, being so few, they can get along comfortably. I doubt whether it is practicable to consolidate the great trunk

lines because they have so many local interests and they are so large and enormous. For instance, there are about 7 or 8 lines that control all this immense business between the Mississippi River and the ocean, north of the Potomac. I do not think it would be possible to consolidate them, and so long as they are not consolidated they are going to fight when business is dull unless there is some way they can agree lawfully among themselves.

Q. Are there not competing lines in New England that have been consolidated—lines that run practically from the same point to the same point, just as your lines running from the west to the Atlantic seaboard?—A. I do not know of any consolidation between them.

Q. (By Mr. FARQUHAR.) The Boston and Albany?—A. The Vanderbilt interests and the New York Central; the Erie, the Lackawanna, the Lehigh Valley, the Pennsylvania, and the Baltimore and Ohio. These are all independent interests, and I can not conceive of anything that would produce a consolidation of these interests. I think that would be too much to attempt. They would have too many local interests.

Q. (By Mr. C. J. HARRIS.) What is the eastern terminal of the Chesapeake and Ohio?—A. Newport News, Hampton Roads.

Q. (By Senator MALLORY.) I am glad to hear you express that opinion. I have been very apprehensive it was going to result in 2 or 3 corporations owning all the railroads in the United States. You think, then, that is not going to be the result?—A. I think not, and I hope not, because when that comes you strengthen largely the party that wants the Government to own the railroads, and then you will be on evil times.

Q. Your opinion is it is impractical for this Government to own and conduct railroad trunk lines?—A. The genius of our Government could do anything, but I do not think it would be wise with our present system. And, above all, the governments in other countries never have managed the railroads as well as individuals, and I do not think they would do it with the same skill and energy here. This is a very large country, which depends almost entirely for its future on its transportation, and the competition between these lines, in a legitimate way, the fast trains and facilities for doing business will always be kept up. The railroads are what have built our country up. It is as easy to go from the Mississippi to New York to-day as it used to be to go 100 miles. We have astonished the world with our facilities for transportation. If the Government had the railroads that would all be stopped. You would have slow trains and bad service, just as they do in France and Germany.

Q. In the event that there was no power to restrain the rates which the railroads should be allowed to charge for freight and passenger traffic, do you think if they were allowed also to make these contracts you speak of, they would drift into exorbitant, extortionate, excessive rates?—A. No; their interests are too large; there is too much competition.

Q. You think that would regulate itself?—A. I do.

Q. You, however, are not unwilling, in the event the power to make traffic contracts is given to them, so they can enforce them in the courts, that the Interstate Commerce Commission be given a supervisory control over the rates?—A. I think that ought to be done to satisfy the people. I doubt if they would exercise it in one case in a hundred; but if the law did not put that in, the people would think they had been cheated. It ought to be in. As to rates, I am perfectly willing to try my case before the Interstate Commerce Commission. If, after I put in my proof, they decide against me, there must be something wrong with my rates.

Q. You would be willing the decision should stand until set aside by the courts?—

A. Yes, so long as I maintained that agreement; and if I am not I can drop out and go it alone.

Q. You would be willing for the Interstate Commerce Commission to determine *prima facie* as to the existence of discrimination as between localities or individuals?—A. I have never objected to that, but I think there ought to be a right of appeal to the courts.

Q. *Prima facie* I mean?—A. I have no objection to that.

Q. The contention has been made here by an eminent railroad gentleman that if the power were given to the Interstate Commerce Commission to determine anything about rates, those rates should not go into effect; its decisions should not go into effect until sustained by the court; but when it came to the matter of discrimination he said he was perfectly willing to let the decision of the Interstate Commerce Commission as to the existence of discrimination stand until set aside by the courts. One, he held, was a matter so vital to the railroad company that he did not think it was just or reasonable to leave the matter of the rate to the decision of an outside party like the Interstate Commerce Commission so that it would take effect. Have you

given the subject any thought?—A. A great deal. That has been discussed in our meetings, and we have had to think of it. We have hundreds of millions of property to look after. I do not sympathize very much with those people who are so afraid of a bad decision by the Interstate Commerce Commission as to rates. I would keep my right to go to the courts, because there might be a matter of principle involved; but here you have five independent men; they never could make a rate so bad as some of us have made ourselves if they tried. I would be perfectly willing that they should settle any special cases, after a hearing, whether the rate was reasonable or not, and let it go into effect, subject to revision by the courts. In case of discrimination, I would go one step further and provide that in case of an agreement between railroads for maintenance of tariffs and division of business, if the rates under that agreement established by them should be complained of, and the Interstate Commerce Commission, after a hearing, found they were unreasonable, their decision should stand so long as the railroads maintained that agreement. It seems to me that is an absolute protection to the people.

Q. (By Mr. PHILLIPS.) Do you think the Interstate Commerce Commission or any other body would be competent to deal with such a vast subject, in regard to the fixing of freight rates all over this country? Could they possibly hear and determine on such large interests?—A. There is the difficulty. If you say you give them power over the general fixing of rates, you make a mistake and overwhelm them. I would confine it to special complaints in regard to special rates or discriminations. These they have a right to hear; but when it comes to the general tariff of the Chesapeake and Ohio Road, with that they have nothing to do. But if the people of Cincinnati complained that the rates from Cincinnati to Richmond are too high, let the Interstate Commerce Commission hear that question. If they decide it against me, I have the right to appeal to the court.

Q. Not to fix the general schedule?—A. No; you can not do that; it is too large. The moment you mention that the people say you are giving them power to fix the rates. You do not do anything of the kind. It is only to hear special cases.

Q. You think it is impracticable for anybody outside of railroad experts to make any rates generally for a system of railway, like the Chesapeake and Ohio, for instance?—A. I do not see how you can get men to do it. I have been in the business for 30 years and have a large staff of competent men who have served with me for years and it is a very difficult matter to fix the tariffs. We have to change them every day.

Q. You say the same thing with reference to making classifications?—A. It seems to me we ought to have the same classification all over this country. I have never justified the difference that has prevailed.

Q. There are now three, I believe?—A. Yes; and it creates an infernal amount of trouble, which it seems to me is unnecessary. But some of my railroad brethren are strong against it.

Q. Do you think it practical to have one classification for the Pacific and the same for the south Atlantic seaboard?—A. I do not see but you should let the gentlemen make their rates on the same classification. They do not have the same rate all over now. I do not see why the same classification should not go from the Atlantic to the Pacific, so that a man should know what class he is going in when he picks up the tariff.

Q. Do you notice any particular inconvenience arising from three systems of classifications?—A. It would not come to me, except occasionally I meet a merchant and he speaks of it. I suppose the freight agents, who get with the people more, would know. It has been discussed more as a general matter, as it comes to me.

Q. (By Mr. KENNEDY.) Do you carry much grain from the Northwest to Newport News?—A. Very large quantities.

Q. Yours is what is called a trunk line?—A. We think we are considerable of a trunk. Some of our opponents think we are more so.

Q. I see by the New York Herald of a recent date that the managers of the trunk lines, or committee, have agreed on a rate for wheat and wheat products from Chicago, I believe, to the seaboard, which is a practical compliance with the recent opinion of the Interstate Commerce Commission. Is that a result of that opinion—that rate—or did business reasons determine it outside of that?—A. I really do not know what influenced them. We have no interest in that. You see we have no local business at Newport News like they have in New York and New England; it is all export. We have always been in favor of making the same rate, if they wanted it, or a different rate; it did not concern us.

Q. You mean a difference of 2 cents between grain and grain products?—A. Yes; I think that was it.

Q. You do not know whether that was the result of the opinion of the Interstate Commerce Commission or not?—A. I think the railroads were so snowed under with business they could not manage it and were making the rates so low they were ridiculous, and that is a compromise, patched up to get better rates. That is usually the way they are made. We are an export line, you know; we do very little interior business.

Q. (By Senator MALLORY.) Your rates are fixed by the rates to New York?—A. Yes; New York and New England. We have to take our chances on whatever they make.

Q. I understood you to say you would be willing to have the Interstate Commerce Commission or some other central body have the power to send an official to investigate and inspect the books and accounts of interstate railroads from time to time?—A. Yes; very glad to have it.

Q. Have you any particular object in that?—A. Publicity helps.

Q. You would think the fact that it is open to public inspection would have a beneficial effect?—A. I think the difficulty with railroads is they have tried to keep to themselves, and have had a little hesitation in dealing with the Interstate Commerce Commission, and I think it has injured them. I think the greater publicity you get the better it will be.

Q. (By Mr. PHILLIPS.) You would be willing to have accounts examined into similarly to the inspections we have by the Government in case of national banks?—A. I think that is what we ought to have; yes.

Q. (By Mr. C. J. HARRIS.) Do you not think the general public have a rather distorted idea of the amount of abuse and the amount of discrimination that is made by railroads?—A. There is no doubt of that, and it is ministered to by every cheap political orator who wants somebody to abuse. I think the railway managers have been perhaps arbitrary and added to that feeling. I think it would be much better if we could get the railroads on a business basis and everything public.

Q. (By Mr. CLARKE.) You are not afraid of the people? You recognize that railroads are quasi public corporations?—A. That is right. We are there to manage them for the people, and there should be no reason why they should not be managed with the people.

Q. (By Senator MALLORY.) Have you any suggestions to make with regard to putting express companies under the Interstate Commerce Commission?—A. I do not know anything about that. They manage their own business by making agreements. I should be sorry to have them put on the same basis as railroads so they could not agree.

Q. The extent of the traffic that they take from the railroad companies, is that really an appreciable quantity as compared with railroad business generally?—A. I do not think so. The railroads with their fast trains of late years have been decreasing that. I think their earnings on the Chesapeake and Ohio are only about 1 per cent of the freight business.

Q. Do you know anything about this question of discrimination in favor of certain individuals by the mileage which is paid for the use of cars?—A. I hear it at almost every railroad meeting I attend. There is a great evil in the mileage of private cars. It is discrimination in business, and it certainly builds up the large shipper as against the small shipper. The large shipper will buy 500 freight cars; he gets a large mileage for these; he gets them handled promptly, otherwise he would not give you his business. I suppose he gets 15 to 20 per cent income on the investment from these cars, and the small shipper who is trying to compete with him in the next store, who does not own cars, will go into bankruptcy. The man who owns the cars gets passes for his agent to look after the cars, and undoubtedly the one who owns the cars does a great deal of buying himself.

Q. Of itself, do you think that is an evil?—A. I do, yes.

Q. Why, if you will be good enough to say?—A. It is an evil because it enables one man to get the advantage of another.

Q. Through the railroad?—A. Through the railroad. Yet it would ruin any railroad in this country that did not do as they are doing now, because it would take off a very large amount of traffic which is valuable.

Q. Have you any suggestions as to the method of stopping it, if it is an evil?—A. Amend your interstate-commerce law as I told you and there would not be any trouble. If I make an agreement with my opponent that we will divide the business from a certain point, and the man who owns the private cars wants to give his business to the other man, he may have it; he cannot hurt me any. As long as you leave me outside the law and I get my business as best I can I will treat with him. That is considered the legal way of beating your opponent.

Q. (By Mr. C. J. HARRIS.) Why should not railroads furnish exclusively the cars that are used in business, and why should not the law compel them to furnish cars?—A. Well, you had better generally amend the law instead of trying to reach the sore spots.

Q. If a railroad undertakes to perform public transportation and does not furnish sufficient cars to do the business, is it not rather derelict to the people?—A. That is not the question. They all try to furnish the cars, but they can not get the business if they do. For instance, I have seen the stock cars of the Chesapeake and Ohio stand idle in Chicago while we had contracts for transporting stock from Chicago to Liverpool via Newport News, and could not get it unless we took these special cars and let our own cars stand idle; and it costs us thousands of dollars for mileage.

Q. Has the supply of private cars arisen from inability of railroads to take care of shippers by furnishing cars?—A. In one way the refrigerator people originated this, but this evil has grown up from the decisions under the interstate-commerce law. It is the large shipper taking care of himself. It would never have been heard of if it had not been for it.

Q. (By Mr. CLARKE.) You think it will eliminate the speculative features, so far as the owners of private cars are concerned, if the railroads are left free to contract between themselves?—A. That is it precisely. These large interests then would have to put in their cars on a fair mileage and we would get legitimate business.

Q. (By Mr. FARQUHAR.) In such an arrangement as that, would you also take in the Pullman service?—A. I leave that to be regulated like the railway, the sleeping-car service. The proper thing to do would be for the railway to own its own sleeping cars, if they only ran over their own line, but with the different lines spread out, you would have to have too many cars on extra occasions, and you would have too much invested. For instance, to-day as I came through the office I was told we had some troops that called for 25 or 30 sleepers. If we undertook to carry that number of sleepers ourselves we would be killed by dead capital. I think your transportation companies should have some limitation on rates as other people, but I do not see how the railroads themselves could afford to furnish this equipment.

Q. Was there not an attempt on the part of some railroads to furnish these refrigerator and stock cars, and did they not have some, say, 15 to 20 years ago?—A. Later than that. When Mr. Roberts was alive, he would not run a private car over the Pennsylvania Railroad, and the other trunk lines agreed to that, but about 5 years ago, I guess, one of the trunk lines decided it could not carry that out. That let down the bars, and to-day private cars are running.

Q. Is it not a fact to-day, on the question of the private cars, that there is no railroad which can afford to have a quarrel with the owners of these cars on rates or anything?—A. We do not think so.

WASHINGTON, D. C., October 21, 1899.

TESTIMONY OF HON. JOHN K. COWEN,

President of the Baltimore and Ohio Railroad Company.

The commission met at 10.35 a. m., Senator Mallory presiding. Hon. John K. Cowen, of Baltimore, president of the Baltimore and Ohio Railroad Company, being first duly sworn, testified as follows:

Q. (By Senator MALLORY.) What is your name?—A. John K. Cowen.

Q. Where do you reside?—A. In Baltimore.

Q. What is your occupation?—A. I am president of the Baltimore and Ohio Railroad Company.

Q. How long have you been connected with railroad affairs?—A. Twenty-seven years.

Q. How long have you been in your present capacity with the Baltimore and Ohio Railroad?—A. Three years and nine months.

Q. Can you state about how many employees there are in the employ of the Baltimore and Ohio?—A. I think we have about 30,500 employees in the service of the Baltimore and Ohio direct. That does not include the employees of lines that we are interested in, such as the Baltimore and Ohio Southwestern and the Pittsburg and Western.

Q. How are those employees paid, by the month or by the week?—A. By the month or by the day.

- Q. Depending on the character of their employment?—A. Yes.
- Q. How do you pay the train hands, locomotive engineers, firemen, and other train employees?—A. We have an agreed scale with them, based generally upon miles run.
- Q. An agreed schedule with them individually?—A. Yes.
- Q. Or is it with any associations?—A. No. All the associations, I believe, are on our road, all the trainmen's associations, but our understanding is with the committees directly of our own men.
- Q. You do not then know the associations at all in the transaction?—A. No.
- Q. It is just simply the committees of the men?—A. Yes.
- Q. Have you any system of suspension of men for dereliction of duty?—A. Oh, yes.
- Q. That is, anything less than discharge?—A. Yes, they are suspended for minor offenses varying greatly according to the offense.
- Q. What do you mean by suspension?—A. Oh, they may be put off for 30 days and then taken on again, or indeed for a longer period of time.
- Q. Have you any such thing as the system of blacklisting discharged employees?—A. No.
- Q. The system to which I refer is one which has gained some notoriety by reason of suits brought by the parties claimed to have been injured. The railroad discharging the employee passes his name as one discharged over to some other railroad interested.—A. No, we do not engage in that.
- Q. (By Mr. FARQUHAR.) Are you aware that such a system did exist between railroads; of blacklisting in case of strikes and troubles of that kind on the road?—A. I think possibly at one time it did; but the extent to which it went, I do not know.
- Q. Are other sections notified of discharges of the man on your own system?—A. I can not answer without asking the general manager whether we systematically notify each of our divisions of the reasons for the discharge. I do not know how that is, and without examination of the general manager I could not testify whether we have a system under which we notify the superintendents of the respective divisions of the discharge or not.
- Q. (By Professor JOHNSON.) If a man sought employment, the first question asked him would be where he was formerly employed?—A. Undoubtedly that is the case.
- Q. And if he were employed recently on a division, inquiry would be made?—A. That is right.
- Q. (By Senator MALLORY.) How many hours out of the 24 are the employees of the Baltimore and Ohio expected to work?—A. My recollection is, in the train service, the day is figured on a mileage basis, and overtime is allowed for excess mileage, or after 12 hours.
- Q. Do they receive additional pay for overtime?—A. Yes, they receive additional pay for overtime—in other words, 12 hours is the limit of a day's work.
- Q. By train hands?—A. That is my recollection. Of course there are a great many of the train hands who make their mile days very much within that time, but we have an understanding that work over that period is to be paid for. If without fault they do not get their trains in or they are delayed and do not get their trains, they are entitled to pay for overtime.
- Q. Well, is that also the length of work per day of the other employees, such as clerks and men engaged in other business than that of train hands?—A. No; our clerks come either at 8 or 9 o'clock and are discharged at 5, and in summer there is a half holiday on Saturday.
- Q. Well, then, there are men employed on the tracks and sections, bosses and so on?—A. Yes.
- Q. And section hands?—A. Yes.
- Q. How are their hours of employment?—A. I would have to inquire exactly what their time is; but my belief is, trackmen, laborers, and employees generally work 10 hours per day.
- Q. Do your men work on Sundays as a rule?—A. The train hands and those that are necessary for the running of them on Sunday do work.
- Q. Do they receive any extra compensation for Sunday work?—A. No.
- Q. (By Representative LIVINGSTON.) You said the train hands worked on both passengers and freights?—A. Yes, both the freights and passengers, but of course there are fewer trains running on Sundays than on week days. An effort is made to curtail the Sunday trains as much as possible.
- Q. You try to curtail the freight trains on Sunday?—A. We do run freight trains on Sunday, but there is a less movement on Sunday always than on week days, and of course there are less men employed on Sunday than on week days.
- Q. (By Senator MALLORY.) You only run those freight trains on Sunday that you can not avoid, I suppose?—A. Well, that is practically so.

Q. In some of the States through which the Baltimore and Ohio Railroad passes there are laws prohibiting the running of freight on Sunday, are there not?—A. Yes.

Q. How do you manage in those States?—A. Just run along; we have not been prosecuted. I believe we were prosecuted once in West Virginia, but the matter dropped. It has been sort of recognized as a necessity to continue the running of certain trains. There has been from time to time complaint, of course, local complaints, of running excursion trains, which are not absolutely necessary, but we do run excursion trains, and of those there have been complaints from time to time, but no prosecution. There has not been any actual prosecution.

Q. Do you remember whether West Virginia permits the running of freight trains under some exceptional circumstances?—A. No, my recollection is that it is absolute, but I have not the statute before me and I do not now speak with certainty.

Q. What is your opinion of such laws anyhow; do you think they amount to anything or are of any benefit to anybody?—A. I do not think they amount to anything or are any benefit to anybody. I have had the distinction of having my name mentioned in some of the church congresses for not stopping these trains on Sunday. I do not think it is possible to do it. I think there is a desire, as far as possible, to curtail the transportation, but it is not possible, I think, to stop it altogether or any very large part.

Q. (By Professor JOHNSON.) Is your particular objection to stopping freight business on Sunday that of reducing the working hours of your plant?—A. That is the economic side of it, undoubtedly.

Q. It must be more economical for you to work 7 days a week than it is 6 days a week?—A. Yes.

Q. That being the economical motive, I should think that your through-freight business would move on Sunday the same as any other day.—A. It does; but you will see at once that all of your stations are practically shut up on Sunday, and there is a necessity for very considerable curtailment for receipts and delivery and a good deal of curtailment of movement.

Q. You do not believe in restricting the movement of through traffic on Sunday?—A. I do not; I do not think it is possible.

Q. (By Senator MALLORY.) I believe you are an attorney at law and have had considerable experience with the matter of suits for damages against railroads by employees who have been injured on the railroad. You have had your attention, of course, called to the modification by statute in some of the States of the common law rule as to the negligence of fellow servants, whereby under certain circumstances even the negligence of a fellow servant is not a defense. Do you know whether that modification has gone into effect generally in the States of the United States?—A. I do not know how many States have adopted statutes modifying the fellow-servant rule.

Q. You know, however, that it has been done?—A. It has been done.

Q. Well, can you, from your observation of it, say whether it has had any injurious effect on the service of railroads by their employees?—A. I have had no experience with the law at all. Of course, there is Ohio, for example, through which we run, which has modified the old rule of non-liability for the act of a fellow servant a great deal by judicial decision.

Q. As to who was a fellow servant and who was not?—A. As to who was a fellow servant and who was not, and introduced the rule of liability for the act of a superior, defining a superior, and in such a case, for example, as where a conductor's negligence resulted in injuring a brakeman, recovery was allowed. That is the rule by judicial decision in the State of Ohio. That is not the rule in West Virginia, and is not the rule in Maryland, and is not the rule in Delaware, through which we run, and it is not the rule in Pennsylvania. I do not see that it has had any effect practically one way or the other.

Q. Your observation is that the courts have differed very much in their decisions regarding who are fellow servants?—A. Yes, quite so.

Q. Do you not think it would be well to have some uniformity of decision on that subject?—A. Well, I presume in some respects it might be well to have a uniform rule. But if I may be permitted to speak from my experience on the Baltimore and Ohio Railroad, I should say this: We have established a relief department which is supported in part by the company and in part, chiefly, however, by contributions made monthly by the men. Under the rules of the relief department, each employee is entitled in case of accidents to a certain sum; in case of death his family are entitled to a certain sum; in case of sickness he is entitled to the services of a physician and to a certain sum. And practically the effect of the relief department has been to almost entirely wipe out litigation with employees on account of injuries; not entirely, but almost entirely. I think really it is quite a rare case now for us to have much trouble with our employees. Under the rules they are, of

course, entitled to sue and recover, but they are not entitled to both remedies; they are not entitled to their relief benefits and at the same time to damage. The effect is that they take what is certain and fixed instead of what may be uncertain.

Q. (By Professor JOHNSON.) I would like to inquire whether you have modified that rule any since the passage of the act of June 1st, 1898?—A. What act do you refer to?

Q. Arbitration and conciliation, in which that clause of your road was made illegal.—A. No, we have not modified our practice in relation to that. I do not understand that act to make illegal our clause. It is a mere matter of contract, and we do not endeavor to prevent an employee from suing for negligence which would entitle him to sue at all. We do not endeavor to curtail his privilege in that behalf; but we do say that if he sues, we will not contribute from any other fund to pay him for the same damages. I do not understand that the act of 1898 sought to prevent that. If it did, I should say unhesitatingly that it was invalid.

Q. (By Senator MALLORY.) It was never compulsory, was it, on the road?—A. No.

Q. A man need not have his wages docked for the purpose of providing for this fund if he did not wish it done?—A. No; it was not compulsory as to any person who was in the service when it was put into effect. If a person comes into the service now he agrees to go into the relief department.

Q. (By Mr. FARQUHAR.) He must voluntarily agree to it?—A. He can not get into the service without going into the relief department, unless he is over age and for some special reason is relieved.

Q. [Reading.] "Section 10. That any employer subject to the provisions of this act, and any officer, agent, or receiver of such employer who shall require any employee, or any person seeking employment, as a condition of such employment, to enter into an agreement, either written or verbal, not to become or remain a member of any labor corporation, association, or organization, or shall threaten any employee with loss of employment, or shall unjustly discriminate against any employee because of his membership in such a labor corporation, association, or organization, or who shall require any such employee or any person seeking employment, as a condition of such employment, to enter into a contract whereby such employee or applicant for employment shall agree to contribute to any fund for charitable, social, or beneficial purposes, to release such employer from legal liability for any personal injury by reason of any benefit received from such fund beyond the proportion of the benefit arising from the employer's contribution to such fund, or who shall, after having discharged an employee, attempt or conspire to prevent such employee from obtaining employment, or who shall, after the quitting of an employee, attempt or conspire to prevent such employee from obtaining employment, is hereby declared to be guilty of a misdemeanor, and, upon conviction thereof in any court of the United States of competent jurisdiction in the district in which such offense was committed, shall be punished for each offense by a fine of not less than \$100 and not more than \$1,000."

That is the act of June 1, 1898, and the question is whether you exact as a matter of compulsion that contribution of your employees in the contract of labor; that they must contribute to this benefit fund?—A. An employee entering our service now makes that agreement. He can stay out or he can come in, just as he chooses; but if he comes in he makes an agreement by which he enters the relief department.

Q. (By Mr. KENNEDY.) The Baltimore and Ohio insists that he shall enter into an agreement?—A. We do not insist anything about it. We say that if he comes in he shall make that agreement.

Q. Is not that in violation of that act?—A. I do not know. If it is sought by that act to change the agreement that is made between the railroad company and its employees, I should say that the act is invalid; that a party has a perfect right to make that agreement on his part and the railroad company has the right to make that agreement. I should take that position unhesitatingly, even if I thought that the act covered our department. It is an enormous advantage to the employees.

Q. As a lawyer, would you not take the position that the law should be complied with until declared unconstitutional?—A. No; I would not. On the contrary, the only way you are going to get a decision as to its constitutionality is not to comply with it.

Q. (By Professor JOHNSON.) I would like to read the clause of the act which I referred to. (Reading.) "To release such employer from legal liability for any personal injury by reason of any benefit received from such fund beyond the proportion of the benefit arising from the employee's contribution to such fund; or who shall, after having discharged an employee, attempt or conspire to prevent such employee from obtaining employment, or who shall, after the quitting of an employee, attempt or conspire to prevent such employee from obtaining employment, is hereby declared

to be guilty of a misdemeanor, and, upon conviction thereof in any court of the United States of competent jurisdiction in the district in which such offense was committed, shall be punished for each offense by a fine of not less than one hundred dollars and not more than one thousand dollars."—A. Yes, we do not have any such; we have no contract that releases us from any liability whatever.

Q. Well, as I understand it, you do.—A. No; on the contrary, our liability for suits remains precisely the same as it was before. The only thing about it is that if he brings suit, he can not, in addition to getting his damages, at the same time get his relief benefits. So that is the distinction.

Q. (By Mr. FARQUHAR.) You base that on the fact that the railroad and the employees are cocontributors to this fund?—A. Precisely so. We do not ask him to release the company from any claim for damages because of its neglect. His rights there are absolute and complete.

Q. (By Professor JOHNSON.) But if he does sue, he loses his relief under your benefits?—A. Oh, undoubtedly; that is, by the terms of the common agreement.

Q. (By Representative LIVINGSTON.) That is mutual between the railroad and the employee, for this relief association?—A. Yes.

Q. And it is voluntary on the laborer's part, whether he goes into it or not?—A. Yes.

Q. (By Mr. KENNEDY.) In accepting that relief, is he not accepting his own relief, the main part of which he has built up himself?—A. It is his own contribution and the company's contribution together.

Q. (By Representative LIVINGSTON.) He can take the relief fund or take his chances of damages, as he chooses?—A. That is it. In this relief department, a great savings fund has been established in connection with it. The employees are entitled to make deposits at the company's agency for their moneys. They are guaranteed 4 per cent. The purpose of this fund, or the purpose of these deposits, I should say, is the creation of a fund to be loaned out to the employees for the purpose of purchasing homes, building homes, releasing liens, or paying off liens on their homes. Now, that has grown to very considerable proportions; and this year, for example, those deposits pay to the employee 5½ per cent. They can not get less than 4 and they are entitled to the increment of their fund, and they are now getting 5½ per cent; and the effect of it has been to furnish homes for hundreds and hundreds of our employees. I have here the statistics of that. It does not give the number of parties who have borrowed money, but the deposits at the end of the fiscal year 1899 were \$1,168,000; the deposits during the fiscal year were \$393,000 and the withdrawals were \$180,000.

Q. (By Mr. KENNEDY.) Would you say how much the Baltimore and Ohio Railroad contributes to this fund and how much the men contribute to it—the proportion of each?—A. I can not give you that proportionately.

Q. Have you the figures on that?—A. I have not the figures here.

Q. (By Professor JOHNSON.) A year ago it ranged from 1 to 5.—A. In addition to that contribution you have to take into consideration a great many things. You take this savings bank. Now, here is a savings bank that pays 5½ per cent to those employees. One of the reasons it can do it is that the whole staff of the company are employed, and of course they are all paid by the company, and there is no charge on this fund. Its lawyers search titles; its agents receive the funds; its agents distribute the money, and all that. The same way in relation to the work of the relief department; everybody does something more or less in connection with the relief department. The committees invest the money, examine the security, and see that everything is right in relation to the mortgages, and all that; and that appears nowhere in the expense in connection with it. And that is one reason that this insurance, of course of a hazardous employment, is comparatively low. I have the whole literature of the subject, which I will be very glad to present to the committee.

Q. (By Mr. KENNEDY.) Do you believe that if the Baltimore and Ohio contribute only one-fifth, that it is just to deny the men the right to sue for damages when the great bulk of the benefit that they receive is something that they have contributed themselves?—A. I believe that the arrangement is not only a perfectly fair one, but I think it is one which is approved by 99 per cent of our men. The reason I think that is this: the association was originally organized as a separate corporation, called the Baltimore and Ohio Employees' Relief Association, organized under a special statute of Maryland. The reformers—if you will permit me to use that term, not improperly—were constantly insisting on modifying that statute to require this and to require that, until finally the statute was repealed. It was repealed apparently as a hostile act by the parties who had been seeking to amend the act itself. The fact about it is that the repealing act was drawn by myself, but as it came in as hostile legislation it went through. The act gave a year within which to settle up all the accounts of the old association. We then organized the relief department. Nobody

was required to join the relief department; it was a perfectly voluntary act. That was what I meant when I said when the association was established nobody in the service was required to join. Second, when the law was repealed and the department organized nobody was required to join. But out of 20 odd thousand members 19 odd thousand became members of the relief department of their own free will, and they had had at that time at least 10 years' experience; so therefore it is found to be a mutually beneficial thing and approved by the employees.

Q. Are the men on your line organized into the brotherhoods?—A. Yes; they are. All the brotherhoods are on our lines, all of them, and while I said to the Senator here that our agreements were with our men, were made with committees of our own men, we do meet regularly with the brotherhood committees, such men as Mr. Arthur and Mr. Clark, and others of that character.

Q. We have had men before the commission who testified that the men believe that the prime object of these relief associations which are promoted by the railroads is to divide the allegiance of the men, so that in time of trouble they will side with the railroads and desert their brotherhoods—stay where their money is. Have you heard any complaints of that kind?—A. No; I think that is just one of those vague suspicions that get into men's minds.

Q. It seems to be pretty universal with the brotherhoods?—A. As far as the road is concerned, I think the brotherhood people themselves would say that they have dealt with us with perfect fairness throughout; and that subject was never mentioned. Its effect is a little the other way in this. Some of our officers complain that the effect of the relief department is to create enormous pressure on them in case of discipline in favor of a person who has something in the relief department, and more especially a person who has borrowed money from the savings fund. Now, if he has to be disciplined, there is always brought up the question, "Well, I have borrowed \$200 from the relief fund; how am I going to pay it back?" Our officers have very frequently spoken of that side of it. But my answer to that always is, "You have to take the bitter with the sweet. There is probably a little here and there where that pressure will be brought to bear, and you better yield to them in view of the larger good that comes from the establishment of a relief department." Take this savings fund. I remember when the savings fund was first established some watchman up in the mountains put in \$1,200 that he had had in the chinks of his cabin. We run through a country not remarkable for savings banks. When we established the savings fund, my recollection is that between Baltimore and Chicago on our line there was not a savings bank, with the possible exception of Columbus, Ohio. To-day there are very few in these smaller towns—Columbus and Pittsburg, I should say. To-day in the smaller towns there are none, and this furnishes a means of enabling them to invest their funds—on the one hand to the thrifty, and on the other it furnishes a means of building up their homes. I do not believe that the effect of it at all—certainly I know the purpose of it is not such as the question indicates.

Q. (By Mr. FARQUHAR.) Do you hear any complaint among the men in your employ that those who are not in the association are not in the line of promotion?—A. No.

Q. (By Senator MALLORY.) According to your testimony it is not practicable for anybody to be out of it?—A. No. I have not heard any complaints of that kind.

Q. (By Representative LIVINGSTON.) Is there any complaint from the chiefs of these labor organizations against that?—A. No; not to us.

Q. (By Senator MALLORY.) What is your opinion as to the effect on relations of employer to employee of such relief associations as you have described?—A. I think they are very good.

Q. (By Professor JOHNSON.) I want to make sure that we understand each other in regard to this question of contract. As I understand, your statement was that you did not employ a man unless he was willing to become a member of the relief department, and in becoming a member of the relief department I understand that that man signs a contract saying that if he receives the benefits as a member of that relief department he will not sue the company for damages?—A. He signs a contract under which he is at perfect liberty to sue the company; but if he does sue the company for damages he will not get his benefits.

Q. Well, is it correct to put it this way: that if he signs a contract that he will either accept the benefits or refuse the benefits and sue the company, and reserve his right to sue the company?—A. He signs a contract saying that "If I accept the benefits I do not sue the company, or if I do not accept the benefits I am at entire liberty to sue the company and get all the damages which I am entitled to under the law."

Q. Then, if a man accepts the benefits and sues the company he violates the contract, does he not?—A. Yes. In other words, when he takes the benefits he gives an absolute release; he does not get them if he does not.

Q. The act says that if any officer shall require any person seeking employment to release such employer from legal liability for any personal injury beyond the proportion of the benefit arising from the employer's contribution to such fund, shall be so and so.—A. We do not require him to do that. He does not release us at all; he is entitled to get his entire damages. We do not ask him to release any portion of his claim for damages. That is not it; he does not release us at all for any claim for damages. What he does do, he gets his entire claim for damages; he gets it; he does not release us; he gets his judgment and collects it; but under those circumstances he does not get second pay by way of a contribution from the relief fund. So I think as far as that is concerned, we are entirely outside of that provision of the statute in our form of contract. Now, there may be some of the departments organized which exact in their contract a release of liability for injury; we do not.

Q. (By Senator MALLORY.) But suppose he gets his relief from the relief fund and gives his receipt, and then subsequently sues the railroad company?—A. Then the release, the receipt, is pleaded in bar of his action.

Q. Do you think that that plea would be sustained in view of that law?—A. Oh, yes; I have no doubt about it; it has been sustained over and over by the courts.

Q. (By Professor JOHNSON.) Since June 1, 1898?—A. There has been no decision, so far as I know, since that act; but I have no doubt about the validity of the plea.

Q. Speaking as a layman, it would seem to me that law prohibited such a contract.—A. The difficulty about it, I think, is that you are misunderstanding the term liability. We do not ask a man to release us from our liability; not at all. You see at once there it uses the term "proportion." We do not ask him to release us at all. Our liability to him is absolute; he can sue us. But the point about it is that if he wants to get the fund, he can not get it any more than if he had come and settled with us, without being in the relief department and had taken \$500, and then sued us again and claimed that it was not enough.

I think the statement I gave of the large transfer at once to the relief department, voluntarily transferring to the relief department all of their interests in the old association and becoming members of the relief department shows their opinion of the arrangement. You see, each member of the old association was entitled to a certain share of its assets, and they assigned those assets to the relief department. The case went through the courts, and, as I say, over nineteen-twentieths of them came in.

Q. (By Senator MALLORY.) Will you state to what extent your road has complied with the requirement of the law as to automatic couplers and air brakes on freight trains?—A. I did not bring the data over, but permit me to speak from recollection. I will give you the exact data from the record. I should think that on automatic brakes we must have about 75 per cent, possibly 80 per cent; I think 75 per cent of our freight cars are equipped; and with the couplers not quite so large a percentage, possibly 70 per cent. That, I suppose, would be a compliance with the law as to brakes and not a compliance as to couplers yet. We have put them on as fast as we could practically; but then there is a certain portion of the cars which do not pay to put on the coupler and the brake and which will go out of service in the next 2 or 3 years. I suppose we will put out this coming year, say, 2,000 cars. Now, those 2,000 cars will do some service in commerce, and you can not well withdraw them from commerce, but at the same time they are not of enough value to put the brake or the coupler on. They are not fitted for it. That is all.

Q. Was not the Baltimore and Ohio equipping its freight cars with automatic couplers and brakes before the passage of the act requiring it?—A. Yes.

Q. It had made some considerable progress, had it not?—A. Yes.

Q. Well, what is the cause of the delay?—A. Well, the situation in relation to the putting on of these couplers is this, and the brakes. When a car is taken into the shop for the purpose of making what they call thorough repairs, which might be said to be a partial reconstruction of the car, then they apply the brakes and couplers if a car is fitted for it; but they do not bring them out of commerce for the purpose of making that application; and if they did, the commerce of this country would stop. In other words, if you withdraw all the cars that have not got brakes and couplers, or if during the past year you had withdrawn all the cars that did not have brakes and couplers, and put them in your shop, and thus delayed commerce, the commerce of the country, or a very large portion of it, would have stopped; and the fastest you can do it is to apply it to the brake and the coupler when the car in its natural operations is brought in for reconstruction. You know to-day the enormous car shortage that there is. Now, if we would stop 20 per cent of our cars or any large proportion of them for the purpose of applying the brake and the coupler, you would see that if we all did it the commerce of the country would suffer very severely. I think the railroads have done about as well as could be expected in complying with the law. As I say, we have our automatic brakes, and we are getting couplers on nearly all the cars that are fit to put them on.

was required to join the relief department; it was a perfectly voluntary act. That was what I meant when I said when the association was established nobody in the service was required to join. Second, when the law was repealed and the department organized nobody was required to join. But out of 20 odd thousand members 19 odd thousand became members of the relief department of their own free will, and they had had at that time at least 10 years' experience; so therefore it is found to be a mutually beneficial thing and approved by the employees.

Q. Are the men on your line organized into the brotherhoods?—A. Yes; they are. All the brotherhoods are on our lines, all of them, and while I said to the Senator here that our agreements were with our men, were made with committees of our own men, we do meet regularly with the brotherhood committees, such men as Mr. Arthur and Mr. Clark, and others of that character.

Q. We have had men before the commission who testified that the men believe that the prime object of these relief associations which are promoted by the railroads is to divide the allegiance of the men, so that in time of trouble they will side with the railroads and desert their brotherhoods—stay where their money is. Have you heard any complaints of that kind?—A. No; I think that is just one of those vague suspicions that get into men's minds.

Q. It seems to be pretty universal with the brotherhoods?—A. As far as the road is concerned, I think the brotherhood people themselves would say that they have dealt with us with perfect fairness throughout; and that subject was never mentioned. Its effect is a little the other way in this. Some of our officers complain that the effect of the relief department is to create enormous pressure on them in case of discipline in favor of a person who has something in the relief department, and more especially a person who has borrowed money from the savings fund. Now, if he has to be disciplined, there is always brought up the question, "Well, I have borrowed \$200 from the relief fund; how am I going to pay it back?" Our officers have very frequently spoken of that side of it. But my answer to that always is, "You have to take the bitter with the sweet. There is probably a little here and there where that pressure will be brought to bear, and you better yield to them in view of the larger good that comes from the establishment of a relief department." Take this savings fund. I remember when the savings fund was first established some watchman up in the mountains put in \$1,200 that he had had in the chinks of his cabin. We run through a country not remarkable for savings banks. When we established the savings fund, my recollection is that between Baltimore and Chicago on our line there was not a savings bank, with the possible exception of Columbus, Ohio. To-day there are very few in these smaller towns—Columbus and Pittsburg, I should say. To-day in the smaller towns there are none, and this furnishes a means of enabling them to invest their funds—on the one hand to the thrifty, and on the other it furnishes a means of building up their homes. I do not believe that the effect of it at all—certainly I know the purpose of it is not such as the question indicates.

Q. (By Mr. FARQUHAR.) Do you hear any complaint among the men in your employ that those who are not in the association are not in the line of promotion?—A. No.

Q. (By Senator MALLORY.) According to your testimony it is not practicable for anybody to be out of it?—A. No. I have not heard any complaints of that kind.

Q. (By Representative LIVINGSTON.) Is there any complaint from the chiefs of these labor organizations against that?—A. No; not to us.

Q. (By Senator MALLORY.) What is your opinion as to the effect on relations of employer to employee of such relief associations as you have described?—A. I think they are very good.

Q. (By Professor JOHNSON.) I want to make sure that we understand each other in regard to this question of contract. As I understand, your statement was that you did not employ a man unless he was willing to become a member of the relief department, and in becoming a member of the relief department I understand that that man signs a contract saying that if he receives the benefits as a member of that relief department he will not sue the company for damages?—A. He signs a contract under which he is at perfect liberty to sue the company; but if he does sue the company for damages he will not get his benefits.

Q. Well, is it correct to put it this way: that if he signs a contract that he will either accept the benefits or refuse the benefits and sue the company, and reserve his right to sue the company?—A. He signs a contract saying that "If I accept the benefits I do not sue the company, or if I do not accept the benefits I am at entire liberty to sue the company and get all the damages which I am entitled to under the law."

Q. Then, if a man accepts the benefits and sues the company he violates the contract, does he not?—A. Yes. In other words, when he takes the benefits he gives an absolute release; he does not get them if he does not.

Q. (By Professor JOHNSON.) In England and certain continental countries there are various special tickets of different classes issued by the railroad companies for the purpose of stimulating passenger traffic of different kinds. And it has often been said that the existence of the ticket broker in this country has prevented the railroad companies from stimulating certain kinds of passenger traffic, because if tickets got out they could not control them. I would like to ask you if the existence of ticket brokerage prevents the railroads from these efforts to stimulate passenger traffic, and thus takes away the benefits which come to the community from passenger travel?—A. Well, I am not enough of a passenger expert to answer that. I believe there have been instances when tickets were not given at lower rates because they did furnish a basis for ticket scalping; but whether that difficulty is very widespread or not I do not know.

Q. It is a curious fact that the passenger travel in this country is considerably less than it is in some other countries.—A. Is not that owing to our sparse population, probably?

Q. Is it owing to the fact that the railroad companies have not been able, as the British companies have been, to stimulate the traffic? Whenever a British company sees a possible traffic that can be developed, it puts in a special rate to develop that traffic; but, as I understand, the ticket-brokerage system practically prevents that in this country; so it has been testified.—A. Well, a passenger expert would know more about that. But my own experience is that our boys have been right lively in stimulating traffic.

Q. (By Mr. C. J. HARRIS.) Do you know, in that connection, any method of developing or increasing passenger traffic that has not been adopted?—A. (Laughing) No; I do not; I must say that I do not.

Q. You have suburban rates, you have mileage books, large party rates, and excursion rates?—A. I tried the question of the party rates in the Supreme Court when the Interstate Commerce Commission decided that you could not give a rate to 10 persons lower than you gave it to a single person traveling between the same points, and the Supreme Court reversed that view. That was a case where the theatrical and amusement traffic, the kind that Professor Johnson speaks of, was built up absolutely upon the low rate, 2 cents a mile. I suppose abolition would have done just what Professor Johnson indicates; it would have destroyed a great business, not only for the railroad company, but it would have destroyed the furnishing of amusements by good artists, the traveling troop of to-day that goes to the little town and furnishes the little town with a character of amusement which it would not get—and the larger cities, too—except for the lower rate, I think.

Q. (By Senator MALLORY.) Do you remember the title of that case?—A. It is *The Interstate Commerce Commission v. The Baltimore and Ohio Railroad Company*, and it is within the last 5 or 6 years of the United States Supreme Court reports.

Q. The court in that case held that there was no discrimination prohibited by the interstate-commerce law in allowing a cheaper rate for individuals, for 10, than there would be for one traveling between the same points?—A. Between the same points; going between the same stations on the same system.

Q. (By Professor JOHNSON.) On the continent of Europe they have a system called *Randresser Billets*, or roundabout tickets. A man may buy a ticket in almost any part of Europe and travel in a large circuit and get back to his point of departure and at a very greatly reduced rate. The French systems of railways have such a system over their lines within France. In Great Britain they have an enormous week-end traffic, as they call it, Saturday to Tuesday traffic. I would like to ask whether it would be possible to inaugurate for a group of systems, or any one of the large systems, schemes of tickets or classes of tickets of that character for the purpose of stimulating a kind of passenger movement that does not now take place, provided you could control the tickets that you issued?—A. Well, it may be possible; I do not know.

Q. (By Mr. C. J. HARRIS.) Would not your mileage book cover this run about business?—A. Mileage books cover a great deal of it.

Q. Covers the same field, I mean?—A. The mileage book undoubtedly covers a large portion of the field. I do not know whether it would cover it entirely.

Q. (By Senator MALLORY.) Has your attention been called to the practice of giving passes, by different railroads in the United States, to individuals?—A. Yes.

Q. If it is not asking a question too personal, does your railroad give passes to individuals?—A. Yes.

Q. Do you regard that as an abuse, ordinarily?—A. Yes; I think the system is abused.

Q. Is it not prohibited by the interstate-commerce law?—A. I will have to answer that by saying that the Interstate Commerce Commission called the railroads up to

show their lists of passes and they gave their lists. As you know, we issue those passes to public men and various people. I said to a judge, "I am going to put your name at the head." He says: "You do so, and then tell the commission that this court has decided that hauling a fellow for nothing is not interstate commerce." (Laughter.) The commission has taken that view. I do not myself believe that there is anything in the act that prohibits it unless it is used as a means of discrimination. In other words, giving it to shippers for the purpose of influencing traffic or something of that kind. But outside of that I do not think there is anything in the act that prohibits it. But it is a source of a great deal of annoyance to railroads to know how to deal with it. I have heard, for example—I do not know whether this is so; you might have got it from Mr. Calloway; I was told so by a leading railroad man in New York—that the prohibition, in the New York constitution, of passes to New York State officers, State officials, had led rather to an increase than to a decrease of free transportation, because the officer had his coterie of constituents, or his ring, if you choose to call it that, and instead of contenting him with his own transportation they were bound to furnish a lot to his henchmen. In other words, I think that if it was examined very closely, it would be found to have just shifted the difficulty over into another direction. I can readily understand why that should be the case.

Q. Is there any particular class of citizens in the United States who are the special beneficiaries of passes, that you know of?—A. Well, there are a great many public officers who hold transportation. It is perhaps quite common. Of course, they interchange passes with each other, and there is, I presume, a certain number of passes given to influence shipments, though I think that latter is being curtailed all the time.

Q. To influence shipments over the road?—A. Yes, I think that is getting less and less all the time.

Q. Well, what are they given to public officers for now?—A. I do not hold the view that they are given to public officers as a bribe. I do not believe it affects a public official in any such way; but it has grown up, possibly wrongfully; still, it has grown up as act of courtesy to certain classes of officials to extend to them free transportation.

Q. Can you specify more particularly what classes of officials those are?—A. As an illustration, the prosecuting officers of a great many of our counties have transportation; and I suppose, if you got behind that, the real reason is that there are a good many offenses against railroads that are prosecuted by these gentlemen. They have occasion to employ the railroad in these prosecutions, and they are furnished with transportation. There are others as to whom the custom or habit has grown up to extend to them the courtesy of transportation; members of Congress, Senators, etc., who are living along your line or near to it; it is quite customary to give them transportation as a matter of courtesy. We do it, and I believe most of them do it.

Q. You have been a member of Congress, have you not?—A. Yes.

Q. Have you had any opportunity of observing to what extent the use of passes by members of Congress exists? Is it general?—A. I think it is quite general. The railroads, from their standpoint, would like to get rid of it.

Q. (By Mr. FARQUHAR.) Except in the case of employees of your own system, were the pass system entirely abolished, would it result in lower rates to the cash-paying public?—A. No, I do not think so.

Q. So that the abolition of the pass system would be more a matter of sentiment than it would be of economic benefit to the people who complain of it?—A. It might be an economic benefit to the railroad, but I do not see how the public would be interested. I do not think it would affect the passenger tariffs.

Q. (By Mr. C. J. HARRIS.) Has there not been a great decrease on all lines you are acquainted with in the giving of passes of late years?—A. I think so.

Q. Is it as low as one-tenth of what it used to be 5 years ago?—A. I think it has gone out of vogue very largely as a means of influencing shipments. I think those that are now given are largely acts of courtesy. A railroad is a great concern and it has various interests in various places, and the extending of free transportation may be all wrong and they would certainly like to get rid of it, but the custom has grown up which they can not very well break without offending a great many people.

Q. (By Mr. CLARKE.) Why are passes given to public officials rather than to private individuals, as a rule?—A. Because you are coming into contact with the public officials; that is the reason.

Q. Is it not the custom to grant passes to delegates to conventions in many places, especially if there is a close contest?—A. Not if we can help it. (Laughter.) We try to arrange for the delegates with the various committees and give them strictly a party rate.

Q. Has it come within your knowledge anywhere in the country that conventions have sometimes been packed by the free issue of passes by the railroad company?—A. I have never known it.

Q. You say passes are given to prosecuting attorneys?—A. I gave that as one illustration.

Q. I suppose that is to enable them to get evidence in offenses against railroad companies, is it not, conveniently and comfortably?—A. Against offenders against the company, yes; the prosecution of offenses in which the company is concerned.

Q. (By Mr. KENNEDY.) Has not a private citizen as much right to cheap transportation as any other—as a public official?—A. Absolutely.

Q. Well, are not the citizen's rights infringed somewhat when this class distinction is made and the public official is given free transportation while the citizen must pay full published rates?—A. He is not treated just as the other fellow, undoubtedly; and in one sense it may be said his rights are violated, but I think it is rather a far-fetched statement.

Q. (By Representative LIVINGSTON.) According to the head of the nation—the chief executive of the nation or the State—a special train is not done for the purpose of bribing him, is it?—A. No. All these things are acts of courtesy that are extended in the various relations of life.

Q. Then when the citizens of great cities go for some special purpose in behalf of the city they get passes; that is a courtesy accorded to the city, not done for the purpose of bribing the city?—A. No.

Q. (By Mr. CLARKE.) On the whole, do you not think it would be better to put the whole on a business basis?—A. I think it would.

Q. The officials of the railroad company or employees going on railroad business pay their fares and let the railroad reimburse them?—A. Yes. I would be very glad to see it done if it could be done.

Q. Do you not think it entirely practicable?—A. Not in the present state of public and railroad opinion.

Q. (By Senator MALLORY.) Legislative?—A. Yes; legislative. I have just given an illustration, I believe. Take the operation of the New York statute. You will find it has increased free transportation instead of decreasing it. We are confronted with certain conditions, old customs; how we are going to get rid of it I do not know.

Q. (By Representative LIVINGSTON.) If the pass system is abolished by law, still your special friends, as a matter of courtesy, could travel on your road without a pass? Could it not be done just as well?—A. There are ways in which it is done; furnish them tickets, you know.

Q. (By Mr. KENNEDY.) You would like to see a system of national laws that would absolutely prohibit all carrying of free passengers over the roads in the country?—A. If I thought the system of national laws would prohibit it, yes. As I do not think they would prohibit it I do not think it wise to encumber the statute books at the present time with that class of laws. I am perfectly aware you will find no other railroad president saying that. I am perfectly well aware that it is one of our troubles—the pass system. I would like to see it abolished. I know it is very easy to say "Just have a law abolishing it." I know most railroad executive officers will take this view and say "Give us that kind of act." I say, do not give us that kind of act at the present time, because I do not think it would be complied with. You want my frank opinion and I give it frankly.

Q. (By Representative LIVINGSTON.) If you did that you would have to stop doing other things on the same line. You give paupers free transportation, you give ministers reduced rates. Now, if you go back to the idea of all men, women, and children traveling on a railroad at one fixed price, these benefits to the pauper and minister, and excursion rates, everything of the kind, would have to go down with it, would it not? To give justice to the mass of the people you would have to put them all on a level?—A. Of course many of these things would pass away. I do not want to be misunderstood. I would like to see the whole system of free transportation, even as between railroads themselves, abolished, and let everybody pay fare. I do not believe that an act of that sort will be effective in the present state of public opinion. The time will come at last when we will all be educated up to where we can enforce it, but you all know no law is worth anything except as it is an embodiment of the customs of the hour. I said before a Congressional committee hearing many years ago, when the question of restriction of interstate-commerce law should apply, etc., that it was a great mistake to legislate against the customs of business or to legislate with the idea of simply enforcing it from the outside without having any cooperation from the inside, and I used this expression; it illustrates my idea, that "the fugitive slave law will not catch negroes in Massachusetts; force bills will not force in South Carolina; prohibition will not prohibit in New York or Chicago."

Q. If the railroad managers themselves would be glad to dispense with the practice of granting free passes would not legislation be helpful to them?—A. Well, I really frankly doubt it. That is just my view of it. I think we have got to follow the scriptural rule "The kingdom of heaven is within you." There must be some thing come from within, because we must curtail it ourselves.

Q. My question is, to use the same rule, when the kingdom of heaven is within the railroad managers would not a little help from the outside make it more general?—A. It might.

Q. (By Mr. CLARKE.) Are you acquainted with the effect of the prohibitions in New York and Massachusetts on the granting of passes to the members of the legislatures of those States?—A. The only knowledge I have is, as I said a little while ago, I was informed by a leading railroad officer in New York that the effect of the amendment to the State constitution prohibiting the issuance of free transportation to State officers had rather increased the free transportation than decreased it, because instead of the issue to the State officer you issue to the State officer's friends. He could no longer get it for himself, so he got it for his friends and his friends are more numerous than himself.

Q. How is it in Massachusetts?—A. I do not know anything about that. I presume the New England roads can do a good deal more than some of the other roads. They are more of a monopoly there and can do pretty much as they please.

Q. (By Senator MALLORY.) Is it your opinion that at present the weight of public opinion is adverse to the granting of free transportation by railroads to individuals?—A. Well, I do not believe there is much public opinion on the subject; but what I fear is that there are not enough, if you choose to put it that way, in favor of it in the railroads themselves to comply absolutely with a statute of that kind as against the pressure that will be brought to bear on them.

Q. (By Representative LIVINGSTON.) Is it true that in some States recently they have passed an act requiring the railroads in those States to furnish the State officials with free passes?—A. I understand that is the law in New Jersey.

Q. Would not that remedy the trouble somewhat, if there is a trouble?—A. That is the view they entertained in that State. I would like to see it got rid of, but I do not want to advise legislation that I do not feel would be carried out, and I must say it does not look to me in the present state of railroad opinion that it will be carried out.

Q. (By Senator MALLORY.) The subject of discriminations is next—the discriminations against persons and against places. Have you any opinion as to the comparative number of discriminations now against persons as compared with the discriminations of 2 or 3 years ago of a similar class?—A. Of course I can not give you figures, but I should say that the discriminations were less, because the rates are very much better maintained than 2 years ago or a year ago.

Q. On general principles you would argue that where there is less cutting of rates there is less discrimination?—A. Oh, yes; it is the cutting of rates that leads to discrimination. Where the rates are maintained you can get along without discriminations.

Q. Then it may be stated, as a general rule or principle, that sharp competition between railroads begets discriminations?—A. When competition assumes the shape of contests about rates, yes.

Q. Is it not pretty apt to assume that shape?—A. It is in this country, because of our system of legislation, I think, in particular.

Q. Do you know the methods by which discriminations are practiced in favor of certain persons and against others—the different shapes which they take?—A. It is different; like giving these passes that we spoke of. It is just giving lower rates, and that is all.

Q. Have you ever heard anything of such things as rebates, concessions, or commissions?—A. That is what I mean by giving lower rates. You can give it by one form or the other, through a system of rebates or a system of giving commissions or through various methods; it is all one thing—giving one a lower rate than another.

Q. In your judgment, is that discrimination against individuals, or, through individuals, against the public weal?—A. Undoubtedly.

Q. Is it not also, in your judgment, injurious to the railroads?—A. Undoubtedly.

Q. In your judgment, then, there is no equity about it?—A. I do not think it has any.

Q. And it ought to be corrected if it is possible to correct it?—A. I think so.

Q. Have you any suggestions to make as to how it can be corrected?—A. There is a question which brings up the self-government of the railroad system of the country. I think the railroads ought to be permitted to agree to maintain rates; form traffic associations for the fixing of reasonable rates, and, if necessary, to divide their traffic or earnings. That is the one suggestion that I have in relation to a better

method of avoiding discriminations. I believe this, that if the interstate-commerce act had not contained the prohibition of pooling and there had been nothing in the antitrust act, such as the Supreme Court has found in it, to prohibit railroads from agreeing to maintain rates, that by this time there would have been evolved in the natural course of railroad development a system of traffic associations, of rate agreements, and of pooling which would have substantially prevented all discriminations. I think that clause of the interstate-commerce act and the subsequent action on the antitrust act has prevented a gradual evolution of a system under which the same rates would have been given to all and discriminations would have been abolished. Now, I think the first step to be taken would be to go right to the inhibition which the courts have found in the antitrust act, prohibiting all kinds of railroad agreements about rates, and to get rid of the fifth section of the interstate-commerce act that prohibits pooling of competitive traffic among carriers.

Q. Do you think it would be advisable to have any provision preventing railroads from charging unreasonable rates, or do you think they would necessarily charge reasonable rates?—A. That is the existing law. I do not think anything additional would be required. Suppose I state in general what my views are. I believe that an amendment of the act so as to authorize pooling and to authorize agreements for the maintenance of rates is all that is required. I believe the other provisions of the act, which prohibit unreasonable rates, unjust discriminations, and the undue preferences, are all that are required. That is my personal belief. Now, I recognize the fact that in order to get any amendment to the act the railroads and the Interstate Commerce Commission must get somewhere near together, and the Interstate Commerce Commission will not approve of an act that does not give them some more power than they have to-day. Upon the other hand, the difficulty with the railroads is to get them to assent to giving any additional power to the Interstate Commerce Commission over the question of rates. I have worked, as you know, for some years trying to harmonize the views, and I give my own suggestions now, which ought not be taken as that of the railroad men, because I do not think they are concurred in generally. I would be willing to meet the Interstate Commerce Commission's views halfway, to this extent at least, to vest that body with power in a litigated case to say whether the rate was or was not reasonable, carefully guarding the act so that the decision of that body, in one form or another, can be made the subject of judicial examination by a United States court, with right of appeal to the Supreme Court. This would require the act to be very carefully drawn in order to insure that the question that the Interstate Commerce Commission should decide should be a judicial one. Now, in a general way, the railroads south of the Potomac, the continental lines, and the Northwest roads, and the New England roads would be opposed to giving the Interstate Commerce Commission this right. The roads in the interior section of the country are divided on it, and a portion of them would assent to an increase of power of the commission over the rates covered by traffic agreements or pooling agreements, but not over other roads not covered by such agreements. There are others that would object to increasing the Interstate Commerce Commission's power in any respect. We have, therefore, got into a sort of cul-de-sac in regard to this legislation. I say I think nothing is required except to give the railroad companies the right to agree; restore to them freedom of contract, giving the commission the right to set aside that contract whenever it pleases if it finds it interferes with the public welfare. But the commission does not take that view. They want certain power over the rates and a large proportion of the railroads are afraid to give any additional power over rates. That is the condition of affairs to-day as I understand it. Personally, I should go to the extent that I have indicated, but my own personal views do not meet with the approval of railroad men generally.

Q. (By Mr. CLARKE.) In case of the exercise of additional power by the Interstate Commerce Commission which should go so far as to fix rates pending litigation, you would favor the enforcement of their rates while the litigation is pending?—A. No; I would not. I do not know of any instance where judgment is executed while the appeal is pending, and especially it should not be executed where, as in a case against railroads, the railroads would have no remedy, while the public has a complete remedy.

Q. In view of the law's delay, would the public have a remedy that would amount to anything in such case?—A. A complete remedy, in my judgment. The public means the shipper. Now, the shipper is the great big fellow. As a matter of fact, the shippers who control the shipments of this country are large people, and they can enforce their rights, and enforce them very effectively. When you come to think about it, I think it is an amazing thing (with the freight traffic of this country, which must be equal, measured by ton miles, to the freight traffic of the entire world outside of the United States) that there are an infinitesimal number of complaints as to

the reasonableness of the rates. It shows there is really very little ground for complaint. I think that Senator Mallory has touched the real point, and that is whatever vices there are in the system of railroad transportation exist in the discriminations. I believe the discriminations have to be removed by the ability of the railroads to agree among themselves as to the maintenance of rates, and as to the means of doing that, if it should be necessary, to divide the traffic or the proceeds, the revenue therefrom. That is the rule in every other country on the globe, and there is no reason why it should not be the rule here. I have worked for some years to bring it about, and am only sorry that I have had no better success than I have. I am willing to go, as you see, a good way, but there is among the railroad men of the country a deeply inbred thought that any additional power given to the commission over rates would be a bad thing. They call it fixing the rates, and that feeling is so strong that at present I do not believe that the suggestion which I make, namely, that you should confine that power to saying what is a reasonable rate, with the right of review in such a form that there could be no question that there could be a review—I say I do not believe my suggestion of that will meet with very much approval.

Q. (By Mr. FARQUHAR.) Do you think there is a physical possibility of five men ever fixing the rates of traffic in this country?—A. No.

Q. Do you think there is any means of collecting a clerical force of experts that could do the work of the experts in the employ of the railroads to-day?—A. I think it is more difficult to fix the rate of transportation than it is the price of wheat. I think that is a much more difficult task, and, therefore, if the commission could be got to view the point in that light and to leave the act as it is, which prohibits unreasonable rates, which prohibits unjust discrimination and undue preference, and vest them with certain powers, and then add to it the simple right to agree, with a power in the commission to set the agreements aside without any appeal from their opinion—that would be the simplest thing to do that could be gotten through. I wish the commission could see it in that light, because I think their work can be more effective than if you invest them even with greater power. My experience with commissions and on commissions is this: A commission does not get its value merely by being able to render a judgment behind which is the sheriff or constable, but it gets its value from the fact that it brings you up against what might be said to be public opinion, and that has been true of the Interstate Commerce Commission. When they deliver their opinions and when they call us up, which is very frequently done in a case of complaint, it may be by letter or in any other form, and they indicate what their views are, after a discussion, in 95 cases out of 100 we will comply with their views without further inquiry, only making a fight where we feel a matter of principle is involved. Now, if you will take a list of the decisions of the Interstate Commerce Commission in a year you will see that they are very few, and you may not see what is the use of keeping up a commission that only does that little work; but the real work that the commission does is on the complaints that come in from towns and individuals or from communities and individuals and are adjusted without going through the technical form of litigation. In that way the commission does a very great service. Now, they have very large powers notwithstanding all that has been said on the subject, and if the railroads now will be permitted simply to agree to maintain the rates under forms of contract that would be deposited with them and subject to the right of revocation and leave the act stand as it is, I believe that the railroad discriminations of the country would in the progress of time pass away, and that we would under their direction and guidance and under our own self-government evolve a system of traffic agreements and pooling arrangements which would do away with the tremendous strife of to-day. Now, the doing away with strife is not the destruction of competition. If you want to get down to the last analysis, let me illustrate what I mean in this way: Two fellows run a horse race; one cuts the hankstrings of the other's horse; that is not competition; he poisons his oats, that is not competition. Competition, of course, is striving to obtain the same thing at the same time, and each would be striving to win the race, but there is the necessary implication as to the striving to win the race that it shall be done according to the rules of the game. So with railroad competition you must agree to maintain rates. There can be no such thing as two railroads out of the same place charging different rates, or if they are different, the differentials will be only enough to make up the inequalities of one against the other. They must, therefore, be the same rates. But given the same rates, and the same rates to all, the competition occurs in furnishing the facilities, in the way in which you handle your traffic, in the way in which you present your case to the public, and that competition goes on just as vigorously under your rate agreement as it did before. The thing that is destroyed is the rate cutting, but the competition itself, which is striving

for the same thing under the rules of the game established by long experience, goes ahead. That is what we should do here and that is what is done in England; it is done in Germany, and is done in other countries, and I think it was a great mistake when the interstate-commerce act prohibited pooling. And then as to the antitrust act prohibiting agreements for the maintenance of rates, there was not a man who voted for that act who ever dreamed that was the case. The report of the committee shows that railroad transportation was intended to be excluded from the act, but like many other acts, as we all know, the language of the act was so put that the court was obliged to say that an agreement to maintain reasonable rates was within the terms of the act and therefore void. That act has caught two classes of persons, first, the railroads and, next, Mr. Debs, and it was not intended to cover either. I do not know of an instance of legislation where the purpose of the legislation has been so changed, and set aside, and which has run out in an entirely different line, as in the case of the antitrust act. I think, therefore, allowing these agreements for the maintenance of rates and for the division of traffic is all that is really required. The practical difficulty is there, namely, that the Interstate Commerce Commission asks for more power and the railroads, or a large proportion of them, are afraid to give them any power about rates. I do think the power of the commission for good will be just as great without giving them any additional power, but they do not think so; therefore I have been willing from my standpoint to compromise. I do not say I am right. I must be wrong or there would be more general agreement with me.

Q. (By Mr. KENNEDY.) I believe you and Mr. Murray sent a letter to the Interstate Commerce Commission in which you practically admitted that the practice of giving rates and making discriminations had been in vogue on the Baltimore and Ohio Railroad, and that the same system was in general vogue on the different systems of the country. Would you be willing to give the commission a few illustrations of the giving of rebates and the making of discriminations that would apply to the Baltimore and Ohio and the other systems of the country at that time?—A. The letter had reference to the fact that we were not charging our published rates. At the time that letter was issued I should say that the custom of giving rebates had become much more general and much more widely extended than it had been before, and that it covered a very great deal of the traffic; I do not know what percentage, but certainly a very great deal more than 50 per cent. If you want individual instances, not mentioning names, take such things as the packing-house product from the packers; none of them were carried at tariff rates at that time. Take certain classes of large manufactures—iron, steel—they were all getting cut rates. The whole system was bad; but the discrimination of last year was greater than ever before. Fellows would get a cut rate on a 50-cent shipment, a thing which got to be almost ridiculous, and it was a tremendous reduction of our revenues.

Q. (By Mr. FARQUHAR.) Had you to meet cut rates elsewhere in making your rates?—A. Oh, yes; they were all doing the same thing. There are certain difficulties about complying always with a published rate. Export traffic is a difficult thing to deal with. The rate on export stuff varies from day to day; indeed, it varies between certain hours of the day. The same steamer, as you know, carries traffic of the same kind at very varying rates. They must make up their cargo, and they make it up. The result is that the carrying out of the law as to export rates is a very difficult subject. We took it up before the commission and talked the matter over frankly with the commission. There is no doubt about it that the frank disclosures made before the commission last January resulted in a great deal of good, but it resulted from the fact that mind got close to mind and the railroad to the commission and the commission to the railroad. We told them the whole story and said, What can we do? They recognize there are certain difficulties, and among them the export traffic. It is not a question of discrimination, but a question of complying strictly, technically with the law about publishing your rates. The formality has been gone through of putting in a tariff every day, sometimes two a day, which seems rather absurd; but that did not give rise to the question of discrimination. That is always changing, the published rate, because there are certain things to which it can not always apply, and more particularly as to the export traffic; and the export traffic of the country is growing so fast that nothing should be done to cripple it. The Interstate Commerce Commission recognizes that; but these are things we will fight out and we are fighting them out and getting along, but the fundamental trouble mainly is, that we are prohibited from making any agreements, and we can not very well get along; we ought to have the power to agree.

Q. (By Mr. KENNEDY.) Have the character of rebates or discriminations referred to in your letter been done away with?—A. Very largely. Not entirely, but largely.

Q. (By Mr. CLARKE.) What is that due to, general prosperity?—A. Some railroad men would say it is, but I think it is due to our getting a little more sense, and to

the fact that the absurdity of the rebate system forced itself home to us more than ever before; but, of course, we are aided now by the fact that there is a tremendous demand for transportation.

Q. (By Senator MALLORY.) Should there be a change in that respect do you not think there would be a return to the old method?—A. There is a tendency to do that. I think, however, when we run along for six months and maintain rates pretty well it helps to maintain rates in the future; but when traffic falls off there is a danger of the strife beginning again on the cut-rate principle, and for that reason we ought to have this power of agreeing and of enforcing our agreements, too.

Q. (By Mr. FARQUHAR.) What do you say as to the generally accepted public opinion that the so-called combinations or trusts, if rates or rebates were taken away from them, could not exist?—A. I do not think that is so. Of course that term "trust" is a little indefinite, but I suppose you would call the Federal Steel Company a trust?

Q. Certainly.—A. I suppose you would call the National Steel Company a trust and also the American Steel and Wire companies?

Q. Having trust characteristics, I would say.—A. But strange to say, you would not call the Carnegie Company a trust, and yet the Carnegie Company is larger than any of them. They are getting no favors that are not extended in the iron and steel trade generally now to others, and, moreover, I have heard two of these concerns say that the railroads were making great fools of themselves by not advancing their rates on iron and steel. They recognize as their product has advanced our supplies are costing us a great deal more than they did before, and that we should advance a certain amount. We would not have to advance a great deal; but 25 to 50 cents a ton on steel, whereas steel is now \$33 as against \$18; 25 to 50 cents a ton advance on transportation is not very much, and the fact about it is, these gentlemen, strange as it may appear, are in favor of us advancing. They recognize the fact that we have been too low; and we have been too low; we have been brought down, I do not say below the cost of transportation, but below the point where fair profit could be made for our stockholders and security given to our bondholders.

Q. (By Senator MALLORY.) Why don't you raise?—A. That is it; why don't we? That is one of the most curious problems in economics. We are trying to do it now, and by the 1st of November we will be able to do it somewhat possibly.

Q. How many classifications of freight are there in this country, of the railroads; do you know?—A. I do not know the number of classifications.

Q. How many different systems of classifications? Is there what is called the official classification?—A. Yes. I do not know the number. There is the southern classification and all that; I do not know the number.

Q. It is testified to here, I believe, that there are three and they all differ?—A. Yes.

Q. And the differences existing between the different classifications frequently give rise to much that is incongruous and much that is disagreeable where the two classifications come together?—A. Yes.

Q. And when the rate based on one classification comes to the boundary line of the other classification it has to be changed because of the difference in classification. Have you any suggestion at all as to that, as to whether there should be but one classification in the United States?—A. I have not. I do not regard myself as sufficiently expert to give an opinion about that except in a general way. That must be left again to the traffic managers to be worked out.

Q. You think it impracticable for anybody except the traffic managers to arrange these classifications?—A. I think so. If this was not a single country, nobody would ever suggest that five men should arrange the schedules for half the world, and yet we have a traffic equal to that. The tendency, too, is to uniformity as much as possible. The various associations are all organized, the American association is organized with a view of getting standards, like standards of cars, standards of engines and all that, and standards of signals.

Q. It has been urged that unjust discrimination on the part of the railroads as against the public and individuals could be checked to a certain extent by some legislation that would authorize all interstate railroads to hold their books or accounts open at all times to the inspection of United States officials or examiners. Has that subject been called to your attention at all?—A. Yes; I have heard that subject discussed somewhat. I have no objection whatever to such a provision of law, but I do not believe, frankly, that it would be any good. I will give you a single illustration: Right up here in the Interstate Commerce Commission office you will find all the records, sworn to, containing everything about the railroads. It has a very fine statistical bureau, exceedingly capable men in it, and they get out the statistics, and get them out fully and completely; all about it. Now, if you want to know the statistics of railroads (just think of this for a moment), where do you go? You have never gone yet—you do not go to the Interstate Commerce Commission report,

HEARINGS BEFORE THE INDUSTRIAL COMMISSION.

although they have a splendid statistical bureau, but you take the private compilation of Poor. You go to any banker or broker, any large lawyer's office in this country, and in it you find Poor's Manual; and yet here are the official statistics of everything. That private compilation, with which the Government has nothing to do, furnishes the so-called publicity, of which we hear so much, of railroad accounts.

Q. (By Mr. CLARKE.) Is not this preference for it largely due to the fact that it was published before the Interstate Commerce Commission was established, and therefore the people got accustomed to using it; and is it not also due to the fact that it gives a history of contracts between railroads, leases, etc., so that it is valuable for reference in that respect?—A. Yes; it does all these things, undoubtedly. Of course I know it is a common notion that what is called publicity to-day—that is, to have your accounts examined by somebody—is the remedy for a great deal, whereas I, myself, do not think it is a remedy for anything, although I have not the slightest objection to having my accounts gone over by any public accountant; but as to expecting results from it, I do not believe there will be any; I believe you will still go to Poor's Manual.

Q. You believe in publicity in some form, of course?—A. Yes.

Q. Do you think that a remedy for suspicion and discontent?—A. I do; that is right. But I suppose that some examination would be made of these aggregations of capital. If that was thought necessary for railroads it would probably be necessary for the others.

Q. (By Senator MALLORY.) If it could be done; that is, by Federal authority?—A. Yes.

Q. Can you say whether or not to-day the unreasonable increase of stock by interstate railways is an abuse of any magnitude?—A. I have not looked into the matter very carefully, but I do not believe any of the large and well-established railroads could be reproduced for their existing capital.

Q. You think, then, as a general rule among large roads of the United States, their capital really is less than what the value of the road is?—A. There may be a great deal of misplaced capital, and it may not be earning, you know, but I do not believe that, take the railroads as a whole, you could reproduce them, certainly east of the Mississippi and north of the Ohio—I do not believe you could reproduce the existing roads, take them all in all, for their present bond and stock; but it does not follow that their value is equal to their stock, because we know definitely—in other words, there are a great many mislocations, a great many things that do not pan out as the promoters expect them to pan out; but you take all of this enormous cost of getting into cities, and I do not see how it would be possible to incur all that expense without increasing the capital.

Q. There is an impression in the minds of a good many people that much of the difficulty of the railroad problem is due to the fact that the railroads have been over-capitalized, and that the effort to pay interest on excessive capital necessitates exorbitant rates that otherwise would not be required. What is your opinion about that?—A. I do not think there is a single thing in that; I do not think there is anything in it at all; and as to excessive rates, I declare, from my standpoint, the rates seem to be most abnormally low.

Q. The through rates, I believe, are undoubtedly very low?—A. Well, our local rates are low.

Q. But local rates generally are pretty high?—A. Well, I can not speak, of course, of "generally;" I can not speak of it; but my impression is that they are low. You get a railroad like the Baltimore and Ohio, whose traffic last year only averaged three mills and nine-tenths, and if you can get any nearer the vanishing point than that for carrying a ton a mile, I do not know what is the vanishing point. One mill a ton a mile on our traffic would have been \$5,137,000. Sixty per cent of our tonnage must consist of articles like coal, coke, brick, sand, and stone—articles that are right along the tracks; they take this at very low rates, but our section, north of the Ohio and east of the Mississippi, I should say the local rates were down along with the through rates. Practically everything is on a through basis. Now, I do not know enough about New England to speak. I know nothing about that; that is a separate and distinct system up there; they have very great advantages over the rest of us.

Q. Do you know anything about the Southern, Southeastern Division?—A. I do not. The Southern rates I know are higher, but that is a very sparsely populated country, and they are bound to be higher, if a railroad can live at all. To show the difference in the density of traffic south of the Potomac and north, take Mr. Carnegie's concern at Pittsburgh; they produce a tonnage in and out that is about 4½ times the tonnage of the entire cotton crop of the United States; under the control of one man. This of course is not in value, but it is the tons moved, from the railroads' standpoint. I can show you little towns in western Pennsylvania of 10,000 inhabitants that will

produce a tonnage equal to the wheat tonnage of such roads as the Great Northern or the Northern Pacific. You would hear them say they haul sixty or seventy million bushels of wheat, and "millions" strikes you as enormous, and yet the towns in Pennsylvania with 10,000 inhabitants will produce a tonnage equal to the tonnage of one of these great big roads.

Q. Have you anything to say on the subject of taxation of railroads, based on your experience with your road; taxation by States?—A. By States; yes. I have found they differed in the different States. I have never found very much ground for complaint of the system that is in vogue in the States through which we go. Generally there is a system of taxing the physical property under a system of State assessment, and distributed through the counties and townships and school districts, that is working very well.

Q. When you say "physical property," you mean both real estate and movable?—A. Yes, that is right; rolling stock assessed according to the amount used in the State, and distributed among the counties. It has worked very well, that system with us. In addition to that, there is in the States of Ohio and Maryland a gross receipt tax. In Ohio there is a tax on the gross receipts by a sort of common understanding between the State officials and the railroad companies. They pay the tax, though I think a good deal of it is now a tax of both classes of receipts, State traffic as well as interstate traffic. In Maryland, by some arrangement, there is a tax of that kind. It is thought not to be excessive and is just submitted to. In the main I should say the taxation of the physical property is about as fair a way of taxing railroads as any other. The taxation of receipts does give rise, if taken by the State, to this question, which is a somewhat unsettled one, of whether the States have the power to tax receipts from interstate points. The taxation of the physical property, including the rolling stock, etc., gets rid of all questions of that kind. I should say there are counties in northern Indiana where railroads pay two-thirds of the tax.

Q. The subject of Government ownership of land transportation is one that has attracted some attention. Have you anything to say on the subject? What do you think of the scheme of Government ownership of interstate railroads?—A. I think it a most sublime folly. Of course, I am rather radical on that general subject of State ownership and State interference. I think the further we keep away from all of those nostrums the better we will be off. The most informing book I know of on the general topic of socialistic adventures is by Mr. W. H. Mallock, on Labor and Popular Welfare, and if there is any single point that ever was demonstrated, it was demonstrated by him that the great welfare of the world, especially of what we call laborers, defining a laborer as a man who burdens his hands and is of average intelligence—that the great welfare of that class arises from the fact of private ownership of private capital and giving to industrial power whether in the shape of the inventor or the organizer of industry, the rewards of the use of private capital. The astonishing thing that is demonstrated by the figures is that the fundamental concept of socialism is false, to wit, that labor, defining labor as I have defined it, is the great producer of wealth. Divorce it from the intellect that invents, and the intellect that organizes, and the labor of to-day would not be receiving a third of what it did at the beginning of the century; so that, taking an industry like railroads, which is next to the farming industry, out of the category, where there are thousands and thousands of the brightest minds who are at work in solving all of these problems, and making it a mere routine machine of the Government, is one of the greatest mistakes that this country could make—especially this country.

Now, I do not refer to political difficulties and all that sort of thing, but the economical result arising from the fact, you may say, of leaving the railroads to be developed as they have been developed, if you choose, by permitting them to operate under the stimulus of private cupidity; in other words, giving the rewards to the people who handle the tools—I say, the results which have come from that system are admirably presented by Mallock in his book, and it shows that it is the laborer who receives far more than he would receive if you took all the instruments of production and divided them out amongst all.

Q. (By Mr. KENNEDY.) Are not all those instruments of production produced by labor?—A. No; not labor in the sense which you are using the term.

Q. I understand it is generally used that way?—A. It is generally used that way, when it becomes the subject of socialistic argument.

Q. The man who invents is doing labor?—A. Of course, in that sense, yes. In that sense Commodore Vanderbilt was a laborer, and the organizing genius who puts together all these railroads is a laborer, but you hardly would address a fellow of that kind as "My fellow-laborer." You do not refer to them as laborers. The term does not have that meaning when you are using the term labor. Take these great properties, and the farms of the country, and turn them over to the State to operate,

and you take away private motive; take away private cupidity and you have a very poor concern compared with what you have now.

We have in Maryland a capital illustration of State ownership. The bed of the Chesapeake Bay is capable of producing a wealth greater than all the corn of Illinois, the gold of California, and all the wheat of the Dakotas, and it is wasted; it is wasted, because we have made it a species of common ownership, regulating the fishing of oysters between two classes, called tongers and dredgers. Turn the bottom of that bed into private ownership, as private property, and Maryland will produce wealth greater than the cornfields of Illinois to-day; but it is going to waste now because of State ownership.

Q. (By Mr. CLARKE.) I want to ask you a question about the system of combination and interchangeable mileage tickets on different roads; are you familiar with the working of that in this country?—A. Not very familiar. That belongs to the passenger department. I know in a general way, but I am not very familiar with it.

Q. I hold in my hand the cover of a Northern mileage ticket bureau, 1,000 mile rebate ticket, covering a number of roads in Michigan and some in Wisconsin and Illinois, and perhaps some other States in the Northern-Central West?—A. Yes; we issue them.

Q. You issue them?—A. Yes; we issue interchangeable mileage tickets west of the Ohio.

Q. Does that system work well?—A. I so understand from the passenger department that it works very well.

Q. You do not understand that you lose money by allowing your receipts to be taken by other roads and accounted for to you?—A. No.

Q. Suppose these roads happen to be in bankruptcy or anything of that sort?—A. Well, we have had one case where we lost, but only one; and in relation to that, I think as a rule the traffic balances, whether they are passenger balances, or whether they are freight balances, in cases of bankruptcy of roads, are settled by the receivers of the bankrupt road. Whether that is strictly legal or not, I am not exactly prepared to say; but the fact that you must do business as a rule with that connecting road, compels you to pay the traffic balances. We did it with our receivership. I know they are looked upon as trust funds, which should be accounted for as trust funds, and go over to the party to whom they belong.

Q. You recognize that a ticket of this kind would be a public convenience?—A. Yes; it is a public convenience.

TESTIMONY OF MR. STUYVESANT FISH,

President of the Illinois Central Railroad Company, and President of the Yazoo and Mississippi Valley Railroad Company.

The commission being in afternoon session, Senator Mallory presiding, Mr. Stuyvesant Fish, being duly sworn at 2.45 p. m., testified on the subject of transportation as follows:

Q. (By Mr. C. J. HARRIS.) What is your full name and address?—A. Stuyvesant Fish; New York.

Q. What position do you hold with the Illinois Central Railroad Company?—A. I am President; also President of the Yazoo and Mississippi Valley Railroad Company.

Q. Any others?—A. Those are two independent and operating companies; the others are leased, and are subsidiary companies.

Q. If you have prepared a paper, and so wish, you may read it, and if any members of the commission desire to ask questions on any point they can do so.

The WITNESS:

Mr. Chairman and Gentlemen of the Commission, railroads are "of the people and for the people." They are permanently attached to the soil. Capital invested in them is irrevocably dedicated to a public service. It is presumably for these reasons that the commission, in investigating "questions pertaining to immigration, to labor, to agriculture, to manufacturing, and to business," have called so many railroad presidents.

However this may be, I take pleasure in answering your summons, well knowing that nothing can affect, for good or evil, any important interest in the United States without in like manner affecting the railroads.

You have heard and will hear from other railroad men representing different parts of the country. What I have to say will relate to the great central basin drained

by the Mississippi River—the heart of the country, its granary, and its workshop—and New Orleans, the seaport of that basin.

The Mississippi River drains the whole of 9 States and Territories,¹ and parts of 23 other States,² not to speak of a considerable slice of the Dominion of Canada. Rejecting 8 States,³ of which but a small portion lies within the valley, 24 States and Territories may be fairly considered as tributary to that river.

Its valley contains 1,240,039 square miles, or 41 per cent of the area of the United States, exclusive of Alaska and other outlying possessions. There dwell 35,000,000 of our people, or nearly one-half of our citizenship.

Its soil, beside feeding all of our own people, except those on the Pacific coast, yields the whole of our exportable surplus of live stock of every kind, and most of the breadstuffs. Its mines yield our petroleum oil and most of our coal, its forests supply our lumber, and its workshops turn out annually an increasing share of our manufactures.

In these days of large and increasing tonnage and of low and constantly falling rates for transportation by rail, the question of grades is becoming more and more controlling. It is, therefore, in the level prairies of the great valley that we must look for the solution of the problem of how to conduct transportation ever at or near, and often below cost, without so absolutely bankrupting the carriers as to close the highways of traffic. The accumulated surplus earned in previous good years, and the borrowing power based thereon, coupled with a rigid and distressing economy, barely kept the Western and Southern railroads from universal bankruptcy during the bad times from 1893 to 1897. On June 30, 1894, there were in the hands of receivers 40,818 miles of railroad, or nearly one-fourth of all in the United States (176,602). These bankrupts represented an investment of over \$2,500,000,000.

The enforced economies of that year reduced the number of railroad employees by 93,994. The effect on those employed by manufacturers of railroad supplies in particular, and on immigration, labor, manufacturing, and business in general, while not specifically reported, is too well remembered to need repetition. While we all hope that those evil days have passed, never to return, may we not gather wisdom from that sad experience?

The statistical reports of the Interstate Commerce Commission divide the United States into 10 territorial groups.⁴ The following table has been compiled from these reports:

¹ Kentucky, Tennessee, Arkansas, Indian Territory, Oklahoma, Missouri, Kansas, Iowa, and Nebraska.

² New York, Pennsylvania, Maryland, West Virginia, Virginia, North Carolina, Georgia, Alabama, Mississippi, Louisiana, Texas, New Mexico, Colorado, Wyoming, Montana, North Dakota, South Dakota, Minnesota, Wisconsin, Michigan, Illinois, Indiana, and Ohio.

³ New York, Maryland, Virginia, North Carolina, Georgia, Texas, New Mexico, and Michigan.

⁴ The Interstate Commerce Commission define these groups as follows:

Group I. This group embraces the States of Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, and Connecticut.

Group II. This group embraces the States of New York, Pennsylvania, New Jersey, Delaware, and Maryland, exclusive of that portion of New York and Pennsylvania lying west of a line drawn from Buffalo to Pittsburg, via Salamanca, and inclusive of that portion of West Virginia lying north of a line drawn from Parkersburg east to the boundary of Maryland.

Group III. This group embraces the States of Ohio, Indiana, the southern peninsula of Michigan, and that portion of the States of New York and Pennsylvania lying west of a line drawn from Buffalo to Pittsburg, via Salamanca.

Group IV. This group embraces the States of Virginia, North Carolina, South Carolina, and that portion of the State of West Virginia lying south of a line drawn east from Parkersburg to the boundary of Maryland.

Group V. This group embraces the States of Kentucky, Tennessee, Mississippi, Alabama, Georgia, Florida, and that portion of Louisiana east of the Mississippi River.

Group VI. This group embraces the States of Illinois, Wisconsin, Iowa, Minnesota, the northern peninsula of the State of Michigan, and that portion of the States of North Dakota, South Dakota, and Missouri lying east of the Missouri River.

Group VII. This group embraces the States of Montana, Wyoming, Nebraska, that portion of North Dakota and South Dakota lying west of the Missouri River, and that portion of the State of Colorado lying north of a line drawn east and west through Denver.

Group VIII. This group embraces the States of Kansas, Arkansas, that portion of the State of Missouri lying south of the Missouri River, that portion of the State of Colorado lying south of a line drawn east and west through Denver, that portion of the State of Texas lying west of Oklahoma, and the Territories of Oklahoma, Indian Territory, and the portion of New Mexico lying northeast of Santa Fe.

Group IX. This group embraces the State of Louisiana, exclusive of the portion lying east of the Mississippi River; the State of Texas, exclusive of that portion lying west of Oklahoma, and the portion of New Mexico lying southeast of Santa Fe.

Group X. This group embraces the States of California, Nevada, Oregon, Idaho, Utah, Washington, the Territory of Arizona, and that portion of the Territory of New Mexico lying southwest of Santa Fe.

322 HEARINGS BEFORE THE INDUSTRIA COMMISSION.

Comparative distribution of railroad employees, by groups, for the years ended June 30, 1893 and 1894, respectively.

| Group. | 1893. | 1894. | Decrease. | Per cent. |
|---|---------|---------|-----------|-----------|
| III..... | 137,913 | 117,233 | 20,680 | 14.99 |
| V..... | 66,419 | 58,182 | 8,237 | 12.40 |
| VI..... | 170,336 | 144,168 | 26,168 | 15.36 |
| VII..... | 26,567 | 23,878 | 2,689 | 10.12 |
| VIII..... | 71,287 | 63,525 | 7,762 | 10.88 |
| Total of the 5 groups in the Mississippi Valley..... | 472,522 | 406,986 | 65,536 | 13.87 |
| I..... | 65,521 | 58,272 | 7,249 | 11.06 |
| II..... | 224,360 | 208,910 | 15,450 | 6.89 |
| IV..... | 42,805 | 39,107 | 3,698 | 8.64 |
| IX..... | 35,727 | 31,258 | 4,469 | 12.51 |
| X..... | 32,667 | 35,075 | 2,408 | 7.37 |
| Total of the 5 groups in other parts of the country.. | 401,080 | 372,622 | 28,458 | 7.10 |
| Total of all the United States..... | 873,602 | 779,608 | 93,994 | 10.76 |

¹ Increase.

This shows that seven-tenths of all the railroad employees discharged during the year ended June 30, 1894, had been employed in the Mississippi Valley, and that while throughout the rest of the country 1 man in 14 lost his employment during that year, in the valley nearly 1 in every 7 met with like misfortune. The distress was most severe in Groups III and VI, comprising substantially the area bounded east by the Allegheny Mountains, south by the Ohio, and west by the Missouri and the Mississippi rivers. Virtually half (46,848) of all the men discharged lived in those two groups.

In Group III the rate per ton per mile is the lowest of any, and in Group VI it is lower than in any of the other six groups lying west of the Alleghenies. The rate in Group I, the New England States, is more than 40 per cent higher than that of Group VI, and more than double that of Group III.

Justice apart, is it wise for us, as a nation, to continue to thus rob the carrier Peter and his "hired man" in order to pay the shipper Paul?

New Orleans is the natural port of the Mississippi Valley. You are familiar with the struggle made by the people of the valley toward the close of the last century against the embargo laid by Spain and France on commerce through New Orleans, which led to and justified the so-called Louisiana purchase in 1803. Down to the breaking out of the civil war in 1861 the river carried the products of the valley to the Gulf, and brought back imported goods. During the four years of that war and the following period of misrule at the South, the very mouth of the river was allowed to fill up until only vessels of small draft could enter it, and transportation between the valley and the sea was forced into the unnatural channels provided by steep or circuitous railroads over or around the Allegheny Mountains.

That even the most direct of them is crooked is shown by the fact that while the short-line distances by rail from Chicago to New York and to New Orleans are identical, 912² miles, the air line distances are—to New York, 709; to New Orleans, 826. That is to say, in running over the mountains 203 miles, or 28¹/₁₀ per cent, are added to the air-line distance, while in running down the valley only 86 miles, or 10¹/₁₀ per cent, are added thereto. The summit on the short line between Chicago and New York is nearly midway between those cities, at an altitude of about 2,161 feet above tide; the summit on the short line between Chicago and New Orleans is within 34 miles of Chicago, at an altitude of 804 feet above tide. As Chicago is 590 feet above the sea, the dead lift to New York is 1,571 feet and to New Orleans 214 feet. While it is true that other railroads running to New York by longer routes cross lower summits, the most level of them reaches an altitude approximating, if not exceeding, 1,100 feet above the sea, and is compelled to lift every ton it carries in either direction 500 feet vertically above the level of Chicago.

When order was finally restored at the South, its railroads were, without exception, physical and financial wrecks. It is within my knowledge that they were then, and long continued, incapable of competing with the lines to the Atlantic seaboard.

²The distances given in the Official Railway Guide for the passenger trains of the Illinois Central Railroad cover a detour made in order to serve the city of Memphis, and are some 10³/₁₀ miles longer than as above stated. Freight trains take the shorter route.

by the Mississippi River—the heart of the country, its granary, and its workshop—and New Orleans, the seaport of that basin.

The Mississippi River drains the whole of 9 States and Territories,¹ and parts of 23 other States,² not to speak of a considerable slice of the Dominion of Canada. Rejecting 8 States,³ of which but a small portion lies within the valley, 24 States and Territories may be fairly considered as tributary to that river.

Its valley contains 1,240,039 square miles, or 41 per cent of the area of the United States, exclusive of Alaska and other outlying possessions. There dwell 35,000,000 of our people, or nearly one-half of our citizenship.

Its soil, beside feeding all of our own people, except those on the Pacific coast, yields the whole of our exportable surplus of live stock of every kind, and most of the breadstuffs. Its mines yield our petroleum oil and most of our coal, its forests supply our lumber, and its workshops turn out annually an increasing share of our manufactures.

In these days of large and increasing tonnage and of low and constantly falling rates for transportation by rail, the question of grades is becoming more and more controlling. It is, therefore, in the level prairies of the great valley that we must look for the solution of the problem of how to conduct transportation ever at or near, and often below cost, without so absolutely bankrupting the carriers as to close the highways of traffic. The accumulated surplus earned in previous good years, and the borrowing power based thereon, coupled with a rigid and distressing economy, barely kept the Western and Southern railroads from universal bankruptcy during the bad times from 1893 to 1897. On June 30, 1894, there were in the hands of receivers 40,818 miles of railroad, or nearly one-fourth of all in the United States (176,602). These bankrupts represented an investment of over \$2,500,000,000.

The enforced economies of that year reduced the number of railroad employees by 93,994. The effect on those employed by manufacturers of railroad supplies in particular, and on immigration, labor, manufacturing, and business in general, while not specifically reported, is too well remembered to need repetition. While we all hope that those evil days have passed, never to return, may we not gather wisdom from that sad experience?

The statistical reports of the Interstate Commerce Commission divide the United States into 10 territorial groups.⁴ The following table has been compiled from these reports:

¹ Kentucky, Tennessee, Arkansas, Indian Territory, Oklahoma, Missouri, Kansas, Iowa, and Nebraska.

² New York, Pennsylvania, Maryland, West Virginia, Virginia, North Carolina, Georgia, Alabama, Mississippi, Louisiana, Texas, New Mexico, Colorado, Wyoming, Montana, North Dakota, South Dakota, Minnesota, Wisconsin, Michigan, Illinois, Indiana, and Ohio.

³ New York, Maryland, Virginia, North Carolina, Georgia, Texas, New Mexico, and Michigan.

⁴ The Interstate Commerce Commission define these groups as follows:

Group I. This group embraces the States of Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, and Connecticut.

Group II. This group embraces the States of New York, Pennsylvania, New Jersey, Delaware, and Maryland, exclusive of that portion of New York and Pennsylvania lying west of a line drawn from Buffalo to Pittsburg, via Salamanca, and inclusive of that portion of West Virginia lying north of a line drawn from Parkersburg east to the boundary of Maryland.

Group III. This group embraces the States of Ohio, Indiana, the southern peninsula of Michigan, and that portion of the States of New York and Pennsylvania lying west of a line drawn from Buffalo to Pittsburg, via Salamanca.

Group IV. This group embraces the States of Virginia, North Carolina, South Carolina, and that portion of the State of West Virginia lying south of a line drawn east from Parkersburg to the boundary of Maryland.

Group V. This group embraces the States of Kentucky, Tennessee, Mississippi, Alabama, Georgia, Florida, and that portion of Louisiana east of the Mississippi River.

Group VI. This group embraces the States of Illinois, Wisconsin, Iowa, Minnesota, the northern peninsula of the State of Michigan, and that portion of the States of North Dakota, South Dakota, and Missouri lying east of the Missouri River.

Group VII. This group embraces the States of Montana, Wyoming, Nebraska, that portion of North Dakota and South Dakota lying west of the Missouri River, and that portion of the State of Colorado lying north of a line drawn east and west through Denver.

Group VIII. This group embraces the States of Kansas, Arkansas, that portion of the State of Missouri lying south of the Missouri River, that portion of the State of Colorado lying south of a line drawn east and west through Denver, that portion of the State of Texas lying west of Oklahoma, and the Territories of Oklahoma, Indian Territory, and the portion of New Mexico lying northeast of Santa Fe.

Group IX. This group embraces the State of Louisiana, exclusive of the portion lying east of the Mississippi River; the State of Texas, exclusive of that portion lying west of Oklahoma, and the portion of New Mexico lying southeast of Santa Fe.

Group X. This group embraces the States of California, Nevada, Oregon, Idaho, Utah, Washington, the Territory of Arizona, and that portion of the Territory of New Mexico lying southwest of Santa Fe.

Nevada and Utah to Ogden, with branches reaching into the Indian Territory and the Republic of Mexico.

2. The so-called Queen and Crescent Route, operating 1,155 miles in Louisiana, Mississippi, Alabama, Tennessee, and Kentucky, and reaching Cincinnati, Ohio.

3. The Louisville and Nashville Railroad, operating in its own name 2,988 miles, and controlling, through an ownership of stock, the Nashville, Chattanooga and St. Louis Railroad, which operates 1,189 miles, making together 4,177 miles.

The lines of these two companies lie in Louisiana, Mississippi, Alabama, Florida, Tennessee, Georgia, Kentucky, Illinois, and reach St. Louis on the west, Cincinnati on the northeast, as well as all the lower crossings of the Ohio River, except Cairo.

4. The Texas and Pacific Railway, operating in Louisiana and Texas 1,492 miles. While this railway is affiliated with the so-called Gould system of railroads, which comprise in all 9,000 miles, reaching through Arkansas, Indian Territory, Missouri, Kansas, Colorado, and Nebraska to Denver, Omaha, Kansas City, and St. Louis, only the mileage actually controlled by the corporation operating in New Orleans, the Texas and Pacific Railway Company, is considered in this connection.

5. The Yazoo and Mississippi Valley Railroad, operating in Louisiana, Mississippi, Arkansas, and Tennessee, 969 miles.

6. The Illinois Central Railroad, operating in Louisiana, Mississippi, Alabama, Tennessee, Kentucky, Illinois, Indiana, Wisconsin, Iowa, Minnesota, and South Dakota, 3,679 miles. Railroad mileage tributary to New Orleans, 19,086 miles.

No other port in the United States is served by railroads reaching, under single managements, so far and in such varied directions into the interior of the continent. That those railroads ought to bring to and carry from New Orleans vastly more than they do of goods for foreign commerce is shown by their gross receipts during the past year from the carriage of passengers and freight, being \$130,637,703, or 30 per cent more than the *value* of all the imports and exports of New Orleans, which, in turn, amounted to \$100,090,537.

Far from discriminating in favor of New Orleans, it is to be feared that its railroads, taken as a whole, have not done their full measure of duty by the port in which each of those above named terminates.

The testimony given before you by the presidents of other railroad companies, as reported in the newspapers, has suggested the following remarks:

It does not seem to me that disputes over wages form so vital a question as to exclude arbitration so absolutely and universally as does the maintenance of proper discipline. The duty of safely carrying passengers and freight has been by the State committed to corporations. They can not share that responsibility with others, much less arbitrate with irresponsible strangers the method of its discharge. Discipline, if peculiarly severe, will carry with it increased pay. Wages, on the other hand, have been generally controlled by supply and demand, to the great gain in recent years of the employed. That natural law will always control, except as its operation may be influenced by labor trusts seeking to prevent free men from selling their only capital, labor, in the best market. By labor trusts I do not mean organized labor as exemplified by the Brotherhood of Locomotive Engineers, the Order of Railroad Conductors, and like useful and honorable organizations of intelligent railroad men, but the lawless and disorganized bodies of outsiders who know nothing of, and care nothing for, either the railroads or the high class of men whom they employ.

No reductions in pay were made on the Illinois Central Railroad during the long period of depression (1893 to 1897) from which we are emerging, excepting that in some parts of the country the fall in the wages of farm laborers necessarily affected, for a short season, those of our track hands. But many of our men suffered severely through our diminished need of their services. Making less use of our cars and engines, we had less of them to repair, and both the number employed and the hours of work in the shops were reduced. It seemed to me then, and it seems to me now, that it would have been better for the men, if it had been possible for us, by reducing the scale of wages a little to have employed more men or to give them work on full time. Men in railroad shops are paid by the hour. The question is whether the men and the communities in which they live would not have been benefited by adopting course B below, rather than adhering to A, as we were forced to do.

CASE A.

Reductions in force and in time.

Men in shop, say 100.

Full time, 6 days of 10 hours—6,000 units of pay per week.

Reduction in force from 100 to 75—men discharged 25.

Reduction in time to 5 days of 8 hours, or 40 hours per week.

Result—75 men at 40 hours, or 3,000 units of pay per week, and pay roll diminished by one-half.

CASE R.

Reductions in wages.

Men in shop, say, as above, 100.

Full time, as above, 6,000 units of pay per week.

10 per cent reduction in wages, 5,400 units of pay per week.

15 per cent reduction in wages, 5,100 units of pay per week.

20 per cent reduction in wages, 4,800 units of pay per week.

25 per cent reduction in wages, 4,500 units of pay per week.

Pay roll diminished as follows:

By 10 per cent reduction, 600 units of pay per week.

By 15 per cent reduction, 900 units of pay per week.

By 20 per cent reduction, 1,200 units of pay per week.

By 25 per cent reduction, 1,500 units of pay per week.

That the Illinois Central Railroad Company could have employed more shop hands in building new cars and engines if it could have secured their services on a lower scale and one commensurate with the reduced cost of living, is shown by its having bought new engines and cars, as follows:

New equipment bought by Illinois Central Railroad Company.

| Year ended June 30— | Locomotives. | Passenger cars. | Freight cars. |
|------------------------|--------------|-----------------|---------------|
| 1893..... | 42 | 62 | 301 |
| 1894..... | 49 | | 2,531 |
| 1895..... | 19 | | 1,044 |
| 1896..... | 45 | 1 | 2,596 |
| 1897..... | 25 | | 1,800 |
| Total in 5 years | 180 | 63 | 8,272 |

During the whole of this period we built but few cars (241) and no engines, because we could buy them from others more cheaply. Now that the car makers have restored their wages and advanced their prices we have begun to build cars freely. In the past 3 months we have built nearly 500 new cars and bought the material for 1,250 more, which should be completed before the end of next March.

As to average rates of transportation, the attention of the commission is called to a pamphlet herewith submitted on "Changes in the Rates of Charge for Railway and Other Transportation Services. Prepared under the direction of John Hyde, statistician, by H. T. Newcomb, chief of the section of freight rates in the Division of Statistics, Miscellaneous Series, Bulletin No. 15, United States Department of Agriculture, Division of Statistics."

That pamphlet contained the first, and, I might say, the only, statistical publication by authority of the Federal Government which has come to my notice, dealing with these important questions with sufficient candor and accuracy to be of real value in determining questions affecting the regulation of commerce. The attention of the commission is particularly called to Table 1, on page 12, under the heading of Freight traffic, and to Table 54, on page 63, under the heading of Passenger traffic, each of which gives the volume of traffic, efficiency of service, and earnings. These tables give an immense amount of accurate information for the long period of 30 years from 1867 to 1896.

Conformably to a suggestion made by one of your officers that the commission would be interested in the plan adopted by the Illinois Central Railroad Company for aiding its employees to buy stock of the corporation, permit me to say that, in brief, it amounts to this: On the 1st of each month the price of shares at the New York Stock Exchange is telegraphed to Chicago, and the paymaster is authorized to sell 1 share to each employee at that price. Payment is accepted in sums of \$5, or any multiple thereof. Interest at 4 per cent per annum is allowed on the partial payments, and when an employee leaves the service he must either pay in full for his share and receive a certificate therefor or take his money, with the interest added.

The number of officers and employees, other than directors of the corporation, registered on the books of the company as stockholders is 705, and their holdings amount to 2,554 shares.

The stock is being gradually purchased by those resident on and near the line. In each of the 11 States in which the company is operating railways there are a number of stockholders, varying from 7 in Indiana to 767 in Illinois. The total number of

stockholders in these 11 States is 1,126, and the number of shares held by them 33,995.

There are resident in the United States 3,868 stockholders, owning 346,207 shares, or over 57 per cent of the whole; in Great Britain, 2,543, owning 198,616 shares; elsewhere, 115, owning 55,125 shares.

Exclusive of one large block of shares, held for more than 30 years past in trust by a Dutch syndicate or administration office, against its own certificates, good to bearer, which are widely scattered among hundreds of owners, the average holding of the remaining proprietors registered on the company's books is $85\frac{1}{2}$ shares. In the United States the average is $89\frac{1}{2}$ shares.

All told, the books show 5 holdings of 5,000 shares or over; 85 of 1,000 shares or over; 93 of 500 shares or over; 694 of less than 500, but more than 100 shares; 455 of exactly 100 shares each, and 5,194 of less than 100 shares. The number of stockholders registered on the books is 6,526. Barely one-seventh of them own over 100 shares apiece.

Q. (By Professor JOHNSON.) I want to ask if you will tell us more about the increase in the capitalization of your company? You spoke of having grown from \$38,831,000 to \$185,996,925. How do you account, in the main, for that immense increase of capital; what has been done?—A. Additional lines have been bought, and the whole property has been rebuilt and reequipped; grades have been cut down; new and heavier engines have been bought; heavier rails have been bought; the whole property has been rehabilitated. Many things were added in these years; as, for instance, a bridge across the Ohio River at Cairo at a cost of \$3,000,000 and over. I can not give you the figures, but it is not merely in the acquisition of new properties, but rather in thoroughly rebuilding the railroads and reequipping them. I can give you one figure which happens to come to me, which is typical. Ten years ago we did not have a rail in a track that weighed 67 pounds to the yard. To-day the average rail over the whole system weighs over $67\frac{1}{2}$ pounds. In other words, all the little lateral lines have been brought up, and our lowest standard rail to-day on our main lines is 75, and it runs up to 85. Indeed, we have some 4 miles of 100-pound rails. That is simply typical of the whole matter.

Q. Has that increase of capital taken the form of stocks or of bonds?—A. Both; it takes the shape of stocks and bonds. We will sell stocks or bonds as the markets suit. At times it is advantageous to sell stocks; there is a demand for them. Of course we supply the public with stock at that time; and if there is a demand for bonds, we sell them; and our bonds have been sold at better prices than those of any other company in the United States. We have always been in advance on the rate of interest. We issued 6 per cent bonds during the civil war. We issued 5 per cent bonds as early as 1874.

Q. You might tell us whether these various issues were floated at par.—A. They were floated at pretty near par. There were some commissions off, but they were the ordinary reasonable bankers' commissions. They were not floated at any great discount. It was a discount that we took up in the current year's earnings. In 1886 we issued $3\frac{1}{2}$ per cent bonds. We issued 4's about same time, in 1886. In 1895 we issued 3 per cent bonds.

Q. Now, what has been your practice in regard to stock issues?—A. We have never issued any stock below par. We have offered it to our stockholders at par, and that which they have not taken we have sold at the same price. There is one exception to that statement, where we sold our stock, a million dollars, at a premium; I forget how much; it is a good many years ago; but at a very considerable premium. We have never sold any stock below par.

Q. Have your stock issues been purchasable by the public generally?—A. They have been purchased as stock. We have offered it to our stockholders for 60 days or a limited time according to public notice, and then what they did not take the board of directors sold at the same price. Sometimes it takes a good long while to sell it, but we generally succeed.

Q. And you say there have been no sales below par?—A. No, not by the company; and one sale I remember very well, of a million dollars, at a considerable premium above par. My recollection is that it was about 30. It was a good many years ago.

Q. And that is equivalent to saying that every dollar of stock issued there represented so much value?—A. Yes; and more, too, primarily. Besides that, in the rehabilitation of the property, we have taken the current earnings in succeeding years by the millions—taken \$3,000,000 in the last 2 years—and put it into the property and our capitalization does not represent by, it is safe to say, \$20,000,000 what the property cost.

Q. Absolutely no water in it?—A. No; no water.

Q. The last paragraph of your printed statement reads: "All told, the books show 5 holdings of 5,000 shares, or over." Can you tell what percentage of your total shares

or capitalization is represented by those 5 holdings?—A. Off-hand, I can not. The only large holding, the Dutch holding, I should think amounts to about 40,000 shares, \$4,000,000. What the others are I really don't know at the moment.

Q. The question is whether a majority of the stock is in the hands of the five men?—A. Oh, no, nothing like it. The majority of stock is in the 5,194 small stockholders. I know that. I could not tell you how much it is. There is no other interest, I am very confident, that amounts to half that. There is 4,000,000 in 1, but bear in mind that is not one man, that Dutch administration office. I am very familiar with those people. I have known them for nearly 30 years. They have their own due bills out, their own certificates, and being the owner of one of their certificates, I can go in their office any business day and demand the Illinois Central stock. They are mere stakeholders, but the stock, as far as the company is concerned, is registered in their names. They do not, however, own a share of it, that administration office. I think that is quite a common thing in Amsterdam. It arose in this way, years ago. They wished to have the certificates in the Dutch language, which they could understand, and have somebody in Holland responsible for them. They take our certificates, lock them up in a safe, subject to the joint order of two banking firms that constitute the administration office, and of the notary public who enrolls their certificates. It is done under their notarial system. Then, if I buy one of their certificates in the market and go and tender it to them and say: "Here, I want to redeem this and take my Illinois Central stock," they must give it to me. They are very nice people. I do not want to say anything against those Dutchmen. They have been my friends all my life, but they no more own that stock than you gentlemen do. They are simply trustees.

Q. (By Mr. KENNEDY.) I would like to ask you to more clearly define what you mean by a "labor trust," as used in your paper?—A. Well, I do not want particularly to go into that. My idea is that there is somewhere or other a lot of people who make a profession of dealing in labor and dealing with labor, and those are the people I am afraid of, from the manifestations I have seen of them as professional agitators. Organized labor I understand perfectly. I understand the Brotherhood of Locomotive Engineers and other organizations. These other things have come up from time to time. They are ephemeral. They are not anything known to the law; corporations or anything tangible. They are irresponsible. They are the men who come in between us and our men, and get in control of these organizations that we were treating fairly; and our men now believe we are treating them fairly.

Q. You have nothing to fear from your own men being organized?—A. We do not fear it; but they do create a great deal of trouble; they have in the past—these disorganized people. I am an advocate of organized labor and organized everything. I do not think that anything strong and good has been done and come down in this world yet except by organized effort.

Q. Is this a fair characterization of them to call them a "labor trust," these labor organizations that you have in mind?—A. I would not call them organized labor; I have too much respect for organized labor.

Q. Then it is not a trust at all if it is not an organization?—A. I would not class them by the same name as the Brotherhood of Locomotive Engineers. These things are only organized for the moment.

Q. (By Professor JOHNSON.) The American Railway Union?—A. Yes; that was a type of them. It was a thing that lasted for a while; a thing that grows up and then disappears.

Q. (By Mr. KENNEDY.) They were not all railroad workers?—A. The American Railway Union?

Q. Yes.—A. I do not know who they were. I would not like to say who they were. I know at one time they tried to make us believe that there were not any railroad men in those riotous gangs that were around our tracks in 1894 until somebody shot one of them, and we buried him, and found out who he was.

Q. Your suggestion was that it would have been better to reduce the wages of your men instead of reducing the number of employees. You say that you were not permitted to do that. I would like to ask you what there was in the way of your carrying that out?—A. It was the apprehension of disorganizing all our labor and having a strike in the shop. Not that the men threatened to strike. We were paying the regular standard railroad scale. We were earning some money. We were doing fairly well even in those times. Our company was paying dividends; but we were not in position to force that on our men. It was the apprehension of trouble with our men. We talked it over with the men. But it was not practical.

Q. You feared a strike?—A. We were not threatened. I want to say that in justice to our men; they did not threaten anything of the kind, nor did we get far enough for it, but we felt that they might. We were not in any position to do it. Their wages were not reduced at any time.

Q. Probably if the men were organized you would have pursued a different course?—A. I think not; we would have talked that in the same way.

Q. You would have reduced their wages instead of the number of men?—A. I do not think it would have turned on their organization; it would have turned on their expression of willingness to accept a lower wage; but you see there is a regular standard scale running through all the wages, and we pay and have paid for years the standard scale.

Q. (By Professor JOHNSON.) I would like to ask you if you have definite arrangements with the locomotive engineers or conductors or any other organization in regard to the scale of wages; whether that is an agreement between your company and the organizations?—A. I do not think it is; I think it is a matter between ourselves and the organization of our men—our own men; but I would not like to say positively.

Q. The organizations say they have a contract with you.—A. I am inclined to think they confuse the agreement which is made between what they call their general grievance committee and the corporation with the contract between the Brotherhood of Locomotive Engineers, if it is a corporation, and the company as a corporation, as we would know it as lawyers.

Q. Then you think this agreement is between your local grievance committee and your superintendent?—A. Yes; our master mechanic, or general manager, or whatever it is.

Q. (By Mr. FARQUHAR.) Might the Illinois Central Railroad be characterized as a land-grant railroad?—A. It did receive a land grant from the State of Illinois, the State having received it from the Federal Government.

Q. Do you recollect what the amount of the land grant was at that time?—A. It was every alternate section for 6 miles on each side of the railroad.

Q. The main line?—A. Main line and branches, as then defined. Seven hundred and six miles, built under the charter.

Q. Have you any figures to show how much that land grant would yield to the road?—A. No; I have not got it here, because it was sold many years ago, but I can tell you very closely what it was worth when it was granted. I can not tell you what it yielded.

Q. What was it regarded as worth at that time?—A. The circumstances were these: The lands had been in the market for a number of years—many years. There were no navigable rivers through them, and therefore there was very little settlement there. The Federal Government had marked those lands down to \$1.25 an acre, and they granted to the railroad company the even numbered sections. In the act of 1850, granting the lands to the State of Illinois, they marked up the price of the alternate odd numbered sections reserved to the United States Government to \$2.50. That practice was not followed in the other land grants generally afterwards, I learned later, but it was in ours. The effect was that the land near our line reserved to the Government were sold rapidly at from \$2.50 up. At that time, in 1850, there was a great deal of Mexican war scrip floating that could be bought for from 40 to 50 cents on the dollar, and with that Government lands could be bought, and were bought. Mr. John M. Douglas—not Stephen A.—told me that just before the Illinois Central charter was granted he bought 3 sections of land up in the northern part of the State—and it is very fine land, I know it—at Wadams Station—just in that way. It cost him 50 cents an acre in cash. He was a lawyer in Galena at that time, and is dead now. He was a very accurate and truthful man.

Q. Have you disposed of all that land grant?—A. We have sold all we can sell. There are some remnants. The total sales to June 30, 1898, of donated lands aggregated 2,540,468.89 acres, leaving unsold at that time 53,645.39 acres. The whole area of donated lands amounted to 2,594,114.88 acres.

Q. (By Senator MALLORY.) Reverting to your argument, you say that in the year 1894 the men who lost employment on the Mississippi Valley railroads were nearly 1 in every 7, while in the rest of the country it was 1 in 14. Why was that?—A. I can not say exactly why, but the burden seemed to rest there, and particularly in those two groups, III and VI. The figures referred to in the text seem to show it. I suppose that constant reduction in rates had something to do with it, but I would not like to swear that it was the only thing. Business was bad all through that country. We had been going ahead very rapidly, but we had a check in the Upper Mississippi Valley, and we also had at the South a very serious check with the general stoppage of business; and the fall in the price of cotton came along about that time, a very serious fall. It is hard to say precisely what brought that about. The fact is there, and the coincidence of the lowness of the rate per ton per mile in Groups III and VI struck me with force enough to bring it to the attention of the commis-

sioners; but I would not like to swear that that produced the discharge of those men; that would be going a little too far.

Q. Well, in your judgment is there not some connection between that condition and the discharge of the men?—A. I think there is, undoubtedly. We had been doing business at a loss, and when the railroads came to a realizing sense of it they simply discharged their men.

Q. From your statement and showing, the roads running down the Mississippi Valley, say from Chicago and St. Louis to New Orleans, ought to be able to haul freight at a less cost per ton per mile than the roads crossing the Allegheny and Blue Ridge mountains?—A. Give us the volume and we will do it.

Q. And I infer from your argument that you think that New Orleans ought to be a point of much greater exportation than it is. In your judgment does not the fact that New Orleans is 20 days distant from Liverpool, and even a longer distance from continental ports, while New York is only about an average of 8 or 9 for freight steamers, would not that have some qualifying effect on that matter?—A. I do not think it would on the freights made. As I understand, the time for freight, New York to Liverpool, is 10 days; New Orleans to Liverpool, 16 to 17; I think that is about the difference. That is more than the ratio of distances, but the New York ships would average better time; faster ships, perhaps. But that all goes into the question of rates. I do not think the time would control on exports when you consider what the exports are. They are cotton and products of cotton; they are grain and the products of grain; beef and the products of beef, including meats of all kinds; those are the great things—and lumber. Now, those things are not needed with great expedition, but dry goods are, and especially silk goods, and things that have to meet the fashion. Answering your question, I would say, on imports, yes; exports, no. The ocean rates from New Orleans are higher than from New York. That is the advantage New York has. New Orleans rates are higher. It is a longer journey; a journey, I should say, 50 per cent greater. On the other hand you keep in the Gulf Stream and away from Newfoundland. In the case of New Orleans the great circle from the point of Florida does not carry you so far north as the great circle from New York would.

Q. The same could be said of Galveston, also?—A. It would apply generally. I tried to make my remarks apply to Gulf ports generally, although, of course, the specified points I had to name and the statistics I had to give relate to New Orleans. I do not know about the others.

Q. Is it not a fact that your export rates from Chicago via New Orleans to Europe regulate the export rates via New York to Europe?—A. No; just the contrary. They make the rates. New York has the good will of the business.

Q. (By Mr. FARQUHAR.) Has the question of return cargoes entered into that matter with you; return cargoes to New Orleans, character of cargo, etc.?—A. It is very light; yes. The imports via New Orleans are very light. Our north-bound freight, however, is not light by any means. We have bananas to carry North; we have sugar to carry North; and after we get a little way from New Orleans into the long-leaf pine country we have lumber to carry North; and we also have cypress lumber, and the deciduous lumber, oak and ash, from all that territory; so that our north-bound business and our south-bound business at times come very even. In the year 1898 it did not vary 1 per cent.

Q. (By Mr. CLARKE.) Do you not carry a great deal of cotton also?—A. Well, not much North; but cotton preponderates South. New Orleans is the great market. We carried into New Orleans last year upward of a million bales of cotton. That is about one-tenth of all the cotton grown in the United States.

Q. (By Mr. FARQUHAR.) Until manufacturing occurs in the South and Southwest do you expect much of a return cargo to be shipped there, so as to make New Orleans a great depot?—A. Well, I have been expecting it so long. "Hope deferred maketh the heart sick." New Orleans used to market everything imported into the Mississippi Valley. In 1852 the Illinois Central Railroad was begun to be built, and its building was completed with English rails brought to New Orleans and carried up the Mississippi River. The other roads in Illinois at that time were built in that way.

Q. Was not that the time when the rivers there—the Ohio and Mississippi—controlled nearly all the carrying trade of that whole section?—A. Now, why should not the railroads of that section control the carrying trade of that section?

Q. Is it not because the manufacturing line is North?—A. Yes; but I am talking on import goods now. On the goods we are importing, why should they not come in that way?

Q. Is it not because you have a great open market right up in Chicago there that sets you right out in immediate contact with New York, and because you need to be in

contact with the money market, too—the Wall street exchange?—A. I will agree with you; but in the coffee business—that is the natural way to bring it in here. Why should coffee, for instance, come from Rio Janeiro to Baltimore and come into Chicago and then drift down into the Mississippi Valley? Why should it not come to New Orleans? Why should it not come from La Guayra and Mexico?

Q. While the barge system was in existence on the Mississippi River what effect did it have on the rates?—A. It is still in existence; but it is not the factor it was. They used to take a great deal of grain and heavy freights, but our rates have got so low that, including the two elements of marine insurance and our better delivery at the point of destination, being able to switch all around towns, our rates are as low as theirs for practical purposes. The barge line has not been the factor it used to be in our business. I can give you a very good illustration of that in regard to another business—cotton. It used to be carried from Memphis to New Orleans in steamboats in large quantities—upward of a hundred thousand bales a year. I watched for 3 years the shipments from Memphis by boat to New Orleans, and they did not carry 1 bale in 3 successive years. The railroad rates had got so low, including marine insurance and the delivery, that we could take cotton from Memphis and contract to put it alongside a ship on a day certain, whereas a steamboat could not.

Q. What is the relative difference between the rates from Kansas City to Galveston and from Cairo to New Orleans?—A. I am sorry to state that I can not tell you; I do not follow the rates. I have very little to do with that business. I know there is that competition every day in the year. We are interested in the Kansas City situation in another way. The Memphis, Kansas City and Birmingham road brings us considerable freight at Memphis.

A question by Professor Johnson led up to a matter on which I wrote something. It was on that question of capitalization, and the thought came to me after I had prepared the paper already read to you. The facts are interesting, I think. (Reading.)

"As to capitalization: The statement that the railways of the United States are overcapitalized has been so often reiterated as to be quite generally believed.

"While I know not only that there is no water in the securities of the Illinois Central Railroad Company, but that their sum total does not represent by millions of dollars the cash actually spent on the property, permit me to call your attention to the following statements, taken, with respect to the railroads of the United States, from the statistical reports of the Interstate Commerce Commission, and with respect to those of the United Kingdom of Great Britain and Ireland, from the returns of the British board of trade.

"The statements contrast the situation in 1890—the first year for which the Interstate Commerce Commission published statistical reports—with the year 1898.

"It will be seen therefrom that, while the number of miles of railroad in the United States has increased 18.06 per cent, their capitalization, including both bonds and stock, has increased only 14.64 per cent; and that the increase in the capitalization per mile of railroad is \$3, a sum too small to be expressed in percentages, less than one-half of one-hundredth of 1 per cent.

"Also that the gross receipts of the railroads in the United States have increased in almost exactly the same ratio as the miles operated, viz, 18.58 per cent, while their gross receipts per mile have increased \$30, or less than one-half ($\frac{1}{20}$) of 1 per cent. This in a country which has developed enormously in the meanwhile, and whose population is estimated by the Interstate Commerce Commission to be increasing at the rate of 1,250,000 per annum.

"On the other hand, in the same time in the United Kingdom the number of miles operated increased 7.9 per cent, the capital increased 26.41 per cent, the capital per mile operated increased 17.15 per cent, gross receipts increased in amount 20.39 per cent, and per mile operated, 11.57 per cent.

"While it is true that, as a whole, the English railways are better built than ours, there are many points in which ours excel them, and there are also thousands of miles of railroad in the United States which are well and permanently constructed.

"The capitalization, including bonds and stocks, of the railroads in the United States, is \$60,343 per mile; that of the railways in Great Britain, £52,379 per mile, which, at \$5 to the pound, equals \$261,895.

"The increase in the capitalization of the railroads of the United States per mile in 9 years has been, as above stated, \$3.

"The increase in the capitalization of the British railways per mile during the same 9 years has been £7,669, or, at \$5 to the pound, \$38,345.

"The figures are given as reported, without accepting responsibility for their accuracy."

Railways in the United Kingdom.

[Stated in dollars, £1 being taken as worth \$5.]

¹ Less than one-half of one-hundredth of 1 per cent.

I think there are some inaccuracies in the Interstate Commerce Commission's figures, and I have had a good deal of correspondence with them about that. I have been very much impressed with that difference within the last 10 years. What may have happened 40 or 50 years ago I do not know, but in the last 10 years the railroads of the United States have gone through a process of undercapitalization, not only as to the amount, but as to the rate of interest. In all the recent reorganizations the 7 per cent bonds which the bondholder had a right to exact under his contract have been put in at 3½ and at 4 or 3, or whatever the rate may be. There has been a tremendous undercapitalization in the last 10 years out of that. I can point out 6 miles of the Illinois Central Railroad on which we have spent \$6,000,000 in the last 10 years and not \$1 of capital has been issued for it. We may have borrowed a few dollars of money, but I mean no stock has been issued for it; and that is going on all over the country.

Q. Do the Interstate Commerce Commission or do you railway men ever take into account the amount of local stock and of common stock that by reorganization is entirely wiped out and does not appear on a single figure to-day? For instance, township stock, county, State, or city stock and private individual stock, taken up in these reorganizations, has been entirely wiped out of existence and never shows in any figures whatever on the record. Are there not millions involved in that way that never show up?—A. I had a personal experience on that line. In 1877 I came back into the Illinois Central service. I had been out for a while, and then came back, as secretary of a reorganization committee for the New Orleans, Jackson and Great Northern and the Mississippi Central Railroad, leading from Cairo to New Orleans, 567 miles. Those 2 concerns had a capitalization, as shown by their reports, of about \$50,000,000. They were bankrupt; they were physical wrecks; and we went to work and in 5 years thoroughly rebuilt them. We relaid every bar of iron with new steel rails; we rebuilt all their engines and all their cars and added to them, and at the end of the time we turned them over with a capitalization of \$28,000,000, and it went on the books of the Illinois Central at that figure, having in the meanwhile spent the earnings of 5 years, and that was all the money we could scrape together. The difference between the \$50,000,000 and \$28,000,000 was not what I spoke about earlier as being at least \$20,000,000 in the Illinois Central property which is not shown by capitalization there. I mean real property—real money applied to the purposes of the corporation. I should say there must be something like \$20,000,000 of it. I would not like to swear to the figures, but it is many millions—I would certainly swear to that.

Q. (By Mr. KENNEDY.) Have you fixed any limit to your capitalization?—A. No; there is no limit; that is to say, it is authorized from time to time to be issued by our board of directors.

Q. (By Mr. C. J. HARRIS.) Have you been able to pay dividends in these depressing years?—A. Yes; we have always paid dividends. The Illinois Central Railroad has always paid a 6-monthly, semiannual dividend. We have paid in recent years at the rate of 5 per cent.

Q. (By Mr. CLARKE.) Was any of this shrinkage to which you referred traceable to the increased value in money?—A. No; the loss in those Southern railroads was due to two facts—the war and the reconstruction period. During the war the railroads were destroyed. I had in my possession—I suppose I have still—2 receipts given, 1 by a Federal officer and 1 by a Confederate officer, for the destruction of a bridge across Yalabusha River, near Grenada, Miss. It was in Forrest's country, where General Forrest was cavorting around there back of Memphis in north Mississippi. I merely mention that as showing what went on. Bridges were destroyed over and over again during the war. And then came the period of national political reconstruction and the period also of the reconstruction of these railroads; and there were carpetbaggers in both; there was rascality in the railroads.

Q. I suppose some of the earlier capitalizations of your various roads were on the greenback basis, and when we got to the gold standard of course there was a shrinkage?—A. Well, of course, there was a shrinkage; and as a result of that panic of 1873 the Illinois Central, which had been paying 8 to 10 per cent, had shrunk; they got down in 1877 to paying 4 per cent. But I do not know that there was any shrinkage in the capitalization; it was in the earning power.

Q. More millions of stock on a greenback basis would have to be issued than on the gold basis, of course, at a gold premium?—A. Some of our stock was issued during the war.

Q. I would like to inquire if there has been a large natural increase in the value of your locations, especially in cities?—A. I think there has been in Chicago, very large; and elsewhere, but chiefly in Chicago.

Q. Is that fully covered by your present capitalization?—A. No; our land in Chicago, as far as capitalized at all, stands on our books at just what it cost 40 or 50 years ago. That has never been marked up. Those things have stood.

Q. Your position, then, and your opportunity to do business, the value of which is constantly increasing, would bear in your judgment a much larger capital than is shown in the amount issued?—A. The mayor of the city of Chicago had an estimate made by experts within 2 or 3 years—I think it was Mr. Mayor Swift, the predecessor of the present mayor—of the value of the property of the Illinois Central Railroad on our first mile, and he brought in figures of about \$34,500,000. I should say that that property probably stands on the company's books at \$200,000. I do not know the figures. Now, that is the same unearned increment that any other owner of real property would have had if he bought it. When this company was organized with \$17,000,000 of paid-in capital, the directors themselves paid in \$2.50 per share, and made themselves personally liable for \$97.50, and they were the first men in New York at that time. They were men like William H. Aspinwall and Jonathan Sturges, George Griswold and Ludlow—I can give you the names of all of them—merchants in good standing. They believed that the sale of the land would build the railroad, and therefore were willing to make themselves personally liable. Then came the panic of 1857 and these gentlemen, after indorsing the company's paper very largely, had great trouble to pull through, and they assessed themselves on that stock first \$20 and then \$10 more and then \$10 more until every last dollar was paid in on that \$17,000,000 of stock. Now, suppose those gentlemen, intelligent men, men of affairs, had gone into the city of Chicago and taken their \$17,000,000 and bought corner lots and let somebody else build this fool railroad. It nearly broke them; it did break some of them. They had the money to do it, and they had the credit, and they could get money just as well for Chicago real estate as they could for the railroad.

Q. (By Professor JOHNSON.) There is a question connected with taxation on which I think I would like to hear from you. The Illinois Central pays to the State of Illinois a tax upon its receipts?—A. Yes.

Q. And the amount is fixed by the State constitution, I believe?—A. Yes; it is fixed in the charter, and then the constitution provides that it shall not be altered.

Q. Will you please give us your views on the question of taxation, as to the best system, and as to the working of the various systems?—A. It seems to me that a tax on gross receipts, if properly regulated as to per cent, would be the fairest tax. Seven per cent is undoubtedly excessive.

Q. That is, on gross receipts in the State of Illinois?—A. Yes; we pay 7 per cent, and that is undoubtedly excessive. It is very much more than other railroads pay, and it is more than the business will bear. That was accepted by my predecessors, and I do not complain. We have made our bargain with the State of Illinois and we have lived up to it and we shall; but that was predicated on the railroads in the New

England States showing, in the years previous to 1850, that they could be operated for less than 50 per cent of their gross receipts, payment of taxes and everything else.

Our people thought, and it is in writing that they said so, that the railroads in Illinois, on those flat prairies, with coal abundant under the soil, could be operated for less. Now, if we got 55 per cent of our gross receipts, after paying operating expenses, you know, if we had that left, we could afford to pay the State 7 per cent; but as a matter of fact, we have only less than 30; our operating expenses run up to about 70 per cent. Last year, including taxes, it came to 69.580 per cent—operating expenses, very nearly 70 per cent, leaving 30.420 per cent as net. Now I have deducted there all taxes, taking the whole railroad as a system. To take from a business which it costs 62½ per cent to operate 7 per cent out of the 37½ left is too large a proportion for a tax. We should get to some figures such as they have up in Wisconsin, 2½ to 4, varying with the different classes of railroads. My reason for believing that a tax on gross receipts is a fair thing is that it is a tax on the money which the railroads take from the people for transportation in a quasi public service. Now, it is not unfair to the railroads, it seems to me, that they should be taxed in proportion as they take, just as I might be taxed on my income. There is nothing unfair in that. Nobody pretended that there was anything unfair in an income tax properly adjusted.

Q. (By Senator MALLORY.) How many employees have you in connection with your system?—A. The 2 railroads, the Illinois Central and the Yazoo and Mississippi Valley, have 28,750.

Q. Has your system any objection to employing men who belong to labor organizations?—A. No; we employ them regardless of what they do in that respect.

Q. Have you any arrangement with the men providing for them in case of sickness or injury?—A. We have on one division; on the Louisville division. We have a hospital fund there. There is a small contribution by the men from their wages and the company contributes a house and the land. The details of that I am not very conversant with—whether we make a monthly addition to it or not.

Q. The money for running it comes out of the earnings of the men?—A. A part of it does, I know. The company furnishes them with a very nice house and a piece of land and all the transportation for the hospital, etc., of course; but whether we make a payment of money I do not know.

Q. Is it compulsory on the men to subscribe to it?—A. No.

Q. Or is it just a matter of their own?—A. They all do it, though. They see the advantage of that. It is in a country where hospitals are not as close together as they would be here—western Kentucky and along the Ohio River.

Q. What are your hours of labor for train hands—men who are connected with the running of trains? Do most locomotive engineers and train hands work by the mile?—A. Yes; and we watch those men very carefully. The master mechanic watches that; looks his men over to see that a man can not go out unless he has had his sleep, and all that sort of thing.

Q. Have you any rule regarding intoxication of employees?—A. Yes; especially the men on the trains.

Q. I assume that that is rigidly enforced?—A. Yes; that is enforced.

Q. To what extent has the Illinois Central complied with the law requiring automatic couplers and air brakes to be put upon freight cars?—A. I can give you that information down to the 30th of June. It is in Mr. Harahan's report. On the 30th of June we had 95.39 per cent of our freight equipment equipped with automatic couplers and we had 38.83 per cent of our freight equipment equipped with air brakes. Of course all the passenger equipment is equipped with both. We will conform with the law at the end of the year.

Q. Have you any complaint to make about the system of ticket brokerage as it is practiced in this country to-day?—A. I did not come here to make any complaint, if you ask me the question.

Q. Have you any criticism to make?—A. Yes; the thing is wrong, because the companies are not free merchants. They can not sell above their advertised rates, and under those circumstances it seems to me that we ought to be protected against such sale by others below our rates. While I know that other railroad men will not agree with me—I do not suppose anybody will agree with me—I have always thought that that thing could be cured by a very simple statute, which would require every ticket to be stamped with the price at which it is sold and to be redeemable by the company issuing it within 30 days, if presented, in proportion to the part used on any coupon; not on any piece of a ticket or on a piece of a coupon. A piece of a ticket would be cutting it up a little too small. But if there is a ticket sold from Boston by the Boston and Albany Railroad to Albany, by the New York Central Railroad and over the New York Central Railroad to Buffalo, and over the Lake Shore Railroad to Chicago, and so on across the continent, and a man does not use one of

those coupons, I think he is entitled to have his money back; and if the price of the whole ticket is stamped on there, printed on there in plain figures, there will be no quarrel as to what the proportion is, and there will be no reason for the life of the ticket broker except forgery. He would be out of any honest business that he has. I admit that they have some honest business; but there would be no reason for their existence except some of the things that they are accused of doing—altering the dates and places. But I do not believe the other railroad men would agree with me in that. I proposed it years ago. I think that such legislation would kill the ticket broker so that you would never hear of him again.

Q. (By Mr. KENNEDY.) Is not the proportion of business which the ticket broker does on unused portions of tickets very small in comparison to the business that is turned over to him by the railroads themselves?—A. I do not know about that, frankly. I imagine that there are some of the weak roads that do that business. I know that it is in evidence in the Interstate Commerce Commission, reported in their first big investigation in Chicago 8 or 10 years ago, that they found the tickets of every railroad except the Illinois Central in the scalpers' offices. I have had no dealings with them, and I do not think our people have. I think you are right about that—that there is some of that business going on at times. I doubt whether there is just at this moment.

Q. The statement you just made in regard to the finding of the Interstate Commerce Commission would seem to bear that out.—A. This is 10 years ago—1888, I think it was—one of their first investigations.

Q. Can not the railroads correct this evil themselves without going to Congress for it?—A. I do not see how we can prevent any other railroad company which has a line to points which we reach selling that ticket at any price they please through a broker as long as a broker exists.

Q. Then part of your object in going to Congress will be to control the action of those other railroads as much as that of these scalpers?—A. Undoubtedly.

Q. (By Senator MALLORY.) There is a feature of discrimination in the practical working of the ticket brokerage business, is there not, as where a man gets a ticket to travel over a certain distance at a less rate than the advertised rate which the public is generally called on to pay?—A. You mean that the railroad company sells a ticket to the broker and pays him a commission for the sale out of which he scalps the rate?

Q. I do not care to go into any details of that kind. What I meant to say was this: The principle on which this business is done is such that a man who buys a ticket from a ticket broker gets a ticket, say, from here to New York, at a less rate than he will be able to get a ticket from the railroad company; he pays less for it, less than the published rates, and it is therefore an infringement of the law, a violation of the law, very plain and flagrant.—A. You and I are not prohibited from selling tickets at any price, as I understand it, under the statute nor from buying. The law does not prohibit me from buying a ticket for \$20 and turning around and selling it to you for \$15. It does as a railroad officer, but not as an individual.

Q. As an officer of the company, yes.—A. Undoubtedly; it would be a violation of the statute.

Q. What have you to say about the giving of passes by railroads to individuals, discriminating against other individuals?—A. I think the evil in that is largely due to the twenty-second section of the act to regulate commerce. After carefully drafting a bill prohibiting discrimination they provide in this way (reading):

"Sec. 22. That nothing in this act shall prevent the carriage, storage, or handling of property free or at reduced rates for the United States, or municipal governments, or for charitable purposes, or to or from fairs and expositions for exhibition thereat, or the free carriage of destitute and homeless persons transported by charitable societies, and the necessary agents employed in such transportation, or the issuance of mileage, excursion, or commutation passenger tickets; nothing in this act shall be construed to prohibit any common carrier from giving reduced rates to ministers of religion, or to municipal governments for the transportation of indigent persons, or to inmates of the (2) National Homes or State Homes for disabled volunteer soldiers and of soldiers' and sailors' orphan homes, including those about to enter and those returning home after discharge, under arrangements with the boards of managers of said Homes. Nothing in this act shall be construed to prevent railroads from giving free carriage to their own officers and employees, or to prevent the principal officers of any railroad company or companies from exchanging passes or tickets with other railroad companies for their officers and employees."

Now, there are 20 lines, half a page, of exceptions, and the law has so expressed them that you can not see the limits of the exceptions. There should be a provision there for commutation tickets and mileage tickets, and then strike out all exceptions

looking for reduced rates for charity, for the United States Government, and for municipal governments, and, above all, for other railroad men—strike that all out; and about the employees of the company itself. Cut out all these exceptions and forbid discrimination absolutely. Each railroad company will take care of its own employees very easily by increasing their pay or giving them an allowance for traveling. The root of the evil is in the exchange of passes. If you can cut that out you have done a great deal toward the whole. Why should I, who happen to belong to the Protestant Episcopal Church, be called upon to carry a Roman Catholic or a Hebrew minister free?

Q. (By Professor JOHNSON.) Is not the granting of passes an illegal discrimination when you carry a man across the boundary of a State?—A. I would rather you would prove it by some other witness, gentlemen, to put it in all candor. (Laughter.)

Q. (By Senator MALLORY.) Do you regard it as an evil?—A. Yes. I am so constituted I do not believe in giving something for nothing under any circumstances. I think the evil of the pass situation is, seriously, this: It is the only way of getting value out of the treasury of the railroad company without leaving a voucher. There is no other way known to me.

Q. (By Professor JOHNSON.) Do not the railroad companies give these passes for value to be received?—A. Some of them, but the particular value received is not of record.

Q. It is not of record, but is it not in the form of favors of various kinds?—A. I am giving passes now to persons that are serving the company well, and they are entitled to it. I can defend hundreds of passes. There are reasons; but the same thing would enable me to go right to the treasury of the company and put in a voucher and give these men, say, \$100, just exactly the same. If it is defensible for value received, it can be paid by money.

Q. (By Senator MALLORY.) What do you say about these passes given to members of the legislature and members of Congress and Senators?—A. I think the whole thing should be stopped.

Q. Do you think there is value received in this case?—A. I have been told there is at times.

Q. (By Mr. KENNEDY.) Do you think there is any chance of getting value received from the ministers by issuing them passes?—A. Hereafter?

Q. No, now.—A. I do not know. Yes; there is something in that if you consider the corporation as a moral being, which it is not. If you consider it simply as what it is—a corporation for gain—I do not see why the clergyman should be helped in his business any more than a shoemaker should be in his. They are both doing good and perhaps the shoemaker is doing the most good.

Q. The ministers come up almost unanimously and denounce to Congress the immoral practices of discrimination.—A. I am glad to see they are after it. It is their business to denounce immoral practices.

Q. (By Mr. FAIRBANKS.) If the corporation is on the line of a moral being, what do you say of a community that leaves church property untaxed?—A. I would tax it.

Q. Has that the character of a moral being?—A. I would advocate taxing it. I do not see why Congress, in legislating on this subject, should put it in the hands of a manager of a railroad who belongs to some particular church to make this discrimination. I try to be honest in what I do, but belonging to one denomination I can see the demands of that denomination more clearly than I can any other. I am naturally so constituted. So far as the issuance of free transportation passes through my hands personally, a clergyman of the Protestant Episcopal Church would probably have someone whom I know who could come to me, while a clergyman of the Methodist Church, for instance, might not have a way of approaching me. If the other men who grant passes are in like case, why not strike it out absolutely and stop it? Why should not the law say there shall be no discrimination? Then I see no loopholes, rat holes, and no leaks. It is pretty high ground to take and I know most railroad men will not agree with me. I doubt if any of them will.

Q. Do you think if the pass system were abolished there would be any decrease of rate to the paying passengers?—A. No; I do not think it amounts to enough to affect the passenger earnings. All my railroad friends say, "Fish, what are you fighting for? The thing does not amount to enough to make it worth while to stop it." I do not think it affects the revenue to any considerable extent. The people simply would not travel.

Q. (By Mr. KENNEDY.) Congressmen and legislators would travel, would they not? A. Members of Congress would travel, yes; but they are not many; 400 perhaps.

Q. State legislatures in every State?—A. Yes; but they would not go home on Friday; they would go up and sit 6 days in the week and stay a fortnight and get their mileage and adjourn.

Q. (By Senator MALLORY.) What is your judgment in regard to discriminations as practiced to-day compared with those practiced a year ago or two years ago?—A. I think the situation is good to-day. Rates are fairly well maintained generally over the United States to-day; better than they have been.

Q. What do you ascribe that to?—A. The conferences between the Interstate Commerce Commission and the railroad people have had a very good effect. Then the abundant crops and the immense amount of tonnage freight has had another, and the getting of certain railroads into fewer hands has had an effect—consolidation.

Q. You think consolidation has a tendency to affect competition?—A. It checks the destructive kind of competition.

Q. Competition is really the cause of discrimination?—A. Yes; I do not see anything else that could cause it.

Q. If there was no competition there would be no reason for discrimination, would there?—A. No more than in the sale of any other commodity.

Q. What is the principal method of discrimination now in existence that you know, if you know of any, whereby certain individuals get a benefit out of railroad transportation which others do not?—A. As I said before, I am not in that part of the business to any extent, but it is the little things that the Interstate Commerce Commission have talked about so much, the underbidding and underweighing, any kind of rebates, contracts, and everything else; I do not think there is any one worse than the others.

Q. They are not practiced as much now as they were?—A. No.

Q. One system to which our attention has been called by several witnesses is where mileage is paid for the use of private cars owned by firms or individuals, which is a considerable amount on each car. Have you given any consideration to that question?—A. Necessarily. I think that it is less of an evil than it was. The cost of repairing cars as they become larger and heavier and more complicated in their construction increases. By holding the rate of mileage down we will come to a point where there is no particular profit to the owners of the car; where the mileage will just pay for the wear and tear on the car; I think the two things will gradually come together on that.

Q. Are not this class of shippers who own these cars sufficiently powerful to compel the railroads to give them the rates of mileage they want?—A. I think they would have great difficulty in getting the rate raised again. You see, the railroads are getting much more powerful in the sense of being better able to buy equipment of their own. The day when the railroad went to the shipper to borrow equipment is past. As a rule, the railroads do not invest in that kind of car; the refrigerator car, for instance, for beef. Of course, these great packers do own refrigerator cars and they refuse to ship in anything else, and that is where they have it.

Q. Are they not sufficiently powerful to say to the railroad shipping it, for instance, if you do not give us this mileage, which we are accustomed to get from you, we will ship by another road?—A. They can get the mileage but as the car becomes more expensive I do not think they will find it easy to get more mileage. Suppose a refrigerator car costs \$800; suppose the price goes up to \$1,000—25 per cent increase; it will not get an increased mileage; the thing will tend to close itself up there.

Q. In your State do you recognize the distinction between export rates and what are known as inland rates?—A. We have to.

Q. Shipping down through the Mississippi Valley to New Orleans, for instance?—A. We have to.

Q. What do you mean by having to do it?—A. Here is grain, for instance, coming into our local stations in Illinois. That has to go to Liverpool and the ocean rate is so much. Now, we must either let that business go entirely or make a lower rate than the local rate on grain. We have done it over and over again. The question is up before the Interstate Commerce Commission now, and it has been for months, on that sort of discrimination.

Q. You think it is absolutely necessary for the business; if you do not make a discrimination there will be no export business?—A. Either that or to reduce our local rate to New Orleans to a point at which it would not pay us to haul it. Our condition is very different from that of the Eastern trunk lines because we have a grain producing country all along our road more or less until you get close to New Orleans and we have no large consumption of grain in New Orleans, only to feed that quarter of a million people; no flouring industry, especially; no manufacturing into crackers or anything of that sort; no glucose factory or things of that kind to consume corn, and our local shipment is small. Our rates are reasonable in there and our export business is large and in order to get to the port of New Orleans we have, at times, to make a lower rate than the local.

Q. I understand you to say, then, if you were prohibited from making discriminations between your export and local rates you would not have that export business?—

A. We would have to give it up or carry our local way down below the cost on so small a volume as the local. You see we do this export business by the train load and deliver it into our elevators in New Orleans, and it goes on the ship, and we have these cars back on the track inside of a few hours. On the other hand, if we have to handle that grain through a house in sacks or something of that kind, we hold these cars around there waiting on the convenience of the consignee for days or weeks.

This difference between export rates and local rates arises from a commercial necessity which is universally recognized. The same is true in all business. Every merchant does it. Every manufacturer does it. He keeps the foreign markets as a place on which to throw his surplus and relieve himself, even if he has to do it at a loss. In Europe and especially in England it works clearly against the local consumer, because there the freight is carried from one border of the country clear through it to the other and out of the other side; either the consignee or the consignor, both of whom are foreign to that country, gains the whole advantage. With us the case is different. If there is a glut due to overabundant crops, overproduction in some point, we will say, in central Illinois, in so far as we relieve that glut by making a low rate on export, we raise the price on the farm of that grain, and help the producer to that extent. Moreover, this thing is an absolute necessity, if the United States are going to stay in competition with the other points of production like Argentina, India, Japan, Australia, and Asia. If we are to be cut off from the power to do the same thing that they do, we are at a disadvantage. It is not a thing the railroads seek or want to do, it is a thing they must do. The question of the legality of that discrimination is before the Interstate Commerce Commission and has been for a long time.

Q. The question of discrimination between flour and wheat has also, I believe, been before the commission; the rates from Chicago and the West generally to the Atlantic seaboard?—A. I do not think that applies on our business, so far as I know.

Q. The great point of objection to-day against railroads, one which is urged more than any other, is that of discrimination; and the railroad people, so far as we can judge, are inclined to think that is correct, and that that accusation would not necessarily be made against them if they had a right to deal more freely with each other and make contracts concerning the rates. What is your view about that?—A. I have never been an ardent advocate of the pooling bill, but I believe if I were differently situated, if the property I represent was differently situated, I should advocate that as ardently as the others. We had a very large per cent—84 per cent of local traffic—which is ours; and while the pool would affect more or less all of that, we have got that, which we live on, and we can stand it.

Q. It is yours?—A. It is ours. You see our position in regard to the grain business is that there is brought to our local stations somewhere from 70,000,000 to 90,000,000 bushels of grain in a year, one time and another, and we have never exported more than 23,000,000. Now, that local business we will haul somewhere. We may haul it to New Orleans for export, or we may haul it to other lines and give to Eastern trunk lines, but we will get something out of it always.

Q. Eliminating your position in connection with a road that is not harassed much by local competition?—A. (Interrupting.) We have lots of competition.

Q. Well, you have 84 per cent of your business pretty secure, you say?—A. No; I say that is our business. We are contented with it. If we went around and made 80 per cent of our business competitive, we might have four or five times as much competitive business but we might not make any more money. That is what I mean. We are attending to our own legitimate business in our own country, and getting 84 per cent local now. I saw the statement of one road that got 82 per cent competitive through and 18 local. If we could come to that position and retain the 84 which we have now, we would have that much in addition of the competitive business. We have not reached out for that business and do not want to. I do not think there is much profit in it.

Q. You do not agree, you say, with the sentiment which seems to be quite strong among railroad people that it would be a good thing for them to be allowed to make pooling contracts which would be valid?—A. I do; but I do not think it is going to be a panacea. I think it is but fair to give them the right to contract. I do not think it was fair of Congress to deprive them of that right. I am not at all opposed to the pooling bill, but I believe we will have wars and rumors of wars if the pooling bill is passed.

Q. (By Professor JOHNSON.) On this question of local and through rates, your statement is very strong. I should like for our information to know what you consider local and what through; what you consider the basis of your classification?—

A. I telegraphed for that. I have it here. I guessed that question would come up. (Reading:) "Business moving between terminal stations of northern, western, and

southern lines"—I will explain those terms later—"or over entire line is considered as through. Cincinnati also a terminal point. Example: Between Chicago and New Orleans, Cairo, Dubuque, Sioux City, East St. Louis; between New Orleans and Memphis, Louisville, Cairo, East St. Louis; between Sioux City and Dubuque, East St. Louis, Cairo, Memphis, New Orleans. All other freight considered local." That is the same classification which prevailed right along. I said I would define those terms. The terminal stations of the northern lines are Dubuque, Chicago, Cairo—a triangle; of southern lines, Cairo and New Orleans, with Memphis, Louisville, or Cincinnati on the flank.

Q. (By Senator MALLORY.) What do you think of the idea of Congress requiring a Government inspector to visit all interstate railroads and look into their business, and if he finds anything that is prohibited by the interstate commerce law make it public, make complaint?—A. I do not believe he will find much.

Q. I infer from that you do not approve of that plan of railroad restriction?—A. I do not think it is necessary to have that minute examination, which might also be called espionage, on a lawful business, in order to keep men who are addicted to unlawful practices from pursuing them. I think the thing to do is to fine the companies and enforce that law and put somebody in the penitentiary. We are told the interstate commerce law is violated continuously, and yet in ten years no one has been punished for it.

Q. (By Mr. KENNEDY.) Could we not find out a great deal more if we had such expert examiners?—A. If so, why does not somebody do it? It is not my business to go around and do it; nor do I think it is the business of the courts to do it. It strikes me it is the failure of the person who is hurt to make the complaint.

Q. (By Senator MALLORY.) These people complain that they are individuals and that they can not make any headway against a railroad, and I think the facts indicate the truth of that. Where a case of unjust discrimination or a case of excessive freight rate is charged against a railroad, the Interstate Commerce Commission may decide in favor of the complainant, but it would be years before the matter would be finally disposed of, by going up to the different courts on appeal, and really the case and everything else is forgotten. The man who brought the original suit is dead. Now, for that reason, by reason of the delay and the alleged injustice which arises out of that delay, it has been thought that by having an official whose duty it would be to call attention to these cases and make complaint—not necessarily to have a lawsuit, but to call the attention of the public to the fact—that it would be an amendment that would perhaps be very beneficial in checking such things?—A. The idea is a new one to me. I had not thought much about it; but I think it would be futile.

Q. You do not think they would be able to discover anything wrong?—A. Well, I do not mean thereby to say there is nothing wrong, but I do not see how an officer of that kind is going to find out very much, not enough to earn his salary.

Q. (By Professor JOHNSON.) Do you think the bank examiners are able to find out anything?—A. The worst fraud I ever knew of in a bank (I was a victim of it) was where the bank was robbed of \$90,000, and it was only found out by accident the next morning, after the examining officer had given us a clean bill. We were robbed of \$90,000 and no one knew it. It had been going on for months, and the books showed it, too.

Q. (By Mr. C. J. HARRIS.) What is your opinion as to Government ownership of roads?—A. I think it would be a bad day for the Government and a good day for the railroads. We would get out of a not over-profitable business, and I do not believe the Government could operate them within many per cent as cheaply as we do.

CHICAGO, ILL., November 15, 1899.

TESTIMONY OF HON. JOHN H. REAGAN,*Chairman of the Railroad Commission of Texas.*

The subcommission on transportation met at 10 a. m., November 15, 1899, in Chicago, Representative Lorimer presiding. Hon. John H. Reagan was introduced as a witness and, being duly sworn, testified concerning transportation as follows:

Q. (By Mr. C. J. HARRIS.) Please state your name and address.—A. John H. Reagan; my post-office address is Palestine, Tex.; place of business, Austin, Tex.

Q. Please state your relations, officially and otherwise, in regard to the railroads of the country.—A. I am chairman of the railroad commission of the State of Texas.

Q. (By Representative LORIMER.) Have you a paper to submit?—A. If the commission will permit me I would like to read a statement and then subject myself to such examination as you wish to make.

I do not propose to discuss the question as to the details of railroad transportation, except as they may be necessarily involved in the consideration of the greater question of the solution of the railroad problem.

I propose first to make some suggestions as to necessary legislation by Congress as to interstate and foreign transportation, and by the State legislatures as to transportation beginning and ending in a State, which seems to me to be necessary for the proper settlement of this greatest of our economic questions.

1. Congress should empower the Interstate Commerce Commission to make, regulate, and maintain freight rates and passenger fares as these relate to interstate and foreign commerce. And the several legislatures should make like provision for State traffic.

This I believe to be entirely practicable. The railroad commission of Texas is clothed with these powers and duties. On the 30th of June, 1899, the aggregate mileage of railroads in the State of Texas was about 9,675 miles. With the large powers above referred to this system of railroads is successfully managed by 3 railroad commissioners, 2 rate men, 1 auditor, 1 engineer, a secretary, and 1 clerk, who does the shorthand and typewriting—9 in all. There are about 70 railroads in this system. On the 30th of June, 1898, there were in the United States 184,428 miles of railroad. The total number of railways in the United States on the 30th of June, 1897, was 1,987. For the same year there were about 130 persons, including the commissioners, employed in the service of the Interstate Commerce Commission. Now, if 9 persons were found sufficient for the management of 70 railroads in Texas, of 9,675 miles in length, with these powers and duties, is it not practicable for 130 persons to manage in like manner the 1,987 railroads of the United States with a mileage of 184,428 miles?

The right of the commission to make, regulate, and maintain rates should be subject to appeal to the courts on questions of law only, the facts found by the commission to be conclusive of their accuracy.

The establishment of independent and impartial tribunals of this kind, to stand between the railroads, generally demanding higher rates, and patrons, generally demanding lower rates, it seems to me it is the only way in which this problem can be properly and justly solved, and is probably the only alternative to Government ownership of railroads.

I am of opinion that the ownership of the railroads by the Federal Government would so increase the power and patronage of the Government as to cause a change of the character of the Government and endanger the liberties of the people.

2. On the 3d of December, 1889, the Board of Trade and Transportation of New York filed with the Interstate Commerce Commission a complaint against the Pennsylvania Railroad Company and others, charging, in substance, that the defendants, being common carriers, engaged in the transportation of property between New York, Philadelphia, and Chicago and other Western points, had, since April 4, 1887, in violation of the act to regulate commerce, been and were guilty of unjust discriminations, in that they had been and were in the habit of charging the regular tariff rates upon property when delivered to them in New York and Philadelphia for transportation to Chicago and other Western points, while charging other persons rates which were lower, and even 50 per cent thereof, for a like and contemporaneous service under substantially similar circumstances and conditions, when the property was delivered to them in New York or Philadel-

phia by vessels and steamship lines under through bills of lading from foreign ports and foreign interior points, issued under an arrangement between the defendants and such steamship lines and foreign railroads for continuous carriage at joint rates from the point or port of shipment to Chicago and other Western points, the defendants' share of such rates, as aforesaid, being lower than their regular tariff rates.

The defendants substantially admitted the facts as charged. The Interstate Commerce Commission, in a clear and very elaborate opinion, said to have been written by the late Judge Cooley, held that the interstate-commerce law applied to shipments of freight wholly within the United States, or shipped from a foreign country to any place within the United States, and carried to such place from a port of entry either in the United States or an adjacent country. And it held that such rates were unjustly discriminating, and ordered the railroads to forthwith cease and desist from carrying any article of imported traffic, shipped from a foreign port to any port of entry of the United States or any port of entry in a foreign country adjacent to the United States, upon through bills of lading destined to any place within the United States, at any other than upon the inland tariff covering other freight from such port of entry to such place of destination, or at any other than the rates established in said inland tariff for the carriage of other and like kind of traffic, in the elements of bulk, weight, value, and expense of carriage.

The Southern Pacific Railway Company refused to obey this order, and the commission applied to the circuit court of the United States to compel obedience to its order. The circuit court of the southern circuit of New York adjudged the case in favor of the decision made by the commission, and on an appeal to the second circuit court of appeals, that court affirmed the decision of the circuit court of the southern circuit. And, on appeal of this case to the Supreme Court of the United States, the decision of the commission and the judgments of the circuit court and the circuit court of appeals were reversed, by a divided court; the chief justice and two of the justices dissenting.

The jurisdiction of the United States is limited to the territory of the United States, to the marine league from the shores of the United States, and to the decks of the vessels of the United States. The court, in reaching this decision, assumed jurisdiction over commerce on the high seas and in foreign countries, and the circumstances connected with it, to the extent of declaring that the rates of freight on railroads in foreign countries and on the ocean might be blended with the inland rates of the United States so as to make such inland rates lower than the rate for the same kind of shipments made wholly within the United States.

Mr. Justice Harlan, in his dissenting opinion, states that the records show that on certain kinds of goods, which he names, the rates from Liverpool and London by New Orleans and over the Southern Pacific system of roads to San Francisco is 107 cents per hundred pounds, while the rate from New Orleans to San Francisco for like merchandise over the same roads, and probably on the same trains, is 288 cents per hundred pounds. And he shows that on other classes of goods the rate from Liverpool and London, via New Orleans and the Southern Pacific Railroad, to San Francisco, is 107 cents, and the rate from New Orleans to San Francisco on the same kind of a shipment, is 370 cents per hundred pounds. In this way the decision of the Supreme Court of the United States provides for most burdensome and mischievous discriminations in freight rates against the merchants and manufacturers of the United States. And while doing this it puts it out of the power of the Interstate Commerce Commission to know what rates are being charged on such shipments, and opens wide the door to unjust discriminations and fraudulent practices.

This is the most serious blow which has been struck at the efforts of Congress to prevent cut rates, rebates and unjust discriminations in freight rates, and to protect the people against fraudulent devices in this respect.

My object in calling attention to this subject is to direct the attention of this Industrial Commission to it, in the hope that it will look into this question and urge upon Congress the great necessity of remedying the mischief caused by this decision of the Supreme Court, by proper legislation. If the members of this commission should think it proper to look into this question they will find an able review of it in the Tenth Annual Report of the Interstate Commerce Commission, pages 7-16.

3. The allowance of free passes by the railroad companies is not done as a matter of charity, for they are not, as a rule, given to the poor and needy, but for the most part to public officials and to influential persons. It is one method of unjustly discriminating in freight rates in a way that it is difficult, if not

impossible, to prevent, by furnishing free passes to shippers, their families, their agents, etc. And as the revenues of the roads must be kept up, it is the taxing of one part of the people for the benefit of another part of them which violates the commonest rules of right, and it is undoubtedly employed as one of the means of influencing public officials and members of legislative bodies in the performance of their official duties. It is unfair, unjust, and demoralizing, and should be prohibited by Congress and the several legislatures in their respective spheres of authority.

4. Congress and the several States should protect the public, and give permanence to the value of the stock and bonds of railroads, by prohibiting their issue except for money paid, labor done, or property actually received and applied to the purpose for which the corporation was organized.

Article 12, section 6, of the constitution of the State of Texas, provides as follows:

"No corporation shall issue stock or bonds except for money paid, labor done, or property actually received, and all fictitious increase of stock or indebtedness shall be void."

Article 4410 of the Revised Statutes of Texas provides that:

"No railroad corporation shall issue any stock or bonds except for money, labor, or property actually received and applied to the purposes for which the corporation was organized; nor shall it issue any shares of stock in said company except at par value, and actual subscribers who pay or become liable to pay the par value thereof."

Such provisions enacted by Congress and the several States and enforced would protect the people from being imposed on and swindled by the sale and purchase of watered and fraudulent stock and bonds. It would give permanence to their value and make such securities safe in which to invest trust estate and the surplus funds of citizens, and it would give that character to such securities which spring from honest dealing and good faith.

5. If I may be excused, I will refer to another measure adopted by the legislature of Texas to prevent the evils of watered and fraudulent stock and bonds, to give permanent value to such securities issued by the railroad companies of Texas, and to fix, to some extent, a measure to govern the freight rates necessary to furnish just and reasonable revenue to the railroads, where the business on them is sufficient for that purpose. This is by the enactment of what is known as the stock and bond law of April 8, 1893. The second section of that law, article 4584b of the Revised Statutes, provides as follows:

"That hereafter no bonds or other indebtedness shall be increased or issued or executed by any authority whatsoever, and secured by a lien or mortgage on any railroad or part of a railroad, or the franchises of property appurtenant or belonging thereto, over and above the reasonable value of said railroad property; provided, that in the case of emergency, on conclusive proof shown by the company to the railroad commission that the public interest or the preservation of the property demands it, said commission may permit said bonds, together with the stock in the aggregate, to be executed in an amount not more than 50 per cent over the value of said property."

And this act of the legislature, and the eleventh section of the railroad commission law of this State, article 4584c of the Revised Statutes, makes it the duty of the railroad commission of the State "to ascertain, and in writing report to the Secretary of the State, the value of each railroad in this State, including all its franchises, appurtenances, and property."

This has been done by the commission; and the average value per mile of all the railroads in the State has been determined to be \$15,759.02. And the aggregate value of all the railroads of Texas, so valued, on the 30th of June, 1899, was \$141,117,176.53. Their value as capitalized by the railroad companies, including stocks and bonds, was \$302,953,383. But these valuations do not include the new railroads built since the passage of the stock and bond law, act of the legislature of April 8, 1893, article 4584b of the Revised Statutes, which have only been preliminarily valued.

I had better state the plan adopted by the commission for making these valuations: The law requires the railroad companies to file with the commission profiles of their several roads. When this has not been done the commission directs its engineer, in connection with the engineer of the railroad company, to prepare a proper profile. These being of completed roads, the profiles disclose the character of the material through which the cuts and fills are made. We then collect evidence of construction companies, contractors and others, as to the cost of grading, and put that on our files. We, in like manner, obtain evidence of the cost of cross-ties and put that on files. In like manner we obtain evidence as to the value of iron and steel rails and fixtures, from manufacturers and others, the cost of engines

and of all kinds of cars, from those who make them and from others, and place this evidence on file. So of every article which enters into the construction and equipment of the railroad. We also ascertain the value of the right of way. Having thus ascertained the value of the physical property of a railroad, we generally fix an arbitrary allowance to the company of about 6 per cent of our valuation of its property, to cover the cost of charter fees and for engineering service and counsel fees. And we make to the company another arbitrary allowance of about 6 per cent on our value of the property, to cover the interest on the cost of construction during the period of construction.

When this is done the law requires the commission to furnish a copy of its valuation to the railroad company, and give it a notice of forty days in which it may contest the accuracy of the valuation. We have done this in every case of valuation, and not one of our valuations, of all the railroads of Texas, has been contested. By our plan of valuation, if contested, we could ask what item in it was complained of and could from our files show the proof on which it was made.

The purpose of the legislature in requiring these valuations was twofold: first, to protect the patrons of the roads against rates of freight which would pay interest on watered and fraudulent stock and bonds, and, second, to enable the commission to know, with greater certainty, what freight rates and passenger fares would be required to pay the interest on the actual value of the roads.

I supposed that a statement like this, showing some of the means adopted in the State of Texas to secure fairness and justice between the people and the railroads, might be more acceptable to the members of the Industrial Commission than an attempt to make categorical answers to questions propounded by it.

In the following I shall refer to the numbers on the margin of your "Topical plan of inquiry."

No. 32. The practice, so prevalent among railroads, of making unjust discriminations as between persons, places, and railways, and of allowing rebates, cut rates, etc., should be prohibited under penalties, which would make the doing of these things a felony, and such is the law of Texas. These practices are conceived in fraud and operate to the injury of innocent people. They demoralize the public and as a general rule deplete the revenues of the railroads and benefit only the managers who perpetrate the frauds. The enforcement of the long and short haul policy is of paramount necessity. Without it a few great commercial and manufacturing centers would be built up, and the people of the smaller intermediate places would be rendered unable to do a mercantile or manufacturing business successfully. And the people between such great commercial centers would be taxed, by increased freight rates, with the cost of transportation to the great centers of trade.

So long as you make pecuniary penalties the temptation is so great that every man will take the risk of doing wrong. Of course the company can not answer in pecuniary damages, and if it is a penitentiary offense they can not substitute the company's liability, and they will be more careful; at least our legislature took that view of it.

No. 33. Unjust discriminations, the allowance of rebates, etc., as practiced, tend to reduce the cost of carriage of merchandise to the wealthy and large shippers, to increase the cost to the poor and small shippers, cause every merchant and shipper to fear that others are getting lower rates than himself, and to induce men, otherwise honest, to ask the railroads to violate the law for their benefit simply, as they suppose, as a matter of self-defense.

No. 39. It is due to the public, and necessary to secure fair dealing, that freight rates should be published. The method for this provided by the Texas law is "That each of said railroad companies shall cause said schedules (meaning the freight rates) and rules to be printed in type of a size not much less than pica, and shall have the same posted up in a conspicuous place at each of its depots so as to be inspected by the public."

No. 40. Answering the question as to the cases in which lower than the published rates are allowed in Texas, I quote from subdivision (h) of section 15 of the railroad commission law:

"Nothing herein shall prevent the carriage, storage, or handling of freight free or at reduced rates for the State, or for any city, county, or town government, or for charitable purposes, or to or from fairs and expositions for exhibition thereof, or the free carriage of destitute or indigent persons, or the issuance of mileage or excursion passenger tickets; nor prevent the railroad from giving free transportation to ministers of religion, or free transportation to the inmates of hospitals, eleemosynary or charitable institutions, and to the employees of the agricultural and mechanical departments of the State, or to the peace officers of the State; and nothing herein shall be construed to prevent the railroad from giving free

transportation to any railroad officers, agents, employees, attorneys, stockholders or directors, or to the railroad commissioners, their secretary, clerks, and employees hereinbefore provided for."

And then, as if a sufficient number of persons had not been provided for, the section adds:

"Or to any person not prohibited by law, provided they, or either of them, shall not receive from the State mileage when such pass is issued."

That law was in force for 8 years, and the commission has diligently attempted to get it remedied so as to make it more reasonable. I have conferred with members of the legislature time and time again about it, but as long as they have free tickets, annual passes, they do not afford us any relief.

Q. (By Mr. C. J. Harris.) That provision is still in?—A. Yes. We have very fine legislation on the subject, according to the view I take of it, and I always look upon that as a disgrace to the State.

No. 50. I suppose reference is here made to the case of *Smyth vs. Ames*, 169 U. S. Reports. While the Supreme Court in this case announced some very important and valuable principles of law, there is a feature of the case which I take it could not have been fairly represented to the court, or understood by it.

In discussing the basis of the valuation of the property of a railroad it said:

"What the company is entitled to ask is a fair return upon the value of that which it employs for the public convenience."

And that statement is followed by the court with the further statement that—

"In order to ascertain that value, the original cost of construction, the amount expended in permanent improvements, the amount and market value of its bonds and stock, the present as compared with the original cost of construction, the probable earning capacity of the property under particular rates prescribed by State, and the sum required to meet operating expenses, are all matters for consideration, and are to be given such weight as may be just and right in each case."

Now, I submit, with all respect for that great court, that parts of the foregoing statement will not successfully bear criticism. For instance, what just relation is there between the "original cost of construction" and the present value of a railroad? It may have been built when material and labor bore a very high price, when stock and bonds were at a great discount, or upon an improvident and excessive contract, and, owing to the fall in prices or other causes, may not now be worth the half of what it cost "originally." The original cost of a railroad is not and can not be, in any sense, a just measure of its present value.

So the amount expended in permanent improvements can not be a just test of the present value of the property. The material for such improvements may have cost too high, the contracts for making them may have been improvident and excessive; such material and labor may have been greatly reduced in price.

And the "amount and market value of its bonds and stock" can not be a just measure of the future value of a railroad. There may have been an excessive issue of bonds and stock, as has often been the case, and our common experience teaches us that by speculation and manipulation the market value of stock and bonds of railroads are constantly and often violently fluctuating, so that they are not a reliable or fit measure for values of any kind.

Surely it will not be seriously assumed that these matters will be considered a standard by which the subsequent value of a railroad should be measured. I submit as a substitute for all this that a safer means of ascertaining the present value of a railroad would be for experts to ascertain, as actual facts, what it would cost now to obtain the right of way and build and equip a railroad, making reasonable additions to its value to meet engineering expenses, the fees of counsel, the interest on the money necessary for these purposes, and whatever additional amount might be found proper of actual ascertainable value. We could thus determine the value of a railroad upon the ascertained value of its elements, and we would not be driven to loose speculations, like those stated in the opinion of the court, in order to assume what the value of a railroad might be.

I am inclined to make this statement here: I believe, just as in this case, that in determining what the rates shall be the State should furnish sufficient revenues to offset the railroad company for their industry. It was assumed it was necessary to limit the rates on interstate shipments and to put into the amount loaned from the State the revenues derived from local State shipments. Now, then, to meet that case fairly, the State grants the charter and the franchises; it authorizes the construction of the railroad; it authorizes its operation; it authorizes the collection of fares and revenues, and yet it is assumed that, notwithstanding a part of the freight may be interstate freight, it is not entitled to pay for the carriage of freight across the State. It has always seemed to me, at any rate, when

I know that the State furnishes the means of transportation, that it ought to be credited with the amount it receives, though some other corporation in connection with the State have no right to it.

No. 51. This, I suppose, has reference to the case of *Reagan vs. The Farmers' Loan and Trust Company*, 154 U. S. In that case the Supreme Court sustained the constitutionality of the railroad commission law of Texas. The only suggestion I have to make about that case is, that the justice who delivered the opinion of the court discussed the freight rate case as extensively as if that had been a material issue in the case. The truth is, the railroad commission believed that they could win the case as to rates, as well as in reference to the constitutionality of the commission law, but their rates would have stood enjoined until the final disposition of the case by the Supreme Court of the United States, which might have been from 3 to 5 years, and which they felt would be a serious misfortune to the people of Texas, and therefore in the circuit court they withdrew their answer as to the facts of the case, in order to secure an early decision on the constitutionality of the law. This was the question before the court, and its early decision enabled the commission, with much less delay, to assume the control of the question of freight rates.

I never understood why the question of rates was discussed, because we abandoned it in the court below.

No. 52. Congress should prohibit the Federal courts from issuing injunctions pendente lite in cases in which suits may be brought to enjoin the enforcement of freight rates, until the rates are found to be unjust or illegal. Otherwise a judge at chambers, on an ex parte statement, may arrest the employment of rates which have been regularly made by proper authority, and in this way arrest the business of a great railroad, or a system of roads, or of a whole State, which has been the effect of some of the injunctions heretofore issued. The issuance of such injunctions is too great and too dangerous a power to be intrusted to the arbitrary will of any one judge or more without a previous lawful ascertainment whether they are just and legal or unjust and illegal. It is not safe to allow the judges to assume that rates made by lawful authority will cause irreparable injury before their justice or injustice can be determined by a court. When a State railroad commission, duly appointed and sworn, has agreed to freight rates, some deference is due to its official action and to the authority of the State it represents. At all events, courts should be prohibited from issuing temporary injunctions until both sides of the case have been represented and heard.

When an injunction is sought to prohibit the enforcement of freight rates which have been established in conformity with law, the right of way should be given such suits over other business in all the courts by Congress for interstate shipments and by the legislature for State shipments.

Now, gentlemen, I am at your service.

Q. (By Representative LORIMER.) You are the author of the Reagan bill?—A. I should make some explanation about that. The first bill introduced on that subject of pooling was introduced when I was in the Forty-fourth Congress, and was introduced by Mr. Hopkins, of Pennsylvania. I was on the Commerce Committee and took a very active interest in trying to get it considered by the committee, but failed to get it considered during that Congress. Hopkins didn't return to the next Congress; I was returned. I received a letter from him asking me to reintroduce the bill. I had already prepared a bill with a view to introducing it. I introduced a bill which contains the great remedial features of the interstate-commerce law, except as to the commission, and it passed the House several times—I think, as many as three times—before it went to the Senate. In the Senate it was amended, adding the commission features of it. The question of the commission now arose. I might say that the fear of whoever the President might be who would make the appointment of the commissioners influenced us somewhat, because we did not know but what the influence the railroads would bring to bear would lead to the appointment of commissioners who would not execute the law; so the law was made to point out what they could do and what they could not do, and fixed the penalty, to be thereafter determined by the courts. That was, of course, changed. I put in the House bill a provision that State courts should have concurrent jurisdiction with the Federal courts in civil cases. That passed the House, but the conference committee struck it out. I also provided in the bill for a penalty to be inflicted on the railroad companies afterwards proved to be the beneficiaries of rebates and cut rates. In the conference committee that was struck out, because it was decided that they would all be guilty alike and that the penalty should be put upon them alike. I think the main remedial features of that bill were embodied in the bill I got passed through the House several times.

Q. (By Representative OTJEN.) What Congress was that?—A. Forty-fourth Congress.

Q. (By Professor JOHNSON.) That was in 1879?—A. 1878. That was the time it was finally passed. Hopkins introduced the bill in 1876, and I introduced my bill first in 1878.

Q. (By Mr. C. J. HARRIS.) And are you satisfied with the results of that bill as it was afterwards passed by the House and finally adopted in Texas; are your people in Texas satisfied with it?—A. I think the law is a very good one. I think the law is all right if it is fairly and justly interpreted.

Q. (By Representative LORIMER.) That is, by the courts?—A. Yes.

Q. (By Mr. C. J. HARRIS.) You claim in your paper, which, of course, is testimony, that the Interstate Commerce Commission should have certain powers in regard to rate making?—A. Yes. I know the objection is made to that that the system would be so exclusively with the commission that it would be impracticable; but I have studied this question practically for the last 8 or 10 years, and, under a fair law, I don't see why it can not be done. Of course, a system of rates can be fixed to cover a great deal of country which would have the same rates. If it can not be done in that way I don't see that there is any other way that you can ever get that question fairly solved.

Q. Do you care to say anything in regard to pooling?—A. I have spoken on that subject at the meeting of the State railroad commissioners. I think if you can not have the rates fixed in that way the next best thing to do is to regulate by law. My idea has been that if we can not get a law regulating the rates, we ought to provide for agreements binding in force and subject to the approval of the railroad commission, and to be amended or revoked by the commission, and with provisions for the imposing of a penalty sufficiently severe on railroad directors for the violation of any of their contracts. A great many efforts have been made from time to time in the past to get out of rate wars and keep peace among the railroads.

Q. (By Professor JOHNSON.) It is useless to talk of pooling, is it not, unless you have a penalty for the violation of a contract and one that can be enforced by any company or by the United States against any company?—A. Yes; that under the control of the commission would go a great way toward preventing rate cutting and to secure a regular rule regulating rates. If we could not get good legislation which would enable the commission to make, regulate, and maintain rates, I think that would be the next best thing.

Q. Have you any suggestions to make as to the power of reducing rates and the power of controlling and regulating rates on the part of the United States commission? You are aware that the Interstate Commission has for several years been asking for power of reducing rates and regulating rates that had not been put into operation by the railroad companies themselves?—A. You will have seen from what I have said that my view is that the Interstate Commission should have the power of making, regulating, and maintaining rates. I think that the commission should have some power of reducing rates at all events.

Q. (By Representative LORIMER.) If they had the power of reducing rates, that would practically mean that they could establish rates?—A. It would help a great deal.

Q. (By Professor JOHNSON.) Do you think the commission possesses the technical knowledge to work out a schedule of rates for this country as a whole?—A. Yes; I don't doubt it. They have some very able experts there. It is the same practice that enables a commission to do that work in the State; it is only applying it on a larger scale. The principles are the same; there is no difference in them at all. We have a territory in the state of Texas that is larger than France and with nearly 10,000 miles of railroad and nearly 60 active operating roads. The commission under the law governing these great powers is composed of three commissioners, two expert rate makers, an auditor, secretary, engineer, and one clerk, and we maintain it although of course it is very hard work. However, it is necessary, so we maintain it although we can not have any specified hours; we work all day.

Q. (By Mr. KENNEDY.) Does your commission fix the rates of Texas?—A. Yes. We make the rates, regulate them, and have absolute control.

Q. State railroads only?—A. I mean State shipments.

Q. How would you arrange about the shipment of freight from St. Louis to Austin?—A. That would be under the control of the Interstate Commerce Commission.

Q. You would not control the rate in Texas where shipments are made from one State to another?—A. No; the Interstate Commerce Commission controls any rate if it is from one State to another; freight from another State or from a foreign country is out of our jurisdiction.

Q. (By Representative OTJEN.) You simply regulate the State traffic?—A. Yes; by law and by our action.

Q. (By Professor JOHNSON.) You spoke of the case of *Smythe v. Ames* in your testimony. I think you implied that a very important part of that decision seemed to be overlooked?—A. Yes; about the methods to be adopted as to certain values.

Q. In the fixing of rates now you can be guided, since that decision, only by the earning capacity of the railroads as regards their control of State traffic?—A. Yes; that is what I tried to deal with really. I have said that investigation will show that if that decision in that respect is carried out and enforced, it will bankrupt every railroad in the United States; I don't think there will be a single exception to it. When you take away the right from a State to embrace in its receipts pay for all the carriage done in it, you take from it the right to embrace in its receipts the cost of interstate shipments, and it makes the amount so low that it will not be commensurate with the value of the property and the operating expenses. The enforcement of that particular law will bankrupt every road in the United States.

Q. I was looking at that question from another standpoint altogether. It seems to me that a large part of the State traffic is but the initial or original proportion of other traffic; that most of the traffic which becomes interstate is in its initial stages State traffic, and from that point of view a considerable portion of the traffic within the State is really interstate, or in character it becomes interstate, and the railroads so regard it. If there is an all-through freight business and by allowing a charge on the all-through business of rates high enough to cover the cost of that business, would it not impose such a high local maximum of rates that it would be practically impossible for the State commission to regulate rates?—A. I think it would.

Q. You know this very question has arisen with regard to tickets. The rates fixed by ticket men have been set aside because of this ruling in *Smythe v. Ames*. Why do you offer your schedule in Texas?—A. In our State we are threatened with legislation on that very subject. This freight shipped on a published rate, which constitutes a contract between the railroad and shipper from one point to another in the State, causes some railroads to undertake to assume they must necessarily be interstate shipments; it must necessarily go somewhere else. Our law provides that our jurisdiction covers shipments from one point to another in the State of Texas. The action of the commission there is when the bill of lading calls for a shipment from one point to another in the State. That is the contract for the local State shipment.

Q. (By Representative LORIMER.) If the commission you suggest fixes the rate would it not be necessary for them to take into consideration every item of the expense?—A. It would seem theoretically that that would be necessary; practically it is never done, because the items that enter into it are so numerous that the degree in which they affect the rate is uncertain. They would have to be guided by experience from day to day, as there is no science in rate making. You can not make a science out of rate making; you have to be governed by experience from day to day, and how much a particular piece of freight costs, and what proportion it bears to the expense of carriage. There are a great many things you must necessarily put very low rates on. Then there are other things, very costly things, you put a very high rate on. There is no uniformity, because if you make a uniform rate it would make rates almost nothing on costly goods and almost if not quite prohibitive on these cheaper things. In theory it is necessary to consider everything, but so far as the practice is concerned it is not necessary to consider all these things, and it can not be done for the reason I stated—because the road has to be guided by every day's experience and the observation of what has been done before and the effect of it.

Q. What I wish to learn from you is, whether or not, ultimately, this commission that fixes the rate would not have to settle the rate of wages of the employees of the roads?—A. I don't think that would be necessary; I don't think one follows the other necessarily; that is a matter of contract between the corporation and its employees.

Q. If every item of expense must be considered is not that one of the items.—A. Of course a part of the cost of transportation is the expense of the employees of the road.

Q. Would it not finally have control of the road and everything that goes to make up the road?—A. They would not undertake to determine a question which no commission has jurisdiction of, and which the courts alone have jurisdiction of, and would not undertake to determine the rate of wages. They might consider that in making up the rate on freight, but they would not determine that question independently.

Q. You think if they were to fix the rates they would have to take the wages into consideration?—A. They would necessarily consider everything that affected the cost of transportation so far as they practically could. The difficulty is that there is such an endless number of things that enter into the cost of transportation that you have to be guided by what has been done in the past, the experience of day to day and time to time, to ascertain what can be done in the way of carriage of any particular commodity and to make the carriage valuable to the public and at the same time secure the necessary revenue for the railroad; so that a railroad commission would not be embarrassed by such a question as that, with the opportunity of an examination to see what the carriage had been heretofore. Of course, to get down to the details would be a matter of infinite labor, and I suppose very unsatisfactory.

Q. It strikes me it will be necessary for the railroad company to go into all those details. All our railroads to-day, in considering the rate they make, take into consideration all those causes.—A. Our annual report shows the extent to which our commission goes into that subject. Of course we did not embrace every item, but we show a great many of the controlling influences that enter into the cost of transportation. These things are considered in connection with others. It is not only a question as to what is reasonable upon each commodity, but we have also to consider the questions growing out of competition.

Q. (By Professor JOHNSON.) In connection with this question of rates I would like to ask whether you think Government ownership, in case we should come to that, would mean the elimination of discrimination.—A. It is a very big question you are asking, and I have discussed it very fully on other occasions. Government ownership would, I think, necessarily make the cost of transportation much greater than its cost under the influence of private interests, corporate interests. They exercise all the economies they can in cheapening transportation and they have done a great deal of it from time to time. As they have made improvements of various kinds that facilitate and cheapen transportation, rates have gone down. If the Government owned the roads and appointed the employees the influence of private interests and corporate interests would go out of it, and all experience shows that everything the Government does requires more time, more men, and more money than the like thing done by the private individual or corporation. So I take it for granted, as the railroads are managed under corporate and private interests, the rates can be and as a rule will be cheaper than would be possible to make them if they were under the control of the Government. But there are other elementary troubles about that. There are now nearly 900,000 employees in the service of the railroads. They are men in the active years of life, energetic, intelligent men. Give the Government the appointment of these men in addition to the appointments it now makes and any man who is President can continue himself in office just as long as he wants to. I remember a speech made by Mr. Webster and one made by Mr. Calhoun over 50 years ago in their respective States, and each discussed the question and reached about the same conclusion. Each said that when the number of Government employees reached 100,000 it would endanger the character of the Government and the liberties of the people. There is now not less than 160,000 employees. Add the railroad employees to it and you have over 1,000,000 men under the control of the Government, with their families and their influences. To my mind Government ownership means the subversion of our system of government and the destruction of popular liberty.

Q. (By Mr. KENNEDY.) Has not experience shown that they were false prophets?—A. I do not know. It has not turned out that when we reached 100,000 we endangered the Government, but it is not safe to say they were false prophets, because I take it there is no man who has studied carefully the operations of this Government that does not see the increased danger of multiplication of offices under the Federal Government.

Q. (By Representative LORIMER.) They probably had in mind the population at that time.—A. Yes.

Q. (By Professor JOHNSON.) In my question I had another point in mind. The recognized evil of the transportation business is that of discrimination?—A. Yes.

Q. And it is claimed by those who do not believe regulation will be effective that we ought to deal with this question of discriminations by Government ownership. Would Government ownership necessarily eliminate discrimination?—A. It would have an influence in this way: Under corporate and private management the managers are interested in getting the most freight they can get. Under Government control that element would be absent from the managers of the road, they being under the employment of the Government and not interested in the aggregate amount earned by the railroads. It might have some influence in preventing discriminations in that respect.

Q. Would not the influence of localities result in discriminations between localities?—A. That might be.

Q. The valuation per mile you put on roads in Texas—is that on the basis of the taxation?—A. No; it does not control taxation.

Q. Are the stocks and bonds of the companies limited to the valuation of their roads?—A. All of the roads that have been built since the passage of the law. That, of course, is not retroactive. It is applied only on the new roads. It could not affect the stocks and bonds issued before the passage of the law.

Q. Suppose the railroad has increased its terminals in cities a good deal over what they originally cost, what effect would that have—simply to raise the price of stocks?—A. Our view—we have never practically acted on it—is that on account of increased value of the property a revaluation might be called for. If the conditions change I think they would have a right to a revaluation.

Q. Do you allow anything for improvements of railroads and betterments of conditions in making the rates for these railroads?—A. What we do is to take evidence of the value of the right of way, take evidence of the value of all that enters into construction and equipment of the road, then get its physical value, and then add to that arbitrarily an allowance in the aggregate of about 12 per cent. So we do not quite reach the subject of that question.

Q. Every railroad is trying to better itself; adds heavier rails; makes better bridges; has better ties, perhaps, and rock-ballasted roadbeds. Now, do you allow anything for that in your making of rates?—A. No; we take the value of the road; what it would take to rebuild the road. As I suggested, we have contemplated that as improvements are made and the value of the property increases corporations may demand a revaluation and would be entitled to it if the increase was such as to call for it.

Q. (By Mr. KENNEDY.) What system of taxation, among the various systems of the United States, do you favor for railroads?—A. I like the plan adopted in Kentucky and New Jersey, where the railroad commission fixes the value, because they have the means of knowing what ought to be known. I think in our State the commission can not do that. In the first place, the railroad company gives in its property to the assessor of taxes, and then there is a board of revision that goes over that and can raise or lower the taxes if it thinks proper. Then the board of revision passes on them. Now, to give an illustration of the way it is worked: The Texas and Pacific road is capitalized at about \$60,000 a mile. It is valued by us at about \$18,000 a mile. It is given in by them for taxes at about \$8,000 a mile. They ask us to impose rates upon the people that will pay interest and dividends on \$60,000 while they do not propose to pay taxes on but \$8,000. That is a pretty strong illustration, but it gives a general idea of the whole thing.

Q. What is this Kentucky system you speak of?—A. The commission fixes the value. I do not assume the railroads ought to be taxed their full value, in view of the fact that no other property, as a rule, is given in at its full value; but if we could ascertain the percentage less than the full value at which other property is given in that ought to apply to our valuation of railroads also.

Q. You tax the franchise in Texas?—A. There is now a contest going on about that. It has never been done heretofore.

Q. How do you determine the value of the franchise?—A. I have never undertaken to determine that.

Q. Has anybody in Texas?—A. The county courts are now at work on that and there is litigation in several counties about it. The cases are to test this plan of valuation of the franchise.

Q. Have you an opinion as to how the value of the franchise should be obtained?—A. I have seen statements of the method, but I do not think I could state it intelligently to you. I have seen statements of the method by which they propose to reach the value of the franchise. It seems to me a little odd that the State should tax the property and the earnings. We have, I believe, a tax on the gross earnings of passenger fares and a small tax on the gross earnings of freight. If we should tax the property and then tax the earnings and then tax the franchise it would seem to me it would be going a good ways.

Q. (By Representative LORIMER.) Then you think if the property and the receipts are taxed that the franchise ought not to be?—A. I think we had better stop there; that would be my idea.

Q. (By Professor JOHNSON.) You think it would be better to levy all the taxes on the earnings than to tax the property and the earnings both? In Wisconsin the tax is on the receipts.—A. I have never undertaken to consider which of these plans would be better. Railroads with us are taxed upon their supposed value, and the average valuation in the State is somewhere in the neighborhood of \$8,000 a mile. Some go as high as \$10,000, and others a great deal lower.

Q. (By Representative OTJEN.) You spoke of a defect in the interstate-commerce law, made so by a decision of the court. Will you explain that a little more fully as to rate making? It was with reference to goods brought from foreign countries in comparison with domestic goods?—A. If you ever have occasion to look into that, and if you take up the opinion of the railroad commission as written by Mr. Justice Cooley, you will find it is a very elaborate and masterly opinion. It is just like a geometrical demonstration. He shows, it seems to me, beyond doubt that the authority of the United States to regulate rates is limited to the territory of the United States. The circuit court of New York sustained that opinion. The circuit court of appeals sustained that view. It was reversed under conditions that allow them to charge nearly four times as much as to certain classes of merchandise from New Orleans to San Francisco as from Liverpool or London to San Francisco. I have always understood that the jurisdiction of the United States only extended to our soil, and to the marine league from the shore. They take jurisdiction of the oceans—all of them, and of commercial states in all countries, because you see in their opinion they enumerate different countries in which there may be railroads bringing commerce to be forwarded here. It also seems to me very strange that they could take jurisdiction for such a purpose when they can take jurisdiction for no other purpose under the sun. I do not understand it. Under that, a man in London or Liverpool would make a contract for delivering merchandise at ports agreed on for Chicago. They would agree what portion should be given to the railroad bringing the merchandise to the port, what portion should be given to the ocean carrier, and what to the inland carrier. The complaint of the New York Board of Trade was that the portion which went to the inland carrier was much less than the rate that our citizens had to pay. In the dissenting opinion in that case it is very forcibly stated that that is a strong discrimination against our own merchants and our own manufacturers. Now, in addition to that, in the tenth annual report of the Interstate Commerce Commission, there is a very able argument showing that this has destroyed the power of the commission or anybody else to determine what the rates shall be in this country.

Q. (By Mr. C. J. HARRIS.) Would not an amendment to that bill regulate that matter?—A. That would do it, and I trust Congress may take it up and so amend it as to make rates uniform.

Q. (By Mr. KENNEDY.) Would you like also to see the interstate-commerce law amended so as to bring interstate railroads under the jurisdiction of the Government as national banks are now; that is, that experts may be sent out to examine the books of the interstate railroads?—A. They ought to have the power to send their experts and examine the office records. We used to have that power, and we used it. We knew morally that the roads were allowing rebates and making cut rates, but the legislature refused to give us any appropriation by which we might have the necessary investigation made to get the legal evidence of it. At the session of the legislature before the last one, we asked for \$5,000 a year for two years, but stated to them that we could not tell what we wanted with it, but promised that we would return \$10 for each and every one they gave us. We got the governor, and the attorney-general, and the State treasurer to unite in the request, and they finally consented to give us one appropriation of \$5,000. We have already returned \$67,500 in penalties, and a good many cases remaining yet. It has done a great deal to check it. That enabled our auditor to go into their offices. We have a right to demand the inspection of papers, contracts, and everything, and bring them before us and examine them as witnesses.

Q. You would like to see the interstate-commerce law amended giving the commission that power?—A. Yes; because if they can keep secret from the commission their doings there is no use for the law.

Q. You will probably get your \$5,000 a year in Texas hereafter?—A. Yes; they made us an allowance this last legislature, but we do not have so much use for it. While the railroads contested our commission law very earnestly at first and carried it to the supreme court, now most of the railroads say it is a benefit to them as well as to the public, because it protects them against themselves and stops the giving of rates and the wasting of revenue.

Q. Are you familiar with the complaints against the Belt Line around Chicago?—A. No; I know there was some litigation and a decision, but I never took particular interest in that question.

Q. There is no complaint in your section of the country about it?—A. I think the cattlemen of Texas have something to do with it.

Q. Do you know the circumstances of the case?—A. I do not know that I do. I understood that there was a charge of \$2 a car for bringing the cars off the roads into the city, and I think I saw a statement that the courts had reduced that to \$1 a car. I am not familiar with that sufficiently to express an opinion about it.

Q. (By Professor JOHNSON.) I would like to ask if your experience leads you to believe you could enforce the imprisonment penalty?—A. I have no doubt of it; as well as you can for any other felony.

Q. Do you think a jury in this country would convict and send a man to prison for violating the law regulating transportation?—A. Well, I take it for granted they would not commit perjury, and the law requires conviction.

Q. (By Mr. C. J. HARRIS.) Did you ever have any cases of that kind in Texas?—A. None that I know of. We had a pecuniary penalty before that.

Q. (By Mr. KENNEDY.) Which of the three freight classifications is Texas in?—A. We have the Western.

Q. Do you have any conflict with the classification committee?—A. We have no special conflict, because we, in a general way, adopted their classification. But in their classification they make, in several cases, reservations in the interest of the road. Our law prohibits them from making any of these reservations. We have our classification made out and based on the Western classification, but these clauses—for instance, exempting them from liability in various cases—we strike them out of our classification.

Q. Do the shippers of Texas have an advantage over those of surrounding States?—A. They can not enforce these exceptional clauses against the people there. They have no legal force.

Q. Do you think the method by which the rates are fixed by the classification committee is the proper one? Are both sides fully heard before the committee?—A. All interests ought, of course, to be heard. The Interstate Commerce Commission has very earnestly urged uniform classification, or at least as near as can be made practical, which would be of great advantage to the public and of great convenience to the railroads also. There are different systems of classifications, as you referred to, and these give considerable annoyance.

Q. (By Representative LORIMER.) Have you any views on ticket scalping?—A. Yes; I think it ought to be prohibited.

Q. Have you any suggestion as to how to prevent it?—A. Well, yes. I have never thought about proposing a remedy. You can make it a penal offense to engage in that business.

Q. Whom would you punish, the purchaser or the seller?—A. In case we would have no witness, I would punish the scalper.

Q. Suppose the ticket is purchased by an individual and then sold on the platform to another person who is about to make a return trip; would you punish either of these two?—A. Well, that would be for legislation to determine. I would not like to make a statement about exceptions to the general rule.

Q. You know we had a bill before Congress providing for a penalty for purchasing and selling tickets that are purchased by an individual intending to make a trip, and selling it to another person who might make the whole trip or half of it?—A. Our law meets that in this way: If the person purchases a ticket and does not use it, he can go back to the office and have it redeemed.

Q. This bill also had a redemption clause in it?—A. With that clause, I would make him go to the railroad and not let him speculate.

Q. You would put him in jail if he sold it to anybody else?—A. Whatever the law said, I would put it on him.

Q. (By Mr. KENNEDY.) What do you believe to be the evil in ticket scalping?—A. It enables the railroads themselves, as a party to it, to underbid each other, and makes discriminations in that way, some having to pay full rates and some less than full rates. That is one of the evils. Then there are statements in the reports of the Interstate Commerce Commission that a great many frauds are perpetrated through the instrumentality of the ticket scalper. I do not know as I can say what they are, but the reports show the numerous cases in which frauds grow out of it.

Q. Have you studied the subject enough to know whether the railroads themselves are responsible for the system?—A. In some cases they are, because they agree with their agents to undersell other people. I do not know as I ought to say it. I think it is stated in the reports of the Interstate Commerce Commission, but I do not know it of my own personal knowledge, though I suppose it is correct. That is assigned by the Interstate Commerce Commission as one of the reasons why it should be prohibited. A railroad in Chicago in competition with others might go to a scalper and say, "You sell these tickets at such a percentage, and I will give you such a profit."

Q. You know it is the railroads that have gone to Congress asking for this legislation, and not the brokers?—A. Yes.

Q. Do you not think the railroads can break it up whenever they act unitedly upon it?—A. It seems to me they could, like all other sorts of free tickets. I do

not know why they could not do it. I know the railroads have told us that they wanted free passes prohibited. I told them very plainly, "I do not suppose you do want it, because if you wanted to all you have to do is to withdraw your passes and it will be no trouble at all."

Q. What do you think of the large railroad lobby in Washington seeking the passage of the antiscalping bill and not asking to have any defects in the interstate-commerce law remedied?—A. I do not know. Maybe they think it will benefit them to get the scalping bill through and not benefit them to get the other legislation.

Q. (By Representative LORIMER.) Have you anything further to suggest?—A. I do not think of anything.
(Testimony closed.)

CHICAGO, ILL., November 15, 1899.

TESTIMONY OF MR. JOHN J. HYLAND,

Traffic Manager Freight Bureau, Board of Trade of the city of Chicago.

The subcommission on transportation being in session in Chicago, Representative Lorimer presiding, at 3.55 p. m., November 15, 1899, Mr. John J. Hyland was introduced as a witness, and, being duly sworn, testified concerning transportation as follows:

Q. (By Representative LORIMER.) You may state your name and place of residence.—A. John J. Hyland, Chicago, Ill.

Q. Your business?—A. Traffic Manager of the Freight Bureau, of the Board of Trade of the city of Chicago.

The WITNESS. Before reading this paper I would like to make a few remarks. These are my own suggestions, which I believe will be approved by the majority of the members of the Chicago Board of Trade, which I have the honor to represent in traffic affairs.

Q. (By Representative LORIMER.) This is a production not of the board of trade, but of your own individual ideas?—A. Yes; that is right.

(Reading:) Although we have some grievances against the railroads, the board of trade of the city of Chicago does not at present desire to enter a formal complaint with your honorable commission.

It is, nevertheless, gratifying to this board that your kind invitation affords an opportunity to offer, through our freight bureau, a few suggestions on the subject of transportation, or, rather, on the matter of a "legalized railroad pool."

We are aware that many well-meaning persons, including some of our own members, are in favor of a legalized railroad pool, in the belief that more stable rates would obtain under a pool than under the present system of open competition.

A very large majority of our members, and, we believe, a large majority also of the general public, oppose a legalized railroad pool and favor "necessary changes in the interstate-commerce law."

We believe the law should be so amended as to give to the railroads the privilege of establishing, by mutual agreement among themselves or by arbitration, rates acceptable to all concerned, based along geographical lines or otherwise, provided, always, that such rates are just and reasonable, and to the Interstate Commerce Commission full power to regulate inland freight rates where complaint is made and the fact established of any discrimination existing against persons or localities.

The penalty for a willful violation of the law as interpreted by the commission to be placed against the corporation found guilty of such violation and not against the individual, and in cases of violation each carload or part carload shipment to constitute a separate offense, and a penalty to be imposed by a fine of double the gross earnings, at the tariff rate, for the services performed, either over one road or a combination of roads having a through line between any given points, the money collected as such penalty to be divided equally between the person or persons giving the information upon which the conviction is secured and the Government of the United States, the money thus accruing to the Government to be used in defraying the expenses of the Interstate Commerce Commission in the hearings occasioned by the railroads because of their willful violation of the law.

While the means employed to obtain information and secure conviction are open to objection, they seem to us justifiable in the interest of the public good.

With a pool established, a division of tonnage or earnings on fixed percentages

between the various railroads entitled to share in the traffic must be included in the arrangement, and it will inevitably follow that some of the roads will become dissatisfied with their allotment, and, in order to be in better position to demand an increased percentage, will make private concessions in rates to a very few large shippers, that they may establish their right to an increased allotment in the pool. This is not a matter of theory, but of fact, as demonstrated by several years' experience with the workings of the Southwestern Railway Association—the strongest railroad pool ever operated in this country—and during the existence of which, rates were not always maintained in accordance with the printed tariffs.

Under a policy of open competition, as at present exists, there is really no necessity for any road to violate the law, for the reason that, if not getting a fair share of the moving traffic from a given point, the law allows, after 3 days' legal notice, the issuance of a tariff making reduced rates, and the public derives the benefit of the lower rates until the road in question has become satisfied, and again gives a 10 days' legal notice of restoration of rates to the former basis. If the long and short haul clause of the interstate-commerce act can be strictly enforced by the commission, the other roads, having enjoyed a satisfactory business, will permit their less fortunate competitor an increase in tonnage rather than jeopardize their own interests by meeting the lower published rates put in temporarily by their weaker rival.

We regard the observance of the long and short haul clause as absolutely essential to the strict maintenance of tariff rates; and if any railroad should deem it best to abandon the traffic of a certain territory rather than to reduce local rates, in observance of the long and short haul clause, there is no law to prevent; and the presumption is that other roads better entitled to that particular traffic will continue to serve the people satisfactorily. One great trouble with the railroads is their propensity to overstep legitimate boundary lines in their efforts to secure tonnage which properly belongs to other roads on account of geographical conditions.

With reference to charges usually made against the weaker lines as being the first to offer private concessions in rates, we are constrained to say that such has not been our experience; but, on the contrary, the so-called strong lines are usually the ones to lead in violating their traffic agreements and the weak lines follow at about the time the leaders are ready to make a new agreement.

We are of the opinion that a railroad pool, formed under protection of the law, whereby the railroads of this country would be permitted to pool their tonnage or their earnings, would cause to pale into insignificance all other combinations of capital commonly known as trusts.

The effects of such a combination upon the interests of the people would, indeed, be far-reaching and far from satisfactory, inasmuch as a pool would not prevent discrimination, but would restrict competition and confine the favors of the railroads to fewer individuals than under the present system of open competition.

This has been experienced in railroad pools and doubtless will continue to be the experience of all such pools, whether legalized or not. The prime object of a pool is to increase the net revenue of the railroads, and we believe this would follow regardless of the interests of the people, from whom the railroads have received their valuable franchises.

We think it would be a great mistake for Congress to enact a law permitting either a tonnage or a money pool, and for the following reasons:

First. It is against public policy.

Second. Would not absolutely maintain published rates nor prevent discrimination.

Third. Would result in a minimum service at a maximum cost.

Fourth. Would, in the interest of economy, deprive of their present position thousands of men who have spent the best years of their lives in the traffic departments of the various railroads and fast-freight lines; their occupation would be gone.

Fifth. Would soon become odious and intolerable to the business men of our country.

Sixth. The railroads do not need a pool; they are doing well enough without one, their earnings at the present time and under existing conditions being generally regarded as satisfactory.

With the interstate-commerce law amended as suggested; rates agreed to and published by the railroads; a copy of every tariff filed with the commission, together with the name of some one official of each road, who alone is to be held accountable for the strict maintenance of all freight rates legally published by his road, it would not be difficult for the commission to enforce the law and make it of great benefit both to the railroads and to the public.

Q. (By Mr. KENNEDY.) You said you expressed your own opinions, though I

see this paper is phrased as though you were voicing the sentiments of others. Perhaps, if you insist you are just speaking for yourself, the phrasing had better be changed by the stenographer.—A. I stated in my remarks that while these were my own opinions, I believed they met with the approval of the majority of the members of the board of trade.

Q. (By Mr. C. J. HARRIS.) He probably represents that part of the board of trade—A. I represent the entire board.

Q. I mean in this you represent those not in favor of pooling, and while here we will hear the other side from other witnesses.—A. Yes.

Q. (By Representative LORIMER.) As I understand it, this is all you want to say on this question of pooling?—A. That is really all I care to say at present. I think that covers the situation as I see it.

(Testimony closed.)

CHICAGO, ILL., November 16, 1899.

TESTIMONY OF MR. HERCULES F. DOUSMAN,

Grain shipper, Chicago, Ill.

The subcommission on transportation met at Chicago, Ill., on the 16th of November, 1899, at 10 a. m., Hon. William Lorimer presiding. Mr. Hercules F. Dousman, being duly sworn, testified as follows:

Q. Will you please state your name and residence?—A. Hercules F. Dousman, Chicago, Ill.

Q. Your place of business.—A. It has always been the board of trade.

Q. And your business?—A. Well, I am not in active business now, but for 17 or 18 years I was a grain shipper on the board of trade.

Q. (By Mr. C. J. HARRIS.) You have been a large shipper of freight in and out of Chicago?—A. I don't know that I would call myself a large shipper—a moderate shipper. In Chicago everybody receives more or less grain. My main business was getting it forwarded.

Q. You are familiar with the freight rates of the various lines? I would like to ask if there are any discriminations or rebates in the way of giving large shippers advantages over small ones?—A. As I told you, I have not been in active business for two years. I only know what other people tell me.

Q. In your experience has there been any trouble of that kind hitherto?—A. From the time the interstate law went into effect, for twelve months, or six months at least, everybody was on an equality. After the first six months, rebates began to be given. At the end of the first year they were quite frequent, and they have continued ever since. Prior to 1887 the only time when rates were absolutely solid, when everyone was on the same basis, was when the Vanderbilts were trying to bankrupt the West Shore road, and rates were down to 12 cents to New York. Everybody, as I understand, had the same rates.

Q. In what way were discriminations made?—A. What I got in those days was so many cents per 100 pounds, off the regular tariff, 2½ or 3 cents, whatever it might be. I feel that I have been driven out of business because I would not accept a rebate. I have never taken a rebate since the interstate law went into effect. I did not propose to put myself in the shape of a criminal, and but one man has had the impudence to offer me a rebate since that time.

Q. (By Professor JOHNSON.) Have you ever been offered favors of any other kind than rebates? I understand from what I hear that various favors have been offered.—A. No; I can not say I have.

Q. Is it not frequently the case that salaries are paid for merely nominal services?—A. It has been so reported. I have no definite information of anything of that kind.

Q. You can not say, then, that rebates are the only inducement that has ever been offered?—A. I was speaking of the time prior to the interstate law. A rebate is so much off of the freight. If the freight was 20 cents, your off rate would, perhaps, be 18 cents, which would be effected by paying back 2 or 3 cents, as the case might be.

Q. But you were in business at least ten years under the interstate-commerce law?—A. Yes, sir.

Q. What was your experience then? Were strong inducements made by the railroads to secure your shipments?—A. As I say, my position from the first was well known. I was chairman of the transportation committee of the Chicago

Board of Trade, which made some trouble for the railroads here, and I suppose I am persona non grata with the railroads here on account of that.

Q. You found that your business suffered so that you decided to go out of it?—A. I did not think that I could do business honestly.

Q. Do you think any other man can?—A. I don't know about that. Other men are doing business.

Q. I should like to have you tell us how the grain business is handled by the railroads and the lake lines. I would like to have an elementary account of the actual methods by which this grain business is handled—the grain that comes to Chicago and is shipped East from here.—A. When I came to Chicago, the grain was, I think, all consigned to Chicago; rates were not made beyond. It practically came here to be sold in Chicago, was received by one set of men called receivers, who sold it to another set of men called shippers. The receiver represented the people in the country who consigned it here—the country merchants—and the shipper either bought it for speculation on his own account or bought it here to be sold to the Eastern market, or else bought it here for someone in the Eastern market who consumed it. The elevators at that time were all situated on Western roads, and did not buy grain themselves. I think one elevator concern, when no one else was buying grain on their road, took it and sold it in the option pits—as we call them—and delivered it as soon as they could get receipts. The rates from the West were made into Chicago. There were very few through rates before the interstate law went into effect. Soon after it went into effect the elevator proprietors became grain buyers here on the market, until to-day there are practically no other buyers of grain who go on the market except elevator proprietors, and they also buy grain in the country, and send out bids for grain in the country, and the men who used to be called receivers, and received it and sold it here, have been forced to become buyers, and are bidding against each other. Of course, you understand that these elevator people are public custodians. The law of the State of Illinois gives them the right to charge three-fourths of a cent per bushel on every bushel of grain going into their house which covers ten days' storage, and that three-fourths of a cent gives them that much leverage over anyone else. They can give it away to anyone they wish. If an individual goes there and ships grain in and out he has to pay three-fourths of a cent a bushel. About the same time the railroads began to make rates from the West through Chicago from the Mississippi River to New York, or the rate was made from Iowa, thus giving Chicago the go-by.

Q. (By Representative OTJEN.) The grain never leaving the car?—A. Generally transferred here unless on a line car. A great deal of this grain was shipped on through billing, as it is called; that is, taking a rate from beyond, and that rate would be less to the road that brought it from the West to Chicago than the rate into Chicago. They might fix the rate from a central point in Iowa to the Mississippi River, and from the Mississippi River the percentage of the rate would make less than the local rate into Chicago. The men who used to buy the grain here to ship, on the open market, who have been going more or less to the West to buy grain themselves, are the elevator people who run it through their elevators, and there is a rate made now from the West on grain going through elevators which is a reduced rate over the local rate into Chicago.

Q. (By Professor JOHNSON.) Try to run it through the elevators to grade it down; is that the process?—A. Of course it leaves an opportunity to mix the grain.

Q. To grade it down to the actual grade at which it is sold?—A. Yes; there is more or less of clipping and cleaning, and manipulation charged by people. I guess it is fair to say that none of the Chicago grades of grain have improved at all.

Q. (By Mr. C. J. HARRIS.) How does the grading of the grain compare with other cities? Have you grades here pretty well up to the standard?—A. The standards differ in different places.

Q. How do they compare with other standards: are they as good as St. Louis, do you think?—A. I don't know anything about St. Louis grades; but to draw grain out of the elevators here the men who draw it tell me they get the lowest grades of grain. In old times cars with top grades were handled by people who had no interest in them, and the bin that received 10 cars of grain had to put up with the poor cars which got the benefit of the good ones, and it represented a pretty fair average grade. There has also at this time grown up a system of private elevators, men who own their own elevators on railroad tracks and on Eastern roads. They have on their tracks what are called transfer elevators, where they clip oats for people who wish them clipped and mix them and transfer from car to car, and, as I understand, the Eastern roads have a fixed charge for that service in their own houses and allow people owning private elevators on their tracks the same charge for transfer.

Q. What is clipping oats?—A. At the end there is a little tail like a point. That is rubbed off and the oats lay closer. It is done by machinery, and makes a heavier oat. You can get more in a car and in a bushel measure.

Q. You say most of the elevators on the railroads are owned by private concerns. What effect has that on the farmer who is selling his wheat?—A. Before you get to the farmer there stands the country buyer, who has to take the wagon-load the farmer sells. The country buyer has the offer of bids from 5 to 25 grain dealers.

Q. (By Representative OTJEN.) He represents other persons?—A. No; the country buyer is the merchant. He buys the wagonloads from the farmer and makes up a carload, and every morning he gets from these people who buy postal-card bids saying they will give so much for his grain. My opinion is that on the average they don't get as much for their grain as they did in olden times, when it was consigned in open market and met the competition of all the dealers. The old-style elevators, from which the grain goes into the vessels, were all public elevators, which the law permitted to charge three-fourths of a cent. These are leased to large firms, generally.

Q. (By Mr. KENNEDY.) Are they in the combination?—A. I don't think so. They are charged with being in the combination. Sometimes they have agreed between themselves and sometimes there is a fight between them.

Q. (By Mr. C. J. HARRIS.) We have had complaints before us that out on these lines of railroad the elevator system is so controlled by the railroads that men doing business independently can not exist. Do you know anything about that?—A. In 1890, I think it was, I was the chairman of the transportation committee of the Chicago Board of Trade, and we had complaints straight along from men in the West that they could not move corn in the elevators that they had owned for years, and which they had paid for, and bring it to Chicago, but were forced to sell it to individuals. One firm, who were proprietors of an elevator on another road, were bringing corn on a certain road; they quoted every day; and one case came to me where a man said, "I have sold this man, who was the proprietor of the elevator on a rival road, so many bushels of corn; he turned around and sold it in the pit." I said, "How did it come?" He said, "It comes in over my road." The difference showed a cut of 5 cents. The Interstate Commerce Commission at that time had before it what is known as the corn rate case. The complaints were coming in so strongly that I could not help taking cognizance of them, and I went up to Washington and saw the commission in regard to it; but the time for taking testimony had passed. The time for argument was only ten days away. Colonel Morrison was chairman, and said he would be glad to hear our case on argument, but could not hear it in any other way. We got up a combination case. The railroad commissioners of Iowa, Grain Dealers' Association of Iowa, and people from Lincoln—the different State boards there interested, G. N. Lambertson, and the board of trade notified these gentlemen that the matter was going on and they were all represented. We presented our facts in regard to the postal-card bids, showing the price as it was to-day and the price as it was yesterday, and the nominal rate, and we showed that there was an actual rebate of 5 cents per hundred right along. We made such a case that the committee of the railroads, appointed to bring in their report denying the jurisdiction of the commissioners and declining to put on their rates, changed their tactics and made a report recommending to the commission that the rates be put into effect. The commission took up the case before the Federal courts and the result was two freight agents were indicted, but the case never came to trial, because, finally, on the protest of Mr. Counselman, who was one of the witnesses, that he could not testify without incriminating himself, the Supreme Court sustained it and the cases fell. Some of these men have since been obliged to go out of business on that road.

Q. Is there at the present time a fair elevator market for produce in the Western grain-raising States?—A. I should say it was a congested market; it is not a market where buyers and sellers can meet each other face to face; and the feeling in the country is that the proprietors of elevators to-day are the men who have favors that the general public does not have. I don't know whether their bids show it or not. But the fact that one man is the only buyer on a road shows that other people do not have a chance.

Q. Do you hear any complaints of not moving the cars promptly, except for people presumably connected with the elevators?—A. Not very much. I have heard of such things.

Q. Are those the complaints that used to exist some few years ago and are an echo of those days?—A. I think not. There are grounds for complaint right along.

Q. The grounds actually exist to-day?—A. Yes. A man told me day before

yesterday the same thing, in relation to moving cars into Chicago, that you have in mind. He said he sold a car of corn a month before and shipped it to an Eastern road, and could get no report from it. He went to the Eastern road and they told him to go to the transfer elevator man. He did so, and was told they only receive orders to forward it two days before. For 30 days it had been lying in the yard, and in the meantime freights had advanced, I think, 5 cents per hundred.

Q. That would not be a strange thing to happen now when there is a congestion of freight and famine of cars. Was not this due to the car famine that now exists?—A. I should say not, because if a buyer wanted the grain he could give them the transfer order the day after buying it and let the railroad work it out. In this case the transfer order was not given for four weeks.

Q. Who would you think was responsible for it?—A. The Eastern roads. They have the right to charge demurrage and force the property out. That little case shows where general interests suffer from special favors. The man should have a return in a week, whereas he did not get returns for four weeks. The seller who paid the countryman's draft could not get his money back in four weeks, when he should have had it in a week, all that some special shipper might be favored.

Q. (By Representative LORIMER.) Is it your opinion that only one man buys along the line of one road because they have a special rate, or is it because they have superior facilities for handling the grain when they purchase it and can therefore do better and drive other competitors out?—A. I don't think the large concerns can do business in grain against the smaller concerns unless they are favored, for the reason that the average moderate commission merchant does his business himself and this enables him to do better by his customers than will the clerks of large concerns.

There is another thing in connection with elevator control, and the buying of grain by public elevators. The system of inspection in Chicago is run by the State. You know how in Democratic times appointments were made for political purposes. You know the character of the elevator proprietors. They are rich people. Their business is run by clerks. You know the inspectors are men appointed for political purposes, and who work for \$1,000 per year. Now, I don't think any class of public servants should be exposed to such temptations as these men are placed under.

Q. What is the condition of the grain-inspection department now, so far as you know?—A. I think it is fair, so far as I know; but at the same time you can not get away from the fact that it is for the interests of certain men to have high inspection of some grain—high inspection when it comes in and low when it goes out.

Q. Are the men who are inspecting grain in Chicago generally men who have been recently appointed and never saw service before or are they the old inspectors who have served for 20 years?—A. The man in charge has been there for 20 years or more. I don't know about the men under him.

Q. Are the old inspectors there now?—A. Well, you know they were taken out, and there is the danger of a change all the time.

Q. One of the members of the railway and warehouse commission is an old inspector, who had 20 years' service before he left, and was a first-class inspector. I think he was associated with Mr. Smiley.—A. He was his assistant once.

Q. Under that sort of organization we should have fair average inspection, should we not? They have the ability, if they perform their duty faithfully.—A. Yes.

Q. Then, in your opinion, the advantage that the shippers have now or the purchasers have now is either in a rebate or an advantage that they have by reason of owning the large elevators?—A. No; the advantage that the State gives them in permitting them to charge three-fourths of a cent per bushel. Most of these elevators are owned by the railroads. They give a through rate on wheat but don't carry the grain through their own houses. They put their elevator in the hands of private parties who are dealers, and give the through rate on flour and handle it themselves, and a through rate on merchandise and handle it themselves. Now, the Canadian Pacific road—as a matter of fact, I understand have no side-show connected with their road, but they own steamboats, elevators, dining cars, hotel, and everything connected with this business, and they say they can give a man a pass from Montreal to Vancouver and get \$50 out of him on sleeping cars, hotels, and such things, and they report \$1,000,000 profit from these things.

Q. (By Mr. C. J. HARRIS.) You don't mean to say that these elevators should handle this for nothing?—A. The railroads could handle it for nothing and make it a part of the through rate.

Q. The elevator should not be connected with a railroad and no special charge made for elevator service?—A. Not for their service; that is, for the service in transporting it through. If people want to hold their grain, that is different.

Q. (By Representative OTJEN.) The elevator service in carrying the freight?—A. Yes; and should be performed by people who have no interest in the property. I think it is so done at Duluth by some of the railroads there.

Q. (By Mr. C. J. HARRIS.) What proportion of freight is by water transportation, in your judgment, about Chicago?—A. That varies. The report of the secretary of the board of trade shows.

Q. I mean generally?—A. Oats, the greater part, go by rail; in summer, corn, the greater part, goes by water.

Q. Does not water competition make railroad rates very low?—A. I don't think water competition has ever made them as low as fights between the railroads.

Q. A good deal of your grain from the West comes by lake?—A. Very little. The only grain that comes by lake is wheat from Duluth for storage purposes.

Q. (By Professor JOHNSON.) There are about ten lines of steamers on the lake, are there not?—A. The trunk lines east of Buffalo each have their own lines; the New York Central, Erie, Pennsylvania, Lehigh Valley, Lackawanna; and I think the Baltimore and Ohio had a line for the last year or two, connecting at Fairport; and there is a line running to Ogdensburg.

Q. Are there any lines not owned by railroads?—A. There are boats belonging to individuals, to firms, that run as wild boats, practically like tramp steamers on the ocean.

Q. Are there any regular lines operated independently of the railroads?—A. Not that I know of.

Q. What proportion of the business is done by those so-called lake tramps?—A. I could not give you an estimate. You will have to get that of some of the vessel men.

Q. Do they constitute an important factor?—A. Yes.

Q. So far as you know, are the railroad lines worked in accordance with a rate agreement through the Lake Carriers' Association?—A. I don't think it is the Lake Carriers' Association. I think they have an association of their own—an agreement in regard to rates.

Q. That is not through the Lake Carriers' Association?—A. I think not. I think the Lake Carriers' Association embraces all the lake interests—boats that go to Lake Superior and boats that carry iron ore and lumber.

Q. Does the competition between the trunk lines take the form of competition on the lakes? Do they compete with each other vigorously?—A. I could not tell you that. I fancy they do when trade is scarce.

Q. (By Mr. C. J. HARRIS.) If you could not make satisfactory rates with these regular lines, you would have no trouble in chartering a tramp steamer to take a cargo, would you?—A. No.

Q. As a matter of fact, are not freight rates down to about bed rock, or have they not been hitherto?—A. They have been very low for several years. I have paid 23 cents a bushel for wheat from Lake Michigan to Lake Erie; it has been taken at 25 cents. The rate now is 2 cents, and has been as low as 1. Of course, that does not pay.

Q. (By Professor JOHNSON.) Do you think there is any danger of these independent boats being driven off the lakes? It has been stated to me that there was danger of the abolition of competition on the lakes, the same as on railways.—A. If the Erie Canal was out of commission I think they might.

Q. Do you think competition on the lakes depends on the Erie Canal?—A. It means an outlet for an independent shipper. Of course, they can make a contract with a railroad company on the Erie Canal.

Q. Would not the Canadian highway give them that same freight?—A. For their export business I suppose it would, and still it is a small proportion of the business that can go that way. The season is short, and even with their new canal 14 feet of water is all they have.

Q. If your statement is true, it would be a pretty strong argument for the Erie Canal.—A. I think the salvation of the grain trade rests in the Erie Canal and its independent competition.

Q. (By Mr. C. J. HARRIS.) Is there any difference between freight rates in the winter and in the summer here?—A. That depends. There has been and there has not been. Just now freight rates are higher than I think they have been since 1893. I think rates should be made to the markets. There should be fixed rates that would not change. I don't think it is a part of the duty of any freight agent or railway man to move the crops of the country. It is their business to make fair rates and hold them stable and let the merchants of the country move the crops of the country. The market price of all these commodities fluctuate. I think from here to the seaboard there should be two rates—a rate for 6 or 7 months in the winter, and a rate a little smaller for 5 or 6 months in the summer—and these rates should not change in that time.

Q. (By Representative OTJEN.) Do you think that would be practicable at all times? For instance, at the present time there is great business and freight rates are higher, are they not? Then there are times when freight rates are low, owing to the lack of business.—A. I think if you will call before you some of the managers of these railroad companies you will find that last summer rates were as low at the end of August as they have ever been, and I think you will find that the congestion here on all the roads occurred from having contracts for large amounts of freight at low rates. Since then there have been, I think, two or three advances in rates, but the congestion came from large contracts on low freights, the lowest we have ever had. For whose benefit or for what reason they were made I can not say.

Q. (By Mr. KENNEDY.) If last summer you had the lowest rates that ever obtained here, would you not naturally expect that there would be an increase in freight rates owing to the prosperous times?—A. Prosperous times in business came before the rates went down. I understand rates were as low as 11 cents to New York last summer.

Q. Was traffic as heavy as it is now?—A. Heavier, I guess, and therefore the wisdom of loading themselves up with large quantities of freight at low prices, instead of holding the rates steady and allowing the merchants to move the business of the country every day as wanted, I fail to see.

You ask if it is feasible to have railroad rates uniform. I suppose you gentlemen know that for 35 years a man could cross from Buffalo to Albany and buy a ticket from station to station just as cheap as he could buy a ticket from Buffalo to Albany, except for the penny that was given away. The rate was fixed, I think, by the act permitting the consolidation of the railroads. I don't see why the freight tariffs on all the railroads in the United States should not be as solid as that. The president of a large Chicago road said, "I wish we could nail up our tariffs on the freight boards and go about our business and know for a certainty what would happen and see how business would distribute itself; but," he said, "our people can not submit to it, as they are afraid somebody will get the advantage of them."

Q. Presidents of railroads have stated before the commission that one president admitted that the discriminations were never more flagrant than they were last year; but since the 1st of December there has been very little of it. If that is true, would you believe that it is because the railroads now have more business than they can handle and don't seek business and offer rebates or discriminations?—A. I can not tell you the philosophy of the railroad men in doing their business. I have never seen a railroad man who did his business as a merchant does.

Q. Could you state why rebates and discriminations are more flagrant in hard times than in prosperous times?—A. My experience is that they have always been the worst when there was the most stuff to move. In 1890 there was the biggest crop of corn in the West it ever had, and it was moved at the lowest price that obtained up to that time, and simply because of a fight between the railroads.

Q. (By Representative LORIMER.) Was that rate a general one?—A. No; it was not general. The people could have shipped corn in themselves and sold it in the pit; instead of that they were obliged to sell to one man, not a dealer, on their own road, but the proprietor of an elevator on another road.

Q. (By Mr. KENNEDY.) As a general thing, were rebates and discriminations made upon the solicitation of shippers, or were they offered by the railroads?—A. Prior to the interstate-commerce law everybody was seeking them.

Q. Were the railroads sending around agents and offering them?—A. Yes; that was done, and I presume it has been done since the passage of the interstate law. I once had a railroad freight agent offer me a rebate under the interstate law.

As regards the extent of these rebates, the amount paid in rebates—at the time of the Brown case in the United States Supreme Court, which forced the Pennsylvania company men to testify in a lawsuit, one of our Chicago papers stated that a railroad director or official said that the railroads of the country were paying out at least 12½ per cent of their freight receipts in rebates. Of course, that was a statement made in the public press. I don't know anything further about it.

Q. Do you know whether it is true that Mr. Armour monopolizes the buying, selling, and shipping, for domestic and export purposes, of the barley crop of the country?—A. No.

Q. Do you know who would be able to give the commission information as to that?—A. Nobody could give the statement, except Mr. Armour's own men who do the work.

Q. (By Mr. LORIMER.) Do you know whether or not barley is handled through

any other elevators than Mr. Armour's in Chicago?—A. Mr. Armour's elevators handle a great deal of the barley because he has elevators on the St. Paul and Burlington roads—barley roads. A great deal of barley comes in on the Chicago and Northwestern road, and more or less on the Rock Island road.

Q. Is it handled through elevators other than Armour's?—A. I could not tell that. I suppose the proprietors of the houses in the grain business would get their share of it.

Q. Does Armour own elevators along those lines that you refer to—the Northwestern and Rock Island?—A. Mr. Counselman is supposed to control the elevators on the Rock Island system and through the Chicago terminal company, which they represent. Weare & Co. control the elevators on the Northwestern, and I think the Great Western is also one of the Weare roads.

Q. (By Mr. C. J. HARRIS.) I understand you have paid considerable attention to the interstate-commerce law: will you give the commission your views in regard to its workings?—A. The practical effect of the interstate-commerce law has been to put the giving of favors by the railroads into fewer hands than it was before. I do not think that can be disputed or doubted.

Q. Has it lessened them?—A. I doubt it.

Q. (By Professor JOHNSON.) Will you tell us how that has been accomplished?—A. Never having been a participant. I can not tell you.

Q. What is there about the law that produces such a result?—A. Apparently the railroad gentlemen feel the necessity, since the first 6 months of the law, of giving rebates to somebody, and they give them to the people who will protect them.

Q. But they always did that, did they not? What difference has the law brought about?—A. The law has made criminal what before was not.

Q. So that they endeavor to cover it up somewhat?—A. You see that yourself.

Q. (By Mr. C. J. HARRIS.) You think while they do not give them indiscriminately, as they used to, they do give them to parties they think are responsible and will protect them?—A. Well, I tell you the statements I have read in the newspapers.

Q. Have you any particular change to suggest that would help matters?—A. Well, the only railroad rate that I know of that has been unchangeable is the one I spoke of—the passenger rate on the New York Central road. Mr. Stickney, in his book, as I recollect it—it has been a good while since I read it—gives his remedy for these things in a fixed rate per ton per mile over the country, with allowances for fixed terminal charges at the different towns, on the theory that little country stations can gather and discharge business more cheaply than the city, which is undoubtedly true. It costs a great deal more to get business through Chicago than Elgin, Rockford, or any small town. That, as I recollect it, was Mr. Stickney's remedy. That would be Congress trying its hand at its unmistakable authority to make rates.

Q. (By Professor JOHNSON.) You would advocate a legislative enactment of rates?—A. I would advocate anything that would make all the railroads of the country treat the people the way the customs-house and post-office treat the people—every man on the same basis. I think the minute you get that, all the danger from large combinations of capital will be done away with. I do not think there is an individual whose business is dangerous to his competitors, or a combination dangerous to the community at large, but that owes its formation or continued existence to special favors of some sort.

Q. (By Mr. KENNEDY.) By railroad companies?—A. Railroad companies chiefly.

Q. (By Representative OTJEN.) Transportation companies?—A. Transportation companies, yes.

Q. (By Professor JOHNSON.) Do you think in order to secure this uniformity of rates, it is necessary to have them established by law?—A. Either that or by the Interstate Commerce Commission, which comes to the same thing—Congress delegating power over the rates.

Q. What kind of control?—A. Such as will be effectual. I believe the owners of a good railroad should be protected against a poor one. I will tell you an instance, in my own experience, illustrating at least how one company tried to do some business. I was buying wheat at Duluth, which we shipped during the summer time by lake. One winter we got short and had to have some by rail, and our wheat had always been bought in one elevator on account of the difficulty of buying what we wanted. Our correspondent bought 5,000 bushels of wheat. There are two lines between Chicago and Duluth, and that wheat was directed to be shipped by one of them, simply saying that we wanted it brought to Chicago and delivered to our eastern road. The next day a clerk from the Chicago office of the railroad owning the elevator in Duluth came to me and asked to have

the transportation of that wheat around by Minneapolis. I told him he could not have it. The day after the Chicago agent of that line came to me and asked for the wheat. I told him he could not have it. The next day the general freight agent of the road whose office was in St. Paul came to me and I told him he could not have it. The next day the general manager of the road came to see me and asked for the transportation of that 5,000 bushels of wheat. I said to him—I thought I had exhausted the limits of courtesy—"Can you haul that wheat any cheaper than the regular rate?" "No." "You will take it by St. Paul and transfer it there because you do not let the cars get off your own line?" "Yes." "And will give it to any one of a half dozen roads to bring it here?" "Yes." "Do you not make more out of the \$2 a car you get from handling the cars at your elevators at Duluth than all that?" "I think I do." I said, "Are you not ashamed of yourself to try to take away from the road that can make a little money on it this little jag of wheat; while you take it away from our control and never let us know when we are going to get it." He said, "We are awful poor." I said, "You will remain poor as long as you do business that way." He wanted to haul it 100 miles farther, and put it through an expensive terminal, and do the business without any profit to themselves, when this direct line could make a little. But 6 cents a bushel for hauling wheat 450 miles through the woods of Wisconsin is not a high rate. I believe the direct road should be protected against that sort of competition.

Q. In what way would you vest the rate-fixing power in a commission?—A. Give them the authority to name maximum and minimum rates, and make their order effectual at once.

Q. You mean to promulgate a general schedule of rates?—A. No; but a uniform classification over the United States, which was once attempted by the railroads, and came near being accomplished, should be made and can be made by consultation between the merchants on one side and the railroads on the other—a fair classification. Then let them make their own tariffs, subject to revision by the commission either on complaint or their own motion.

Q. Subject to the higher authority of the court?—A. Subject to review by the courts.

Q. However, upon injunctions sued out by the railroads?—A. I should not let an injunction issue at all on a thing of that kind. Let it take its course through the courts.

Q. In accordance with the present plan?—A. Like an appeal.

Q. At the present time the commission has no power to enforce its commands?—A. I should have the commission's orders go into effect at a certain time, say 30 or 60 days after issue, and then let the railroad litigate it out.

Q. You would take away from the court the power to enjoin an enforcement of the rate?—A. I think I would. An experience of 20 years shows the railroads and the community are in no danger from any rate that anybody like the Interstate Commerce Commission may make.

Q. (By Representative OTJEN.) Can you take away from the court the power of injunction?—A. I am not a lawyer; I can not answer that.

Q. (By Professor JOHNSON.) If you could, would it not give the commission power to fix rates for several years in advance?—A. I do not see why.

Q. It takes 3 years to get a case through the Supreme Court, after you get it appealed to the higher court?—A. Emergency and constitutional cases go quickly.

Q. (By Mr. KENNEDY.) You see no obstacles in the way of uniform classifications?—A. None so serious as the ones that come from the multiplicity of classifications.

Q. (By Professor JOHNSON.) That would have to be brought about by compelling the roads to do it, or by giving the Interstate Commerce Commission power to adopt a classification?—A. Directing them to adopt it, not authorizing, but directing them to adopt it, and give time enough. We have a classification in the State of Illinois. Three or 4 years ago our board of railroad and warehouse commissioners called together the merchants, manufacturers, and railroads, and they finally agreed upon a classification that no fault has been found with.

Q. (By Mr. KENNEDY.) Do you not think there should be a different classification in the State of Illinois, where the country is level, and there is a considerable less cost of building railroads than in mountainous States?—A. That can be remedied by a different rate. I do not see why the classification should be different. You never know where you stand on a classification. Where the classification is fixed the rate should have whatever flexibility it needs. Of course the rates east from Chicago should be per ton per mile less than the rates over the mountains, but I do not see why a blanket is not a blanket, or a chest of tea a chest of tea, from the shores of the Pacific to the Atlantic, and lumber and shingle the same.

Q. Do you see any fault in the arrangement by which classifications are made

now? Are the shippers properly represented? Do they have proper hearings before the classification committees?—A. Not being a merchant I do not know much about it. I do not think they are called upon as a rule.

Q. They are not consulted when the classification is made?—A. I think not as a rule.

Q. (By Representative LORIMER.) We have four large lines running from New York; two over the mountains—the Baltimore and Ohio and the Pennsylvania—the Lake Shore and Michigan Central not. Under your system how would you fix these rates?—A. Well, under Stickney's system the shortest road would make a little the cheapest rate, if I quote Mr. Stickney correctly, and I think I do.

Q. Then you would not take into consideration the fact that one goes over the prairie and the other over the mountains?—A. I do not think it makes any particular difference. The road that carries property the cheapest in the United States is the Chesapeake and Ohio, and that runs over mountains and through tunnels.

Q. (By Professor JOHNSON.) You do not see any reasons why differentials should be given in the case of a rate-fixing scheme such as you have described—A. I think differentials are inventions of the devil.

Q. Are they not one of the necessary inventions?—A. I do not think so.

Q. How can a line like the Grand Trunk or Baltimore and Ohio compete with the New York Central, for instance, without a differential? How can they divide the business?—A. I think you will find in business practice that any railroad that has any excuse for being a railroad, does at least 75 per cent of its business that it actually does to-day or has done for the last 10 years, better than any other railroad. That is its own business, in which it should be protected, that percentage on the average at least, that it can do better than any other railroad; that it will get more net profit out of than the balance. The other 25 per cent, which is competitive business, should be done on a straight, square rate, uniform and stable, regardless of differentials, letting the merchant take the business to his friends, to the people who do his business well—but in case one road was tied up and the other free, he would take it to the road that had the cars. Let it distribute itself naturally, and then there is no demoralization, however the rates are made.

Q. (By Mr. KENNEDY.) You are not in favor of pooling then?—A. In this instance, the Duluth case, the general manager said, "We get lots of freight from Chicago to Duluth." I said, "You are not entitled to a car." But under the pooling contract, he would come in and sandbag the direct lines and get what he called his share of it. The railroads want a pool, and I should be in favor of giving them the permission, with proper supervision of the Interstate Commerce Commission, provided they will withdraw their objection to the commission having control of rates; but they won't concede that at all.

Q. (By Representative LORIMER.) In substance, then, you are in favor of a fixed rate for a vast territory the country over, and of authorizing somebody, say the Interstate Commerce Commission, to fix that rate, a maximum and minimum?—A. Yes; but in case of contest reduce it to whatever is a fair, reasonable rate. They would have discretionary power between these two rates. I am no advocate of low rates. The business community can not get service unless the roads make money.

Q. (By Professor JOHNSON.) You say then to Mr. Lorimer's question as to the same rates for the country over that you favor it. I should infer you would divide the country into sections?—A. Yes; I see no other way, and I think that was Mr. Stickney's idea.

Q. You would have one classification for the whole country?—A. Yes.

Q. One scheme of rates for one section, and another for another; however, the classification being the same?—A. I do not say I have that scheme, but it seems to me that would accomplish the purpose of giving stable and remunerative rates.

Q. What do you think about the penal feature of the interstate commerce law?—A. While it is right, it is not expedient. The railroad men take the ground they will not furnish testimony while it will send one of their fellows to the penitentiary. They do send a man to the penitentiary for stealing a barrel of flour or a box of shoes, but the merchant who will violate the law and steal thousands of dollars must be absolved.

Q. You would change that to a money penalty?—A. A severe penalty, such as could bankrupt a railroad if they violated it.

Q. (By Mr. KENNEDY.) You mean the officers of one road will not give information against the officers of another road?—A. That is what I understand.

Q. If the penalty attached in the way of a fine on the company they would give information?—A. That is what I understand.

Q. (By Representative OTJEN.) Please explain in what way private cars are

detrimental to the public welfare.—A. During the hard depression we had here in 1896 and 1897, a manager of the traffic department on an Eastern line told me, referring to the private car department of a Chicago meat firm, which has a great many private cars, that that branch of the business had paid as high as 14 per cent profit, and that his own company was then striving to keep from reducing their dividends. A man on 'change told me that he had an order for a thousand bushels of wheat and that in order to get the wheat he had to buy it in a private elevator where the switching charges would be excessive; that is, \$4 or \$5 a car; and to make the burden as light as possible, the freight being 44 cents a bushel, he sent for a 1,000-bushel car, so that he could load it all in 1 car. That, of course, is not an excessive load. Now, instead of sending a 1,000-bushel car, they sent 2 cars belonging to a private car company. He said, "What does this mean?" You can figure out the transportation. The distance to this point was 415 miles and the mileage on these cars, according to the published report, is three-fourths of a cent a mile, which goes to the private car companies, or \$3.12 per car that the company would get on each car, or about \$6.35 for the use of the 2 cars. The freight bill was \$45 and the switching was \$4, and if they had used a 1,000-bushel car they would have had \$4 for hauling. As it was, they received \$45 and paid out \$8, \$4 a car for switching the 2 cars, and paid the private car company at least \$6.12 for the private cars, and got \$30.88. Allowing the 2 cars had been there and they had no freight back, they would have had to pay about \$6.25 to run the cars back. Now, the company that owned those 2 cars was the company that I referred to as having made 14 per cent on the investment. And it is on account of these things that I say I think the private car should be abolished.

Q. (By Mr. KENNEDY.) The presidents of several great railroad companies in this country have stated before us that they would like to abolish the private-car system.—A. They can not do it as long as one road uses them. If it is done it must be done by a higher power. There is a book published by the railroad companies giving the number of private cars and the people owning them.

Q. Do you know what book it is?—A. I don't know the book. There is one concern that had 10,000 private cars. Any railroad man knows what it is.

Q. (By Mr. C. J. HARRIS.) I understand these private companies have these cars.—A. No; the company I mentioned was a meat company, and that business was gone into, the private-car system, to further their own interests.

Q. (By Representative OTJEN.) They took these two cars to ship these goods in, I presume, to get other business on some other product?—A. Yes; and to the detriment of the stockholders of the road. It is simply an indirect way of cutting freights. Certainly, when railroads are earning 12 or 13 or 14 per cent they can build all the cars they need. This man that I spoke of, this traffic manager, didn't want to run these private cars, but he did not know how to get rid of them.

Q. (By Mr. KENNEDY.) Would this book that you spoke about give the number of private cars that Mr. Armour has?

A. Yes; every one in the United States.

(Testimony closed.)

CHICAGO, ILL., November 16, 1899.

TESTIMONY OF MR. ALEXANDER A. KENNARD,

Vice-president, Butter and Egg Board, Chicago, Ill.

The sub-commission on transportation being in session in Chicago, Representative Lorimer presiding, at 11.40 a. m., November 16, 1899, Mr. Alexander A. Kennard was introduced as a witness, and being duly sworn, testified concerning transportation as follows:

Q. (By Representative LORIMER.) Will you state your name?—A. Alexander A. Kennard.

Q. Your place of business?—A. 144 South Water street, Chicago.

Q. Your business?—A. Butter, cheese, and eggs.

Q. You represent an organization before this commission?—A. Yes; known as the butter and egg board. I am vice-president of that organization. It is the successor of the Chicago Produce Exchange. The produce exchange went out of existence and the butter and egg board succeeded to all its privileges and rights.

Q. (By Professor JOHNSON.) I think it would be well for us to have a few words

in regard to what the butter and egg board does; then take up the question of transportation of its products.—A. The butter and egg board is an organization that meets daily to give opinions and vote on the market price of the products in which we deal—butter and eggs. They vote as to what the market should be daily; what is the supply and demand; and if anyone has butter and eggs to sell, it is posted on the board. If he wishes to buy, he can buy there. It is a kind of auction—not exactly that, but the transactions are made there in these perishable products. I should say that in the practice of this business, of course we have to have special railroad facilities. We have refrigerator cars, particularly in the summer time, and the rates of freight on these perishable commodities are much higher than on ordinary freight, such as garden truck and things of that sort. And, in a general way, it is considered very desirable freight for the railroads to haul and they are very glad to get hold of it. My own business, particularly the butter trade in the West here, is developing in the way of export business—trade with Great Britain, Germany, etc.

Q. (By Representative OTJEN.) Explain how many people are engaged in the business, and the capital. Give a little idea of the extent of the business.—A. In the whole United States?

Q. In this locality.—A. In this locality there are some 200 or 250 firms in this line of business. I include in this line of business country products, such as fruit and potatoes, general produce, and things of that sort. They all go together and are handled by the same persons. The trade is mostly on Randolph and South Water streets.

Q. You mean in Chicago and the country surrounding?—A. In Chicago there are about 250 engaged in that line of business.

Q. What localities do you buy from?—A. Minnesota, Wisconsin, the Dakotas, and southern Illinois.

Q. And western Missouri?—A. And western Missouri. Also some from Michigan and Indiana, and also some cheese from New York State; but the bulk of the business is done between the West and the East. Now, in fruit products we do a great deal of business with California, and that is one of the matters I want to call the commission's attention to. The railroads give us refrigerator cars; they have to do that; it is indispensable to the business, because the goods are perishable; and they charge us an extra rate of freight for refrigerator-car service; and they also charge us for icing these cars, which we think ought to be done without charge, as they get a high rate for freight. As they charge for refrigerator cars the cars might be iced.

Q. (By Professor JOHNSON.) Do any of these firms own their own cars?—A. Yes; several firms. That is another matter I wish to call to your attention later on.

Q. (By Mr. KENNEDY.) I suggest Mr. Kennard state in his own way the complaint the merchants in his line have to make against the transportation companies.—A. I have jotted down as a reminder a few notes. One of them is discrimination against shippers of freight from California. There are several large fruit concerns there—Porter Brothers Company, Earl Fruit Company, Fay Fruit Company, and there are two others I believe. These companies practically control the entire fruit-car service between California and the East; they seem to be in collusion with the railroad companies. They are mainly California concerns, but they have their branch houses and partners and so on in Chicago. Chicago is really the largest fruit-distributing center in the United States, and, I suppose, in the world, and therefore it has a very large interest in this market.

Q. Does that have to do with your business?—A. Yes. These gentlemen on our board are largely interested in this fruit business, and they have requested me to mention these items to your commission.

Q. (By Representative OTJEN.) Do the firms you spoke of own these cars?—A. The cars are controlled by them, that is, in collusion with the railroad company. They can get cars, any quantity of them, and at any time they want them.

Q. It requires special cars?—A. Special cars; and whereas a private grower or small dealer in fruit that is not identified with any of these five fruit concerns can not get cars or has to pay a considerable premium, it shuts out the smaller dealer and fruit grower. The only way he can ship his fruit is through or under the auspices of these growers, which seems to be a close corporation, and he has to pay a certain bonus to these people for the privilege of shipping his stuff so.

Q. These five firms practically control the shipments of fruit to Chicago?—A. I am so informed.

Q. (By Professor JOHNSON.) And they do that by controlling the cars?—A. Yes.

Q. (By Mr. C. J. HARRIS.) Do you know whether they have any rebates on fruits, or discriminations?—A. That I do not know, but there must be something

of that nature, because anyone outside of this combination has to pay a premium in order to get these cars—\$60 to \$90 or more.

Q. (By Representative OTJEN.) More than they have to pay?—A. More than they have to pay.

Q. (By Professor JOHNSON.) I do not understand how that comes about. Do these five firms own the cars?—A. Whether they own the cars or whether the railroad company owns them, I am not quite sure about that. I do not know. I only state the fact as it is said to exist.

Q. When you say they get \$60 to \$90 advantage over their competitor, that is equivalent to saying they are paying \$60 to \$90 for the use of the car?—A. Yes; I should say that would be probably the way of it.

Q. (By Mr. KENNEDY.) If their competitors can live and do business at a profit, these people must have enormous profits in their business?—A. It frequently shuts out the smaller dealer and fruit grower, as I understand it.

Q. (By Representative OTJEN.) Practically all the business is centered in these 5 firms?—A. They make their rates, rules, and regulations so the consumer and dealer in Chicago is practically at their mercy.

Q. (By C. J. HARRIS.) Of course, they have a printed rate and they hold to that?—A. The only thing that could be said against them is that they charge extra for the use of the special car—\$60 to \$90 for the ventilated car.

Q. (By Representative LORIMER.) The special point which it is sought to bring out is that only these 5 firms can have cars at their disposal as they call for them. The others may have them, but if they want a car at any town they pay a premium of \$60 to \$90 to one of these firms in order to get a car.—A. They have to be second-handed, as it were.

Q. (By Mr. C. J. HARRIS.) I understand they pay the \$60 to \$90 to the railroad company?—A. I do not know. You will have to ask these people—Porter Brothers and these companies. You will have to refer to them for full information if you wish it; I can not give it to you.

There is a complaint made in regard to excessive charge for demurrage on cars. Cars arrive in Chicago—butter, eggs, potatoes, or whatever it may be; the consignee has only 24 hours in which to move the merchandise, and after that he is charged \$1 a day. The merchants think that is too short a time and not favorable to business. They should have at least 3 days in which to move the perishable goods.

I would also say that there are times when there is considerable discrimination in markets, particularly against Chicago. In April, 1898, the railroads centering in Kansas City and points in Kansas, in the matter of carload rates on goods, rebated to shippers the local rate as between Kansas City and Chicago, instead of charging the sum of the two locals, as it is now and provided for in the tariff. The rate from Kansas City to Chicago and Chicago to New York, we will say—they take it to New York at the same rate as they would bring it to Chicago. The consequence was last year our merchants and cold-storage warehouses were really almost bare of goods that would come here except for this discrimination.

There are other discriminations, of course, which I might call to your attention. One is the rate from California to New York.

Q. Before you go any further with that, do I understand they charge as much to haul freight from Chicago to Kansas City as they do from Chicago to New York—a thousand miles farther?—A. I mean to say they charge from Kansas City to New York the same rate as from Chicago to New York.

Q. The difference is Kansas City to Chicago?—A. The rate from Kansas City to Chicago is about 45, and the rate from Chicago to New York is 65, making \$1.10. Now, they take it from Kansas City to New York for 65.

Q. (By Representative OTJEN.) Where does the railroad gain anything by giving Kansas City a rate as cheap as they would to Chicago, for instance? How do the railroads gain anything by the operation? I can see how it would benefit Kansas City.—A. The cut was made by railroads that did not center in Chicago by other roads that go around Chicago—and the other roads that do center in Chicago were thus compelled to make this cut in the rate.

Q. (By Mr. KENNEDY.) Is it not for the purpose of controlling the business over these lines that would otherwise go to Chicago?—A. It is in a great measure to build up what is called the fast freight lines. They like to have the long haul from Chicago and Kansas City to the East. I have here a letter from one of the fast freight lines telling a party it would be greatly to his advantage to send his goods to New York instead of Chicago, as all the people in his neighborhood are sending to New York. His object is to get the haul over the New York Central, in this case, the Merchants' Dispatch. Consequently, the fast freight lines

whose offices are in Chicago—their purpose seems to be to carry freight not to Chicago—but it is for the railroads themselves; they have their own refrigerator cars; and east of Chicago and east of Kansas City the Merchants' Dispatch, the Star Union line, and the Erie Dispatch get the benefit of the long haul. They are interested in trying to divert freight from Chicago.

Q. (By Professor JOHNSON.) Do these fast freight lines own their own cars?—A. Yes.

Q. And pay to the railroads?—A. Pay mileage to the railroads.

Q. This discrimination is really the result of competition between lines—between railroads from river points to the Atlantic seaboard?—A. Yes. As I understand, the fast freight lines are really a railroad within a railroad. The New York Central is a railroad and the Merchants' Dispatch is a fast freight line running over the New York Central Railroad, and they get the benefit of the high-class freights.

Q. It is not the competition of the Gulf?—A. Oh, no; the other freight lines especially.

Q. (By Mr. KENNEDY.) Do you say the Gulf competition has nothing to do with it?—A. I do not think it affects our particular business.

Q. (By Representative OTJEN.) It would be too slow for butter and eggs to go by the Gulf?—A. We have to have rapid transit, and have to have special cars, and to pay special rates.

I have been asked to call your attention to the fact that the freight rate on cheese from Wisconsin to Chicago is higher than the rate from Michigan and New York State for the same distance. That is, they haul freight going west cheaper than they do from Wisconsin and points west of there; therefore, the farmer in Wisconsin seems to be discriminated against by paying an excessive freight rate. For instance, the railroads running into Michigan and New York State will transport cheese from Utica or Buffalo to Chicago more cheaply than you can get it from the interior of Wisconsin, the same distance.

Q. Is it due to the fact that cars go west empty to a large extent?—A. That is the reason they assign for it.

Q. Cheap back freights?—A. Yes.

Q. Is that not a true reason, do you think?—A. It seems so. Yes; it seems justifiable in this case.

There is another matter suggested, and that is that there are firms and corporations that own their own private cars, and that they load these cars with merchandise of various classifications. Some of them would be third class, some first class, and fourth class, and second class, perhaps. These cars being owned by these corporations and sealed up when fully loaded, are usually subjected only to the tariff rate applicable to the lower class of freight. That is, instead of paying second class and fourth class, they pay the fourth-class rate.

Q. (By Representative OTJEN.) It is discrimination in another form?—A. Private individuals shipping butter, we will say. That would take a rate of 75 cents and would have to pay that rate in a carload or less, whereas a party shipping flour, or pork, or lard, which would be a lower class of freight, and then filling it up with butter or something else that was a higher class of freight, he can get his car through at the lower rate of freight. There must be considerable opposition to this private-car business. The merchants generally can not compete with it. They can not meet that sort of competition. The railroads haul these cars at a mileage rate instead of charging the regular rate of freight.

I want to say this. The people in my line of business feel that they are very heavily burdened by the excessive rates for telegraphic service, which is really an expensive business and a very serious item in our business, because of the sale of perishable goods; in fact the most of our business is done by telegraph; I suppose three-fourths of the business we do is done by telegraph and telephone. Therefore, we feel that it bears very heavily upon us, possibly heavier than upon anyone else. The rates are very high and the service is far from satisfactory, and we are inclined to think it is one of those things that ought to be under the control of the General Government, that is, made a part of the post-office system.

Q. (By Professor JOHNSON.) Postal telegraph, as it is sometimes called?—A. Yes; it should be under the control of the Government.

Q. (By Mr. KENNEDY.) As it is in England?—A. Yes; in England, as I know from experience. We could get a much better service and at a much lower cost. In Great Britain you can send a telegram anywhere of 10 words for 10 cents; throughout France for 11 cents; in Germany it is 12 cents; Belgium, it is 10 cents.

Q. (By Representative OTJEN.) Are the telegraph lines under the control of the government in France and Germany?—A. Yes. It is a government institution

in Great Britain. The post-office department attends to the telegraph and telephone business; the same thing in Germany.

Q. (By Representative LORIMER.) Do you consider that you are in any way discriminated against by the telegraph companies?—A. No; I don't know that we are. We have not been able to feel it, and, therefore, I could not state it as a fact. It may be we are, but I don't know. However, as it is now, there is practically no competition at all. The Postal Telegraph Company and the Western Union are substantially one company; that is, they charge the same rates so far as the public generally is concerned. There is no competition any more than there would be if the two companies were under one name, and, as I say, the service is very poor. In regard to the telephone, that, too, is a serious item of expense. From what I have read and learned on the subject, I should think the Government could afford to send telegrams for one-fifth or one-tenth of what they now cost the people of the country. It is not the actual cost of the message that makes the rate so high, but it is the dividends that the company has to pay on an enormous capitalization. I saw a statement, that I believe to be reliable in every way, showing that for every \$1,000 worth of stock in the Western Union Telegraph Company, the stockholder gets \$3,000 per year.

Q. (By Mr. KENNEDY.) You believe the United States Government should be given the right of fixing the rate?—A. Yes. I know the Government has a cheaper rate for telegrams itself. I don't think there is any discrimination, at least there is not, so far as I know, between individuals. Of course a great many firms own private wires, and what advantage that is I don't know.

Q. Do you think the telegraph companies should give service as cheap to the individual as to the Government?—A. I don't know of any reason why the Government should not own the telephone system. I feel that if we had to do away with the post-office or the telegraph and telephone, that we could do away with the post-office so far as the business man is concerned better than we could do away with the telegraph or telephone. Of course I don't refer to private wires or anything of that kind, but to the fact that the telephone and telegraph system is more indispensable to our business than the post-office. It may be true only in our line, and that it is not true in other lines of business. But I don't think you could mention a line in which it is not indispensable; brokers, bankers, commission men, in every line of business; so far as I know there is not a line of business in which they are not just as useful as they are in our line of business.

Q. What do they charge you for a telephone?—A. One hundred and twenty-dollars per year.

Q. (By Professor JOHNSON.) What suggestions have you to make in regard to the telephone service; would you have it owned by the State or by the Government?—A. I think that the telegraph and telephone systems should be incorporated in the general post-office arrangements and that they should all be under the Postmaster-General.

Q. You think the Government should maintain the service in the States?—A. Yes. I realize of course that it would cost a great many millions of dollars, and I don't know whether the country is growing so rapidly or trade is increasing so enormously as to make it pay for itself in a short time. It would probably take 10 years, or something of that sort, to get thoroughly inaugurated.

Q. (By Mr. KENNEDY.) Do you know anything about the sentiment of the business men in Chicago generally on that question?—A. I think they feel as I have expressed it; that they are not only in favor of Government service, but that they feel they are paying an exorbitant charge for the telephone and telegraph service—a charge that is far beyond the actual cost or anything of that sort. It is an enormous charge upon the amount of capital invested.

Q. Have there been no suggestions or remedies offered on the part of the business men to bring about any other condition? Has there been any organized effort to bring about any better condition?—A. I think we obtain more courtesies to-day than we did, but to go about it in the way of a business organization we feel rather helpless.

Q. You know you have to educate Congress up to these things?—A. We realize that, but everything utterly fails, and this committee, by coming around and hearing us, has made us feel that we are worth listening to, and that there is some one to hear our complaints. I would also say that the country has been very much benefited and pleased with the benefits they have received from the active interest that has been taken in our business by the Commissioner of Agriculture, and the fact that this commission as well as the Commissioner of Agriculture should look into these questions. Now there is no particular detriment to anyone and especially not to these members, and I think it will give

great gratification to the citizens, and that it will be the result of our getting better service in every way. I think that we should have a commissioner of commerce as well as a Commissioner of Agriculture, to look into these questions. It would be no particular detriment to anybody, and it would give us better service.

Q. (By Professor JOHNSON.) You mean a commissioner of commerce to be made a Cabinet officer?—A. Yes; a commission with the Commissioner of Agriculture even, and it would afterwards become such an important office that it would be made a Cabinet office. There is no particular department now to look after these matters, and I think there should be one. I think we ought to have a department to be called the Commission of Commerce.

Q. (By Representative OTJEN.) A great many of the complaints or difficulties you express in your business would be corrected, would they not, if you had a commercial commission that was an interstate commission and had authority to regulate rates on the railroads, with the exception of telegraph and telephone rates?—A. I think our own Interstate Commerce Commission has authority to do that, but they don't exercise it very actively.

Q. If they had the authority, and it was so recognized, many of these difficulties would be overcome, would they not?—A. Yes; by submitting the question of freights to their revision. As the matter is now, they are not subject to anyone's supervision apparently. These tariffs are gotten out without any reference to the claims of anyone affected by them. I have been in business a great many years, and so have lots of others, and I never knew anyone who could see any good about the tariff rates. They seem to be in the hands of the railroads entirely, and whether they classify eggs in the second or fifth class, we have to submit to it.

Q. Are your associates in business members of an organization that has a representative to look after the transportation interests of the business men of Chicago?—A. Not a committee especially. That is only as it may appear to the association to be necessary.

Q. Is there not such an organization in Chicago in which a great many business men are associated and have a representative looking after their interests all the time, going to railroad companies and asking that rates be reduced, etc.?—A. I am not aware of it.

Q. (By Professor JOHNSON.) Central freight committee, I think, is what Mr. Kennedy means?—A. Yes; central traffic organization.

Q. There is the Central Traffic Association and then there is a Chicago freight committee, I believe?—A. What its functions are I don't know.

Q. (By Mr. KENNEDY.) Have they such organization in other cities, such as Philadelphia, St. Louis?—A. I think the business men of Chicago all have one.

Q. They had for some years, did they not?—A. We had for some years what we called the Chicago Freight Bureau, representing the Board of Trade, which paid half the expenses and the merchants and manufacturers generally of Chicago paid the other half. Franklin MacVeigh was the president for some years. That has been dissolved for two or three years. The business of that was the joint interest of the merchants and manufacturers and the Board of Trade of Chicago, and if anything general came up we had a committee to meet sometimes with a railroad company, sometimes with the railroad association, and sometimes before the Interstate Commerce Commission. There is no regular organization now. I think the chief houses here in business have their own traffic man. I would say that the department at Washington has taken a very general interest in this export business of butter and cheese, about which you have asked me, in trying to develop the business between our country and Europe, and also with regard to the Philippines and China and Japan, and with some success. The business itself is quite a large one and goes into millions of dollars every year. There is a great lack of shipping facilities from the inland of this country. The only line out of New York that is available for shipments of butter and cheese, and butter more particularly—cheese don't require refrigerating like butter does, except for a short time in the year—is an American line running from New York to Southampton and other ports. Their freight rates have been almost prohibitive. They charge from New York to London a rate of 75 shillings per ton, whereas we ship from Montreal to London and the general rate is 40 shillings—35 and 40 shillings; it varies. We supply a demand from Liverpool at from 25 to 30 shillings and sometimes it runs as low as 20, and to Bordeaux generally from 30 to 35 shillings, so that a great portion of the butter of the country is carried in foreign ships before being reshipped, so that it really divides the trade in shipping to foreign countries to the disadvantage of our own interests. Of course a great many shippers going from here to various ports ship on the American line, but

nearly all the lines except the American line have refrigerator facilities. The Atlantic Transport line is one of them; they have refrigerators that they own and operate. But the transportation facilities are getting more and more toward the exclusion of dairy products on account of other traffic; so that if we want to make a small shipment of butter on an American line we have to pay 75 shillings, or we can get a less rate by sending it via Montreal and having it go on a foreign ship. The result of this in connection with the encouragement that Canada is getting from the Government of England in these matters is that the Canadian trade in butter and cheese and such dairy products has developed enormously, while on the other hand our own trade is growing smaller and smaller. The actual shipments of butter and cheese from the United States to Europe are less now than they were 5 or 6 years ago or 10 years ago, whereas from Canada butter is shipped to the extent of eight times as much as it was ten or a dozen years ago, and cheese about four times as much.

Q. (By Representative OTJEN.) You ship from here to Canada instead of from here to Europe?—A. No; we ship to Europe via Canada. There is a tariff of 4 cents a pound on butter, and I think 2 cents on cheese, and we have to ship in bond from here to Montreal. Then it is taken in bond across to the other side without our having to pay a duty.

Q. (By Representative LORIMER.) Is that included in the Canadian shipments?—A. I am inclined to think it is, although the Canadian people claim they don't include American shipments in keeping the statistics of their shipments. The shipments of cheese from Montreal for the last 6 months—that is, from the 1st of May to the present time—were 1,678,390 packages, containing 60 pounds each. From New York during the same time the shipments were 254,099 packages, or about one-seventh as much. On butter from Montreal for the same time the shipments were 430,051 packages, and from New York 106,102, or a little less than one-fourth.

Q. In your opinion that is all due to the difference in the rate from our ports to Canadian ports?—A. No; not to that. There are several reasons outside of that. The first one of the reasons is that they get better freight rates than we do. That is considerable of an inducement. Another reason is that in the English markets they prefer to trade with their colonies and try and develop them, and for that reason the Canadian trade is rather favored in the English markets more than the American. Of course, we don't carry that trade, at least not to the same extent. One disadvantage we labor under is the registering with the Montreal steamers. The Canadian steamers being subsidized by the Canadian Government, they have a right to discriminate against American products. They will only take our products when they can not get the products of their own people, and they keep their freight rooms open for their own products up to within three days of sailing, so that it really shuts us out to a great extent.

Q. (By Representative OTJEN.) Then if they find they have room they take your products?—A. They only take ours when they find they have not enough of their own to make out a cargo, and they only tell us this within three days of sailing, and we have to take our chances on getting our products shipped. It is all according to whether their room is filled by Canadian products.

Q. (By Representative LORIMER.) Have you thought of any remedy?—A. I don't know of any remedy except the encouragement of our own shipping interests in this country, so as to have American steamers with carrying facilities for dairy products, instead of having to depend upon England for our ships.

Q. Build up the American merchant marine?—A. Yes. I think there are several very good reasons why that should be done, and that is one of them.

There is one other matter that I have been asked to mention to you, and that is local weights and measures, which I should like to speak of if I am not going contrary to your rules. We are put to great inconvenience from that here in Illinois. For instance, in Illinois a bushel of buckwheat weighs 52 pounds, and in Wisconsin it only weighs 50 pounds. Down in Indiana it is the same. In Michigan it is only 48 pounds. Another item is dried peaches. In Illinois 23 pounds make a bushel; in Wisconsin, 28; in Indiana, 33 pounds, and in Michigan, 28 pounds, etc., and the same way with a number of other items, so that a farmer or country merchant shipping to market really don't know what he is going to get for his produce. I submit a table showing the difference between some of the legal weights and measures in the States of Illinois, Iowa, Wisconsin, Michigan, Indiana, Missouri, New York, and Ohio.

Legal weights and measures.

[Pounds per bushel.]

Q. (By Representative OTJEN). According to that one bushel is a little bigger in some States than in others?—A. Yes. I think everything of that kind ought to be regulated by weight instead of by measure, so that they would be uniform.

Q. (By Mr. KENNEDY). Have not the business men the remedy entirely in their own hands by purchasing by weight instead of by measure?—A. They purchase it by weight, but when it comes to Chicago—we will say a man in Wisconsin ships his potatoes, it seems a certain number of pounds of potatoes in that State constitute a bushel, and when he gets here he is going to get 3 or 4 pounds more or less, as the case may be.

Q. That is disconcerting?—A. Yes. There is no reason why it should be so any more than that the different States should have a different currency.

Q. (By Representative OTJEN.) You don't know anything about the metric system of weights and measures?—A. No; I don't.

Q. You don't know whether that would be a proper thing to adopt in business here?—A. Well, it would if it was thoroughly introduced. I don't know but what it would take a long while to introduce it.

Q. It would take some time before people would understand it?—A. Yes. Another cause of complaint with us is the charges of the express companies for the stamps they put on their receipts. A man shipping to the merchants must pay for the stamp that goes on the express receipts. It is thought that the original intention of the lawmakers was that the express companies should pay for the stamp that goes on their receipts.

Q. (By Representative LORIMER.) You mean the internal-revenue stamp?—A. Yes. There was a decision by the supreme court of New York within the last few months, that the express companies should stamp their own receipts—that they should pay for the stamp on their own receipts—but that practice is not followed out here. I think, also, the telegraph companies ought to pay for the stamp on their dispatches. I believe that was the original intention of the law.

Q. (By Representative OTJEN.) You think that was the intention of Congress when the bill was passed?—A. Yes; and that the law should be amended, if necessary, so that it would take effect along the lines of the original intention.

B. (By Mr. KENNEDY.) Your association recommends that?—A. Yes; we certainly do.

CHICAGO, ILL., November 16, 1899.

TESTIMONY OF MR. SAMUEL H. GREELEY,

Commission merchant, Chicago, Ill.

The subcommission on transportation met at 2 p. m. November 16, 1899, at the Auditorium Hotel, Chicago, Ill. Representative Lorimer presiding. Mr. Samuel H. Greeley, being duly sworn, testified as follows:

Q. (By Representative LORIMER.) Please state your name and business.—A. Samuel H. Greeley, commission merchant, Chicago.

Q. You are a shipper, I presume, of grain here?—A. Yes.

Q. What, if any, are your complaints or criticisms of the railroad facilities given?—A. In regard to this railway situation, it seems to my mind that there are four or five different phases that are either directly or indirectly connected with the railroads in the handling of grain in this market. Primarily, I might mention railroads, bucket shops, bear speculators, and the ownership of private cars. And in order that you may get these matters placed somewhat systematically before you, I will state first in regard to public warehouses. The original intention of the State law of Illinois, and the constitution of this State was, that the public warehouseman should be a licensed servant of the people, created by virtue of the necessities of commerce, to care for the grain intrusted to him by the public in these warehouses. The growing importance of Chicago as a market center, necessitated the establishment of these warehouses for the conduct of this immense grain trade from the great West and Northwest.

The representatives of the people at Springfield early saw the importance of having a public institution to look after this large volume of trade, and therefore they created this commission for the purpose of storing the grain, and properly mixing the different grades into their proper bins as they arrived in storage; and they had no other function than to simply be the custodian of the grain for the public. But about 1887, when the interstate-commerce law was passed, the entire system of public warehousing changed. Previous to that date it was the custom of the railroads, if I am correctly informed, from my personal experience and what I have learned from others, that rebates on freight were allowed individual shippers in different portions of the country in order to draw that grain into Chicago as against any other competition that might divert it to any other market. Fearing the result of the interstate-commerce law, the railroads saw the necessity of intrusting these rebates into the hands of a single party, to protect the hauls on their lines, so they chose a man here who would necessitate the least rebate of freights, and still get the grain. Therefore, they picked out these public warehousemen, furnished them with warehouses and permitted them as merchandisers to overstep the duties for which they were created, and thus become

dealers in grain. The fact that a public warehouseman is a grain dealer, as against the public, has led to a condition of affairs that has almost stifled competition for the crops in the western country.

The advantages that the warehouseman possesses over the public is that he can take his grain into the public warehouse and pay storage to himself; in other words, pay no storage, while the public pays the full advertised rates. These rates are annually posted as being so much per bushel, and the public is obliged to pay that set of rates. In addition to paying no storage whatever on his grain in these houses, he is in position, being the proprietor, to mix the better qualities of a certain grade with a poorer grade, preserving them for his own trade, and when the public calls for that particular grade, they get the worst possible sample of that grade. By virtue of the fact that he pays no storage, he can take advantage of the storage rates as against the public and give that rate away, and use it as an over competing price to get possession of the grain from the party of whom he buys it in the West. In addition to these large profits, which are enormous, resulting from the mixing of grain, together with the storage which he is not obliged to pay, this has gradually led up to a condition where competition for grain in the West has become almost dead, the details of which are set out very fully in the trial held in 1896 in the circuit court before Judge Tuley. A large number of witnesses were there examined—men familiar with the trade—and the proof was conclusive that at least 75 per cent of the grain in public warehouses sooner or later became the property of a public warehouseman. Having thus reduced competition in the West to almost a minimum, they then go to work to stifle the dealers who offer grain to the East from the Chicago market, and they are enabled to do this by offering any shipper who buys grain from these public warehouses the inferior samples, they themselves being able to quote to the same trade the better grade that they have remaining in the house; so that, having killed competition for grain in the West, and having killed the trade which offers grain to the East, it leaves them virtually with a monopoly of the grain business in this market.

Now we must not overlook the fact that a very important feature connected with the business is the fact that the public warehouseman does not aim primarily to buy the grain in the West for the sake of immediately selling it to the man in the East, but it is his intention to hoard it up in these warehouses and keep it there as long as possible, or at least so long as the speculative public is willing to buy it of him for future delivery and pay him a carrying charge. I will illustrate that by saying, for instance, that cash wheat to-day may be worth 67½ cents and wheat for May delivery may be worth in the neighborhood of 70 cents or 71. We will say, for the sake of argument, that the May wheat is 3 cents per bushel premium over the cash wheat. Now, they want to hold that grain in the elevators here just as long as people will buy grain for May delivery and pay them that premium for May wheat. Then the more grain they can carry in Chicago in these elevators the larger their profits, because the heavier tax is imposed on the man who buys it, and it continues a running tax. When May arrives it is their object not to deliver that wheat to the man who bought it for May delivery, but to force the man to sell it out, they standing ready to take it when that man is tired of the load, and sell it ahead for another deferred delivery to any other sucker who buys grain purchased on deferred delivery, and thus add another income to the carrying of the wheat in the elevator. This produces what you might term a state of enforced liquidations, enforced selling out on the part of the buying public. And we must bear in mind also that the poorer they can get the quality of the grain held in these public warehouses, so that it will barely pass the inspection grade that is applicable for a sale for future delivery, the better it suits their purpose.

It is evident that the poorer the grade is the less the public will care to take it and the more inducement is offered the public to sell it out and continue its existence in storage. It is evident to those posted in the trade that the lower they can get the values of grain the larger their profits, because the less the insurance and interest to carry it in the warehouse pending these months of future delivery for which they have it sold. Now these large stocks of grain carried in these elevators in Chicago give birth to what is known as the professional bear raider, or speculator. It encourages an army of short sellers to enter the market and sell millions upon millions of bushels of grain, taking these large stocks as a nucleus for the safety of their sales, and it brings about a condition whereby the buyer of grain for future delivery is not on a parity with the man who sells it short. It can readily be noticed in your minds that if, for instance, as at the present time, 20,000,000 bushels of wheat are held here in the Chicago market and are carried

until next May, that when next May comes, these men who buy grain for future delivery being speculators and perhaps not wanting the grain at all, see this immense volume staring them in the face, and they are ready immediately, seeing that they will get it delivered to them and being of a poor quality, to dump it right out on the market. It produces a condition that forces the man who has bought it to get out of the way before the man who sells it short has to cover, so that now in the market we have got around to that condition—"when will the longs liquidate? When are the buyers going to sell out?" It is not a question of when the shorts will buy. I have stood in the pits in this market and have seen this army of short sellers hammer and hammer and hammer that market with millions upon millions of bushels of stuff, and their single solitary argument being based upon the fact that this immense volume of wheat was stored here, and that being stored it would force the man that bought it to finally liquidate; and then they buy it in at the reduced liquidating prices and secure the profit.

Not only has this large quantity of grain stored here produced these bear raiders, but it has brought into existence and made safe what is known as the bucket shop. A bucket shop is a place where a man supposes he buys grain for future delivery, but which in fact is a place wherein he goes and actually makes a bet with the proprietor of the place as to whether or not the market will advance or decline, there being no intention at all on the part of the man who conducts the bucket shop to deliver the property or receive it, as the case may be.

The existence of the bucket shops is made safe by depression in prices, and fully 75 per cent, I should say probably 90 per cent, of the business that goes into a bucket shop is buying business. If these large accumulations of grain held in Chicago by virtue of the grant of a railroad company did not exist it would not be a safe policy for a bucket shop to take the short side of a trade in making a bet on the market.

Thus indirectly a railroad company becomes a surety for a concern that should be prosecuted and in the penitentiary. They don't primarily establish the institution, but the privileges they grant really give it protection. Now, we must stop to consider the larger sense in which this subject must be looked at, and that is, What would be the effect of these large volumes of grain bought in bucket shops if they actually entered the market places?

I have heard it estimated that there are at least 10,000 bucket shops in the United States, and that they trade in 30,000,000 bushels of stuff a day. If 75 per cent of the business traded in in these bucket shops is buying business, and we could get 30,000,000 bushels of buying business on that exchange and other legitimate markets throughout the country, we would not see the condition that has been staring this country in the face for the last 12 years.

Not long ago we saw in Nebraska corn worth 8 cents per bushel. I have seen oats on the exchange in recent years at 13 cents a bushel.

In my opinion it was the constant working on the speculative public, taking away from them the tributes that purchases for future delivery necessitated, that led up to the panic of 1893, when people throughout the Western country threatened to repudiate their debts. You may talk about the tariff and free silver and other questions of importance that have come before the people in recent years as political issues, but to my mind it has been nothing more nor less than this combination on the part of the railroad companies with these warehousemen, and the effect of that combination, both directly and indirectly, upon the purchasers of this country, which has caused these political disturbances and created so much dissatisfaction.

It has finally assumed a position in the grain markets of this country where one man puts out the price for the product of the producer. On the Rock Island road you will find Charles Counsellman and perhaps one or two others almost the only competitors for grain on that system. You will find on the Northwestern that there is Bartlett Frazier and the P. V. Elevator Company, and possibly one or two others. On the St. Paul you find Armour; on the Chicago, Burlington and Quincy you find Armour; and these will serve as illustrations to prove to you my former statement that the competition has been killed.

However much of an injustice this may appear to be to a Chicago commission merchant, who has been so loudly dilated upon by the warehousemen, nevertheless the fact remains true that this storage of large quantities of grain at the market center, together with the indirect favoritism shown the bucket shops, the encouragement of these bear raiders and the final killing of competition for the offering of grain East, and the purchase of grain West, have brought it right down to a condition similar to this beef business.

If I am correctly informed, these warehousemen, with the assistance of the rail-

roads, are driving from business the country elevator dealers, and the deal is assuming such vast proportions that they are getting possession of these country stations, and as soon as that is entirely consummated on the various lines one price will go to the producers of the country and one price to the consumer.

I think this has all come out of one particular feature, and that is railroad competition. The railroads have to draw that grain, and they want a man to get it for them if it takes a special rate to do it, and he is the man that is favored, in my opinion. They go after grain not naturally tributary to Chicago. They invade territory that, by the geography of the place, it is absolutely impossible for it to come here on regular tariffs. But in competition with the Gulf and with points North, and in competition with through-billed grain that is diverted at various junction points, they are obliged, in order to protect their systems and secure this haul, to give away to some favored party the advantage to do it; and in my opinion the officials of the railroad divide the swag with the elevator proprietors, and the deal is perpetually carried on perhaps to the detriment of the stockholders of the road, although I am not prepared to state how much of a detriment that is to the stockholders.

Q. (By Professor JOHNSON.) If you have any evidence on that point I think you ought to submit it.—A. I can suggest to you the names of five men who have been in the habit of meeting every day at the close of the board of trade, for the sole purpose of arranging the combination price for grain throughout this Western territory. In my opinion those men will not deny the fact that they have entered into a pool, a combination for the purpose of establishing a set price. The public is not able to compete with that price.

It may appear to you that because these men are able to pay more for the grain than any other competitor, it is a good thing for the producer. That is the one single, solitary argument that these men have rested upon in all their trials and tribulations, both before Judge Tuley and at Springfield—that they pay more to the producer. And I will simply answer that by saying that, although they do give away a fraction perhaps more than others can to get possession of the property, when they do get possession of it they bring it into this market and put it in the elevators and adopt the policy I have previously spoken of, of hoarding it here from year to year, manufacturing it into an inferior grade as possible, and then, while they may pay a small fraction to get possession of it, they take 5 or 10 or 15 cents per bushel off of the value of the crop.

Another feature, to my mind a very important one, is the ownership of private cars. I believe that the firm of Armour & Co., or firms in which P. D. Armour is himself interested, own between 10,000 and 20,000 private freight cars. I may be mistaken and put my estimate too high, but if any man is allowed to own a private freight car and receive, for instance, a minimum of five-eighths of a cent a mile from the railway companies for every mile the companies haul that car, or in a general way, pay a man \$15 on a round trip on that car from Chicago to New York, he could lose money in the grain business and still make fortunes out of the railroad companies, and there is no possible way that competition with him can exist; and it seems to me that if there is any evil that should be taken up, either by Congress or otherwise, it should be this ownership of private cars by firms and corporations.

I have explained to you in a very general way what I consider the abuses of the greatest importance in the grain trade to-day. I have not touched particularly upon special rates of freight, although I believe every public warehouseman in the city of Chicago is receiving them. They can pay more to-day, or have recently at least, for grain in Nebraska, than they have for grain in Iowa. I believe also that they have been previously notified by the railroad companies of the existence of new tariffs 30 days in advance of the public and have contracted for the purchase of large volumes of grain long before the rates were ever generally known. I believe that is the general practice.

The Eastern roads have taken up a feature quite similar to the Western roads, and that is, they have seen the necessity of having a favored individual to look after handling the grain from Chicago east. If I want to ship a car of corn, for instance, from Chicago to New York, and buy it on the Northwestern road here, and desire that it be sent east over the Lake Shore, it has to be transferred from a Western to an Eastern car. That transfer takes place in the transfer houses of the Eastern railroad. The railroad company puts that transfer house in the charge of a grain dealer. It is not an independent warehouse where the public can receive the accommodations which would usually devolve upon a public institution. If I want a car of oats clipped in the transfer house on its way from this market to my customer in the east, my competitor clips those oats for me. If I sell 36-pound clipped oats down east and my competitor does the clipping, I

might get a 84-pound clipped oat, and not only that, I believe he possesses the ability to know the name of my customer when that car is forwarded.

I believe that Eastern railroads in this city use these parties as their chosen individuals to get special rates of freight when it is necessary for their interest.

And summed up altogether, the grain business in Chicago, which should be subject to certain conditions that are absolutely public in their nature, by which everybody should have an equal opportunity, is now monopolized by favored individuals, and competition for the crops of the country is going to pieces. We have recently seen our corn market very firm, with a demand absolutely good for all qualities, indeed so urgent that the poorest grades were at a premium over the price of better grades when the latter were not to be secured, and in the face of an urgent export demand and an urgent local demand these markets here have dropped 7 cents per bushel in the futures, dragging the cash grain down in proportion. The whole result of this large accumulation carried in these public warehouses, and the raiding of these bear forces, and the continued success of these bucket shops, has caused men who were buying in these bucket shops to think they were purchasing grain.

Now, what are the 40,000,000 farmers of this country up against? I will defy any member of this committee or any other committee to contradict by evidence or statement the facts which I have stated to you, and I also believe that the opinions which I have given are correct. They are not only my own personal opinions, but many of my statements are in the form of sworn evidence, which has been introduced in our courts and decisions obtained in our favor. We fought these public warehousemen at Springfield in an effort to enforce the fact that a public warehouseman should not deal in grain. They fled to Springfield just as soon as the courts decided that they should not deal in grain, and, in my opinion, by the use of a large volume of money, secured State legislation that to-day overrides the opinions of the supreme court of this State.

I have not touched upon the fact of the grading in grain—the attempts on the part of at least a portion of these warehousemen to influence the inspection department. I have not touched at all in reference to the weighing of grain, which to my mind is and has been for many years a source of a great deal of discomfort to western shippers.

Now, in regard to speculation in grain, whether or not that may be a fortune or a misfortune to the producers of this country—it does exist, and they have finally succeeded in killing the buying speculative public to the extent that the trade does not come in, as it used to, to support the price.

The heavy tributes that buyers are obliged to pay for grain for future delivery are so strong and embarrassing that they have finally caught on to the game, and it largely leaves the field in the possession of the men who sell it short; and the fact that these things encourage so many short sellers on the market, where the buying trade is at a disadvantage, has produced this condition of wheat in the sixties, and corn possibly in the twenties, and oats frequently under 20 cents a bushel. When we raise crops of 3,500,000,000 bushels in this country, worth from \$1,000,000,000 to \$2,000,000,000 annually, even at these depressed values the conditions not only force the value on the grain that comes to market, but it fixes the value on the entire crops, and, in my opinion at least, from 15 to 25 per cent of the values of the crops are taken off annually by this condition that exists by reason of a railroad company insisting that it shall practically go into the grain business.

President Stickney, of the Great Western road, admitted that his road was in the grain business, and gave the name of the company that conducted it, and that his representatives are on that floor to-day. What a pass the people are coming to, if the railroads are to become the merchandisers of the product. The difference between the price of grain in the West and in the East is the rate of freight. To my mind there is nothing short of Government ownership that can correct it. Control is impossible. To my mind it could not be done, and it is impossible for a committee of any kind, interstate commerce or otherwise, to regulate a railroad.

Railroad pooling—it would be an impossibility for them to ever stop it, because of the fact that if the railroads did pool it would never prevent one man from naming a rate to an outsider. And since the ability rests in the hands of the manager of a railroad to name the rate, there is no hope for improvement; and so far as banking on any joint agreements is concerned, these things have been tested many times and found wanting. A little illustration, I think, will serve to show you, gentlemen, the situation of the public warehouseman being a grain dealers. Suppose the collector of the port of New York should enter into and do an active business in competition with Marshall Field & Co. and J. W. Doane & Co., and

should pay no import duty whatever as against these men. How long would competition exist with them? And especially if the Government should furnish him with a free custom-house, and he should be permitted to mix his goods with their goods and secure the better samples for himself and give them the poorer samples, and then give him special facilities when he shipped, in the shape of plenty of cars, rebates, etc. Where would competition exist in commercial life under such circumstances? President Stickney cited an illustration and said he didn't see why the people would not resort to arms if need be rather than submit to such a condition.

Q. (By Mr. C. J. HARRIS.) Is this elevator charge made so much a month, or how is the elevator charge arranged?—A. Three-fourths of a cent for the first 10 days, and a quarter of a cent for each following 10 days. The storage charge remains the same and does not depreciate in proportion to the product; that is, it is so much per bushel.

Q. Is that a high charge?—A. Yes.

Q. How long has that rate been in force?—A. I think 2 or 3 years; previous to that it was slightly higher.

Q. (By Representative OTJEN.) These rates are established by the State law?—A. I believe so, the maximum. In connection with that, if I want to transfer a car of grain from the car to a boat, and do it through one of these public warehouses, and the car contains 1,600 bushels of oats, it would cost me three-fourths of a cent to make that transfer. My competitor would do it for nothing plus the cost of running the elevator.

Q. (By Professor JOHNSON.) Does your competitor own the elevators or does he rent them?—A. In some cases they own them and in some cases they are leased by the railroad company.

Q. Is not his capital sufficient to give some justification for not paying storage the same as his competitor? He owns or rents the elevator, and has a considerable capital involved in so doing. His remuneration on his capital, in one sense, is free storage, is it not?—A. In most cases, it seems to me, that the capital invested in the property is practically nothing. They are presented with the elevators by the railroad companies. In some instances they own their own elevators, and if I am correctly informed, railroad men have been the incorporators of these companies. I understand that Jay Gould was interested, and President Fish of the Illinois Central, and Russell Sage, and others.

Q. (By Mr. C. J. HARRIS.) They would not own them unless there was some profit in it some way?—A. They were incorporators. As to what their interests in the profits were I am unable to state.

Q. You think they get something back somewhere?—A. I certainly think they get a great deal back every year.

Q. (By Professor JOHNSON.) Theoretically, if a man owns an elevator, and makes use of it in his own business, he is placed differently from the other man who makes use of it?—A. There is a great injustice done the public.

Q. As a theoretical argument, I think the man ought not to pay the same for the use of his own elevator as you, an outsider, pay for it?—A. Every man should be forced to put his grain through at the same cost. If it is a public elevator, they should all be treated alike, whereas in this instance, on a car of oats I pay my competitor \$12 to do my business, and he may use that \$12 to my detriment.

Q. (By Representative LORIMER.) If you had money enough invested in an elevator, your own money, you would save that \$12, but would not that \$12 be applied as the cost of running your grain through the elevator that you own?—A. If I owned an elevator, I could probably put that grain through there for \$1.50 or \$2 a car, where I pay him \$12.

Q. (By Mr. C. J. HARRIS.) Do you count interest on investment, rent of land, and all that?—A. As I understand it, the proprietors of the transfer elevators on the eastern lines to which I referred, receive from the railroad companies \$1.50 a car for the transfer of grain and make it very profitable. So when we are obliged to pay \$12 through a public warehouse—

Q. Why should the rate be that?—A. It is fixed.

Q. By State authority?—A. I think by the State a maximum.

Q. (By Representative LORIMER.) The maximum rate is fixed, but is the specific rate fixed?—A. I think the rate is fixed by the warehouseman within the maximum.

Q. Is the rate higher or lower than it was prior to the passage of this bill you referred to?—A. I do not know which bill you refer to.

Q. The bill which I think you said was passed in 1896 or 1897 authorizing the elevator owners to purchase grain?—A. I think they are very nearly the same.

Q. You do not know whether up or down?—A. Just about the same; not much difference.

Q. Is that information obtainable?—A. Yes, readily.

Q. If you ship a load of grain to one of these elevators, is there any way in which you can have it placed in a bin in the elevator and have it remain there, sealing the bin, and know that you are getting the same article out that you put in?—A. In theory that is supposed to be granted to the public, but, as a matter of fact, you can not get it, and it seems almost impossible to get even general storage.

Q. Is there no provision in the law for that sort of thing in this State?—A. No; I think not; nothing that will force an elevator proprietor to give you storage.

Q. You referred to the panic of 1893 and stated that it was your opinion that these railroad discriminations were what brought about that panic. You remember that that panic affected every line of industry and almost every financial house in this country, and that the most of the shops in this country, or many of them, were closed, and many of them were doing a good deal less work after that panic than before. Did you mean to attribute all that depression in trade to the discriminations of the railroads?—A. It was my intention to convey the idea that low prices for farm products in this country for so many years had finally led up to the fact that the West was almost bankrupt.

Q. Were prices low for grain in 1893?—A. Yes. Corn sold in 1893, if I remember correctly, at 19½ cents on the Chicago market—best grade, or about 1893.

Q. How about 1892?—A. I would have to become posted on that. The records are easily obtainable. About that time I think you will find wheat sold at in the forties in the Chicago market.

Q. (By Professor JOHNSON). You remember in 1892 the prices for grain were high because of the heavy foreign demand.—A. It is probable that when the prices were high they had very little for sale. It was the constant depression previous to 1893 that I think led up to the fact that the people were unable to buy goods. When you depreciate the value of farm products, you have taken the nucleus of the welfare of the people away from them.

Q. (By Representative LORIMER). You think the discriminations of the railroads brought about that condition, and that condition brought about the panic?—A. Yes; that is my opinion.

Q. And all these other conditions had practically nothing to do with it in your opinion?—A. The others probably assisted after the ball started rolling, but I believe that all resulted from these conditions.

Q. You suggest that these people are able to pay a trifle more for grain than the average trader?—A. Yes; that is correct.

Q. That means that under these conditions the farmer or producer gets a trifle more from these people than from the other traders?—A. Yes; that is correct.

Q. You say the board of trade and the bucket shops operate to reduce the price?—A. No; I would not infer that the board of trade did.

Q. The bucket shops?—A. The existence of bucket shops.

Q. And the bear raiders?—A. The bear raiders, yes.

Q. Do you mean to say that the grain is cheaper after they get through with it than it was when purchased?—A. Yes; that is the idea I mean to convey.

Q. If the elevator men pay more for it than the others pay for it, and put it in the elevator, and the bears jump on it there in the bucket shop or board of trade, and their raiding it has the effect of reducing the price, I can go in and buy at that price and can have it delivered out to me and put it into flour; then I am able to sell my flour at a less rate than I could have sold it if I had purchased the grain at the time the elevator men purchased it and before the bear raider jumped on it. Is not that the natural deduction from your statement?—A. It depreciates the value of the crop.

Q. Then the consumer purchases it for less than the farmer gets for it?—A. You may stop to consider this also, that only a small proportion of the crops are marketed, that is, sent to market; and I think figures will show that probably not to exceed 3, 4, or 5 per cent of the crop is exported.

Q. Of the wheat crop?—A. I would say the corn crop. I think a larger proportion than that of the wheat crop is exported.

Q. The wheat crop is practically all sent to market and the corn largely fed out.—A. Yes; that is it. I would convey the idea that it is a fact that the conditions here do depreciate the price.

Q. When the bears get through with it they have broken down the price?—A. When the bears get through raiding it, encouraged by these conditions, it slumps the market; oftentimes before the crop is out of the ground; they will depreciate the value of the new crop long before it exists.

Q. (By Representative LORIMER.) Now, with reference to the bucket shops and the board of trade, is it your opinion that any considerable amount of the grain that is traded in by the commission houses which have membership on the

board of trade is ever actually delivered to the purchaser?—A. If you will permit me to answer in my own way, in a general way I will try to cover that point. I look at the board of trade as an institution that was founded for the purpose of facilitating business. It is a gathering of buyers and sellers, shippers and receivers, and railroad men, with all conveniences for the handling of the grain trade. By virtue of the enormity of the product handled, it seems almost necessary to buy and sell grain for future delivery, and that custom has finally become so large that it is probably the largest speculative commodity in the world. I believe that within that institution there have grown up practices among individuals by which they have prostituted their occupations by becoming criminals; and I believe that strong efforts have been made and are being made and will be made to root out from legitimate trading all such firms and men. There has grown up within that board of trade also the existence of these combinations, not a part of the board in itself, but taking advantage of the institution to transact their business; something for which the board of trade is not responsible, and which the board of trade has spent a great deal of money to abate, both in court and in the usual way in trying to enforce its rules; but I will freely admit that I believe it is true that what you may term bucket shops do exist there; that is, men who never execute their orders on the market, men who should be punished criminally for not doing so. But that is something likely to creep into any institution, like you find plenty of sinners in church, although the simile may be somewhat strained.

Q. Is it not a fact that there are hundreds of thousands, yes, millions, of bushels of grain traded in in the pit on margin deposited with the commission houses with no intention of ever actually delivering out the grain by the person who sells to the person who buys?—A. You would have to ask the men who made the trade as to their intention to deliver the property. I am not here to defend any institution. I simply know when a commission man takes an order to buy and sell grain, and he executes it on the market, he does it with the intention of buying and selling, receiving and delivering the property.

Q. You have been connected with the board of trade for a good many years. Is it, in your opinion, generally understood that the great proportion of the trading done there by the commission houses on the board of trade is simply done on margin, with the intention of buying to-day at a low price and selling to-morrow at one, two or three points raise, for the profit out of the transaction and with no intention of taking the article? Generally, I say, not specifically.—A. There are millions of bushels of grain traded in, bought and sold, and in that volume there is no doubt a great deal intended to be delivered and, it may be, a great deal that is not, but I am not prepared to say what the percentage is or is not. Nearly all my business is conducted with the intention of receiving and delivering cash grain. I am in the cash grain business. There are some men who trade there who do not own any grain and sell it; who buy grain and do not want it.

Q. When this bear you talk about sells grain, outside of the elevator owner, has he grain to deliver or does he depend on the depreciation that he hopes to bring about to buy it in?—A. No doubt he intends to buy it in as low as possible, and uses his efforts to depress the market.

Q. There are deals made where they have not the commodity?—A. That same man that sells the property may intend to deliver it, but depress the price and never do so.

Q. You suggested that this condition encouraged bears to go into the market because other men own large quantities of grain, and that being so they must sell grain that they have not got.—A. The bear is the man who wants to see a lower price after he sells short.

Q. If he sells short, he is selling something he has not got?—A. Yes.

Q. The short seller is a fellow handling an article he has not got?—A. Yes; and he is encouraged by these conditions. When he sells short he enters into a contract that is legalized.

Q. Then, as a matter of fact, there are trades on the board of trade that are as much gambling as gambling in the bucket shops?—A. No; you can not consider that a gambling trade. He has a right to sell what he has not got if he intends to get it.

Q. How do you know the bucket-shop man does not intend to deliver it?—A. Because he does not make a contract on the market that he will buy or sell.

Q. Suppose he makes a written contract with you?—A. If he makes a written contract that he will buy or deliver certain property, and it is on the market, and he does it, it is legitimate trade.

Q. Suppose he does not call on the market, but buys it somewhere else—from the farmer?—A. If he buys the grain he is doing a legitimate piece of business.

Q. Are there such bucket shops?—A. I never heard of one, and I have been in the business seventeen years.

Q. You talk about the private-car business. Is it cheaper for the railroad company to own their own cars or to rent them at the rate you talk of, or do you know?—A. I think it is cheaper to own their own cars. I think it pays the man who owns the car 25 per cent to 50 per cent per annum on the value of the car.

Q. You would prohibit a railroad company that is not well enough off to purchase its own rolling stock from renting rolling stock to supply its trade?—A. Rent it of whom?

Q. Of anybody who has it to rent: private party.—A. I believe it is a bad practice. I would prohibit it; yes.

Q. If they can get the business and do not have the cars or money to buy them, you would prevent them from renting?—A. Yes. I believe it would be the establishment of a wrong principle.

Q. Are you testing the elevator bill, that was recently passed in the legislature, in the courts?—A. The case was passed upon in 1896 by Judge Tuley, and appealed to the supreme court of the State, and Judge Tuley's opinion was approved, but pending the decision of the supreme court of the State this law was passed at Springfield. As I understand the matter now, the case is up again before Judge Tuley to enforce his injunction against the public warehouseman being a grain dealer, the original suit brought in the circuit court having been in the nature of an injunction.

Q. The old suit?—A. Yes.

Q. There is no suit pending testing present legislation?—A. No. An effort was made at the last session of the legislature to have the bill repealed, but various manipulations prevented the bill passing in the Senate after it passed the House.

Q. Have you any recommendations on which legislation could be based to prevent bear trading on the board of trade and in bucket shops, as you suggest?—A. No; I do not believe it is a good thing to prevent it. I believe all you want in regard to grain speculation is that the man who buys the grain is on an equal footing with the man who sells it short. Then these men who have the grain bought will say, "You deliver it to me," and the grain will never be carried in Chicago if they have to pay full storage rates. But when a man can hold it up here without paying storage and use that as a club to force the man who buys it to sell it out, there is the evil. Legitimate conditions no longer exist. They are artificial conditions. The grain would be in the invisible supply in the country if it had to pay full rates, and the reason would not exist for these men to hammer the market. I object to hoarding at the centers. Let the grain go through the market on its course from the producer to consumer; then let the men who want to buy grain put their money in. The bucket shops would be an impossibility without the short seller.

Q. Would a Government report in September, say, stating that the foreign crop for this year would be higher than they anticipated in July by several hundred millions, have any effect on the price if there were no elevators?—A. Well, it is hard to tell. It would depend on other speculative features that happened to be in the market at the time the Government report came out. I, myself, object to any Government report. I think it is detrimental to business.

Q. Under the law prior to 1897, in your recollection, did a Government report ever have anything to do with the bulling or bearing the price of grain?—A. I presume it has been used that way.

Q. Before this elevator system came into effect?—A. That was so long ago I do not remember. That has been in effect ever since I have been in the market myself.

Q. (By Mr. C. J. HARRIS.) What would be the life of a freight car?—A. I am not prepared to state.

Q. Suppose it is only four years. The wear and tear is quite great necessarily. The use of a car from here to New York and back, you state, is 15 days?—A. More or less; not far from that.

Q. Would not that be about as cheap as the railroad company could furnish the car itself? Five-eighths of a cent a mile, according to testimony we have heard, is about what it costs the railroad to run its own cars; the wear and tear, interest on the money, etc.?—A. The secretary can easily figure that out. Consider a freight car, an ordinary box car, worth \$400. It takes 15 days to make the round trip to New York. How many round trips could you make in one year and how many round trips could you make in four years on that basis?

Q. In the usual run of business, you would not expect that car to make over ten or twelve round trips in a year, would you? You know practically in your shipments cars lay at either end a considerable time, are delayed on the way, and

are in the repair shop, and by this, that, and the other.—A. Assuming that it makes twelve trips a year, I think you will find it makes about 50 per cent on the investment, without figuring it.

Q. (By Mr. KENNEDY.) If the private car is an evil in commerce, is it not an evil that has been brought about by the refusal or neglect of the railroads to recognize the needs of commerce and build such cars?—A. That might be. How the conditions sprang into existence I am not able to state.

Q. Were not these cars built by those men who shipped perishable freight when the railroads had no facilities for them?—A. The ownership of private cars is not confined to products which are perishable.

Q. I am speaking of meats and fruits, largely.—A. I believe these all go on the eastern trips loaded with other products.

Q. Is it not your opinion that that is what brought about the system of private cars?—A. It might have been; quite likely. But it has finally developed into handling merchandise not perishable to a very great extent. I think it could be shown on investigation that even when railroads have cars of their own that they want to use in the handling of the product the men have become so powerful in a commercial way that they can insist on the railroad company handling their cars and paying tribute.

Q. You stated, I believe, the only remedy was Government ownership?—A. Yes.

Q. And that there could not be Government control or regulation. Do you believe that it would be impossible for the Government to regulate in this way: Say that the Interstate Commerce Commission should compel the railroad companies to make public their rates, and have power to adjust these rates, and have their decision enforced. Do you think, while you are waiting for Government ownership, that there might not be alleviations in that way?—A. Well, something might come out of it, but I have no confidence whatever in railroads maintaining rates. By the very nature of the competition of railroads, cuts will continue.

Q. If the rates were made public, and they would have to be under such a law, and the Interstate Commerce Commission had power to say whether the rates were just or not, then if they were not given to all without favor the Interstate Commerce Commission would know of it?—A. I do not believe there is any law that can be made that will control a railroad.

Q. (By Professor JOHNSON.) Do you think our conditions are similar to those in Great Britain, where the rates are very stable and, on the whole, very satisfactory, under Government regulation—private railroads?—A. I believe there is a condition on the other side that for years past has educated men there to respect law and the enforcement of it.

Q. A higher moral sense?—A. A higher moral sense, yes, and the fear of justice; but with the conditions that have grown up in our country in politics, and the general condition of business and commercialism, I do not believe anything short of absolute ownership of roads will ever rectify the evil.

Q. If we are beneath these other countries in public morals, are we going to be able to work a system of Government ownership without serious difficulty?—A. I believe with Government ownership we must get to a higher system of morals, to maintain civil service before we ever endeavor to own the railroad, and see it carried out and know that we can do it.

Q. (By Mr. KENNEDY.) You mean civil-service reform?—A. Put it into operation and see that we are able to carry it out. Continue the standard in civil service, and the right to participate in political affairs. I believe it is every man's duty to participate in politics. I think a man should have the right to vote and still be employed on the railroad. I believe the system of civil service would have to be so rigid that he would perform his duties in a satisfactory manner.

Q. (By Representative LORIMER.) Do you believe Government ownership would reduce freight rates?—A. Yes; just about one-half.

Q. Have you any theory under which you think that would be done?—A. My reading in past years has led me to suppose that honestly conducted railroads, owned by the people, would give a man a round trip from here to San Francisco for about \$25 or \$30 in a first-class vehicle. Of course, it is impossible to tell just what the rate would be in case of Government ownership, considering the proper operation of the roads and reasonable salaries for all services rendered.

Q. (By Mr. C. J. HARRIS.) Did you ever know of any instance of the Government doing anything, running any line of business, that did not cost, perhaps, double what a private individual could do it for?—A. If the United States Post-office did not pay such heavy tribute to these railroads beyond what the actual service costs I believe there would be no private institution in the world conducted on a cheaper basis—from the knowledge that I have of what the Post-

Office Department is, although I may be greatly mistaken in that. I know in the town in which I live the people own their own waterworks and will own the gas works and I am led to believe we will get cheaper water and cheaper gas than is furnished almost anywhere else.

Q. While it is hardly material to our question, you will count the interest on the plant and all charges?—A. I see no reason why the people should not operate a thing just as cheap as any individual could operate it.

Q. (By Representative LORIMER.) The people contribute the money to the waterworks and expect no dividends; so you figure just the cost of maintenance and operation without the interest that that amount of money ought to bear?—A. When you come to compare that with railroad matters, railroad prices are a calamity compared to it.

Q. (By Mr. C. J. HARRIS.) Returning to the elevator subject, I want to ask you one question: The elevator men, whoever they may be, railroads or buyers of grain—would there be any object in their paying the farmer less for the grain than it costs him to produce it? In other words, would there be any particular object in their grinding the farmer down and getting wheat at a low price of the producer?—A. Yes; because they are carriers of grain for storage. The longer they can carry it here the more the storage. Now, it is a great deal more to his profit to carry wheat worth 50 cents than \$1, because it is simply an investment. The cheaper the product the less his insurance and interest. Now, the railroad man, in my opinion, divides the profit these warehousemen make. Whether this is correct or not, they do not seem to be willing to change the system.

Q. If the elevator man controls the buying price in Nebraska, and the selling price at the other end, what difference does it make to him if he pays 75 cents a bushel in Nebraska for his wheat? He would simply charge so much more at the other end, if he regulates both ends of it.—A. He may carry it here a year, or sometimes two years, simply for storage. He does not intend to let go of that grain until he absolutely has to.

Q. If he regulates the price at each end, he can put a correspondingly high price at the other end to cover all that insurance and other charges.—A. He does when he lets it go. Sometimes they sort out this wheat and refuse to sell to Eastern buyers, except at high premiums, sometimes 15 cents a bushel, as the evidence before Judge Tuley shows. That existed sometimes in the same grades.

Q. (By Mr. KENNEDY.) Do you know anything about barley?—A. Not much.

Q. Do you know whether it is true that Mr. Armour controls or monopolizes the barley trade of the United States, and that those who want barley, for milling purposes even, have to go to him to buy it?—A. I think he is a very important factor in the market, but I would not want to make the statement that Mr. Armour controls it, because I do not know. But I will say this, that I believe Mr. Armour is the backbone of this entire railroad combination.

Q. Do you know him personally?—A. I know his methods. I believe Mr. Armour is the man who has concocted this public warehouse scheme with the railroads, and is such a large handler of freight that he can dictate his rate of freight to any railroad in or out of Chicago, whatever it may be. That is my opinion of Mr. Armour, in brief.

Q. I have been informed that he controls the barley product of the United States absolutely; that used for domestic purposes, and for export, and that those brewers of beer who use barley malt in the manufacture of beer have to go to him for it, or to his agents. Can you suggest anybody who could give the commission information on that point?—A. I can not think of a man that would dare to state it if he knew, but I may, if I think it over. There seems to be a particular indifference to making any statements regarding that outfit, with all the unsavory record against that concern in years past.

Q. (By Representative LORIMER.) Do you know whether or not barley is held in elevators other than those owned by Armour?—A. Oh, yes; no doubt of that.

Q. (By Representative OTJEN.) In speaking of public warehouses relating to grain, you mean elevators?—A. Yes. I believe it would not be a bad plan, as a public investment, and for the convenience of the people in handling this crop, and that it would result in millions of dollars of good to the producers, if the United States Government would operate public grain warehouses.

Q. Would not a great many of these conditions relating to elevators would have to be directly under the control of the State—the State of Illinois, for instance?—A. There is so much interstate business that must necessarily go through these elevators that I do not see how it could ever be completely controlled by the State. It might to a certain extent.

Q. Could there not be a State law passed requiring all public elevator men not to engage in the buying of grain?—A. We tried to defeat that measure when they

went to Springfield. They got the State legislature to pass it, and, in my opinion, that was bought with a considerable sum of money; but of course it is a law just the same.

Q. Has there been any other effort, so far as the State is concerned, to try to regulate these difficulties by having proper legislation passed?—A. I think not, except the usual laws that have existed for years on the statute books. It was a novelty previous to 1887 to see these low prices of grain; but these railroads, as it were, practically entered the grain business themselves—because it amounts to that—and since they have established these conditions and found out that in the speculative feature of it they could pile up enormous profits in addition to the freight on the property, the whole situation changed and came around as it is to-day.

Q. (By Mr. KENNEDY.) Do you know whether the Terminal Belt Railroad imposes excessive, unreasonable burdens on commerce that flows through Chicago from the West?—A. You refer to the "inner belt"?

Q. Yes.—A. I have never given that particular attention. I understand their usual charges for shipping grain around is about \$3 a car.

Q. Do they not charge what they please because they are not subject to the interstate-commerce law?—A. I presume they do. I do not see where there is anything to prevent them charging what they please.

Q. Would it not be to the interest of the business men of Chicago, or Chicago, to have the State legislature compel them to charge only reasonable sums for transferring the cars from one line to another?—A. I think it would. I think \$3 is too much to charge for switching anywhere in this city on a shipment from the West.

Q. (By Professor JOHNSON.) You said Congress could not interfere with these switching charges. Has not that case arisen before the Interstate Commerce Commission and been passed upon by them in the case of a Texas shipment?—A. I did not intend to be quoted as saying that the Government could not interfere.

Q. As a matter of fact, you know it does come under the interstate-commerce law as interstate shipments, and they do come before the commission?—A. I think on a shipment emanating from outside of the State of Illinois, and subject to belt switching, the Interstate Commerce Commission might have some authority.

Q. (By Mr. KENNEDY.) Their claim is the Interstate Commerce Commission has no authority because it is not an interstate road, is it not?—A. That would be a question of law I would not feel capable of deciding.

Q. (By Professor JOHNSON.) I want to know whether you make great use of the telegraphic service in your business?—A. Yes.

Q. Have you any statement to make in regard to that?—A. Yes; I believe it is a gigantic crime for a man to have a right to a private wire, just as much as for a man to own a private freight car or get a private rate. They all come in under the same head. I believe it is a crime under the United States law for the Western Union Telegraph Company to give quotations to bucket shops, those quotations being the means of fleecing the unsuspecting throughout the country.

Q. You mean to say when the telegraph company gives a private wire it does something against public policy?—A. Yes.

Q. You would be in favor of the Post-Office taking hold of the telegraphic system?—A. I would, most decidedly. I believe one of the greatest enemies of the welfare of the country rests in the telegraph companies.

Q. (By Representative OTJEN.) Do you not see any danger in turning over these vast interests to the Government and having them regulated by the Government alone?—A. Yes, I do.

Q. Do you know about how many employees are connected with the railroads of the United States, for instance?—A. In the hundreds of thousands; I am not posted exactly.

Q. About 900,000 was given to us here yesterday.—A. I do not believe Government ownership will ever make the conditions much worse than they exist to-day in commercial matters. The railroads, unquestionably, are the very foundation stones of combinations that are to-day wrecking business enterprises. Special rates are the food that they live upon, and without them they could not exist. I have been constantly in the railroad business for 17 years as regards the handling of freight and I have served on various committees in which we have had quite heavy questions involved in regard to the regulation of rates, etc.

Q. You think even if the Interstate Commerce Commission, for instance, had full authority, by enlarging the present law so that they could revise rates and fix them, that that would not fully meet these difficulties?—A. No; because you could never prevent a man from getting a special rate.

Q. Could not the law go still further and make it a crime for the officials to

give a special rate?—A. You could not cause their arrest. If you were willing to take circumstantial evidence—and we hang men on circumstantial evidence—it can be produced by the barrels. If that could be used to secure conviction, I would be willing to fall in with your proposition, but you must get the system down to the place where it would be impossible for a man to get a special rate, and I believe that is impossible.

Q. Could not that be done by giving the commission authority to investigate the transactions of railroads, and also the individuals who do business with railroads?—A. You might catch a man every 5 years, and would be lucky if you did. It is almost impossible, on a system of currency rebate, and various other means they would soon become familiar with, to bring them to justice.

Q. (By Mr. KENNEDY.) Your fear of what might happen if the railroads were placed under Government control is, I think, a reflection on the 840,000 workers in transportation in this country. Do you believe they would be any more controlled in their political convictions if the railroads were under Government control than they can be to-day; or do you think they can be controlled?—A. I would make it a crime for any influence to be used over an employee of the Government under Government ownership. We must come to the higher sense of obligation, and when the people are able to own the railroads, they will be able to see that they are properly owned.

Q. Do you think there is any foundation for the fear that the workers in transportation would belong to any one political party, or could be controlled by any one political party, in case the roads were owned by the Government?—A. Not when the people were educated up to the owning of the railroads.

Q. You know the railroad men are pretty generally educated, as far as working-men go?—A. Yes.

Q. (By Representative LORIMER.) Have you any further suggestions to make?—A. I think not.

(Testimony closed.)

CHICAGO, ILL., November 17, 1899.

TESTIMONY OF MR. CHARLES COUNSELMAN,

(Grain and stock merchant, Chicago.)

The subcommission on transportation being in session in Chicago, November 17, 1899, Representative Lorimer presiding, Mr. Charles Counselman was sworn as a witness, and testified as follows:

Q. (By Representative LORIMER.) Will you please state your name?—A. Charles Counselman.

Q. And your business?—A. I am in the grain, elevator, and stock business, in Chicago.

Q. We are informed, rather in an indirect way, that there is a combination of elevator owners in Chicago who are running their business and their elevators to the detriment of the community generally. We had a gentleman before the commission yesterday who made a statement covering the side which is more opposed to elevators, and if you will, we would like to have you state to the commission in your own way the actual condition.—A. I will be very glad to. I want to state, first, that there is no combination of any kind or nature among the elevators of Chicago, and never has been, in any manner, shape, or form. I will begin at the beginning. Some years ago the railroads had into Chicago a local rate from Western points, and a local rate out from Chicago to various Eastern points. Then these commission merchants who now claim that we have done them some injury used to receive the grain from the West on a commission largely, out of which they got probably 1 cent a bushel commission, and the grain then flowed into the elevators in the natural or normal way, so that the elevator owners at that time did not feel the necessity of being purchasers of grain in the West.

Q. (By Professor JOHNSON.) Who were the owners of the elevators at that time?—A. In our case there were the Rock Island, with which I am more intimately connected than any other; Flint, O'Dell & Co; Wheeler—I forget the old gentleman's first name—but the Wheeler family were the owners of the Northwestern properties; and the Illinois Central was controlled by Buckingham & Co.

Q. The elevators were not owned by the railroads?—A. Some of them were and some were not. The Wheelers sold out to other parties, and Flint, O'Dell & Co. sold out to me. I will relate our conversation about the matter, of which I

know specifically, and I have been informed that the others had the same views controlling their actions. They concluded to sell their properties because they did not want to enter into the purchase of grain. It was a detail they did not care to enter into. They were old men and were willing to retire; so the elevators were sold out, as the case happened to be, and we were up against this proposition. The railroads then introduced a rate, a through rate from a Western point to an Eastern point, less than the sum of the locals. I want you to have these points well in your mind, because right here is the pivot to this whole matter. For instance, to illustrate clearly, a local rate from Omaha, if you choose, to Chicago, of 20 cents, and from Chicago to an Eastern point, 20 cents, the two locals making 40 cents. The railroads would then say to a party, If you through-bill that grain from Omaha to this Eastern point we will give you a rate of 38 cents, if you choose. I do not pretend to say that that was the exact figure, but to illustrate the point. So the result of that was that the Eastern buyer could come into our Western country and buy grain for Baltimore, or Philadelphia, or Newport News and pay more money for it at the Western point than we could afford to pay to bring it into Chicago on the local rate and put it out on the local rate. I had invested about \$1,000,000 in elevator property. I built the South Chicago plants, which cost over \$750,000, and therefore I said to myself, These railroads, by this proposition, have destroyed the earning value of my property at least 33½ per cent. What have I got to do? I must buy this grain and do whatever I can to fight this competition. Every other elevator man found himself in that position. Grain came in on our tracks, and comes to-day on our tracks, by the thousands of carloads that never sees an elevator, never goes near an elevator, but is sold as through-billed grain, bearing this lower rate, and that kind of grain on 'change to-day brings 1 cent to 1½ cents, and as high as 2 cents more than the grain in here on a local billing than we can afford to pay. So, instead of the railroads helping us any, I think that they, by their through rates, have done more to destroy the value of our property than all other agencies combined. So we found that Minneapolis, with their elevator concerns, were coming down into the State of Iowa, in Northern Iowa, where I do business, and where the Northwestern run their tracks, and paying more for the grain, taking it to Minneapolis, and going out by Washburn and also Duluth, and going out by lake, and selling this grain in New England all the way from 1 cent to 1½ cents a bushel less than we could afford to sell it here in Chicago. At St. Louis we found the Burlington road, running up into Keokuk, Iowa, was bidding in territory where I had to compete on freights to bring the grain to Chicago, taking it to St. Louis and then out by way of Newport News on this lower through rate.

So we were forced to buy grain, not only to protect the earning power of our own property, but also to keep Chicago in the front as a grain market. Now, these gentlemen—of course, their business was hurt then; there is no doubt about that; but we were no more responsible for that than you are, and are not to-day.

If we had these railroads back on the local proposition there would be no necessity for us elevator men to buy grain in the country to any great extent. It would be reduced to a minimum. It would only be in certain localities and not many places where we would have to buy as a competitive measure for Chicago. So, if these gentlemen will only use their efforts and their intelligence to help correct this proposition, which I consider the basis of all this trouble between us—it is a local affair, however—there would be no trouble between us of any nature or kind. Now, this is about a fair statement of the basic trouble.

Q. In connection with the point you have just made, I would like to ask whether it is not a fact that most of the grain from West to Chicago now starts toward Chicago on a through billing?—A. Yes.

Q. And you simply pay your proportion of the through billing?—A. No, we take that billing; and in my case I sell this grain in Europe; from the farmer I buy it. I have elevators all over the country and buy grain from the farmers, and sell it to Europe. That grain is billed by lake and rail billing, and so on 'change that is the chief way the business is done, except that which comes in locally. However, when property is billed that way they give the owner three rights. They can ship it out as lake and rail, retaining the rate; they can change it to an all-rail rate if it goes by cars, instead of by water; and they can change it to a local and stop it here, provided they pay the local rate. Everybody has that right.

Q. As a result of that practice do you get less than the local rate?—A. No; not when we stop it here. When we ship it to Europe we have the benefit of the rate, like everybody else. That is not confined to anybody. It is a public proposition by published tariffs.

Q. (By Mr. CONGER.) If I understand correctly, that grain coming from the

West, bound into Chicago on a local rate, can be changed to a through rate?—A. No; I say that coming through from a Western point on a through rate it can be changed to a local.

Q. Have you an idea at all definite as to the portion of grain coming into Chicago that comes in on a through rate?—A. I could not tell you that with any accuracy, but it is pretty large, because naturally people can get more money for it because they get this low rate.

Q. So you think the greater proportion?—A. Yes. A very much larger proportion.

Q. (By Professor JOHNSON.) Do all local points west of Chicago enjoy the same advantage for this through shipping?—A. I think they do. Anybody can ship on the through export rate.

Q. How do you explain this fact, that the rates from Iowa are sometimes larger than they are from the State beyond, Nebraska?—A. I judge it is because they have less competition. That would be my judgment without knowing definitely.

Q. (By Mr. C. J. HARRIS.) You control the elevators along one line of road, we will say. Does that give the farmers a competitive market in which to sell their produce?—A. Yes. In the first place, I don't control them. That is the first point. I will tell you how that is. I build elevators through the State of Iowa and Kansas that cost me \$140,000. There is no point where I have an elevator but what there are at least one or two other independent elevator proprietors buying grain. The railroads follow that idea. They will not permit anybody to have the only elevator at a point. They insist upon at least two, which is correct.

Q. What regulates the price of wheat?—A. That is a pretty hard question, of course. I was going to say to you that finally that is the agency that regulates what we can pay for the wheat. Every now and then, of course, speculation pays a higher price than we can for export. Speculation is to-day paying a higher price for wheat on the Chicago Board of Trade than we can export grain for. We can not sell it within 3 cents a bushel of what they are paying for wheat, and corn 1½ cents. Every once in a while the people make up their minds the price is cheap, and they buy it all out of the shipping line and we can not ship it for a while. Of course that is regulated a good deal by the law of supply and demand.

Q. While these local causes might maintain prices for 2 or 3 months, in the end, sometime or other, the export price must regulate that?—A. Yes; altogether our surplus makes the price.

Q. Then, of course, what you pay the farmer at one end, plus the freight abroad, with a fair percentage for handling are the component parts?—A. Yes; that is it exactly.

Q. Do you think if these elevators did not buy wheat that the price to the farmer would be higher than it is now?—A. Very much less.

Q. We had testimony something to that effect yesterday from another source.—A. Very much less. If a man looks at it in a reasonable way, with a real sincere desire to get at the facts, he will see it. The surplus is in my judgment the lever upon which the whole crop is handled. Now, just suppose for instance that we could wipe out every central market where speculation is carried on, where men buy property for future delivery, and all this vast production of grain here was absolutely on the market to the consumer. Now, will you tell me what that consumer would pay? He would pay for it exactly as small a price as he could, and the very element of this great purchasing power in that speculation would be out of the way, and he would be conscious of the fact that he was the only buyer. I don't think you can see how low these prices would be. Look at it to-day. We are carrying millions of bushels of wheat, not only in Chicago but in other elevator centers. Speculation is carrying it. We can not sell it to-day. We are carrying that wheat by the agency of speculation until consumption overtakes it and demands it, and then it goes to consuming districts.

Q. (By Professor JOHNSON.) Does consumption have the price-fixing power or do you?—A. Consumption has to have the wheat. Suppose we try to fix it and carry all the wheat in this country. We had an illustration of this not long ago. We occupy simply the position of holding the great surplus of this country in various stages of speculative conditions until consumption requires it, and then it is sold. To-day Argentina is supplying all Europe with wheat. We can not meet their prices and we can not sell till they get through. They have no system there as we have. They have no elevators there to hold the grain and no speculative market on which elevators could hold it. The elevators could not hold it without this great market to carry it. Then, as soon as it is harvested, it is put on a vessel and sold for what it will bring, and they to-day are receiving their price for wheat because

TRANSFORMATION.

America is held up by speculation, and is not a competitor. If our wheat in this county was put on the basis of Argentine wheat to-day and each competing for a consuming buyer, God knows what the price of wheat would be.

Q. (By Mr. KENNEDY.) Is there any speculation in Liverpool, in the wheat of Argentina and other countries, by which the price is held up, as you say it is?—**A.** Very little. There is none in London, which is, of course, the very great market—none in Europe. In Liverpool there is a little, but, of course, it is a very small proportion.

Q. (By Mr. CONGER.) When you say we can not compete with Argentina in Europe, do you mean that we are not now exporting?—**A.** That is what I mean to a very great extent.

There are some grades of wheat, like the No. 1 hard of Duluth, which is an extra fine wheat. There is more or less of that wheat going all the time. They take it because they mix it with the lower grades of Russian wheats.

Q. Does it bring a higher price?—**A.** Yes.

Q. Than other grades?—**A.** They mix that with the lower grades, so the miller has a mixed grade.

Q. You stated a few moments ago that speculation had raised the price of wheat 2 or 3 cents a bushel above the exporting point?—**A.** Yes.

Q. Is it in practice above the export price or only in theory? In other words, has it held up the exportation of grain?—**A.** It has stopped it for a while. It is only temporary, however. We generally find this condition of things along this time of year. After the first of January the Argentine shipments usually cease, or, at least, from December they are of such small proportions that they do not cut much figure. Then, the consumption, of course, of Europe is so large that they have to take American wheat.

Q. In the operation of these elevators, do you store grain for the public, or for private buyers?—**A.** Yes; whenever they want it. We give them a special bin if they want. That is the State law. We operate here under a statute of the State of Illinois, which requires, at the request of anybody who wants to store grain in a public warehouse; that we shall furnish them special bins for their wheat or any other kind of grain.

Q. What is the practice; in other words, are these requests made frequently?—**A.** No; and I will tell you why. All these arguments and statements you have heard from people are old stock arguments that are put on the shelf and labeled and taken down on occasions like this. There is nothing in them. Let me show you how the grain comes to Chicago and what becomes of it. These very gentlemen who complain so loudly about these matters bring this grain to Chicago. They will have a little sample of each carload in a bag. It is brought up on 'change. It is brought to me as an elevator man, and to other elevator men. It is shown to a miller, it is shown to a shipper, it is shown to everybody, and the object of these men is to sell it to the man who will pay them the most money. If an elevator man will pay the most money he gets the grain, and if he does not pay the most money he does not get the grain. When these men sell me grain, for instance, it goes to the warehouse; it is weighed, and they present a bill with their weights and get their money. Why don't they put it in store? Because they have to accumulate 5,000 bushels before they can sell it in the option or speculative market. In doing that they have to pay storage on some of the grain, they lose the interest on their money, and they lose the insurance on the property. They save these things, and therefore the invariable rule is that the grain is sold on track, and not in the elevator. The weights are ascertained by the elevator, and they have no further interest in the property. That is the reason they will tell you why they do not own grain in the warehouse. There is nothing to prevent them from owning grain in the warehouse, but they don't want it; it costs them money.

Q. (By Professor JOHNSON.) These men say they have to pay three-fourths of a cent per bushel storage.—**A.** That includes the first 10 days and the receipt or delivery of the property on board cars or vessels.

Q. And they say that the men who own the elevators escape nearly all of that cost, and for that reason they are unable to compete with you. Is that true?—**A.** There is something in that. In other words, it is like stating that a man who owns property and who gets remuneration by his storage rates shall not have it because some other fellow is not able to own one. There is no monopoly about this elevator business. Anybody can go into it. It is very common everywhere.

Q. (By Mr. C. J. HARRIS.) Does the State regulate it?—**A.** It does under statute. Anyone can erect one provided he has the money to pay for it and the money afterwards to run the business.

Q. Does the State regulate anything but the price?—**A.** They regulate the

charges; they give the privilege of charging $1\frac{1}{2}$ cents, including the delivery on cars or vessels. However, we do not charge the $1\frac{1}{2}$ cents which the statute gives us the right to do, but do it at three-fourths, the cheapest rate in the United States.

Q. (By Professor JOHNSON.) In your opinion is that a low rate?—A. It is a very low rate, inclusive of the storage, and we could not do business at that rate and make any money unless we did a considerable volume of it.

Q. (By Mr. C. J. HARRIS.) Are there loading and unloading charges besides?—A. No; nothing on earth except that. It is the cheapest rate in the United States. Minneapolis and Duluth and New York and Boston charge $1\frac{1}{2}$ cents per bushel for the same service.

Q. (By Mr. KENNEDY.) You say you do a large volume of it? Did you not say that they do not put their grain in the elevator?—A. No; they do not pay any of these charges.

Q. It is your own grain?—A. Certainly. I buy this grain, or any other man buys it, and he owns it. These men do not own any of this property, and never did.

Q. (By Representative LORIMER.) Do you mean that we shall get this impression, that unless you did a large volume of business on your own account you could not afford to do other people's business at three-quarters?—A. That is exactly what I mean to impress upon you. I do not think our elevators would be worth 25 cents on the dollar unless we did this. We can not help it. We have got to do business, and if we can not do it as public warehousemen we will do it as individuals. Every farmer and dealer in the country nowadays receives on his desk every morning card bids from a score of sources for his wheat on the track. These gentlemen hold us responsible, because these men do not want to continue to pay them a commission for selling the grain here.

Q. (By Mr. CONGER.) You have stated that anybody could go into this business?—A. Anybody can; yes.

Q. Is that strictly true? Isn't it true that you have an exclusive contract with the Rock Island, for instance?—A. No; I beg your pardon. I own and have paid for, with my own money, the elevator capacity on the Rock Island railroad for four million and a half bushels of grain. They do not own these elevators; they only own some old elevators uptown here that are used for surplus, and that is all. I do my own business, 90-odd per cent of it, at South Chicago, on my own property that I have paid for.

Q. Have you a contract with them—that is to say, one that would prevent them from allowing some one else to build an elevator on their line of road?—A. No; not in any manner, shape, or form; never had such a contract.

Q. One would naturally conclude that if this elevator business was so extremely profitable others would want to go into the business.—A. Yes; these gentlemen make some curious statements here. Four years ago they brought this whole matter up. This is an old question here. We turned our contracts over to the Interstate Commerce Commission and said, "Look at them, and if there is anything wrong about them let us know." They said there was nothing wrong about them at all.

Q. I think I have heard it argued that the way the elevators are operated in Chicago it was to the interest of you gentlemen who owned them and operated them to keep the price of wheat down; in other words, that because of the necessarily greater premium that you would have to pay on insurance when the price was high that you could make more money when the price was low.—A. Well, that is really so ridiculous that it is hardly worth answering. We do not care anything more about the price of wheat than if we were not on the earth. I am a warehouseman. I am not a speculator. I do not speculate in grain. I buy it, bring it to Chicago, and sell it on this market, or in the Eastern market, or in Europe, or wherever I think I can get the best price. If speculation is paying a better price here to-day than I sell them the property.

Q. When you say you do not speculate, you mean in options, do you not?—A. No, I mean that literally. I have told you my method of doing business. I have a central station at Des Moines, and from every one of these little elevators in the country, every night, there is reported by telegraph the amount of various kinds of grain that I have bought and the average prices. That grain is sold at once, either for shipment East or to Europe, or in this market in Chicago. I do not hold it more than one hour after the Board of Trade opens. I am not a speculator.

Q. (By Professor JOHNSON.) You do not keep the grain in storage?—A. I do, awaiting shipment only. Some I do and some I do not. I am delivering that grain now. We hold very little in our elevators, but that is sold or expected to be sold very shortly.

Q. Do you think there is anything in the elevator business here that tends to keep a large volume of grain constantly stored here in Chicago?—A. That depends altogether upon the shipping demand.

Q. Just to bear the market?—A. I don't know anything about that. We are neither bulls nor bears. We want grain here to trade in. This market requires a large amount of grain. If they did not have it they would have a corner every month and run it up to \$4 per bushel because they could not get the grain in.

Q. (By Mr. CONGER.) In the Northwest, that is, west of Minneapolis and St. Paul, I have understood that there were two or three elevator companies operating on the same line of road. It has been charged that those elevator men, or, at least, the representatives of them, would always pay the same price for grain. In other words, there was really no competition.—A. I don't know about that.

Q. You have just testified that on your line of road, at every country town where you had an elevator, there is always another elevator.—A. Always, yes.

Q. Is there any arrangement between your representative in that town and the representative of the other elevator by which you pay the same price for grain?—A. Not the slightest in the world; never has been.

Q. (By Mr. C. J. HARRIS.) You say the farmer receives quotations of prices from 15 or 20 different people every day?—A. Yes.

Q. He does not have to put his grain in the elevator; he can load it right on the cars?—A. Yes, and the railroads will furnish the cars.

Q. Those cars need not necessarily go through the elevator here, but can be sold on the track?—A. Yes, nine-tenths of them are.

Q. Did I understand you to say while yours is a public elevator the general public does not store in it?—A. No, hardly at all.

Q. Hardly at all?—A. They sell their grain on the track and get the money.

Q. (By Mr. CONGER.) Just a word further on the prices you pay for grain. It is generally a fact, is it not, that two buyers in the same town, representing different concerns—say yourself and someone else—do pay the same price for grain?—A. I don't know. Of course, it could be possible that they would make an arrangement of that sort, but my experience is that in some places it is not. For instance, I know of one place I had in my mind in Iowa that they have a competing road that is near by. They go to this road or that. These roads are not very far apart. They were paying 2 cents a bushel for corn at one point more than I could pay, and ferreting it down I discovered that the Glucose Refining Company of Chicago is buying the corn.

Q. You refer to corn now instead of wheat?—A. Yes. Wheat is a thing that you can not regulate the price of in that way, for the reason that wheat varies in quality. You as one buyer might think that the wheat is worth so much money and I might say it is not worth within 3 cents a bushel of what Mr. Conger is paying for it.

Q. (By Mr. C. J. HARRIS.) What governs that when a farmer ships a carload in here, and the car is on the track?—A. Do you mean its value?

Q. No, the grade of wheat?—A. Everything is inspected by the State inspector. Every carload that comes into an elevator or goes out on the track. Everything is inspected by the State of Illinois, in and out.

Q. (By Professor JOHNSON.) This statement is made in the complaint, that four men who buy on the Board of Trade meet daily at 1.15 o'clock or thereabouts and decide what price shall be paid for grain along the Northwestern, and that when that price is determined, because of your transportation facilities, through your connection with the Northwestern system, it is practically impossible for any other man to buy grain in competition with you.—A. I am rather surprised that they should make that statement, because when I tell you about it, it will be one of the worst arguments they could adduce. That is true. We do get together. Why? Because of what I told you, the competition on every point. We hire a man, and pay him a good salary, to keep posted as to what parties at other competitive points for our grain are paying, and we are determined to pay the farmer as much for grain as any city that takes it from us. That is exactly true, but the motive they do not arrive at. We are fighting for business here, and we will continue to fight.

Q. (By Mr. CONGER.) In other words, you are fighting for the Chicago market?—A. Yes, the railroads making these through rates hurt us here, and we are going to fight it in every conceivable way.

Q. (By Professor JOHNSON.) Is it true or not that you on the Northwestern system and Mr. Armour on the St. Paul system have an advantage in the shipments which other men do not possess?—A. Do you mean in the matter of shipments?

Q. So that you both pay the same price; that you make the same offer to the

farmer. In other words, that you can both sell at the same price on the market, but that you can secure all the grain, practically, by paying a higher price than others can afford to pay, by reason of your transportation advantages?—A. No; we have no advantage of the transportation.

Q. Please explain; that charge is made.—A. I thought I had explained that. I don't think there is a man in Chicago who buys grain merely for the Chicago market who can compete with me, and I will tell you why. I buy this grain, as I have told you, from the farmer, and I take this export rate and I will sell that grain in any part of Europe where I can get the most money for it, and unless they are able and equipped to do that business they can not compete with me.

Q. Even though they pay exactly the same amount?—A. It don't make any difference, and you can not get legislation to control it. It is the old doctrine of socialism that wants to make the Government do everything and bar individual effort.

Q. (By Mr. CONGER.) Can you tell us what the export rate is on grain to the shipper?—A. I don't know what it is just now. They raised the rates a little the 1st of the month. What the exact rate is to-day, I do not know.

Q. Is it less than the local rates to the shippers?—A. Yes, it is less.

Q. (By Mr. C. J. HARRIS.) What is to prevent these gentlemen who were here yesterday from sending out their quotations to various towns along these roads, whatever they are willing to pay, and having that wheat shipped in here on the track and then selling it to go on?—A. Nothing on earth. They can do that all the time.

Q. Does not that give a perfectly legitimate market to the farmer and to these other gentlemen?—A. Yes; it does. The farmer is getting the benefit of all this competition.

Q. (By Professor JOHNSON.) They say that you have an advantage over them in this three-quarters of a cent storage, and which is your regular price, and that you can grade wheat so as make money that they can not make?—A. That is exactly it. In other words, I am better equipped in my business than they are, and you can not make it otherwise. Now, you can not make a man who has no money as able to do business as a man who has the money.

Q. (By Representative LORIMER.) A man of energy and ability?—A. No; and a man of equal ability can not do it.

Q. (By Mr. C. J. HARRIS.) Unless he has the machinery?—A. Unless he has the machinery.

Q. (By Professor JOHNSON.) They say if they could prevent the man who owns the elevator from buying grain that everybody would be practically on the same footing.—A. I will answer that as I told you in the first instance. I want to be perfectly fair in my statement of this question and all others. If we had the local rates over the roads into Chicago, there would be no great necessity for the elevator men to buy grain. Now, if these gentlemen will address their intelligence to something of that character, they will help themselves in a material way, but you can not correct it while this thing exists. They occupy a sort of negative position in life. Everything is wrong, and nothing is right.

Q. Is it not a matter of the regulation of railroad rates?—A. It is a matter of regulation of railroad rates, if you want to eliminate the elevator man as a buyer of grain. But I think the farmer would like to have some session on that when you try to cut out from him the competition of any buyer. He don't care whether it is an elevator man or a hockcarrier who buys his grain. He wants buyers of grain on his track, and as many as he can get.

Q. (By Mr. CONGER.) Would it be feasible, in your judgment, for these elevators to be owned by the railroads and by them opened to the public generally for the storage of grain; in other words, so that you and everyone else would be on an equal footing?—A. No; and I will tell you why. In the first place, the railroads do not want to go into the grain business. Their charters are against it. They are not in the grain business. In the second place, if that were the case, the elevator men of the country would be in the position that they would not have control of the speculative markets. It is pretty hard to take away individual effort in any proposition.

Q. I doubt if you get my idea. The railroad now furnishes the car that the grain is shipped in from the initial point to Chicago, or to any other destination. Now, it has been suggested that in the exercise of its functions as a transportation agent the railroad should own and operate the elevators here.—A. Yes.

Q. Not in the way of being a grain buyer, but simply in a smaller way, as they use the cars.—A. Yes.

Q. And place it at the disposition of the public.—A. Now, what would that amount to? Would the railroad amount to anything under that proposition? I

own my own elevator. I buy my grain. I ask no odds of the railroad. They charge there for doing this business in their elevator. They would have to charge, would they not?

Q. They would have to make a charge.—A. All right. I buy my grain and sell it to the man who bids the most money in every part of the world. What care I about the railroad elevator. How can they compete against me there? They can not do it.

Q. Formerly there were public elevators in Chicago, were there not?—A. Yes; there are to-day.

Q. Are there any to-day?—A. Yes; any quantity of them.

Q. Do you think the proportion of public elevators, as compared with private elevators, is as large as it was two or three years ago?—A. Yes; larger now; and right on that point I suppose these gentlemen try to make you think that we want more public elevators. On the contrary, they are begging us. "For God's sake, why do you have so many public elevators here? We want to have less property here, so that we can bull and bear the market and speculate on it." And so I do not do much business in my public elevator. They raised such a howl about it that I do not want to be a public warehouseman, if it is going to interfere with my business. I am a grain merchant. I have my private warehouses where I put my grain and sell it to anyone who wants to buy it. I do not want to be a public warehouseman. There is nothing particular in it if it is going to be an obstacle in the way of my prices. It is merely incidental to the business for the accommodation of people who want to trade speculatively and have receipts that they can deliver on the market here. That is the only function of a public elevator. That is all a public elevator means. These receipts are delivered on the speculative market by indorsement, and they go from one man to another. They use our elevators for their convenience, for which we charge them this lower rate.

Q. Your testimony, then, is to the effect that there exist in Chicago plenty of public elevators for the accommodation of these gentlemen?—A. Yes; to any extent. I can nearly approximate them in my mind. I think Armour has about 10,000,000. We have 4,800,000. The Northwestern system has, I think, about 3,000,000. There are on the Alton about 5,000,000. At South Chicago, independently of my elevators, there are about 3,000,000. On the Illinois Central there are about 1,250,000. There are some others I can not just now recall. Just add that up. Twenty-three millions. You can get all the public elevators you want. Gentlemen, they do not want to do it and never did. It is only a talk they have.

Q. How much of that 23,000,000 do you suppose is in use to-day?—A. I judge about 13,000,000, possibly. I have not looked at that feature of it for some time. I may be off in that, but it is something like that.

Q. What, approximately, would be the capacity of all of the private elevators like those belonging to yourself and Armour?—A. I should judge about 10,000,000, as nearly as I can approximate.

Q. Not more than 10,000,000?—A. Not much more than that; no. Two elevators at South Chicago—lately they have turned some of their houses into public warehouses; ten or twelve, possibly.

Q. What was the motive for turning them into private warehouses?—A. The motive was this. These gentlemen made such a howl about public warehousemen buying grain, making out the cause of their being hurt in their business; and they have been suing us under the old law, which was not clear on the subject. It was a law which was really open to two constructions as to whether a public warehouseman had a right to buy grain. And we said to ourselves, Well, all right. We are not going to be bothered so much about this. We are grain merchants, and we will use our private warehouses as we see fit. We are trading and buying. Under the public-warehouse act, everybody kept nagging us to death, so we built our private warehouses for that purpose.

Another proposition is this. Here comes grain that is dirty. It won't grade No. 1, for instance, because of the dirt in it. The grain is all right except for the dirt. The inspection department says it is No. 3. We take that grain and take the dirt out, and it makes No. 2.

Q. You testified as to 23,000,000 as the approximate capacity of the public warehouses and 10,000,000 for private warehouses. That only makes 33,000,000. Is that the entire capacity?—A. I am not just exactly positive as to the entire capacity. It may run to 40,000,000 for all I know. Some men have warehouses here that I don't know anything about. The public warehouse capacity is much larger, and whenever they want a new public warehouse for the grain or whatever they get, we will throw them wide open for them; but we feel they do not need them; they have no grain in the warehouses; they sell their grain on the market and get the money for it and have no further interest in the trade whatever; absolutely no interest.

Q. (By Professor JOHNSON.) You said a few moments ago that the railroads are not in the business of buying grain and do not want it.—A. Yes; that is my judgment.

Q. In view of the history of the Iowa Development Company and its relation with the Chicago and Great Western, and in view of the relation of the Illinois Central with the grain trade, is that statement correct?—A. I don't know anything about the relation of the Illinois Central with the grain trade.

Q. You have not kept track of the case of the Iowa Development Company?—A. I don't know the character of their custom at all.

Q. You are not familiar with the investigation of that subject?—A. No. Mr. Stickney was before the Interstate Commerce Commission, but I don't know what the result was.

Q. It has been, I think, fairly well proven that railroads were to some extent purchasers of grain—buyers and sellers of grain—bought at the initial point and sold out under shipment to Chicago, with the differentials between the two prices as their bonus.—A. I don't know anything of that kind.

Q. That was the business of the Iowa Development Company?—A. I don't know anything about that.

Q. (By Mr. KENNEDY.) Do you buy barley?—A. Yes; quite largely.

Q. Do you sell it yourself?—A. I do.

Q. Does Mr. Armour control that trade?—A. No; ridiculous! Armour control the trade? Of course not. I sell, I think, about eight or nine million bushels of barley.

Q. You have a fair share of that trade for malting purposes?—A. Certainly; it is bought and sold every day on change.

Q. You stated they could never get legislation to regulate your business.—A. I believe that is so. It was the old doctrine of socialism intended to bar individual effort.

Q. Do I understand your position is that you are opposed to this combination that is going on in the industrial world to-day?—A. I am opposed to it to the extent that they have any power to absolutely control prices. I don't mean, however, to be understood as saying that I don't believe in the consolidation idea. Now, you have pointed out a very broad question, and if you will allow me I will tell you just what I think. You can not make Government legislation that will govern any man's business or his prices, and I will tell you what I think about this thing. I appeared before the Interstate Commerce Committee of the Senate once, by request, on the subject of pooling. Now, I honestly believe that there is only one remedy for all this trouble, about railroads and rebates, and that is a pooling law, which will allow these railroads to pool their interests under the control of the Interstate Commerce Commission, which has the power to protect the public in the maximum rates. Why do I believe this? Let me state this: These things are just as they are; there is no use in setting forth abstract theories; we must come down to practical things. Railroads cross the country, and you will find the most of them well equipped and in shape to render fine service, exact service, and plenty of cars. We have been dealing with these roads for some time and have no fault to find whatever with their service and mode of operation. In comes another road, not so well situated, not so well equipped, and not in a position to get so much business nor to handle it as well, and yet it must stand upon the same plane with every other road. Now, people will come in here and make long speeches to you about the railroads doing this and the railroads doing that; but here is the practical question: That road can not do business. Then what does it do? It does the only natural thing and inevitable thing it can do. It says, "We will try to equalize these advantages and we will give you a lower rate," and there you are. Someone takes that lower rate and everybody feels it in a minute in the trade. They can probably sell a little cheaper in consequence, or something or other of that kind.

Q. How does the old road protect itself against the rate adopted by this new road?—A. By meeting that rate. And things go on for a while in the same manner until after a while the same conditions obtain again and the road again puts down the rate in order to get business; and so they keep on cutting, and the rates are uncertain, and no one can predicate any business proposition upon them until that road ceases doing business or they reach some amicable understanding; or under one road goes, into the hands of receivers and operates under the protection and direction of the court. So that the inevitable logic of the whole proposition is that this bankrupt institution which started that decline in rates to get business fell into absolute bankruptcy or bankrupted the solvent road, because the solvent institution can not do business in that way; and they can not get away from these things. God knows I am for an absolute uniform rate, and I will

take my chances of doing business; that is all I want and that is all I ask. People are looking for a remedy and affecting sincerity; but they don't want to stop it, because if they did there is a way to stop it, and that is to let these roads get together and say, "Here, you are entitled to a certain proportion of this competitive freight here;" and they agree upon the proportion, and the rate is fixed, and that gets them out of trouble. Now let the Interstate Commerce Commission here say, "The rates can not be other than so and so; your power to pool shall not be used to charge an exorbitant rate." Then you have taken away from these roads the temptation to cut the rate. No necessity exists any more. They are contented to go on with their business, feeling that they get a fair proportion of freight upon which they agree, and you have stopped the cutting of rates. Of course nothing is perfect, but it would seem to me that will eliminate. I will undertake to say, 99 per cent of the trouble arising from this freight rate.

Q. Would you have this interstate-commerce law amended so that there would be no trouble about the regulation of these rates?—A. I would; yes.

Q. (By Mr. KENNEDY.) You would have the interstate-commerce law amended so as to have no question about the powers of the commission to regulate these rates?—A. I would. Now, this interstate-commerce law has done more in the last few years to restore things to an equilibrium than people know anything about. They have gone about it in a practical way.

Q. (By Mr. CONGER.) Would your proposition for a pooling arrangement do away entirely with the motives for cutting the rate? Let me suppose a case: A pool is made; and it must be done on either a tonnage or financial basis, probably a tonnage basis; and these railroads that enter into it must agree upon a proportion that each shall receive.—A. Yes.

Q. I can understand how the ambitious railroad manager, after that arrangement has been in operation for a few months, says, I do not think I have my proportion.—A. Yes.

Q. He goes out quietly and makes a rate to some large shipper;—makes a rebate, if you please.—A. Yes.

Q. And he is very soon able to demonstrate to the pool, or those who form it, that he is entitled to a larger proportion, and as long as men are controlled by motives of ambition and to get all they can I do not see how that is to be done away with at all.—A. As I told you, you can not make everything exactly perfect. I knew you would ask that question, and my answer to that is this: In any proposition where you can not have perfection you must take that which is bound to make it the best possible. I do not know any better way. In the first place, as you put it, won't it be more likely that the railroad that is trying to increase its percentage on the tonnage proposition will be the weak system, the one that did not have much freight before, and that is constantly cutting the rate to get it, that would be inclined to say, Next year I ought to have a little more tonnage. The result, in my opinion, would be, if these other strong roads feel satisfied with the present proportion, that they will say that these fellows are getting to be a continual disturbance, and the men who own the securities of the other roads will simply go to work quietly and buy control of that weak road, and stop it right there.

Q. (By Professor JOHNSON.) Then pooling will not check consolidation?—A. Unless you have pooling, consolidation will go on.

Q. And if you do have it it will go right on?—A. No; it is only liable now and then, to correct the only evil which is attachable to pools, and only in the manner of protection.

Q. (By Mr. CONGER.) In what way would you protect the public against exorbitant charges?—A. By the Interstate Commerce Commission.

Q. With what authority?—A. Absolute authority on the maximum rate.

Q. (By Mr. C. J. HARRIS.) In the case of pooling?—A. Yes. As long as you protect the public in the maximum rate, you have protected them.

Q. (By Mr. KENNEDY.) How would you protect the shipper in having his freight go over a certain line?—A. I would not have the discretion in the pool. I would let the traffic go as it is to-day. It makes no difference to the railroads; they get their proportion of the business. If it is to go over the Northwestern road, let it go over the Northwestern road.

Q. You said you were opposed to these combinations in case they would finally secure a monopoly of the trade and industry. Do you fear some of them have or may secure a monopoly?—A. Well, of course, it is quite possible.

Q. Has not the American Tin Plate Company practically secured a monopoly of that industry?—A. I should not wonder. I am interested in the packing industry on Puget Sound. I bought a large amount of tin from them the other day, and I told them I thought I would have to go into the tin business and manu-

facture tin. But still there is a good deal to say on the other side. If they keep the price steady, it does not make much difference. Their statement is, if they had to buy the steel to-day, they could not sell at the price they are selling to-day, and I apprehend that is true.

Q. (By Mr. C. J. HARRIS.) Are you the owner of cars yourself?—A. No, I am not. I never owned any cars.

Q. (By Mr. CONGER.) I do not know where I got the idea, but it comes to mind that I have heard it charged or said that the elevator men here in Chicago were paying more for grain in Nebraska than they were in Iowa; in other words, paying more for grain at a point where the mileage was much greater to this market. How are they able to do that, if it is done, if they do not get concessions from the railroads on these large shipments?—A. I do not know that that is true, but I will tell you my experience. Frequently I will give more for Nebraska grain than Iowa grain because of the better quality. The dry climate in Kansas and Nebraska makes a better grain to store or ship than any other. I would give more money for it any day in the week than I would for Iowa wheat.

Q. How do your prices compare on the line of road you operate on in relation to distance from this market? Do you pay as much for the grain at the farthest point as you do at a nearer point?—A. No, not exactly; but the railroads in their tariff rates for a long distance will haul grain pretty close to the local. The long haul is what they are after.

Q. Then you pay approximately as much for grain 1,000 miles as 300 miles from Chicago?—A. Yes. Look at the fish industry at Fairhaven. We can ship fish from Puget Sound to Boston at the same rate we can ship to Chicago. That is on account of these proportionate rates. Now, I have always complained about these proportionate rates, because I do not think they are right. You can start to-day a train of 50 carloads of grain; you can have in that 50-carload train 25 carloads destined to Chicago, and I will have 25 cars billed through; on the same train; identically the same service performed. When it gets to Chicago, you say, "Mr. Counselman, I wish you would clean that grain for me." "All right." I clean it. I put it out on the eastern train, and these other 25 cars come in and make up the eastern train of 50 cars. Twenty-five cars will pay, say, 38 cents on to New York; the other grain, that you had cleaned here, will pay a 40-cent rate. Now, they have performed identically the same service, but charge you the additional rate simply because you did not bill it through.

Q. The grain had to be unloaded here?—A. Yes; so did the other, but it is transferred from the western to the eastern car at their own expense.

Q. That proves to be an interesting point. I think I have heard it said or testified to that at Minneapolis the railroads make the same rate for through grain; in other words, will allow them to do that cleaning and still put it through. Do you know if that is true?—A. If it comes billed through, they do; but my assumption was you had billed it local. That is not right. The railroads ought to let it go in local and out local at the same rate.

Q. Coming back to the industrial matter; quite a number of gentlemen who have appeared before the commission in Washington have favored a national incorporation law. Have you any opinion on that matter?—A. I have not given that subject a great deal of thought. Of course, I can see it is very onerous, people having their different plants in different States, always subjected to different classes of State legislation. I should think, on the whole, national legislation might be a good thing.

Q. (By Professor JOHNSON.) Do you use the telegraph largely in your business?—A. I do.

Q. Are you satisfied with the telegraph service at the present time?—A. Oh, yes.

Q. You think the rates are high?—A. I think they are very fair, indeed.

Q. (By Representative LORIMER.) Have you anything further to suggest?—Nothing.

(Testimony closed.)

CHICAGO, ILL., November 17, 1899.

TESTIMONY OF MR. WILLIAM H. BARTLETT,

Grain merchant, Chicago, Ill.

The Subcommittee on Transportation being in session in Chicago, Representative Lorimer presiding, at 11:15 a. m., November 17, 1899, Mr. William H. Bartlett was introduced as a witness and, being duly sworn, testified concerning transportation as follows:

Q. (By Representative LORIMER.) Will you please state your name?—A. William H. Bartlett.

Q. Business?—A. Grain merchant.

Q. You sat here a part of the time and heard much that Mr. Counselman has said. Will you, in your own way, tell us what your opinions are with reference to the elevator systems in Chicago and about Chicago?—A. I did not hear what Mr. Counselman had to say relative to that. I saw, however, in the paper yesterday some statements made relative to the abuses, so called, of the elevator system, and as I have been in this grain business now almost 30 years, and have seen the elevator system, as it at present exists, grow up, I should like to call your attention to the manner of that growth. Twenty-five years ago the business at country stations was all consigned by the local dealer to some one of the larger markets—Chicago, Baltimore, New York. The local dealer paid a commission at that market, and if consigned to Chicago, the bulk of it was reconsigned to the Eastern seaboard market—New York or Baltimore. There it paid another commission, and it was sold then to the exporter, who sent it abroad. I do not know but Mr. Counselman traced all this, but that was the system in vogue 20 or 25 years ago. The first change in that was when Gill & Fisher, of Baltimore, and C. H. Cummings, of Philadelphia, commenced bidding the Western dealer direct for grain, passing the markets of accumulation like Indianapolis, Toledo, Chicago, Peoria, and St. Louis. They sent direct to the country dealer and bought from him. This system was then adopted by New York, Indianapolis, Peoria, and the last market to go into it was Chicago. To-day Mr. Counselman, our firm, and others not only buy direct from the grain dealer at the country stations, eliminating the commission at Chicago, eliminating the commission at New York, and selling it direct to the consumer on the Continent and in the United Kingdom, but we also do more; we run hundreds of country elevators that buy the grain direct from the farmer, and absolutely we are the only middle men between the farmer and the foreigner who buys the grain. Certainly that change has been for the benefit of the producer. It has wiped out the commissions at the western point of accumulation; it has wiped out the commissions at the eastern point of accumulation.

The change in system in handling this grain, compelled by the action in the first place of six or seven exporting firms at the seaboard, which compelled the Chicago firms either to adopt their policy or go out of the export business, has resulted, so far at least, to the benefit of the producer in removing this commission charge at the points of accumulation. The business to-day, as handled here in Chicago, is not handled by the firms who were in business 20 years ago. Ten years ago we had no elevator in Chicago, but the necessities of the business compelled us to build elevators, one, two, and we are building a third now. Until within a week we have never had a regular house. We have been under no obligations to the Board of Trade in any way. We are simply grain merchants. We have our own houses in Liverpool and Montreal and merchandise this grain. The men who come here and complain about the elevators are generally men who have refused to adapt themselves to the change in conditions and want to have the old commission system in vogue now and levy toll at every point of accumulation on the grain as it passes through. That is not in vogue, and you cannot reinstate it by legislation. The trade has gone beyond that. It is simply the old-timer railing at the business that has passed him.

Q. (By Mr. CONGER.) You said you were the owner of two elevators and building a third?—A. Yes.

Q. On what road?—A. The Elgin, Joliet and Eastern and the Western Indiana.

Q. Have you country elevators?—A. Yes.

Q. Along what road?—A. On the Santa Fe; some in Iowa, on the Northwestern; then I am interested in houses at Peoria that have them on the Central Iowa; in Terra Haute, on the Eastern Illinois, Vandalia, and Big Four; at Evansville, on the Peoria, Decatur and Evansville, and the Louisville and Nashville.

Q. Take the Santa Fe, for instance; is any other firm buying wheat along that line of road?—A. Oh, yes; we do only a small business on the Santa Fe. Our elevator in this city is not on their track.

Q. Along what other trunk lines do you operate?—A. On the Rock Island, the Chicago and Northwestern, and the Chicago Great Western.

Q. Do you buy a considerable amount of grain on the Rock Island?—A. We buy considerable on the Rock Island.

Q. Does Mr. Counselman operate on that road?—A. Yes.

Q. Is there any agreement between you and him as to the prices to be paid to the farmer?—A. Not between the firms at all.

Q. Is there any between the representatives at the local point?—A. We have no agreements; no.

Q. They usually pay the same prices?—A. Oh, yes; we do not aim to get into a fight where we can get along peaceably.

Q. There is not much competition, then? Most of these stations are limited to Counselman and yourselves?—A. We have no elevators on the Rock Island road; we buy from the dealers there.

Q. From the local dealers?—A. Yes.

Q. Do the local dealers handle very much of that grain?—A. Oh, yes; the great bulk of the grain is handled by local dealers.

Q. By local dealers?—A. Oh, yes.

Q. You and Mr. Counselman purchase of these local dealers?—A. Yes; and other firms.

Q. (By Mr. C. J. HARRIS.) Firms from other cities, I presume?—A. Yes. The Eastern exporters buy all through that country.

Q. (By Mr. CONGER.) I do not understand how you always pay the same price if there is no agreement.—A. We do not always pay the same price for the same grade, but we are regulated in our prices by the same market conditions; we are bidding for the same market and have the same freight rates, and have to meet the same competition. That naturally would bring about the same prices. We would not try to start up a fight by overbidding each other.

Q. (By Mr. C. J. HARRIS.) Owing to the price of wheat on the open market, the probability is that grain dealers from Chicago and other cities would have to pay about the same price in the local shipping points along the line?—A. Yes. Of course, in different markets from day to day the prices will fluctuate and the grain will go to Baltimore and St. Louis instead of Chicago; they may overbid us.

Q. (By Mr. KENNEDY.) Do you usually pay the same prices as Mr. Counselman?—A. They will run about the same.

Q. Mr. Counselman admitted that 5 men get together after the close of the Board of Trade and fix the price. Is one of the men a representative of your company?—A. Yes; but that does not cover the Rock Island territory.

Q. (By Mr. CONGER.) What territory?—A. The Missouri territory west of the Missouri River, where the competition has been strongest from the Southwest. There is no agreement whatever in the territory east of the Missouri.

Q. Is that agreement sent to your representatives—about the price?—A. They do not fix the price except as between our firms; more to see that we are high enough than anything else. That is fighting ground, absolutely, west of the Missouri River, with the Southwestern concerns.

Q. (By Representative LORIMER.) Do you fix a maximum or minimum price?—A. Maximum price.

Q. In other words, you agree how much you will outbid the other fellow, or the men in the other market?—A. Yes; we have a man that specially watches the bids from the other markets and notifies us to see that we keep in line with them.

Q. (By Mr. C. J. HARRIS.) Your idea is to divert that trade to Chicago?—A. Yes; to protect the Chicago market.

Q. (By Representative LORIMER.) Do you, along your lines, every day agree that you will not pay more than a certain amount, and that less than the market price of grain; or, in other words, try to keep down the price of grain by agreeing upon a price less than the market price?—A. No; there is no idea or agreement of that kind. Our effort is to get the grain here.

Q. The effort is to go as high as you are compelled to go to take it from the purchaser who ships to another city, in order to bring it to Chicago?—A. Exactly. If the intention was to keep the price down.—

Q. (Interrupting.) Why do you not agree on prices in Iowa?—A. We do not have the competition. The Southwestern lines do not compete in that territory.

Q. Do not a comparatively large number of men in Chicago purchase grain between here and the Missouri?—A. There are a half dozen firms.

Q. (By Representative LORIMER.) Then you only agree on the maximum price you will pay in the market where you have the competition; no agreement where you have no competition?—A. We have no agreement on prices east of the Missouri.

Q. (By Mr. CONGER.) Did the grain formerly from that section west of the Missouri River come almost entirely to Chicago and now go to Galveston?—A. The great bulk used to come here and to St. Louis, and is now diverted to Galveston.

Q. In other words, that competition has been a growing one, has it not?—A. Yes, right along.

Q. (By Professor JOHNSON.) Is it due Gulf competition any more than to these Southern roads to the Atlantic seaboard that do not go through Chicago, lines like the Baltimore and Ohio Southwestern, and other lines that tap that territory?—A. That is the largest competition west of the Missouri, especially in Nebraska.

Q. That is the competition you are trying to meet more than the Gulf competition proper?—A. Yes.

Q. (By Mr. KENNEDY.) Have Chicago lines tapping that territory made rates to enable you to try to get that trade?—A. I have not brought a carload of wheat from Kansas, I think, for more than a year. We have had absolutely to give up that territory.

Q. Did the railroads aid you in any way to try to hold that territory?—A. Not of late.

Q. Formerly?—A. Formerly. It was a standup fight between all Chicago roads, and the Pittsburg and Gulf, and other Southern roads.

Q. (By Mr. CONGER.) That competition must have been of benefit to the farmer while it was on?—A. I presume it was. It did not benefit the road. I believe the Pittsburg and Gulf went into the hands of the receiver.

Q. (By Representative LORIMER.) You refrain from going into that territory for a reason?—A. Because we can not compete with the conditions. Whether that territory belongs by right to the Gulf, I do not know, but the fact is they are holding it now.

Q. (By Mr. C. J. HARRIS.) Is that grain shipped to Galveston exported, or does it go by water to Eastern ports?—A. It is exported direct.

Q. (By Representative LORIMER.) Have they a better rate than the roads running to Chicago can make?—A. Oh, yes; the rail rate to that point plus the ocean rate, is lower than it can possibly be made by Chicago.

Q. It is the rate that excludes you from that territory?—A. That is the reason entirely. They will make a rate to the Gulf no higher than from the same stations to Chicago. Then they are on the seaboard, and we still have a rail rate to pay from here to the Atlantic seaboard.

Q. (By Mr. KENNEDY.) At what point is the line drawn where you can compete?—A. West of Kansas City it is Gulf territory, really, as far as the wheat goes. Of course, more or less corn comes here. At some seasons of the year they can not send it through the Gulf—in the germinating season.

Q. (By Mr. C. J. HARRIS.) Too not?—A. Yes.

Q. (By Professor JOHNSON.) Your business is largely export?—A. Yes.

Q. Entirely to European points?—A. To the United Kingdom and the Continent.

Q. You ship nothing but grain; do not deal in grain products?—A. No, we do not deal in grain products.

Q. (By Mr. KENNEDY.) Are you exporting grain in large quantities at the present time?—A. Until within the last six weeks.

Q. What is the cause of the stoppage of exports in the last six weeks?—A. They overbought themselves on the fear of this war in South Africa, and that stimulated the market.

Q. In Europe?—A. In the United Kingdom and on the Continent. They were so afraid of continental complications, they all stocked up, and now they are receiving that wheat. Then again, the Argentine has been a large shipper of wheat lately. And these two factors together have held them out of the market at present.

Q. These are the two factors alone?—A. So far as I know, yes. The freight rates are now no higher—the ocean and rail rate—than they were at the time we were moving wheat.

Q. (By Professor JOHNSON.) Do you deal in corn also?—A. Oh, yes.

Q. Does any corn go on the Illinois Central to New Orleans?—A. I never heard of any going from Chicago. I have heard of some wheat, but in small quantities. As a general thing, corn is not moved out of Chicago to New Orleans.

Q. Is it probable if you were able to ship by water across the Isthmus to the Orient there would be any grain business to the Orient?—A. I should not think there would be much grain; there might be flour, but I doubt—I could not answer that.

Q. (By Mr. KENNEDY.) Has speculation put the price of wheat up beyond the export point?—A. Well, hardly, because wheat has been declining. Speculation probably does hold up the market here. The believers in high prices are, of course, the ones buying the options, and it is the option that is carrying the price. If it was not for the speculation the market would go down to the level of the bids in Europe, which would be a number of cents per bushel under the market. The speculative market is holding the price where it is now.

Q. It is a good thing for the farmer?—A. Certainly. If we did not have a speculative market to tide us over these times of depression we should have a bankrupt sale every three months. Every time we got an accumulation it would be sold under the hammer for the benefit of the European consumer.

Q. (By Professor JOHNSON.) It would seem then that speculation results in bulling prices?—A. No. When you get it too high, there are lots of people who

would think it too high and sell it down. I think that speculation brings us a fairer average of prices. We do not come to as low prices as we should without speculation, nor as high as if we had no speculation. With no stocks and a small supply we should go to the other extreme.

(Testimony closed.)

CHICAGO, ILL., November 17, 1899.

TESTIMONY OF MR. JOSEPH G. SNYDACKER,

Grain merchant, Chicago, Ill.

The subcommission on transportation being in session in Chicago, Representative Lorimer presiding, at 11.35 a. m., November 17, 1899, Mr. Joseph G. Snyder was introduced as a witness, and, being duly sworn, testified concerning transportation as follows:

Q. (By Representative LORIMER.) What is your name?—A. Joseph G. Snyder.

Q. Business?—A. Grain merchant.

Q. Are you the owner of an elevator or elevators—the concern you represent?—A. No; we do not own any elevators.

Q. Will you tell, in your own way, what information you have with reference to the grain trade and the elevator business in Chicago?—A. I think Mr. Bartlett has very correctly and accurately stated the situation and the evolution that has been going on in the grain trade for the last 20 years. I think in this business, as in every other business, there has been a survival of the fittest. The bringing of grain to the primary markets has depended entirely on the price those markets could afford to pay. It has been demonstrated that the grain could not stand the additional commissions and charges that were formerly put on it and they had to be eliminated. This enabled the various concerns that had facilities in Chicago for handling, shipping, and cleaning grain to go directly into the country and handle this grain from the farmer's hands and eliminate as many of the charges as possible.

Q. That has resulted in eliminating, to a great extent, has it not, the commission men, the so-called middle men of the business?—A. Yes. There are a few old-time commission men still in existence, but their business is not anything like what it used to be. Our firm, or the firm I used to be connected with, was in the receiving business and averaged 100 to 150 cars a day. This grain was consigned to us from all over the United States, Nebraska, Illinois, Iowa, Missouri, and even as far east as Ohio; and all that grain used to pay us a commission for selling it. The countrymen would draw on us and we would practically act as their bankers, and when we got returns on the cars we sent them a check for the proceeds. That business has been gradually declining, and instead of getting 100 to 150 cars, it came down to 5 or 10 at most. A man would have to adapt himself to the conditions as they exist to-day in competition with seaboard and other markets and cut as many charges out of the grain as he could, or die a lingering death, as a majority of the commission men are now doing.

Q. What effect has the change in system had on the price in grain to the producer?—A. I think less the number of men that the grain has to support in handling, the greater the benefit to the producer and the greater price he gets for it. The more people live off a certain car of grain, the less that grain will ultimately net to the producer and man who sells it.

Q. What effect has this change had on the price of grain to the consumer?—A. I think it has tended to cheapen it to him, too. An elevator concern will buy it in the country and deliver it to any part of Europe for probably about the same commission that the middlemen would have got 20 years ago for sending it to Chicago and having it sold there, when that would be the first of four, five, or six charges that would come out of it. Fifteen years ago we used to get 1 cent to 1½ cents a bushel on wheat. One cent a bushel was the regular charge until within a few years ago. The live elevator concern will buy wheat or oats, and, if they can get 1 cent a bushel by buying and selling direct to the consumer on the other side they think they have a fair profit. As Mr. Bartlett stated, when the grain reached Chicago that was only the first link in the chain. It was brought here and put in the elevator, then shipped to Baltimore, New York, London, or Liverpool. It was handled by middlemen at two, three, or four points, paying all a profit.

Q. About what commission would they receive at the different points for handling under the old system?—A. The commission used to be 1 cent a bushel in these cities, but the commission for the last 5 years has been one-half cent a bushel all around. That has been the commission charged by the higher-grade firms. I think some have offered to handle oats and corn for one-fourth of a cent a bushel, and possibly wheat for a quarter of a cent a bushel.

Q. (By Professor JOHNSON.) You say you do not own any elevators. Do you use the public elevators?—A. No; we lease elevators.

Q. Then it is a mere matter of preferring to borrow money in the form of a lease?—A. Yes. We have arrangements in the country at some of the points where there are grain dealers who own their own elevators, and we pay them a certain salary a month, or commission on the grain they buy, rather than tie up our money in owning the elevators themselves.

Q. These are public elevators, are they?—A. No; we own no public elevators.

Q. (By Mr. KENNEDY.) Do you lease elevators in Chicago?—A. We have one in Chicago.

Q. Leased?—A. Yes.

Q. Do you lease the entire capacity of that elevator?—A. Yes.

Q. (By Professor JOHNSON.) Is your business mainly export or domestic?—A. Export and domestic.

Q. There has been a complaint on the part of some communities that the difference between export and domestic rates prevented the development of their domestic business. Have you any complaint to make with regard to the difference between them?—A. No; we have no particular complaint to make. I think it is a wise thing to prevent accumulations in this country, and when grain or grain products can be exported out of the country, and the prices secured, and the conditions justify it, I think it is a wise thing to have a rate that will permit the development of this business. The grain business depends on the export situation, and whenever the market here is above an export basis the situation becomes clogged.

Q. You say it is not a disadvantage to the Eastern miller?—A. It may possibly be, but at the same time I should think if conditions in this country would warrant him in paying a high price, and he could merchandise his property, it is best for the country at large to move the grain for export when it can.

Q. (By Mr. KENNEDY.) What is your Eastern export point?—A. We take some for Montreal, some for New York, some from Philadelphia.

Q. What is the charge to New York from Chicago for export?—A. The rates vary; just at the moment I do not really know. I do not keep in close touch with the rates.

Q. (By Professor JOHNSON.) You export through New York?—A. Yes.

Q. Do you find the terminal charges there at New York are in any way a detriment to your business?—A. For some reason or other New York has been losing a great deal of its export business.

Q. (By Mr. CONGER.) Where has it been going?—A. Newport News has been getting a good share; Baltimore is getting a good share; Montreal is securing a large share. A good many years ago New York got all this export business, and these other ports were getting so small an amount that it was decided to put in a differential rate to Baltimore and Philadelphia and Newport News of 2 or 3 cents a hundred, and the result has been New York has been getting left. The roads discriminate against New York at the moment. Possibly, it may be, the charges, too, are very exorbitant, and that, in connection with the difference in rate, has been responsible for this loss of business.

Q. It does not matter to you individually whether you ship through New York or some other port?—A. Not a bit.

Q. Is it a detriment to Chicago or the central West that the railroad officials in the ring in New York should maintain this heavy terminal charge?—A. As long as we get a seaboard outlet we do not care where it is. I think that is a local matter for them to take up and fight their own battles.

Q. Do you think the railroads are treating men in your line of business equally as regards the rates, facilities, etc., or are there discriminations of any kind?—A. Well, we buy grain on half a dozen different lines coming into Chicago; we buy grain on lines east and west of Chicago, and I think it is an open field. I think a man that will adjust himself to conditions here can do business.

Q. When you have considerable shipments to make, do you inquire for the rate?—A. Yes.

Q. You do not look up the public rate, do you?—A. We know what the public rate is.

Q. (By Mr. CONGER.) You will get it for less?—A. No. At the time the bulk

of this grain is shipped, during the open season of navigation, the matter of lake-and-rail rates and all-water rates is entirely a matter of trade and barter. The cheaper you can get your trade the better you are fixed to do business.

Q. (By Professor JOHNSON.) One of the greatest export shippers of grain in this country made the statement not long since that he never bothered to look up a rate; that he always got the rate quoted to him?—A. We have a man who has charge of our export department who is supposed to get a rate as cheap as any are made. Whether that is the current rate or not depends on circumstances, I presume. For instance, a certain rate is made and no grain is moving. A road may adjust its tariffs to the rate that they propose to make in order to conform their published tariffs to securing that line of business. They will come in and contract a 100 or a 1,000 cars of grain and have that for their tariff.

Q. Of course, they can not change their tariff upward without 10 days' notice, or downward in less than 3 days?—A. No.

Q. You would not mean to testify that when the railroad wants to change its tariff to offer a special rate?—A. I would not want to testify to that extent, except that market conditions govern rates in a general way the same as they do everything else.

Q. Is it not true that most of the shipments are made on rates quoted to the man who has the shipment to make?—A. I should say that is correct.

Q. Rates are a matter of individual barter?—A. I should say that freight rates are something a road has to sell, and it has to meet conditions the same as any other merchant.

Q. It is a matter of barter and purchase?—A. I do not know that they make a rate, for I know they do not for us, but when they work for the lake-and-rail business going through the supply and demand of freight certainly fixes the prices of that rate.

Q. (By Mr. C. J. HARRIS.) Are you speaking of export rates?—A. I am talking about export rates.

Q. (By Professor JOHNSON.) I understand your statement would apply to both?—A. No; I am speaking of export rates only. The grain we send East is entirely export grain. The grain that goes to Montreal, Baltimore, New York, etc., is all exported.

Q. All you ship East is for export purposes?—A. The domestic is a small thing.

Q. (By Mr. C. J. HARRIS.) With reference to the export trade, the railroad, of course, is governed by the vessel rates in New York, which vary from month to month, so there could be no fixed export rate from Chicago.

Q. (By Professor JOHNSON.) A railroad company has no right to carry grain for A to Boston cheaper than for B, or to New York. Is not that true?—A. On local business?

Q. It may be exported again?—A. Yes; you do know.

Q. Perhaps you do?—A. Anybody does. That would be a very serious offense, to dare to divert grain for local or domestic consumption when it is billed for export and at a lower rate.

Q. You mean that a man in Boston who buys grain—A. Pays more money for domestic consumption than export.

Q. You say from the moment he purchases it in the West it is finally and certainly decided whether it is domestic or export?—A. Yes.

Q. (By Mr. CONGER.) You said it would be a serious offense; against whom?—A. It would be getting a less rate than a man is entitled to, and diverting it under false pretenses.

Q. An offense against the statutes of some State?—A. I am no lawyer; I simply know that if a man gets a lower rate for export than the domestic rate—

Q. (By Professor JOHNSON.) You get your rates quoted to you for export. Is it satisfactory to you to have these rates quoted to you, and to have them quoted to other persons, not knowing whether the other man is quoted the same rate as you get? Is that a satisfactory system?—A. It is the same method employed, for instance, about ocean tonnage when we charter a steamer.

Q. There it is unavoidable; but in case of rail rates is it a satisfactory thing to have the rate quoted and have to do business on the kind of rate you can get quoted, instead of a fixed, stable rate?—A. Any arrangement is satisfactory to us which permits us to do business.

Q. Is it as satisfactory as the other system?—A. I presume it is. It would be hard to say definitely about that.

Q. (By Mr. C. J. HARRIS.) It seems to me we are getting the two things mixed up. The export rate varies the tonnage. Anyone knows in New York you can make any rate you can, according to the vessel and the amount of freight there. That varies from day to day. Now, I think in regard to shipments locally to New York

and Boston for consumption there, that you are getting the export rate and that rate mixed up.—A. No; I was very explicit about that; that rate is posted, and a man who is posted knows what that rate is.

Q. Shipments for domestic consumption are at a published rate?—A. Yes.

Q. (By Mr. KENNEDY.) Would not that be as much an offense under the interstate commerce law—to get a rate from Chicago to Boston for export as to get a rate from Chicago to Boston for domestic purposes? That is a published and public tariff?—A. I do not know how others are working on that business; I know we do it on the published tariff rate and figure on it, and fix our own prices and base our sales on those figures.

Q. For domestic or export?—A. Both export and domestic sales on that basis. When you said a rate was quoted before, I did not quite understand what you were driving at. We maintain a basis. When we sell for export we must know the basis we are working on. So I am satisfied we work on the basis of the published tariff export rates. You can not go to work and figure on the basis of a rate quoted, as you intimated, which will vary from month to month and from day to day. We could not carry on a business on that basis.

Q. (By Professor JOHNSON.) To put the question again, is that rate you figure on the rate which is filed with the Interstate Commerce Commission or the rate the railroads publish in some daily paper?—A. I can not tell you.

Q. When you figure on the rate, where do you get the figures?—A. Our export man has a published rate which he works on.

Q. Is that supplied to him from time to time by the railroads?—A. Every time there is a change in rate he gets due notice of it. For instance, there is an advance going into effect December 1 on rates to Galveston, on rates to the Gulf.

Q. Will you testify you get no rate notifications except such as have already been sent to be filed with the Interstate Commerce Commission?—A. Will you ask the question again?

Q. Will you testify you get only such rate quotations as are filed or have been sent for filing to the Interstate Commerce Commission?—A. I should be perfectly willing to testify to that, so far as I know. Our export man is supposed to govern himself accordingly and is the man who has that matter in charge.

Q. Does he not solicit freight rates direct from the corporation?—A. No.

Q. (By Mr. KENNEDY.) Do the railroads solicit your business?—A. We keep in touch with the railroad situation all over the country.

Q. (By Representative LORMER.) I think the original question aimed to bring out whether you got a rate on account of your connections, and, being a large dealer in grain, whether you got a rate below the published rate or below your competitor?—A. We do not. If that is the idea, I can tell you we do not.

Q. (By Mr. CONGER.) You pay the published tariff rate?—A. Yes, always.

Q. (By Representative LORMER.) Do you know whether or not railroads file their rates with the Interstate Commerce Commission?—A. I do not.

Q. So that you would not know whether the rate quoted to you has been filed or not, as a matter of fact?—A. No.

Q. Your man, who attends to your rate, would not?—A. That is his business. You can get a through rate to Liverpool.

Q. Given by the railroad?—A. Yes.

Q. (By Mr. KENNEDY.) So much of it as is made to Boston is subject to Interstate Commerce Commission's regulation.

Q. (By Professor JOHNSON.) I am curious to know whether business men are doing business on rates that are published, or whether they are doing business by secret and special rate quotations when they have shipments to make. One of the biggest shippers in the United States made the statement that he never bothered to look up a rate, but always asked for a rate to be quoted to him, and that is the object of my question.—A. I did not quite understand what you meant, or I could have given you the information you wanted at the start as well as at the wind up.

Q. (By Mr. CONGER.) Does your firm receive any commissions from the railroads?—A. No.

Q. (By Professor JOHNSON.) Do you, as a large shipper, get any favors that others do not get?—A. I do not know what possible favors we could get.

Q. Do the railroads try to get your business and offer inducements of any kind that they do not offer men who do not have so much business?—A. Recently the difficulty has been to get the cars to ship the stuff.

Q. (By Mr. KENNEDY.) Did they ever give you such a favor as this—store your grain at the seaboard and hold it for 40, 60, or 90 days free of cost, while you were awaiting better prices?—A. We do not carry any grain at the seaboard. It is sold for export and to meet steamers and pushed right through. Having storage

facilities and elevators in the West, we time our shipments so that we carry no grain at the seaboard at all.

Q. Do you ship through Peter Wright & Sons, of Philadelphia?—A. No.

Q. You make considerable use of the telegraph, do you?—A. Yes.

Q. Do you feel satisfied with the service as at present given?—A. In the main, yes.

Q. You qualify your answer somewhat.—A. Sometimes we find the service a little slow; sometimes we find where there is no competition that they are inclined to make a little higher charge than where there is competition; but, taking the entire service all over the country—

Q. Do you have a private wire? Of course, you do not see any objection to that?—A. We see no objection, or we would not have them.

Q. (By Representative LORIMER.) What is the object of a private wire?—A. We have them in our offices in the different markets and different cities, and lease the wires for so much a month, and are in constant communication with our representatives or branch houses.

Q. (By Mr. C. J. HARRIS.) That privilege is open to anyone who can pay for it?—A. Yes.

Q. Did you ever know the export rate to be lower than the rate from here to the seaboard? In other words, do they ever make an export rate at the present time less than the rate to the seaboard point—a through export rate to Liverpool?—A. I do not know about the through rate. I am inclined to think—I am not sure about it, as I do not keep in touch with the rate matter, but I am inclined to think they do make a lower rate for export grain than for domestic consumption.

Q. I understand; but I want to know whether it has ever got lower than the rate to Boston or New York—the seaboard?—A. I should answer that and say no, without absolutely being able to swear to it. I should say it was practically impossible. Of course, there is a time at the seaboard when there is an abundance of tonnage—what is known as distress room, and they sometimes carry grain practically as ballast. Instead of getting a fair rate for carrying it, rather than go out light they will take it at practically nothing—carry it for ballast.

Q. You have never heard of any from this end to Europe that were lower than the rate to the seaboard?—A. No; I do not know of it.

(Testimony closed.)

CHICAGO, ILL., November 17, 1899.

TESTIMONY OF MR. GEORGE H. WEBSTER,

President of the Armour Elevator Company.

The subcommission on transportation met at 2 p. m.; Chairman Lorimer presiding.

Mr. GEORGE H. WEBSTER, being duly sworn, testified as follows:

Q. (By Representative LORIMER.) Please state your name and address.—A. George H. Webster, 205 LaSalle street, Chicago.

Q. Your business, please?—A. I am president of the Armour Elevator Company at present.

Q. There has been considerable complaint about the elevator system in Chicago by the commission men, and the commission would like to have you in your own way go on and state what the actual conditions are with reference to that business.—A. I will say to that, that I am very glad of the opportunity, and have prepared and had prepared a paper which I think will cover the whole matter very comprehensively and clearly; and with your permission I should like to read it. (Witness reads paper.)

I appear in response to the invitation of your secretary, asking me for an account of the manner in which the grain business of Chicago is conducted and of the methods observed in transporting grain on the Great Lakes and of the relationship existing between lake and land carriers.

I am the president of the Armour Elevator Company, a corporation operating several large elevators in Chicago. I was a member of the firm of Armour & Co., a firm doing business in Chicago as packers of meat and provisions and dealers in grain, from 1881 to 1894, and from 1865 to 1881 I was a member of the firm of Armour, Plankinton & Co., grain and provision merchants in the city of New York.

In order that your committee may at the outset be fully informed as to the

grain handling and storing facilities of Chicago, I have had prepared and submit below a list of all the grain elevators in Chicago, large and small, public and private, giving, so far as possible, the location and capacity of each and the names of the proprietors:

REGULAR PUBLIC WAREHOUSES.

| Warehouses. | Operated by— | Location. | Storage capacity. |
|--|------------------------------------|--|-------------------|
| Armour A B and Bannex. | Armour Elevator Co. | Chicago, Milwaukee and St. Paul Rwy. and North Branch. | 4,000,000 |
| Armour F | do | Chicago, Burlington and Quincy, and river. | 1,000,000 |
| Alton and B. | G. A. Seaverns. | Chicago and Alton and river. | 1,800,000 |
| Central B and annex. | Central Elevator Co. | Illinois Central Rwy. and river. | 1,600,000 |
| Wabash. | Chicago Elevator Co. | Wabash Rwy. and South Branch. | 1,500,000 |
| Rock Island A. | C. Counselman & Co. | Chicago, Rock Island and Pacific Rwy. and river. | 1,000,000 |
| South Chicago C and annex. | South Chicago Elevator Co. | Chicago, Rock Island and Pacific and Calumet River. | 3,000,000 |
| City. | Chicago Rwy. Terminal Elevator Co. | Chicago and North Western and river. | 1,000,000 |
| Union. | do | Chicago and Alton and river. | 2,000,000 |
| Nebraska City. | Nebraska City Packing Co. | do | 2,500,000 |
| National. | National Elevator and Dock Co. | Chicago and Alton and river. | 1,000,000 |
| St. Louis. | Keith & Co. | do | 2,000,000 |
| Calumet B. | Bartlett, Frazier & Co. | South Chicago, Elgin, Joliet and Eastern and Belt Rwy. | 1,200,000 |
| Peavey B. | | South Chicago Belt and 103d | 2,000,000 |
| Total. | | | 25,000,000 |
| In addition there are two public warehouses, which are not regular in the sense of having qualified under the rules of the Chicago Board of Trade on the subject, viz: | | | |
| Indiana. | Chicago Elevator Co. | Chicago and Eastern Illinois, Wabash, and river. | 1,500,000 |
| Iowa. | Chicago Rwy. Terminal Elevator Co. | Chicago and Northwestern and river. | 1,500,000 |
| Total capacity. | | | 28,000,000 |

PRIVATE WAREHOUSES OF CHICAGO AND CAPACITY OF SAME.

| | | | |
|------------|--------------------------------|--|-----------|
| Armour C | Armour & Co. | Chicago, Burlington and Quincy, Brown and 22d streets. | 1,000,000 |
| Armour D | do | Chicago, Burlington and Quincy, Morgan and 23d streets. | 1,500,000 |

Under the constitution of Illinois, adopted in 1870, by Article XIII it is declared that all elevators or warehouses where grain or other property is stored for a compensation, whether the property stored be kept separate or not, are to be public warehouses, and it also provides for certain limitations upon the conduct of the business and makes it the duty of the general assembly of the State to pass necessary laws to give effect to the provisions of this article of the State constitution. In obedience to the obligation thus imposed upon it, the legislature of Illinois passed an act to regulate public warehouses, and the warehousing and inspection of grain, and to give effect to Article XIII of the constitution of the State, which act became operative on July 1, 1871. Under this law it was provided that public warehouses of Class A should embrace all warehouses, elevators, and granaries in which grain is stored in bulk, in which grain of different owners is mixed together, or in which grain is stored in such a manner that the identity of different lots or parcels can not be accurately preserved—such warehouses, elevators, or granaries being located in cities having not less than 100,000 inhabitants. The State has safe-guarded the interests of the public doing business with these regulated warehouses by a very careful system of rules and requirements which are to be observed under severe penalties for violation. It requires that licenses shall be obtained by application to, and be issued by, the circuit court of the county, permitting the applicant to carry on a public elevator business under the laws of the State, which license is revocable in a summary proceeding in such court upon the complaint of any person showing and proving a violation of the law. The warehouseman is required to give bonds to the State for the performance of his duties, and any person carrying on the business of such a public warehouseman without complying with the law is made liable to a continuing fine of from \$100 to \$500 per day. The law has amply provided for a system of inspection of grain, and all grain taken into such warehouses must be inspected before its reception. The law also provides a system of registration of certificates issued for grain received into such warehouses, and places the duty of executing the inspection and registration requirement of the law under the control of the State board of railroad and warehouse commissioners.

The public elevators of Chicago handle about 25 per cent of the grain which is received in Chicago, the rest being handled by the private elevators and warehouses.

In order that the standing of Chicago as a grain market from year to year may appear, I append the receipts of wheat and other grains here from the year 1880 to the present time, compared with the total production of grain in the United States for the same years:

| Year. | Receipts at Chicago. | | Production of United States. | |
|-----------|----------------------|-----------------|------------------------------|-----------------|
| | Wheat. | Other grain. | Wheat. | Other grain. |
| | <i>Bushels.</i> | <i>Bushels.</i> | <i>Bushels.</i> | <i>Bushels.</i> |

The extension of the improved-farm acreage in the great grain belt of the Northwestern and Western States has of necessity brought about changes in the marketing of grain, just as the cost of labor, the supply and cheapness of raw material, the necessity for closer proximity to the fast-growing markets for manufactured products in the great Central and Western States, has induced so many of the seaboard manufacturers to move this way in order that they may be

nearer to the base of supplies and the seat of growing demand. Before more fully considering the effect of these changes upon the grain market of Chicago, it may be of interest to look into the origin and growth of the grain or elevator storage business and of the conditions attached to the marketing of grain previous to and since the inauguration of the present system, as showing your commission the evolution that has taken place in the grain business in the past 50 years. It is within the memory of the living when the first grain was sold in Chicago. The first annual receipts of grain recorded as brought into Chicago were in 1838, when 78 bushels of wheat were received. Wheat and other grain in those days, and for a great many years after, was brought to the city in wagons by the farmers themselves and sold to the millers or grain buyers. The grain was usually marketed in bags or other receptacles convenient for manual reception and distribution. In the transferring of grain at the shipping points from the wagons, mills, cars, canal boats, or vessels in which it was received, to the cars, canal boats, or ships which should bear it to its final destination, the slow, wasteful, and expensive system of the carriage of grain upon the backs of brawny laborers was in vogue.

To gain time in the handling of grain and to reduce the expense by substituting machinery for manual labor and by handling grain in bulk was a problem solved by Mr. Joseph Dart, of Buffalo, N. Y. He first conceived the idea that this work could be as well done by machinery, and accordingly, in the year 1843, he built an elevator at the mouth of the Buffalo River, in the city of Buffalo, into which canal boats passed and were loaded and unloaded by machinery. It was a small concern compared with the mammoth structures of to-day, having a capacity of only 65,000 bushels and capable of handling 15,000 bushels in a day, but it was the origin and forerunner of the vast machinery of to-day which deposits the cereal production of the country in these huge storage bins, to be stored until sold, and by which the greatest agricultural production of the world is handled so economically, so expeditiously, and so correctly.

Horsepower was the motor power in these primitive warehouses until about 1849, when steam was substituted; and this former avenue of employment to the laborer at grain-transferring points was forever closed, as machinery has in other industries and instances displaced labor in the economy of time and expense. This change in the handling, collecting, storing, and shipping of grain was contemporaneous with the breaking to plow of the earlier of the great grain-growing States of the West and Northwest; and the cities of Chicago, St. Louis, and Milwaukee, which were the business centers of this vast territory, soon became the primary grain markets of the country, both because they were the business centers and because of their being close to inland water routes to the seaboard. It has been the unchangeable rule, where it was possible, that the grain crop of the grain belt should seek the nearest and therefore the cheapest route to market from the nearest inland lake or other water point. Aided by their superior advantages in this respect, Chicago and Milwaukee became the natural eastern terminals of the first railroads into this territory, and as naturally became the primary grain markets.

In 1849, or about that time, Mr. Hiram Wheeler built an elevator in Chicago for grain storage, near the Chicago River and Franklin street. The grain at that time was brought to Chicago by the Illinois and Michigan Canal, by cars, and in teams, and approximated 1,000,000 bushels for the year. In 1853, the first year for which the receipts are given in the board of trade reports, the receipts of grain at Chicago were: Wheat, 1,687,465 bushels; corn, 2,869,339 bushels; oats, 1,875,770 bushels; rye and barley, 278,549 bushels, or more than 6,500,000 bushels of grain in round numbers. At the time of the Chicago fire 6 elevators, with a capacity of 2,475,000 bushels, were destroyed. In 1873 the new city began its grain business with 11 elevators, having a storage capacity of 8,900,000 bushels, and during the year its receipts of grain were 84,511,000 bushels. To-day, all told, large and small, public and private, there are 81 elevators in Chicago, with a storage capacity of 57,000,000 bushels.

To build elevators is a comparatively easy matter, but to conduct them profitably in competition with neighbors, and to keep them filled with grain under existing conditions, involves an exceedingly difficult problem. True, the Western States have increased their grain production until the States of Illinois, Iowa, Indiana, Missouri, Kansas, Nebraska, Minnesota, the two Dakotas, and Wisconsin produce 55 per cent of the wheat crop, 62 per cent of the corn crop, and 87 per cent of the oats crop of this country; and if conditions of marketing had remained unchanged, Chicago, ever progressive and always prepared, would easily have commanded and handled a large part of this 2,000,000,000 bushels of grain.

to disturb and shift the ordinary paths of commerce have diverted much of the grain trade from Chicago to other places more advantageously situated as to producer and consumer.

The four wheat-producing States of Kansas, Minnesota, and the two Dakotas produce 85 per cent of the wheat crop of the Union. In 1870 they were traversed by 2,658 miles of railroad; in 1896 their railroad mileage had increased to 20,857 miles. From this increase in transportation facilities inevitably followed the up-building of the small hamlet and produce-trading village, the local bank and the local mill and elevator man. Many of the numerous commercial communities of the Northwest seem to have been born in a night. Minneapolis, using more wheat in its mammoth flour mills in a year than is received for the same period in Chicago, has wrested the laurel from this city, and is to-day the greatest primary wheat market in the world. It contains 37 elevators, with a storage capacity of 28,000,000 bushels, and annually receives almost 100,000,000 bushels of wheat. Last year its receipts of grain were 120,000,000 bushels.

The city of Duluth, which had a population of 75 inhabitants in 1860, was incorporated as a city in 1869, and has survived to make jest of the sarcasm of Proctor Knott. From its humble place in 1860 it reached a population of 32,725 in 1890, and became second to Minneapolis as a wheat market. It is the Lake Superior terminus of many railroads and the head of lake navigation. It contains, with its sister city, Superior, elevator capacity for 25,000,000 bushels of grain, and handled last year 99,132,318 bushels, of which over one-half was wheat. Every water route outlet to the seaboard draws this grain trade away from the direction of Chicago, and a keen competition has developed between Chicago grain merchants and these outlets.

The annual wheat receipts at Kansas City almost equal those of Chicago, and aggregate about 24,000,000 bushels. St. Louis receives annually of wheat about 11,500,000 bushels. Peoria, Toledo, and other inland points have become largely grain trade channels and handle very large quantities, and lake cities, like Milwaukee, Detroit, Gladstone, and Manitowoc, actively compete for this trade. The grain trade has thus gone into widely separated channels, each channel growing in volume from year to year, and Chicago, to which a few years ago this stream of grain flowed by nature and from necessity and without effort on its part, is now compelled to invade the field of production and actively struggle for control. It can ask no favors and can only control trade when it meets the competition. The grain no longer seeks a market at Chicago; that market must seek the grain. It is a natural trade condition, and is a condition that exists in almost every line of trade. Competition, and the natural desire of both producer and consumer to come closer together, to eliminate the middleman, and all unnecessary intermediate expense, have resulted in dispensing largely with commission men, brokers, and traveling solicitors.

The early business of Armour & Co. was that of country commission merchants, receiving and making advances upon shipments for sale on commission of all kinds of grain, provisions, hides, high wines, tallow, and produce generally. They have been buyers and sellers of grain for 35 years, but they have always been both aggressive and progressive, and have from time to time branched out into other lines as opportunities were presented and the progress of the times demanded. If this were not true of this firm and other Chicago packers, we should to-day be without our prestige as a packing center, and should probably be now competing with small places for hogs dressed upon the farm and sold from farmers' wagons, as we did 30 years ago, when the value of offal of slaughtered animals was lost to the producer who slaughtered and dressed his hogs for sale to the packer.

Among the general evolutions in business that the past 15 or 20 years have developed, the changes in the grain trade that have been described are no exception to the rule in other branches of trade. The methods of the provision business, and especially the export branch of it, present a very forcible example. Formerly, if a Hamburg merchant, for instance, desired to purchase 500 boxes of bacon he would cable his commission house in New York for a quotation; this agent in turn would request a quotation from another house representing Armour & Co., or some other packer in the West. This quotation would be solicited and obtained by telegraph, furnished the commission agent, and thence cabled to Hamburg. If a sale resulted, the deliveries were made in the same roundabout and expensive way, meaning two commissions in New York alone between the packer and the foreign merchant. Now, the Hamburg merchant cables to the packer direct, eliminates New York in the transaction, and the products are shipped to Hamburg from Chicago on through bills of lading, doing away with all intermediate expense. Just such facilities as these have been the prominent

factors in both the grain and provision trades, enlarging their scope and magnitude by developing and opening the markets of the world. Self-interest actuates every man in conducting his business at the very least possible expense, consistent with safe business methods, whether it be in the elimination of expensive intermediaries, unnecessary labor or expense, or by any improved method, machinery, or means, and this indeed is the basis of commercial progress and success. It necessarily and frequently changes the course of trade to the injury of some and to the benefit of others, a condition that apparently will always exist.

So, too, the evolution which has taken place in the grain trade at Chicago, and doubtless also in other cities, has, no doubt, necessarily operated to interfere with the business methods of many persons. A time was when nearly every bushel of grain passed from the producer to the purchaser by the way of a commission merchant. Necessarily, a reduction in the volume of grain consigned to a commission merchant reduces his business. As the producers began to sell to local merchants direct, this reduction began. As this business grew the reduction increased; and it increased still more when it began to become general for the producer or local owner to make his own sales and dispense with the services of a middleman altogether. It is a matter for regret that so many commission merchants should find their earnings diminished. Some of them have found it wise or even necessary to engage in some other business. The majority of those affected are sensible enough to appreciate that their plight is the result of commercial conditions, precisely as many of their fellow-citizens have undergone a similar experience in other lines of business. It is, perhaps, not unnatural that some of them have become irritated and been moved to complain bitterly that they should have been made to suffer. A very few, especially in Chicago, have conceived that the blame lies on certain grain dealers, and as a result they have for years waged a war, before legislatures, in the courts, on the board of trade, in the press, on the street corner, and whenever one could be found to listen, in season and out of season, against those who formerly bought from them as commission merchants, but who find it necessary now to buy from the owner direct. If the present methods of the Chicago grain merchant are to be criticised, why not also denounce the farmer for no longer consigning his grain to the commission merchant? Why not the local grain dealer who purchases from the producer and resells to the wholesale merchant without the intervention of a middleman? These are quite as guilty as the Chicago grain merchant in bringing about the business disappointment which is complained of. Shall the farmer be compelled by law to ship to a commission merchant? Shall it be made a crime to buy from the farmer direct, or for the local dealer to make his own sale? Or for the wholesale merchant to buy from the owner in person? In what respect does the grain trade differ from any other in which such personal negotiations are now the general rule?

The fact that the leading grain merchants of Chicago are also the proprietors of or interested in elevators is not due to a purpose on their part to oppose commission merchants, much less to a desire to control the prices to be paid to producers. The situation has been forced upon them by trade conditions. The elevators were built to accommodate the great quantities of grain which formerly sought Chicago as the natural and necessary market. The situation in former years was thus graphically described in *Munn v. Illinois*, 94 U. S., p. 180: "The great producing region of the West and Northwest sends its grain by water and rail to Chicago, where the greater part of it is shipped by vessel for transportation to the seaboard by the Great Lakes, and some of it is forwarded by railway to the Eastern ports. * * * Vessels, to some extent, are loaded in the Chicago harbor, and sailed through the St. Lawrence directly to Europe. * * * The quantity (of grain) received in Chicago has made it the greatest grain market in the world. This business has created a demand for means by which the immense quantity of grain can be handled or stored, and these have been found in grain warehouses, which are commonly called elevators, because the grain is elevated from the boat or car, by machinery operated by steam, into the bins prepared for its reception, and elevated from the bins by a like process into the vessel or car which is to carry it on. * * * In this way the largest traffic between the citizens of the country north and west of Chicago, and the citizens of the country lying on the Atlantic coast north of Washington is in grain which passes through the elevators of Chicago. In this way the trade in grain is carried on by the inhabitants of seven or eight of the great States of the West, with four or five of the States lying on the seashore, and forms the largest part of the interstate commerce in these States."

As already indicated, in time Chicago ceased to be a tollgate for this grain. The milling industry at Minneapolis, the development of markets or extensive elevator systems, or both, at Duluth, Fort William, on Georgian Bay, at Milwaukee, Omaha, Kansas City, St. Louis, Mississippi River points, and at other cities,

all combined to intrench upon Chicago's former enviable position. The resulting competition necessarily had the effect to greatly reduce the quantity of grain which naturally sought Chicago for a market. This reduction demonstrated that much of the elevator space at Chicago would necessarily lie idle the greater portion of the year. The interest on the investment would remain the same, the depreciation in the structures would continue, and the expenses of operation and maintenance would be but slightly less, whether the elevators were full or largely empty. It was but ordinary business prudence for the elevator proprietors to utilize their storage capacity. This could only be done by bringing grain to Chicago for storage. As the producers and other local owners were being induced by the efforts and advantages of competing cities to ship largely to them, the Chicago elevator proprietors had no alternative except to buy and thus to direct the point of its storage. They were enabled to do this in face of the competition which confronted them—a competition which was fatal, to a very large degree, to a commission merchant or a dealer located in Chicago, who was not similarly equipped in these respects:

1. As to private elevators, the proprietors were enabled to clean and otherwise improve the quality, and thereby the value of the grain which they had bought.

2. As to public elevators, the proprietors were enabled to include the storage charges (so far as they were above the actual expenses of operation) in the cost to them of the grain.

3. As to both classes of elevators, they were enabled to utilize the space which would otherwise have remained idle.

4. And as to both, the situation is but another illustration that a person concerned in a business finds it to his interest to himself supply the needed appliances, or, owning the appliances, to use them for products of which he is the owner. In the one case he seeks to avoid paying someone else a profit for using his appliances, and in the other he seeks to earn the profit which another would otherwise realize from such use.

This principle is not peculiar to the grain trade of Chicago. Illustrations are found in every branch of industry. The farmer supplies his own granaries, instead of storing in the local elevators; he provides his own scales, and, so far as possible, uses his own means of transportation. When it is at all possible, railroad companies and many large manufacturers mine their own coal and buy their supplies at a point nearest their own means of hauling them. Those who need ice in their business endeavor to maintain their own ice houses and refrigerating machines. Large plants install their own lighting apparatus, and so on without end. On the other hand, the producer of an agricultural product or of raw material will, if possible, transform it into a manufactured product. The farmer will make cider or distill his grain, if he can do so. The miner prefers to use his own smelter. The owner of timber lands prefers to sell in the shape of lumber. The oil producer will bend every energy to refine it and to utilize the by-products. And again, the owner of surplus space or other commodity prefers to use it if he can, and will engage in apparently extraneous pursuits to that end. A wholesale merchant will store the goods of others in his warehouse. A farmer will thresh grain, or bale hay, or gin cotton for his neighbors. An electric street railway will engage in the business of furnishing electricity for light, heat, and power for manufacturing purposes. A carrier owning terminals, wharves, and the like will permit others to use them for the sake of the compensation he can earn.

In every such case, and they are as numerous as the countless branches of human industry, the person alluded to, in a certain sense, gains an advantage over his competitors, or others engaged or interested in the same business, who are not similarly equipped. The farmer referred to can save storage, weighing, and transportation charges, which one who is less favorably equipped can not do. To the extent that he makes a profit by transforming his produce into a manufactured article he realizes a greater return than the farmer who does not pursue this course. The net returns from threshing, baling, or ginning will, in a sense, proportionately reduce the net cost of his own produce. The same results follow in all other instances which have been adverted to.

..It does not at all follow, in the case of the wholesale grain merchant, because he survives or even flourishes in his business, that the result is due to special favors granted by railroad companies or to other illegal or improper practices. Indeed, the wholesale grain merchant who is also an elevator proprietor is often driven to pay the farmer or local grain dealer a larger price for grain than the current Chicago market would seem to warrant. This is not because the difference is made up by a reduced freight rate or other reprehensible practice. It is due to a number of causes and explained by a number of reasons:

1. It is because such a price is compelled to be paid in order to meet the com-

petition of other markets whose contiguity and other advantages enable them to pay the apparently higher price. Self-evidently, no more is paid than is necessary to meet the competition which exists. The Chicago dealer, like everyone else, buys as cheaply as he can.

2. In paying this high price the purchaser figures on making up the apparent excess in a number of ways. He is thereby enabled to keep his elevators filled, to make the profit that results from storing on a large scale, to save the expense of paying storage charges to some outside warehouseman, to carry on his grain business on the wholesale basis, to fill large orders, especially in foreign markets, and to make his shipments abroad by means of large cargoes.

3. In order to be in a position to accomplish these ends, the Chicago dealer must maintain himself as a buyer through a large enough territory to produce the requisite quantity. If he habitually bids less than the offers from competing markets he can not expect to get the grain. More than that, he loses his business prestige and customers by proving himself unable to compete with buyers from other markets.

4. By dealing on so large a scale and by computing the bearing of the other elements above mentioned, what seems to involve a loss is made to show, perhaps, even a profit. And at this point it should be mentioned that from his standpoint profit means the comparatively small difference of one thirty-second, one-sixteenth, one-eighth, or one-fourth of a cent a bushel.

5. Again, by buying from the owner direct the Chicago wholesale merchant, in ultimate effect, saves the compensation of an intermediate broker or commission merchant.

6. The most important element is the fact that the local price at Chicago is not the only basis from which the wholesale dealer figures his bid. He recognizes the stubborn fact that the European market fixes the price which he will obtain on a resale of his purchases. Under normal conditions he does not buy to sell to the local miller or feed dealer, but to export or to sell to an exporter. He therefore adopts the European price and computes what it will cost him to lay the article down in the foreign market. In computing this cost he takes into account that he has his own elevators and other appliances at most of the points of transshipment; that he can ship by lake or rail, or partly by each, and that he can utilize the advantage of choosing the cheapest of ocean rates; that he can ship in large quantities, or even in his own vessels, and that he can fill orders abroad in great quantities. In short, he is in a position to reap the benefit of gathering retail lots into a wholesale quantity; of shipping many purchases as one, and of himself earning much of the profit or saving much of the expense incident to the carriage to a foreign market.

It is to be borne in mind, also, that there oftentimes enters into such transaction the element of speculation, so called. On the same principle that others in nearly every branch of business buy and sell for future delivery, the Chicago grain merchant risks his judgment as to the value of grain on a given future date. He figures on making sales later on. He can only be in a position to realize his plans by actually purchasing the grain in advance and storing it in his own warehouse in the interval. His motive and plans are precisely the same as those of any other merchant who buys goods to-day, hoping that a rise in prices will enable him to reap a profit later on. Many times, therefore, the commercial spirit—the speculative instinct, if you please—will move him to pay more than the current market apparently warrants. He is buying not for to-day, nor for immediate sale, but to make a sale 90 days or more in the future. Hence he feels justified in taking the risk incidental to his bid, and especially in territory which he would otherwise have to yield to buyers from competing cities, and in order to avert the depreciation resulting from the ownership and maintenance of an unfilled elevator.

If the local elevator man or the farmer of the interior prefers other markets or methods, there is but one remedy. His self-interest must be appealed to, and this can be done only by outbidding your competitors and making it a matter of personal advantage to him to ship his grain to a given city. The trade must conform to the varying conditions that confront it, and when it fails to meet any and all legitimate competition it necessarily declines and falls. The elevator men of Chicago were forced to face conditions of this character, and rather than run at a loss and see a great part of the grain trade completely diverted to other channels, they met this competition and are entitled to credit to no small extent for the present large annual grain receipts at this point. Whether they took the steps they did or not would make but little difference to those who formerly did a large commission business, because but for their acts the great bulk of the grain would have passed through other cities. But to a large class of men, a class to whom little attention has been directed or given in this matter, it would have

been a matter of deep concern. It would mean curtailed employment to the thousands of artisans and laborers directly and indirectly engaged in grain handling and grain traffic at this city, and this is one of the great reasons why the Chicago public has so generously upheld and seconded the efforts of every man, whether elevator proprietor or grain merchant, in increasing the shipments of grain to this market.

And when all has been said, this is largely a local question. The storage of grain in Chicago elevators can not be said to enter the domain of Federal jurisdiction. It has been and is judicially declared to be a matter for State control alone. (*Munn v. Illinois*, 94 U. S.) Previous to the year 1897 it was considered by some of the courts of this State that, in the absence of permissive legislative authority, it was against public policy for elevator owners operating public warehouses to store grain of their own in the same bins and to mix it with the grain of others of the same grade. The legislature of Illinois at its session in 1897 enacted a law granting this permission to public warehousemen, and it is now lawful for them to store their own grain in this way, subject to the very intelligent safeguards provided in the act. Few acts of recent State legislative sessions attracted more general attention from the public and the press, or were given more earnest or free discussion than this measure. It passed the senate by the convincing vote of 34 to 11, and was no less strongly approved in the house of representatives. In the ensuing period, the opponents of the law availed themselves of every means possible to create public opposition to its continuance on the statute books, and in the session of 1899 introduced an act to repeal the law, but this act was defeated by an even more decisive vote than that by which the measure was originally enacted. The legislators in the two years' practical operation of the measure had had ample opportunity to ascertain the public sentiment as to its wisdom and propriety, and they thus know that public feeling, not only of Chicago, but of the whole State, approved their action. This deduction is particularly justified by the fact that in every instance the large majority of the votes cast in favor of this measure came from the representatives of agricultural communities of Illinois.

The elevator companies in Chicago not only have to meet the competition between themselves in order to get grain to handle, but also, as already shown, they have many prominent outside markets to compete against. This competition has made each grain firm work everything down to the finest possible margin, and has caused the elimination of a great deal of the intermediate expense which originally existed between and was borne by the farmer and the final consumer of the grain. Several years ago, a farmer who did not ship to Chicago would sell his grain to a local dealer, who operated at a small country station. As a general rule, these country stations were not plentiful and the capital of the proprietors was limited; and usually there was but one elevator and one buyer at a point, consequently he would not pay a very liberal price, but would figure on a profit of from 3 to 8 cents per bushel. Most of the farmers were unable to help themselves, as the towns were far apart and buyers scarce. With the great addition to the railroad mileage during late years and the keenness of the competition between the different roads and the building of new towns the original territory of these different grain buyers has been split up into many parts or commercial subdivisions, and at nearly all towns in the grain country there are now located from two to six buyers. The competition among these buyers is very keen, both among themselves and against other towns located but a few miles away; so that these small dealers now rarely obtain more than from one-half to 2 cents per bushel margin to pay for the expense of operating their elevators, the risk of grading, shortages, changes in the market, etc. Up to twelve or fifteen years ago, all these country elevator men consigned their grain to Chicago commission merchants, who received as a commission from one-half to 1½ cents per bushel, besides charging high rates of interest, inspection, weighing, sampling, and numerous other charges. These commission men, when they received grain, went on the board of trade and sold it to other commission men, representing Eastern buyers. The grain was transferred through the public elevators, which at that time received 1½ cents per bushel for the first ten days' storage and one-half cent per bushel for each additional ten days. The commission man's commission and other charges were a burden added to the grain. The Chicago storage which was charged was another burden. The commission man representing the Eastern buyer charged his customer in the East from one-half to 1 cent per bushel for buying the grain, which also added to the burden. The Eastern buyers were sometimes exporters of grain from the Atlantic seaboard cities and sometimes sold to Eastern mills; and, in a large number of cases, large shippers to Boston, New York, Philadelphia, and other Eastern cities.

bought the grain through their Chicago commission merchants in round lots and then resold it to different millers and smaller consumers through the East in carload lots. The exporter sold his grain abroad. In cases where the Eastern shipper bought the round lots from the Chicago market and peddled the grain out in from 1 to 5 car lots through the East, a very good margin was received. The seaboard exporters also made a very liberal commission. The charges for transferring the grain from lake vessels at Buffalo to cars was $1\frac{1}{2}$ cents per bushel. The charges at the seaboard for taking the grain from cars and putting it aboard ocean vessels were very high. Thus, the total charges in the way of commissions, middlemen's compensation, and other expenses, from the time the grain left the farmer until it reached the consumer, were very large.

It is to be at all times remembered that the ultimate market price is fixed by the foreign deficiency, and, therefore, by the European markets. In fixing this price the American producer, elevator proprietor, and grain merchant has no voice and, in the very nature of things, is powerless. That price is fixed by the competition of the entire world, as to which nothing can operate except the law of supply and demand. As the ultimate price is thus fixed, all the intermediate charges necessarily fall on the producer. The price he gets is the European market less the necessary charges incident to getting it there. The higher and more numerous these charges are the less is the price realized by the producer and, conversely, a reduction in the number or amount of these burdens increases the return to him.

By the competition of the different elevator men in the different cities, the margin of profit and the aggregate of the expenses have been very largely cut down. To begin with, in addition to the country grain dealer's margin, which has also been largely reduced, the Chicago commission man's commission has been largely eliminated and reduced, because of the fact that the elevator companies situated at the lake ports, seaboard cities, and other places buy direct from the producer or country grain dealer to so great an extent and do not figure a commission charge into the price they pay. As practically all of the concerns operate private warehouses, at times their storage charge, which is now three-fourths of a cent for the first 10 days and one-fourth of a cent for each additional 10 days, is quite often shaded in order to secure the business. The charges in public warehouses are never shaded under any circumstances. These different elevator men not only buy direct from the producers and country grain dealers, but they in turn sell direct to the Eastern consumer or miller, without any middleman in the East, so that all that expense is likewise eliminated. A large number of Western firms in Kansas City, St. Louis, Chicago, Minneapolis, and Duluth also export their grain direct to foreign dealers, thus saving the seaboard exporter's profit.

The grain business of the United States practically, at present, passes through but two hands—one, the producer, or the country elevator buyer, who receives the grain from the farmers' wagons and transfers it through his local elevator into the cars and sells the same to the elevator concern, exporter, or consumer direct. The local elevator man receives his slight charge for storage or transfer as his compensation. The balance of the original expense, which was formerly incurred, either goes to the farmer or to the consumer, according to market conditions; usually to the farmer.

At Buffalo, up to within a year or two, a charge of $1\frac{1}{2}$ cents per bushel for transferring had always been made. It is now done for one-half cent per bushel. At this point for some years the elevator companies have made a combination, not to regulate prices, but in order to secure to each his share of storage and employment. It has been the only place in the United States known to have successfully operated in that manner. The National Grain Dealers' Association, which has different organizations in different States, has attempted to prevent, in some cases, the ruinous competition among themselves and to secure a fair margin for handling grain; but all these attempts have proved failures.

The elimination of the commission charges at terminal points has caused a very bitter feeling among the commission merchants against what are now known as elevator proprietors and buyers. These commission merchants naturally feel bitter to think that they do not now receive as much of this grain as formerly and get a commission out of it as it passes through terminal points. The Chicago elevator men would be only too glad to have the same state of affairs restored which existed 15 or 20 years ago, when, on grain coming in to the grain commission men, the elevator proprietor had simply to unload the grain and receive for transferring it through his elevator $1\frac{1}{2}$ cents per bushel, with no risk, no wear and tear, and no anxiety. As it is now, in order to get any business he must go out and compete against the other terminal markets, to say nothing of his own market,

and fight for the grain, handling it on small margins and taking large chances in the way of changes in the market, etc., and, finally, receive probably not half of what he formerly received without bother, or risk, or expense.

It must be borne in mind that these elevators are great, imposing, and expensive structures, nailed to the ground, and as fixed and immovable as the locality in which they exist. The grain must be brought to them, they can not follow the grain, while the commission man, movable in his person and his appliances, is fancy free to follow his vocation wherever the varying changes of grain trade may indicate a more favorable location or to change his occupation or methods at will.

The existing state of affairs has caused a large number of public elevators to cancel their licenses and to operate them as private warehouses, free from statutory control and restrictions. In most of these private warehouses machinery is placed for improving the condition of the grain; such as oat clippers, wheat cleaners, scourers, grain dryers and other appliances, which are used for bettering the quality and thus raising the grade. In the public warehouses in Chicago cleaning machinery is not allowed, and all grain must be shipped from the elevator at the same grade as it was received. In other cities the laws are different, the public elevators in Minneapolis and Duluth all having cleaning machines.

These grain-cleaning and quality-improving warehouses are beneficial to the producer and have induced the shipment of large quantities of grain to this city. The quotations on wheat grading No. 2 or No. 3 often vary from 4 to 5 cents per bushel. We will say, for instance, that two carloads of wheat are received in Chicago and inspected by the State inspector. One carload is inspected as exactly No. 3 wheat; the other is inspected as No. 3 wheat, but is pretty near No. 2. This line of wheat, thus different in actual quality, but necessarily inspected as of the same grade, is passed through the cleaning house, is improved, and what was graded as "pretty near" No. 2 wheat, on reinspection after cleaning is No. 2 wheat, is so graded and sold, and the farmer shares in the profit. In this way the No. 3 wheat which was pretty near No. 2 brought a higher price on the market than the wheat which was just No. 3. After an exhaustive judicial investigation of a similar system of grain cleaning in use in Kansas City, the Missouri supreme court not only upheld the legitimate character of the practice, but declared that it was in no sense an adulteration; that it was, in fact, a practice beneficial to all concerned, and that it could not be constitutionally interfered with. (The State ex rel Attorney-General v. Smith, 114 Mo., 188.) Criticism is occasionally made upon the action of the cleaning houses in turning out cleaned wheat just the grade that the rules of inspection require, or, in other words, as "line" wheat. When the cleaners meet the requirements of the law, they have done all they can be reasonably asked for, and it is nonsense to expect that a man will deliver a better grade of grain than his contract calls for. No person engaged in any other business would do so. A laborer agreeing to work 8 hours a day will not give 9 hours' work at the same price. A merchant delivers 36 inches for a yard and 16 ounces for a pound, and is not justly open to criticism for not giving more. A farmer selling live stock, grain, or other produce expects to be paid on the basis of the established standard of weights and measures. The grain merchant asks no more and can not be justly expected to take less.

It is a sufficient answer to the insinuation that the market is sometimes sought to be manipulated by large elevator proprietors or grain dealers to say that it is absolutely impossible, for the conclusive reason that the amount of grain which is grown is so immense that it is beyond the power of any one man or set of men, however powerful in other respects, to control the market for even 1 month. The effort has been repeatedly made by "plungers" and, without exception, the parties have come to grief, either losing a large amount of money or being made completely bankrupt.

The amount of grain raised in the different parts of the country is so enormous and the means of transportation are so varied, plentiful, and prompt, that manipulation at any one point is sure to attract grain from all over the United States in such large quantities, and it can be moved so rapidly, that manipulation can not be successfully carried on.

This much for "bull" manipulation for the purpose of advancing the price of grain. On the other hand, it is impossible for any interest to depress the market for the same reason that they can not successfully manipulate the market so as to advance it. If anyone in one market attempts to depreciate the value of grain at that point, it immediately becomes the target of buyers from all over the world. If the Chicago market is pushed an eighth or a quarter below that of Minneapolis or Duluth, St. Louis, Kansas City, or other markets, advantage of this fact is immediately taken by buyers.

In truth, the Chicago grain merchant can not, in any way, artificially control the prices at which he buys or those at which he sells grain. The buying price is fixed by the market value of the grain at a given point, and this market value is what the grain in question is worth at the most advantageously located market near that territory. If the Chicago merchants bid less, the grain will go to another market. So when it comes to selling, if the Chicago merchant asks more than the producers of Argentina, Russia, Egypt, India, and other grain-raising countries are willing to sell at, he will fail to sell. Of all the branches of human industry this is one in which the natural laws of supply and demand most inexorably control the prices to the producer and to the consumer.

In shipping grain from Chicago a number of routes are used. The cheapest, as a general rule, is by canal and the Great Lakes. The favorite routes are from Chicago to Buffalo, for shipment from there East via the Erie Canal and Hudson River to New York, or by rail from Buffalo or Albany to Boston, New York, Philadelphia; or from Chicago to Erie, then by rail to Philadelphia or Baltimore; from Chicago by water to Fairport, Ohio, and then to Baltimore; from Chicago to Port Huron, Sarnia, Portland, Owen Sound, Parry Sound, and Collingswood, and thence by rail through Canada to Montreal, St. Johns, Portland, or Boston; from Chicago via the Great Lakes and the Welland Canal to Prescott; Kingston, or Ogdensburg, and the transfer to barges and down the St. Lawrence River to Montreal, or taken from Ogdensburg by rail to Portland or Boston.

As a general rule these water routes are cheaper than all rail, although during the past year, for a portion of the time, the all-rail rate was as cheap as the water rate. This was partly on account of the extremely low rates by rail generally against extremely high rates by water, caused by the enormous demand for tonnage for the transportation of ores.

A new route—and one which has handled a large amount of grain during the past season—is what is known as the Canadian-Atlantic. This route is from Chicago via water to Great Lake ports, say Parry Sound, Ontario; thence by rail through Canada to a place called Coteau Point, where grain is transferred into barges and taken alongside vessels at Montreal. This route was built two years ago and has handled an enormous amount of grain. It has had a tendency to regulate to a certain extent the rates via the American all-rail lines. The traffic officials of the trunk lines have kept watch of the cost of getting grain to the seaboard via these water routes and have seen to it, as a general rule, that the all-rail tariffs were made so as to allow the railroads to compete.

The Erie Canal is a factor to a certain extent, but it is really not as great a factor as is generally supposed. It does, to a certain extent, regulate the rates which are charged by the railroads east of Buffalo and has a tendency to keep them from charging exorbitant rates. The Erie Canal's total capacity is very small compared with the amount of grain passing through Buffalo—not over about 15 per cent. This canal tonnage has decreased yearly. The cause for this is largely the fact that a great deal of agitation has been going on looking to the improvement of the Erie Canal so as to allow vessels carrying larger loads to make the passage. This has had a tendency to keep people from building additional canal boats, as when the change is made the small boats will be of little value. New York State is now agitating in a very thorough manner the improvement of the Erie Canal to such an extent as to allow boats of three or four times the present size to navigate the canal.

In my judgment just as soon as the canal is enlarged there will be a large number of canal boats built, thus increasing the tonnage of the canal to such an extent as to regulate largely the grain transportation rates of the United States. The all-rail lines east from Chicago, in order to compete with the lake and canal rates, will have to keep their rates quite low, and this will force the roads running south from Chicago and from the West to the Gulf to lower their rates also in proportion. This saving is bound to go back to the American farmer and he will get the benefit. As a matter of fact, the Western farmer and Western community are really more interested in the enlarging of the Erie Canal than New York State.

At present the Canadian routes are the cheapest, and during last season they have had all the grain they could possibly take care of at Montreal, and the lack of ocean tonnage has been the only thing which prevented Montreal from doing a much larger business. The lines from Montreal are now establishing, for the winter time, ocean lines from St. Johns and Portland, and will doubtless do a very large business via that route.

It would seem that for the benefit of the Western States the Government should use its best efforts toward improving the water routes from the West to the seaboard, as the lower the rates from the Western farmer to the foreign consumer the better the prices for grain will be to the producer.

The prominent water route is likely to remain by way of the Great Lakes. We who daily look upon one of the larger of these lakes do so without always giving full consideration to the fact that it is part of the largest body of fresh water in the world and that the merchant marine of these Great Lakes is greater than that of any nation in the world on the high seas, Great Britain and Germany alone excepted—greater than France or Norway, or any other two powers combined. This is shown by the United States Commissioner of Navigation in a recent statement. The tonnage passing through the Sault Ste. Marie annually is almost three times the tonnage in volume that passes through the Suez Canal, and grain and flour constitute over one-sixth of this tonnage and a much larger percentage in quantity of space occupied, most of the other tonnage being ores. This grain and flour comes mostly from Minneapolis via Duluth, from the elevators at Duluth and Fort William, and graphically illustrates one reason why Chicago is no longer a tollgate through which the grain of the Northwest must pass on its way to the seaboard, whether it will or not.

Some points were developed in yesterday's proceedings which perhaps should be noticed.

Barley.—It has been suggested that Armour & Co. practically control the barley market of the country. This is entirely without foundation. In fact, Armour & Co. have never done but a small business in barley, and during this year it has been less, if anything, than usual. The barley crop of the United States runs from 80,000,000 to 100,000,000 bushels per year, more than 50 per cent of which is produced in Minnesota, Wisconsin, North Dakota, and Iowa. The present holdings of Armour & Co. in barley, at all points, directly or indirectly, do not exceed 190,000 bushels, and the aggregate amount which they have handled during the whole season has been 2,505,000 bushels.

Private cars.—The problem of private car lines does not enter into the grain trade in any respect or degree. Some four or five years ago the necessity of having large clean cars and of meeting a shortage in equipment suitable for the trade moved several grain dealers to buy a number of box cars for transporting their own grain. This never became a practice, and so far as the Armour Elevator Company is concerned the cars they then bought have long since been sold. On inquiry I am informed by those who are in a position to know that they have seen nor heard of only one single private car being used for grain at Chicago during the whole year, so that practically the use of such cars is obsolete.

Ownership of elevators.—So far as the ownership of the Armour elevators is concerned the facts are these:

The elevator known as Armour A and B was built and paid for by them and stands on ground which they own.

Elevator B annex stands on leased ground, but was built, paid for, and is owned by the Armour Elevator Company.

The Minnesota elevator and annex were built on their own land and paid for by the Armour Elevator Company.

The Columbia elevator was bought from a private owner outright.

The elevators known as Armour C, E, and F are the only ones which are leased, and as to these the Armour Elevator Company not only pays a large rental, but also assumes the obligation of operation and maintenance.

Elevator D was built and is owned by the Armour Elevator Company.

The operating expenses of these elevators run from \$350,000 to \$400,000 per year.

The most exhaustive investigation has failed to disclose a single instance in which a Chicago elevator proprietor has ever mixed or handled grain stored in his public elevator so as to give an advantage to himself. The theory has been that he might be tempted to do so unless the matter was controlled by law, and the Illinois act of 1897 does so control the matter that any such temptation can not be yielded to and so that any suggestions in that direction can not possibly be true.

The idea that there is the slightest connection between the course of business by elevator proprietors and the existence of "bucket shops," so called, is as novel as it is ridiculous.

For reasons already explained "bear raids" upon the market, when they are attempted at all, are based on an alleged or actual surplus of foreign production or a reduction in foreign competition, as to which elevator proprietors have neither voice, control, nor influence. To repeat, when the price at Chicago becomes depressed to any material extent, by artificial means or unfounded causes, buyers from all over the world at once turn to that market in order to absorb its offerings.

In all my long connection with them Armour & Co. have never been "short" in the grain market. Mr. Armour's unbroken policy has always been to build up and to resist and to prevent depression. They have never sold, and probably

never will sell, a single bushel of grain which they have not previously bought in this or a tributary market for actual delivery.

In conclusion I desire to say that I have sought to discuss the questions under review in a broad and comprehensive manner. I recognize the high purpose of this body and appreciate the respect due to its dignity and members. Passionate denunciations and, still less, attempts to besmirch private character or business reputation are certainly not argument and seem to me to be out of place. They can only serve to bring, as they should, confusion and discredit upon those who so far forget the proprieties of the occasion as to indulge in them and thereby seek to prostitute this meeting into an opportunity for malicious slander and a display of their personal spleen and animosity. My experience has taught me that the mouths of agitators and so-called reformers do not turn and never have turned the wheels of commerce; neither can they stop the march of progress.

Q. (By Mr. KENNEDY.) Do you say that Chicago handles about 10 per cent of the grain production of the country?—A. Yes.

Q. Have you figures to show what proportion of the grain production that is handled at Chicago enters into interstate and foreign commerce?—A. Only about one-eighth of the total corn production of this country goes abroad. So it is with wheat. It all depends upon the crops and the consumptive demand of the country.

Q. I should like to have you state what proportion of the total production comes to Chicago and is handled here. You say they handle 10 per cent of the total production. That takes into account domestic and foreign consumption?—A. I mean the total production in the country. There comes to Chicago about 10 per cent of the total production of the United States.

Q. (By Mr. LORIMER.) It is shipped abroad?—A. Yes, sir; it is shipped all over the Eastern States and abroad.

Q. (By Mr. KENNEDY.) What proportion of that which enters into interstate and foreign commerce do you get in Chicago and handle here? I don't consider that which remains in the States as entering into interstate and foreign commerce. Have you figures that will show that?—A. I have not here.

Q. Would not Chicago handle more than 10 per cent of that?—A. Chicago handles all that comes here, probably 40 per cent of what is shipped.

Q. (By Mr. CONGER.) You look upon this ownership of the elevators by grain dealers in Chicago as a matter of evolution that is necessary to the conditions and one that could not be avoided?—A. I do; yes.

Q. I want to inquire if the same evolution has taken place in other and competing markets; that is, in Minneapolis and Omaha, Kansas City, and St. Louis?—A. To the best of my knowledge and belief, it has. But this is a larger market. It permeates generally.

Q. I thought you testified that Minneapolis is now larger.—A. They receive more wheat than we do, but not more grain generally. The mills there absorb a large portion of their wheat.

Q. Do you know about these Southwestern markets, such as Kansas City, Omaha, and St. Louis? They are competitors of Chicago, are they not?—A. Yes.

Q. Do you know if the old system of commissions or operations by commission merchants is in vogue there, or has it been abandoned, as it has here?—A. They are buyers and elevator men all over this Western country, just as we are here. Without being able to answer your question from positive personal information, I think the same conditions exist as here.

Q. That is the point I wanted to bring out—whether the old commission system has been superseded by the elevator proprietor.—A. I think it is very general; it has been tending that way for some years. I have been out of the trade for several years until I went back into association with Mr. Armour a couple of years ago. I was out of it 2 or 3 years only, but I can say the evolution has been very general.

Q. (By Mr. C. J. HARRIS.) I see by your figures that 1898 was the largest year of grain receipts in the history.—A. Well, I don't know that.

Q. It struck me that way.—A. We have had two or three enormous crop years. I don't know whether that is the largest year or not. I can figure it out in a moment.

Q. If it was the largest I wanted to know if there was any particular reason for it. I did not know but there might have been improved machinery or something of that nature. How much of the wheat received here goes through the elevators and how much is shipped in on the track; that is, what proportions?—A. About 25 per cent of the grain that comes here goes into the public elevators, the regular licensed elevators; the remainder goes through private elevators.

Q. It all goes through elevators, all grain that comes in here?—A. Yes, sir; practically all that comes here for sale on the market.

Q. Someone said here this morning that some grain came here in carloads and went out in carloads without going through the elevators.—A. Certainly, in through carloads; that does not necessarily change the receipts here.

Q. It was testified this morning that they did not have to pay elevator charges here.—A. There is a good deal of grain shipped from Mississippi River points and other river points on through bills of lading. The Mississippi River business operates adversely to this market; it is a discrimination of that difference.

Q. (By Mr. CONGER.) The wheat that is shipped from Mississippi River points on a through billing to New York, and passes through Chicago, is included in these figures you have just given us, is it?—A. Not through bills of lading. These figures represent only what is handled here in Chicago.

Q. In other words, the figures you have there represent the amount of grain that goes through the elevators?—A. Yes.

Q. (By Professor JOHNSON.) Do your figures for elevators here include the so-called transfer elevators owned by the railroads? There are such elevators, are there not?—A. All the elevators do a transfer business.

Q. What you call the annexes?—A. I don't think they have any special elevators for that purpose which are called annexes.

Q. (By Mr. C. J. HARRIS.) Do these country buyers who buy grain direct from the farmer pay about the market price for it there; that is to say, about what it would be worth with a fair commission for handling it?—A. I have some special knowledge about that, because I have a brother engaged in the business up in the Northwest; he tells me their average is about $2\frac{1}{2}$ or 3 cents per bushel. In that they take the chances of the grain not being up to the grade, of shortages, and differences in quality, and all that sort of thing.

Q. (By Professor JOHNSON.) That is, that $2\frac{1}{2}$ cents per bushel is the difference between the Chicago market price and the price paid the farmer with the transportation?—A. Yes; that is about it. In that price of course there are intermediate charges for elevator storage and handling, commission, and profit.

Q. Is there much variation or uncertainty about that transportation factor—that element of cost to the buyer? Is it a variable factor—the transportation price?—A. Well, they have the tariff constantly before them, and I think they figure on that.

Q. The printed tariff?—A. Yes, sir.

Q. (By Mr. C. J. HARRIS.) You think the published freight rate obtains after all?—A. Yes.

Q. (By Professor JOHNSON.) Is there one tariff published for the use of the Interstate Commission and another for the use of shippers? The charge has been made that the railroads have filed a tariff sheet with the Interstate Commerce Commission, but that they have not only quoted other rates to shippers, but have published or allowed to be published other rates.—A. That is not the case, so far as I know. I don't believe it.

Q. You brought out very plainly in your paper the price you pay; now, with about what commission? In some cases would it be as low as a quarter of a cent?—A. Yes; even lower than that. That varies, of course; sometimes it is less and sometimes it is more, according to the chances we take.

Q. Would the average be a cent now?—A. I don't think it would.

Q. And with a 1 per cent commission he gets the rest of it at the other end?—A. The idea I wish to convey is that in times of sharp competition we have to fall back on a portion of this storage charge, which we assume, of three-fourths of a cent per bushel for the first 10 days, and sometimes we may have to assume the greater part of that.

Q. And of course if the wheat is held for a long time the interest on your money becomes a natural charge?—A. Becomes a factor, of course.

Q. Is the farmer getting his share at the other end?—A. Yes; I think there is no doubt about that.

Q. (By Representative LORIMER.) There is a great deal of complaint that the farmers in the West find no competition for their grain; that the so-called elevator trust controls matters so that they can sell to but one man and for one price. Do you believe that is really the complaint with farmers or is it a complaint that is put forward by the commission men of Chicago who have been injured by the new system?—A. I think the latter theory is correct. I think the farmer gets more out of it than anyone else.

Q. You think the farmer gets more under the new conditions than under the old?—A. I do; yes. I think the farmer is benefited by the present conditions. We are positive of it.

Q. (By Professor JOHNSON.) It is a fact, I believe, that Mr. Armour is a very

large owner in the Milwaukee and St. Paul Railway property, and that he has a large number of elevators along that system of railroads. It has been charged, and persons have stated in my presence, that when Mr. Armour could buy grain along the St. Paul road he would do it instead of buying grain elsewhere; and it was also said that when he started out to buy grain along that line, other buyers could not buy there at the same time. I don't know whether that is true or not?—A. It is absolutely untrue. Armour & Co. own no elevators along the line of the St. Paul road except their elevators in Chicago; that is, the Minnesota terminal elevator, the Minnesota annex, and A and B and B annex on Goose Island. These are on terminals of the St. Paul, so that the grain that comes over the St. Paul, that we have no interest in, goes through them. We have no elevators along the line of the St. Paul road; we own no country elevators except, perhaps, now and then one in different sections; none on the lines of this road at all.

Q. Does the relation which Mr. Armour has with the transportation company and with the elevator company, in your opinion, cause him to receive any advantages as a shipper?—A. It does not.

Q. You think every other man has the same advantages?—A. Yes, sir; with the same facilities. If these gentlemen who have been saying ugly things about us, and about Mr. Armour personally, had the same facilities for handling their grain business they would undoubtedly avail themselves of them.

Q. I refer simply to the transportation cost.—A. No; there is nothing in that at all that I am aware of.

Q. (By Mr. CONGER.) Can an independent buyer of grain along this line of railroad reach a public elevator here in Chicago with his carload of grain without paying a switching charge?—A. I think the switching charge is very general where grain is switched to other roads, but there is none to public elevators on the same road.

Q. In other words, are there any public elevators on the line of this road at the terminal here, on the line of the St. Paul road?—A. We have two public elevators over there, and also one of our elevators is on the Burlington road here. Elevator E is a public elevator.

Q. These public elevators are at the service of the independent buyer?—A. Entirely so.

Q. (By Mr. KENNEDY.) Is there any understanding or agreement between your company and Mr. Counselman's corporation to fix the price of grain, or the buying or selling price of grain at any place?—A. There is a sort of an agreement for ascertaining the price that can safely be paid for grain west of the Mississippi River, but it does not amount to very much. It is really in the interest of Chicago, and was inaugurated for the purpose of meeting Southwestern competition.

Q. And Northwestern, too?—A. More particularly Southwestern. Not for the purpose of reducing the value of grain so much as to sustain the price. It is nothing that operates against the farmer at all; it is directly to the contrary, as I understand it.

Q. One of the operators on the board of trade who does that work is a representative of yours?—A. Yes.

Q. In conjunction with the representatives of Mr. Counselman and others?—A. Yes.

Q. It was stated here that the railroads have been the cause of the warehouse men purchasing grain on account of a discrimination that they had made against Chicago in the through rate. Is that true?—A. On account of what discrimination?

Q. Discrimination against Chicago merchants.

Q. (By Mr. CONGER.) Because of the making of the through rate, which would be less than the local rate here and the local rate beyond?—A. Yes; I think it would be a factor to a certain extent.

Q. (By Mr. KENNEDY.) The testimony this morning seemed to be to the effect that the warehouse men would not be purchasers of grain now had it not been for that condition; that the railroads forced them into it.—A. I think that is so to a certain extent.

Q. (By Professor JOHNSON.) Do you think the question of rates on through billing and rates for local shipments is a serious transportation question here in the Middle West?—A. I think it is; I think there are times, however, when it is more formidable than at other times.

Q. How does it operate as regards the interests of intermediate points between the lakes and the Missouri River; do they suffer through that factor?—A. I understand they pay the local rate.

Q. And they would naturally suffer from that, would they not?—A. That would be my judgment about it; I never came in contact with that very closely, but that would be my judgment.

Q. The system, then, results in quite a serious discrimination over small places?—

A. Yes. We should very much prefer to see it done away with.

Q. (By Mr. KENNEDY.) I should like to state that there was no testimony given here to the effect that Mr. Armour monopolized the barley trade of the country, but a gentleman in New York who sells barley to brewers to malt throughout the country told me that Mr. Armour did control and monopolize that product and that he had to go to Mr. Armour for barley whenever he wanted it.—A. All I know is just as I have given it here. That is the actual condition of things. I heard of several things that have been presented to you and I at once volunteered the information I had. I perhaps have not succeeded, but I feel that when charges of such a nature are made against a man that I have had dealings with during the greater part of my business life, it is wrong and ought to be answered.

Q. (By Representative LORIMER.) Inquiry was made here as to whether or not Mr. Armour controlled the barley trade of the country.—A. I do not allude to that particularly, but to some other charges that were not only made yesterday, but have been made to my knowledge at a half dozen other places by the same individual. It is the same old speech.

Q. You evidently know the speech?—A. Yes; it was given before the committee at the Palmer House and before the Single Tax League; it has been given before quite a number of the meetings of the National Grain Association throughout the country, and I think I could almost repeat it myself.

Q. (By Mr. C. J. HARRIS.) I should have objected to this yesterday.—A. When a man like Mr. Armour is called the greatest highway robber in the country, the one calling him that draws on his imagination for his facts, and it ought not to be considered for a moment.

Q. (By Professor JOHNSON.) Have you anything to do with the packing-house department of Armour & Co.?—A. No, sir; I am not a member of the firm of Armour & Co.

(Testimony closed.)

CHICAGO, ILL., November 18, 1899.

TESTIMONY OF MR. EDWARD P. BACON,

Representative of the Milwaukee Board of Trade.

The subcommission on transportation met at 10.10 a. m., November 18, 1899, Mr. C. J. Harris presiding.

Mr. Edward P. Bacon was introduced as a witness, and, being duly sworn, testified concerning transportation as follows:

Q. (Mr. C. J. HARRIS.) Mr. Bacon, will you give us your name and address?—A. Edward P. Bacon, Milwaukee, Wis.

Q. What is your business there?—A. I am in the grain commission business.

Q. You have been summoned before us to give us, if you have any complaints to make or any suggestion to make with reference to the workings of the interstate-commerce law, any instances of rebates or discriminations given by railroads; and we would ask you, in your own way, to give to this commission your ideas upon these subjects.—A. I will say by the way of introduction, that I have given very close attention to the working of the interstate-commerce law ever since its adoption, and have paid close attention to the important decisions of the commission, and also to the decisions of the Supreme Court in cases that have been appealed from the commission to the Supreme Court. I will say further that I took an active interest in the enactment of the interstate-commerce law. I was one of the delegates appointed by the Milwaukee Chamber of Commerce to appear before the Senate committee on the interstate-commerce act, of which Senator Cullum, I believe, was chairman, at its session here in Chicago before the passage of the act in 1885 or 1886, I believe. I was also a delegate of the Milwaukee Chamber of Commerce to the National Board of Trade for several years in succession about that time, and was a member of a committee appointed by the National Board of Trade to consider the proposed interstate-commerce act, and was appointed, also, by the National Board of Trade to confer with Senators and Members of the House of Representatives in relation to the framing of the act to conform, as far as might be, with the views of the National Board of Trade, and by that means I was brought in contact with those who were the most active in originating and framing the act. I mention these points to show that I have some knowledge of the origin and workings of the law.

I have also been chairman of a special committee of the Milwaukee Chamber of Commerce for several years which has had charge of the case brought by the Chamber of Commerce of Milwaukee before the Interstate Commerce Commission to secure the removal of what we deemed to be discriminations against Milwau-

kee in rates of freight on grain from points in the Northwest, as compared with rates to Minneapolis. That case was pending before the Interstate Commerce Commission 3 years before any decision was reached, and the decision was finally reached in January, 1898, in favor of the contention of the chamber of commerce, and an order was issued by the commission to the several railroads concerned (six different railroad companies operating in the Northwest), requiring a reduction of differentials to Milwaukee as compared with Minneapolis, to a basis corresponding to the differences in their distance tariff rates for corresponding distances.

Q. (By Mr. CONGER.) Was that order satisfactory to Milwaukee?—A. It was.

Q. Was it obeyed promptly by the railroad companies?—A. I was coming to that. The railroad companies, some 5 months afterwards, issued tariffs reducing the differentials to about one-half the amount required in the order of the commission, still leaving the rates to Milwaukee as compared with Minneapolis disproportionate, and to such an extent as to afford Milwaukee no practical relief. It was a coincidence, I will say, perhaps, that the differentials ordered by the commission were almost exactly the same as the differences in values of grain in the two markets, Milwaukee and Minneapolis, and if the order had been fully complied with by the railway companies Milwaukee would have been thereby placed on an exact equality with Minneapolis with reference to the territory in which grain originated, and from which Milwaukee derived its wheat and a large share of its business. The Milwaukee Chamber of Commerce, in consequence, brought the matter again before the commission in the form of a supplementary complaint, and the commission appointed a hearing in Chicago shortly afterwards, at which the case was thoroughly reviewed and the commission affirmed its previous ruling and order. The railway companies, however, failed to make any further reduction in the existing differentials. Most of the roads were willing to comply fully; but one of the principal lines, consisting of the Chicago and Northwestern and the Chicago, St. Paul, Minneapolis and Omaha roads, refused to give its assent to the proposed modifications in the tariff which had been prepared and submitted for adoption by all of the lines concerned. It appears, in the arrangement between the several lines in relation to rates in competing territory, any one line has the power to veto any rate proposed. At any rate, that was the effect in this case, owing to the noncompliance of this Northwestern and Omaha line, and the rates were not put into effect.

Q. Does that grievance still exist?—A. The matter still stands in that state.

Q. What remedy would you suggest?—A. Let me say, before answering that, what has escaped me: I was about to say that the commission further took up the matter by correspondence with the Northwestern and Omaha line, hoping to secure compliance with its ruling, but thus far without any effect, and there is no apparent probability of any further result being accomplished, owing to the determined attitude of that line in resisting the equalization of rates with reference to Minneapolis and Milwaukee, its evident purpose being to favor the movement of the grain to Minneapolis in preference to Milwaukee, owing apparently to the interests of the Omaha road being more thoroughly identified with the Minneapolis than with the Milwaukee market. The ownership of the Northwestern company and the Omaha company, as this commission is probably aware, is very largely identical, and it seems to have been the policy of the Northwestern company to promote the interests of the Omaha company even at the expense of its own.

Q. (By Mr. C. J. HARRIS.) What do you mean by "The Omaha company?" I thought you were talking about Minneapolis.—A. The "Omaha company" is the common term by which the Chicago, St. Paul, Minneapolis and Omaha Railway is known.

Q. (By Professor JOHNSON.) That is the line from the south into Minneapolis and St. Paul, is it?—A. It is a line commencing at Elroy, Wis., on the Chicago and Northwestern Railway, extending northwest to Minneapolis and St. Paul, and from these cities southwest to Omaha, with two or three short branch lines in the northeastern part of Nebraska. It intersects this wheat country from which both Minneapolis and Milwaukee derive a large proportion of their wheat for milling purposes.

Q. (By Mr. CONGER.) I asked you if this evil or grievance was still in existence, and you said yes; I then asked you if you had any remedy to recommend or suggest to us, or any process to suggest by which a remedy could be brought about in the way of legislation.—A. The remedy which I would suggest and which, it seems to me would be effective, would be the strengthening of the powers of the Interstate Commerce Commission to such an extent as to enable it to enforce its orders. The Supreme Court, in one or two recent decisions, has denied that power to the commission which the public had generally considered that it possessed. During the first year of its existence the power was never questioned; its orders were complied with very generally.

Q. What power do you refer to? Power to make rates?—A. Not the power to

make rates, but the power to enforce its rulings; or the power, upon investigation of any particular case and the determining that discrimination exists or that existing rates are unreasonable, to enforce its order as to the modification and qualification of those rates, which would be, of course, only after a full hearing of all parties concerned.

Q. (By Professor JOHNSON.) You mean to enforce its power to revise rates?—A. To revise rates and to apply and prescribe remedial rates—

Q. On particular commodities?—A. On particular commodities and in particular cases that have been brought before it in which all parties have been heard.

Q. Would it not be well to state the programme by which the commission could be vested with this power? What change in the law do you suggest?—A. I do not know that I could specify particularly just what changes in the law would be required, but I would say that the law should definitely state that the orders of the commission, after full hearing and investigation of the case, should be carried out by the carriers to whom the orders are given.

Q. (By Mr. CONGER.) Do you think it would be fair to the railroads to make that decree of the commission absolute, without any appeal?—A. There should be opportunity for appeal in order to give the parties further hearing in the case as to the existence of the facts determined or arrived at by the commission at its hearing; but if these facts are found to be as declared by the commission, then its orders should be enforced.

Q. You mean enforced pending the appeal or enforced for all time?—A. I mean should be enforced for all time. It is a question in my mind whether decisions or orders of that kind should be put into effect pending an appeal, but there are good reasons why they should, the fact being that the carriers can delay cases almost indefinitely, and by reason of that can prevent the carrying out of justice and consequently inflict upon the public the continuance of the evil for almost an indefinite period. I think, on the whole, that the commission's orders should be immediately effective, with opportunity of appeal and a reversal of the order in case it should be found by the courts to be requisite; and I believe the burden would be less if the carriers were obliged to carry out these orders pending the result of these appeals.

Q. I was going to inquire, in this case brought by Milwaukee, why you have not appealed to the courts to have the order of the commission enforced.—A. For the simple reason that the recent decisions of the Supreme Court render it utterly hopeless; that is, the Supreme Court has declared that the Interstate Commerce Commission has no power conferred upon it by the interstate-commerce act to say what rates shall be put into effect. It declares that the commission's power is limited to investigation and rendering an opinion as to whether the rates in existence are reasonable or not, and whether they are discriminative or not, and to urging their correction. It denies absolutely the power of the commission to declare what would be reasonable rates and to require the carriers to put such rates into effect.

Q. (By Mr. C. J. HARRIS.) Would not Minneapolis, through its close lake communications, have naturally a little advantage over Milwaukee in the shipment of freights?—A. The cost of transportation from Minneapolis to the seaboard exceeds the cost from Milwaukee by just about the differentials in rates that were prescribed by the Interstate Commerce Commission from points in the West to these two terminal points.

Q. (By Representative OTJEN.) By way of Duluth?—A. Yes; by way of Duluth.

Q. And if this rate were enforced or carried out it would place the two cities on an equal footing?—A. On an exact equality.

Q. (By Mr. KENNEDY.) Do you believe if the decision of the Interstate Commerce Commission were to be put into immediate effect and then an appeal allowed that the appeal would be acted upon much sooner than if the other course was pursued?—A. Unquestionably it would; it would be to the interest of the carriers to obtain a decision on appeal as early as practicable.

Q. And the other side would not obstruct?—A. They would not have any motive. On the other hand, it is to the interest of the companies to prolong the litigation to the utmost possible extent and subject the public to the burden of these discriminative rates.

Q. (By Representative OTJEN.) In case of an appeal, would you have the court review the facts or would you have the facts as found by the commission stand?—A. I think the facts as found by the commission should constitute the evidence in the case before the court. The court should pass only upon the law of the case. If the commission has made an error in the application of the law the court should pass on that; but, the commission being an expert body, having the means of investigation and inquiry, and being thoroughly familiar with all the various channels of communication and various means of competition, and everything

pertaining to the making up of rates, the determination of the facts before the commission should be final.

Q. That is, the facts as found by the commission should be the facts assumed by the court?—A. That is it exactly. That reminds me, there have been cases carried to the United States court in which new evidence has been presented by the railroad companies in their defense, which has been withheld when the case was heard before the commission; evidently withheld for the purpose of prolonging the litigation and getting more time.

Q. (By Mr. C. J. HARRIS.) Is that point now thoroughly digested?—A. I will go a little further into the matter of amendments of the interstate-commerce law, particularly that section about the long and short haul clause. I think that the provision should place with the commission full discretion in regard to that section, which is now limited by a provision that the rates shall be no greater for the shorter than for the longer distance, under substantially similar circumstances and conditions. Now, the commission, as a rule, under that clause "under similar circumstances and conditions," hold that only water competition changes the circumstances and conditions. In a case about a year ago, however, before the Supreme Court—the Social Circle case—the Supreme Court ruled that railroad competition was clearly a change of circumstances and conditions, which would warrant the suspension of the long and short haul clause. The Supreme Court has consequently made that clause inoperative by that ruling. Now, I claim that that provision "under substantially the same circumstances and conditions" should be stricken out entirely from that clause, making the long and short haul provision absolutely imperative except in cases in which the commission, after full consideration and hearing of all parties, believes it expedient in its own judgment to suspend it.

Q. (By Mr. CONGER.) You would make that discretionary with the commission?—A. Entirely discretionary with the commission, so that when the commission has rendered the decision in the case the railroad companies can not carry it up to any other court to determine whether the circumstances and conditions are similar or not. The commission is best qualified to judge on that point on account of its experience and its knowledge of the workings of transportation.

Q. I judge from what you said, your own idea is that only water competition would change conditions?—A. I believe the commission is eminently sound in that ruling.

Q. (By Mr. C. J. HARRIS.) You spoke about discriminations in rebates; do you want to deal further with that?—A. I wish to make a statement in regard to pooling.

Q. I have your letter here that you are in favor of that. I wish you would introduce that as a part of your testimony.—A. I will say, in regard to the proposition to legalize pooling, that I have with me a letter signed by the secretary of the Chamber of Commerce of Milwaukee, addressed to the Industrial Commission, in which he states (reading):

"I am also instructed by vote of the board of directors of this body to inform you that the chamber has at various times unqualifiedly advocated the amendment of the interstate-commerce act so as to permit pooling of railway earnings under traffic arrangements subject to approval of the Interstate Commerce Commission. It is the firm belief of the board of directors of this body, confirmed by a practically unanimous vote of the full chamber, composed of 600 business men of Milwaukee, that such an amendment will be the most effective remedy against the evils of rate cutting and favoritism to large shippers."

Q. (By Professor JOHNSON.) That letter does not say what would tend to eliminate discriminations as against localities?—A. It is only in general terms an expression of the general sentiment of the chamber of commerce.

Q. (By Mr. C. J. HARRIS.) Does that letter express your own opinion?—A. I am thoroughly in sympathy with that. I will say further, after careful consideration of the question of pooling and the arguments advanced in favor of and against it during the discussion of the law for years, I am fully of the opinion that the legalizing of pooling of railway earnings is the only practicable means of securing uniformity, equality, and stability of rates for the transportation of freight, and also the only means of avoiding discriminative rates between various points. I would, however, have the rates under pooling contracts under the control of the Interstate Commerce Commission, with absolute authority to order such changes in those rates from time to time as might be deemed best, and these orders to go into immediate effect.

Q. (By Professor JOHNSON.) You would give the railroads unlimited power to enforce their contracts with each other?—A. I would have the pooling contracts approved by the Interstate Commerce Commission before they go into effect, and the rates subject to any change that the commission might direct after they have gone into effect.

Q. (By Mr. C. J. HARRIS.) You would have the Interstate Commerce Commission provide a maximum rate above which they should not go, rather than an absolute rate; is that it?—A. No; I do not regard the fixing of maximum and minimum rates as a practical remedy or as a practical means of relief. In case of maximum rates they must necessarily be fixed high enough to cover all circumstances and conditions; and the same with minimum rates; they must be fixed so low they would never be operative. In case of maximum rates they must necessarily be higher than the rates ought to be in certain localities and under certain conditions, and for that reason it would be only an evil; but the commission should have absolute power in case of pooling arrangements to determine what the rates shall be in every particular instance.

Q. (By Professor JOHNSON.) When men speak of fixing the maximum rates they mean, do they not, the fixing of a schedule for that entire classification. That is what you had in mind? While you are advocating giving the commission power to pass only upon one particular rate or a limited number of rates that may be called in question, when you speak of fixing the maximum rates the ordinary man thinks of a schedule covering the entire classification?—A. Yes.

Q. Whereas, you are talking now of giving the commission power to determine only an individual rate within a classification?—A. To determine all rates that are fixed by the railroads under their pooling arrangements. Pooling arrangements are confined to business between certain important points—certain commercial centers—and whatever rates are fixed under pooling contracts the commission should have entire control of each and every individual and separate rate. No general maximum rate can be applied to-day; they will be of no effect. I have observed the working of maximum rates to some extent, particularly in the State of Illinois. The board of railroad commissioners of Illinois have had power ever since 1873 to fix maximum rates for the State of Illinois, and they have issued from time to time complete schedules of rates and tables of classification, and specified certain rates for certain distances for certain commodities and certain classes throughout the State; the result has been that the railroad companies have very generally, under the influence of competition and owing to varying conditions in different parts of the State, fixed rates very much lower than the maximum rates prescribed by the commission, and notwithstanding the commission has reduced its maximum rates from time to time, they can not make a scale of maximum rates that is low enough to meet the existing conditions in certain portions of the State. Generally, throughout the State, so far as I have had occasion to examine the rates—and I have had occasion to do so to a considerable extent, in Wisconsin, in comparison with Illinois—I find the actual rates enforced in the State of Illinois are very much less than the maximum rate; and it would prove to be equally the case if attempted throughout the country. It would be more so, in fact, because the field is so much larger, and so many elements of competition enter into the extensive transportation from one part of the country to another, as compared with the few that enter into that of the State of Illinois. Maximum rates for the country at large would be of less value than in the State of Illinois.

Q. (By Mr. C. J. HARRIS.) In giving the Interstate Commerce Commission such absolute powers as you suggest, do you fear that there might be at some time in that body a condition of affairs that would bankrupt all the railroads of the country? Have you looked at that side of the question at all?—A. All I have said in regard to their fixing of rates is to be understood as applying only to rates made under pooling contracts. But, to answer your question, the Supreme Court has very wisely decided—at all events, several district courts of the United States, and I think also the Supreme Court—have decided in important cases that the making of rates that are unremunerative is unconstitutional on account of their practically being confiscatory of the property. The railroads are fully protected by that principle, which is fully established.

Q. (By Professor JOHNSON.) That was brought out in *Smith v. Ames*?—A. Yes; particularly in that case, but there have been similar decisions in district courts of the United States in different parts of the country, and everybody admits the justice and wisdom of it.

Q. (By Mr. C. J. HARRIS.) The fact that the rate was unremunerative would have to be proved in court and the decision to that effect obtained. In the meantime that rate would be going on all the while, would it not, according to your revised plan?—A. Yes; but there must be hardships sustained somewhere, on one side or the other, and there would be less hardship if the rates were required to go into immediate effect.

Q. (By Professor JOHNSON.) The court would have the power of injunction, would it not?—A. That would be a legal question I would not pass upon.

Q. It does exercise it now, as you know?—A. There have been cases in which the enforcement of rates has been enjoined, but my point is that while it would

be unjust to the railroads to be required to submit to rates proscribed by the commission which they might deem unjust and unreasonable, and were endeavoring through the courts to resist, yet the injury to the railroad companies pending the determination of the question would be very much less than if the public were left to the continued infliction of injustice and exorbitant rates for the length of time which the railroad companies could protract this litigation, which is litigation of a most difficult character.

Q. (By Mr. KENNEDY.) Is there any more probability that the railroad companies would suffer by the decision of the Interstate Commerce Commission than there is that the people and commerce of the country would suffer?—A. Not nearly as much, it seems to me. The point is well established now for their protection, which there is no probability of an attempt to overturn.

Q. They seem always to be able to have their interests taken care of better than the other side?—A. Very much.

Q. (By Mr. CONGER.) Are you familiar with the recent order of the Interstate Commerce Commission as regards the differentials between flour and wheat to the Eastern seaboard?—A. I am, to some extent, and I have something to present on that subject.

Q. Do you remember the substance of that order?—A. Yes.

Q. What was it, in brief?—A. It was that the export rate on wheat should not be more than 2 cents per hundred pounds less than the rate on flour.

Q. Do you know if the roads have complied with that order?—A. They have partially, and partially not. I have a statement which has been prepared for me by George A. Schroeder, manager of the freight bureau, Milwaukee Chamber of Commerce, which I will present as part of my testimony.

Q. Before you present that, let me ask, do you know whether the roads, in complying with that order, raised the rate on wheat for export or reduced the rate on flour for export?—A. The rates were changed on the 1st of November, which is the time of year at which rates are generally advanced between Chicago and the seaboard, and I believe they were both advanced; I am quite sure they were.

Q. On both wheat and flour?—A. On both wheat and flour.

Q. Did they make the difference 2 cents according to the order of the Commission?—A. They made that difference from points on the Mississippi River to the seaboard, but there are intermediate points from which the rates vary.

Q. The point I was bringing out—if the Interstate Commerce Commission were given this authority you speak of as regards the differences in rates, differentials between localities, between commodities and localities as well—would it not be possible for the roads interested to protect themselves by increasing the lower rate to a relative equality with the higher rate, instead of reducing the higher rate; in other words, you would allow the roads that privilege?—A. I think there are cases in which it is justifiable that it should be done. I should think the supervision of the commission over the companies would protect the public from any wrong adjustment of the rates to comply with such a decision.

Q. (By Mr. C. J. HARRIS.) Would you tell us how much the difference has been this summer between the export and the domestic rate on wheat?—A. I have not the figures with me that have been enforced during the summer, but I have those put into effect November 1. I want, here, to correct the statement I made in regard to the export and domestic rate, that the difference is 2 cents from the Mississippi River to the seaboard; I should have said from Chicago to the seaboard. This statement I have will give you pretty specific information in regard to this matter, and I will read it before going further:

The following are the present all-rail rates on export and domestic grain and grain products, as per published tariffs effective November 1, 1899.

I will say right here the rates from Chicago and Milwaukee to the seaboard are the same; they are uniform.

Q. Rail rates or lake rates?—A. Rail rates and lake and rail rates combined are always the same from the two points to all points on the seaboard.

Q. Do lake rates vary?—A. They vary continually.

Q. As you can charter them?—A. It is regulated by charter. The rates from points in the West to Milwaukee and Chicago are the same. Chicago and Milwaukee are practically one point and are so treated in the matter of rates of transportation. (Witness continues reading.)

| | |
|-----------------------------------|--------|
| Chicago or Milwaukee to New York: | Cents. |
| Export grain per 100 | 20 |
| Domestic grain per 100 | 22 |
| Grain products per 100 | 22 |
| Mississippi River to New York: | |
| Export grain per 100 | 20 |
| Domestic grain per 100 | 25.5 |

The following table shows the through rates on export wheat versus the through rates on wheat to Chicago or Milwaukee plus the rate on the manufactured product:

| | Export wheat. | | Wheat and flour. | Differ- ence. |
|---|------------------|-----------------------------|------------------------|------------------|
| | <i>Cents.</i> | | <i>Cents.</i> | <i>Cents.</i> |
| Columbus, Nebr., to Mississippi River..... | 21 | Columbus to Chicago | 20 | |
| Mississippi River to New York | 20 | Chicago to New York | 22 | |
| Through | 41 | Through | 48 | 7 |
| Sioux City, Iowa, to Mississippi River..... | 21 | Sioux City to Chicago | 23 | |
| Mississippi River to New York | 20 | Chicago to New York | 22 | |
| Through | 41 | Through | 45 | 4 |
| Sheldon, Iowa, to Mississippi River..... | 19 | Sheldon to Chicago | 22 | |
| Mississippi River to New York | 20 | Chicago to New York | 22 | |
| Through | 39 | Through | 44 | 5 |
| Des Moines, Iowa, to Mississippi River..... | 13 | Des Moines to Chicago | 18 | |
| Mississippi River to New York | 20 | Chicago to New York | 22 | |
| Through | 33 | Through | 40 | 7 |

The rate from Chicago or Milwaukee to New York is alike for export and domestic flour.

This shows that flour manufactured at Chicago or Milwaukee from wheat from the West, and forwarded to New York, costs 7 cents a hundred more freight in the case of Columbus, 4 cents in the case of Sioux City, 5 cents in the case of Sheldon, and 7 cents in the case of Des Moines than the freight on the wheat direct from these points of origin to New York for export, being that much disadvantage to millers in Chicago and Milwaukee.

The following table shows the through rates on export grain versus the through rates on domestic grain, based on lowest combinations:

| | Export grain. | | Domestic grain. | Differ- ence. |
|---|------------------|---------------------------------------|--------------------|------------------|
| | <i>Cents.</i> | | <i>Cents.</i> | <i>Cents.</i> |
| Columbus, Nebr., to Mississippi River..... | 21 | Columbus to Mississippi River | 21 | |
| Mississippi River to New York | 20 | Mississippi River to New York | 25.5 | |
| Through | 41 | Through | 45.6 | 5.5 |
| Sioux City, Iowa, to Mississippi River..... | 21 | Sioux City to Chicago | 23 | |
| Mississippi River to New York | 20 | Chicago to New York | 22 | |
| Through | 41 | Through | 45 | 4 |
| Sheldon, Iowa, to Mississippi River..... | 19 | Sheldon to Chicago | 22 | |
| Mississippi River to New York | 20 | Chicago to New York | 22 | |
| Through | 39 | Through | 44 | 5 |
| Perry, Iowa, to Mississippi River..... | 14 | Perry to Mississippi River | 14 | |
| Mississippi River to New York | 20 | Mississippi River to New York | 25.5 | |
| Through | 34 | Through | 39.5 | 5.5 |
| Des Moines, Iowa, to Mississippi River..... | 13 | Des Moines to Mississippi River | 13 | |
| Mississippi River to New York | 20 | Mississippi River to New York | 25.5 | |
| Through | 33 | Through | 38.5 | 5.5 |

Q. (By Mr. KENNEDY.) What is the difference between wheat shipped to New York from Chicago for the two purposes, domestic and export?—A. From Chicago and Milwaukee to New York the difference between export and domestic is 2 cents a hundred, but from original points of shipment in the interior it varies from 4 to 5½ cents.

Q. (By Mr. KENNEDY.) On through billing?—A. On through billing, yes.

Q. Is there any reason why there should be that difference as against the differ-

ence from Chicago and Milwaukee?—A. I can not see any reason why there should be that discrimination. I can see the cause of it; the purpose of it, at least, is to secure the transportation of the grain from points west of the Mississippi River to the Atlantic seaboard against the competition of the Gulf ports.

Q. It looks like a discrimination against Chicago and Milwaukee?—A. It is a discrimination in favor of export shipments. It costs the Chicago and Milwaukee millers this much more to take the wheat from the West and grind it here and forward to the seaboard, ranging from 4 to 7 cents in the points which I have named, and these points have been taken as illustrations showing the varying differences from the different points of shipment. This second table shows the discrimination against domestic grain used at the seaboard, as compared with grain exported, putting millers at the seaboard at the disadvantage of the difference in favor of the export rate.

Q. (By Mr. C. J. HARRIS.) Do you not have a milling-in-transit rate?—A. There are mill-in-transit rates, but the export grain rates are not applied to them.

Q. Domestic grain rates would be applied to them, would they not?—A. Yes; domestic grain rates are applied to milling in transit.

Q. That, at present, would be a difference of about 2 cents?—A. Yes; 2 cents difference from Chicago. But the difficulty is, that the wheat from which this flour is produced, must be obtained from these western points—the export rates of freight run, as I have shown you, from 4 to 7 cents a hundred lower.

Q. (By Mr. CONGER.) I notice you do not have Minneapolis in the table; could you tell us the situation as regards millers there? Do they labor under the same disadvantage?—A. I am not conversant with the working of rates at Minneapolis. I have only taken the operation of rates with reference to Milwaukee, and incidentally Milwaukee and Chicago, because of the rates being uniform to and from the two points. I gave Sioux City 41 and Sheldon 39 on through export; on domestic, Sioux City 45, Sheldon 44, a difference of 4 and 5 cents against the American miller.

Q. (By Mr. C. J. HARRIS.) Do you not object to the difference between the domestic and the export rate?—A. It operates very seriously to the detriment of millers in this country.

Q. Is not that export rate necessary in order to get rid of the accumulations at these various points and the surplus product of the country?—A. Not by any means; there never have been export rates until within the past two years.

Q. (By Mr. CONGER.) Why, or in what way, does this lower export rate operate to the disadvantage of the millers, if the export rate on flour was the same as the export rate on wheat?—A. It would not; but that is not the case.

Q. Then you misunderstood Mr. Harris's question. He asked if you objected to the fact that a lower rate was given on wheat and flour for export? That is, a rate lower than on domestic grain and flour?—A. If the export rate was applied to flour there would be no objection to it, so far as I can see.

Q. (By Mr. C. J. HARRIS.) The difference is only 2 cents, as you have stated, from Milwaukee at present?—A. Two cents from Milwaukee and Chicago to New York, but the cost of the wheat enters into it. The wheat must come from Western points to Chicago and Milwaukee to be manufactured into flour, and the cost of laying wheat down at Chicago, added to the cost of shipping flour to New York, makes an export expense of 4 to 7 cents a hundred pounds, on account of the domestic rate applying to wheat from the original point of shipment to Milwaukee and Chicago, as well as to the seaboard.

Q. (By Representative OTJEN.) That is a greater rate than some places west have to pay. For instance, Des Moines has to pay a less rate for the grain they receive and ship to the seaboard than Milwaukee would pay in receiving grain from the West and shipping to the seaboard?—A. That is it.

Q. (By Mr. C. J. HARRIS.) But the flour as a manufactured product ought necessarily to pay a higher classification of freight than the other.—A. That never has been the case.

Q. Is it not harder to handle, and does it not take more car room, or are there not some conditions of railroad traffic that enter into it, that demand a higher freight rate than that on grain in bulk?—A. It is possible that there is a slight difference in favor of the raw material, but the fact is that the rates for flour and wheat have always been uniform from time immemorial.

Q. (By Mr. CONGER.) Until when?—A. Until within the last two years. I am not certain when the export rates were first put in, but the great differences have been made within the past year.

Q. Do you not think the lower export rates have been a decided advantage to the producer of the grain?—A. Not at all.

Q. Why not?—A. The price of grain is fixed at the point of shipment by the freight to the principal markets. These principal markets are Minneapolis, Milwaukee, and Chicago, as far as the West is concerned, and the grain buyer a

the interior points in the country fixes his price to the producer on the basis of the rate of freight to these points.

Q. Very well; is not the price of grain in these markets that you name fixed or at least influenced by the price of wheat at Liverpool?—A. To be sure.

Q. Then it would seem to me that the lower freight rate by which the grain from Minneapolis, Chicago, etc., could be moved to Liverpool would increase the price at this point.—A. If that were the only element of price that would be so; but price elements are innumerable, and no man can resolve them to a point which would enable him to determine what the price is going to be 24 hours hence. The price at Liverpool is only one of the elements. Sometimes the price at Liverpool is 4 or 5 cents—not as much as that perhaps, but often 3 to 4 cents less than it costs to lay the grain down in Liverpool from this country.

Q. What reason can you give?—A. Speculative influence is the principal reason.

Q. The farmer, then, sometimes gets benefits from speculation?—A. He always does. It is a mistaken idea that speculation is injurious to the farmer; it is one of the most important things in fixing the price of grain in his favor instead of against him.

Q. (By Mr. KENNEDY.) Which would European markets prefer, our grain or our flour?—A. They want both; they want grain often for the purpose of mixing with other grain in order to produce certain results in flour, and in other cases they want the manufactured product.

Q. They want grain more than they want the flour, do they not?—A. I can only judge as to that by the actual movement of the two; during the past 2 years the movement has not been far from half and half. It varies sometimes 20 per cent from that, in different years, but generally it averages about half.

Q. Following up that answer, do you believe if the rates were even for export flour and wheat there would be a greater export of flour than of wheat; you say the bulk that goes out is about the same?—A. It has been the same heretofore when there were no export rates—about an equal quantity of export flour and wheat; but the introduction of export rates on wheat without applying them to flour has changed the thing, and more wheat is going than flour, necessarily, for the reason that the miller in Great Britain or elsewhere on the other side can make his flour out of wheat that costs him less, on account of this difference in freight, than the cost to the miller here of buying his wheat and laying his flour down there. It operates to drive the miller in this country out of the manufacturing business.

Q. Have you the figures to submit showing that heretofore the export has been about equal, and that now there is a difference?—A. I have not the figures with me, but they can be readily obtained from the Treasury Department.

Q. (By Mr. C. J. HARRIS.) Has there ever been any export rate on flour corresponding to the export rate on wheat?—A. There never has been any export rate on either wheat or flour until within the past two years.

Q. My question is as to whether there ever has been any export rate on flour?—A. No, there has not been, to my knowledge, and I have kept conversant with these rates for a good many years.

Q. (By Mr. CONGER.) Your remedy for these evils would be the enlargement of the powers of the Interstate Commerce Commission?—A. That would be my remedy, yes.

Q. (By Mr. C. J. HARRIS.) Would this recommendation of the Interstate Commerce Commission of a difference of 2 cents between the export rate on manufactured goods and bulk wheat be satisfactory to you if carried out?—A. It would, so far as Milwaukee and Chicago are concerned. That would put flour and wheat on an equality. But it would not remedy the matter from the point of shipment of wheat. The difficulty lies in the fact that the wheat costs more laid down here for grinding and shipment to New York than this difference of 2 cents a hundred referred to, on account of the difference from the point of shipment to Milwaukee and Chicago being greater.

Q. (By Representative OTJEN.) On account of the discrimination from the points west?—A. That is it, yes.

Q. (By Mr. KENNEDY.) We have been speaking of the discrimination which the land carriers make against the product going abroad. Could you say whether there has heretofore been a discrimination by the ocean carriers as against flour?—A. I can not say in regard to that. I am not familiar with ocean rates as separate and distinct from other rates.

Q. (By Mr. C. J. HARRIS.) It might be the trouble is there.—A. From general knowledge I should say that rates from the seaboard across the ocean are uniform; that there is no distinction.

Q. Have you anything further to say about this, or would you pass on to discriminations and rebates?—A. I will pass on to discriminations. I wish to pre-

sent a letter bearing upon the proposed amendments to the interstate-commerce law from a fellow commission merchant, of Milwaukee, Robert Eliot. Being unable to come himself, he addressed this letter to me and requested me to present it as part of my testimony.

(Whereupon the witness submitted the following communication:)

MILWAUKEE, November 17, 1899.

E. P. BACON, Esq., City.

DEAR SIR: Under date of November 7 I received a letter from the Industrial Commission, stating that Senator Kyle had suggested my name as one desired to give information and expression before the Industrial Commission now in session in Chicago. Owing to having taken a bad cold I am unable to go there, which I regret very much.

I was one of those deputed by the Milwaukee Chamber of Commerce, with yourself and Mr. Charles Ray, now president of the National Exchange Bank, to give expression in the same behalf before the United States Senate committee in 1885 or 1886 prior to the passage of the interstate-commerce act, said committee being composed of Senators Cullom, of Illinois; Platt, of Connecticut, and Harris, of Tennessee.

At that meeting in Chicago I was told by Senator Cullom that they had been to the Middle and Eastern State cities and to St. Louis and had had the views of prominent Chicago dealers, and that I was the only person in the United States who had advocated legalizing railway pooling under the control of the proposed Interstate Commerce Commission, in order that such control might obviate excessive charges or unjust discrimination against persons or places. Senator Cullom said that while he was impressed with the reasons given for such action, it was utterly impracticable because of adverse public opinion. I told him that time would show that there never would be any relief from secret rates or unjust preferences until the railways were permitted to enforce pooling contracts.

Since that time experience has, I think, proved the correctness of my judgment, and many commercial bodies of the United States, including the Chamber of Commerce of Milwaukee, have passed resolutions in advocacy of legalizing such traffic agreements under control of the Interstate Commerce Commission. The railway companies also have expressed themselves as willing to have the interstate-commerce act strengthened, vesting the Interstate Commerce Commission with powers to fix rate, when the commission may find reason for its remedial action in that behalf, provided the power and permission to make traffic agreements as above stated be also granted.

A bill was framed in that behalf 5 or 6 years ago, and many who are deeply interested in the matter are wondering why Congress has not passed it. My solution of this question is this: Many railways have influential directors who are engaged in the grain business, or the oil business, or other branches of business, who are receiving special or preferential rates, enabling them to overcompete and drive out of business others engaged in the same branches of business, and it is the interest of such multimillionaire directors to have the present state of things continue, to wit, competition between roads, which will excuse the managers of the roads for giving these special or preferential rates when said managers have to face their directors or wealthy stockholders, because if the interstate-commerce act were strengthened and pooling legalized there could be no excuse whatever for railway managers to be giving away the earnings of their roads to some of their wealthy and powerful directors. Of course they solidly deny doing anything of this kind, but the manifestations of trade indicate it with certainty to the minds of men engaged in the business.

One method of business which, by reason of its being apparently free to all, but owing to circumstances available especially and preferentially to men operating large terminal elevators, is the monkey work of through billings, which I should be glad to have you explain to the committee. This method constitutes an unjust discrimination against the local trade and milling trade of Milwaukee and Chicago or other terminal points where it is practiced and gives advantage to the parties operating the terminal elevators. It is also an ingenious evasion of the long and short haul clause. I have wondered why the Interstate Commerce Commission has not ordered its discontinuance. I presume it to be because they do not think they have the requisite power. Then the act should be strengthened so that they will have the requisite power, and the power to enforce the long and short haul clause.

For 8 or 10 years the railway companies respected the long and short haul clause, but the courts finally turned it down by their application of the words "under similar conditions and circumstances," which were found in the act, holding that competition between railways constituted a circumstance which warranted an infraction of the long and short haul clause. That emasculated the act

fully and completely as to that clause, because the railway companies can prove competition everywhere. And the consequence is many very unjust discriminations in rates by giving low rates to certain places in preference to other places.

These words should be stricken out of the interstate-commerce act, and no deviation from the long and short haul clause should be permitted except under extraordinary circumstances, such as direct juxtaposition to and competition by water routes, and then only when permitted by the Interstate Commerce Commission.

Yours, truly,

ROBERT ELIOT.

Q. Railroad discriminations and rebates.—A. In relation to the matter of rebates I will present to the commission two bids mailed to the grain dealers at Kinbrae, Minn., and Flandreau, S. Dak., on the 21st and 26th of October last, respectively, by the Milwaukee Elevator Company, a company understood to be owned wholly by a director of the Chicago, Milwaukee and St. Paul Railway Company, the points mentioned being on the Southern Minnesota division of that railway.

Q. (By Mr. KENNEDY.) Do you know his name?—A. I know his name, but I don't care to state it. I will state it if desired; P. D. Armour. I will submit these postal cards as a part of my testimony, and will say in connection with them, that the several elevator companies in Milwaukee and Chicago have been in the habit for some years past of sending bids to grain buyers in the country by means of postal cards, offering net prices at the point of shipment, which they can accept on such quantity of grain as they choose, provided the acceptance reaches the elevator proprietors before the opening of the next day's exchange; that is, 9.30 in the morning. That is stated on the postal card as a part of the condition on which the bids are made, and these prices are based on the closing of the market on the day on which they are mailed and are open for acceptance until 9.30 the next morning. And I will submit tabulated statements showing these bids and the freight, and showing the prices of the bid over the cost laid down at Milwaukee and the market value at Milwaukee at the same time. To show the correctness of the values stated at Milwaukee I will also file the daily market reports, the official daily market reports of Milwaukee on the dates mentioned.

Q. (By Representative OTJEN.) What, in substance, do these postal cards show?—A. The postal cards show the prices bid at the points mentioned, and the market reports show the value at Milwaukee at the time.

Q. And you are just going to follow that up, to show the application of it?—A. Yes; show the working out of the bids, with the cost of freight and the cost laid down at Milwaukee as compared with the value of the property at Milwaukee at the time. I will say, first, in connection with these bids, they have been sent to me by my traveling agent, and the parties who gave them to him stated that the prices named were subject to a deduction of the freight to Minneapolis and I consequently stated the freight to Minneapolis in my table which I presented. (Reads:) Prices per bushel for grain at Kinbrae, Minn., October 21, 1899, by Milwaukee Elevator Company, for shipment to Milwaukee, subject to Milwaukee inspection and dockage and Milwaukee or Chicago weights. Tariff rates of freight to Minneapolis to be deducted; showing cost laid down at Milwaukee, as compared with closing market value at Milwaukee on the same date.

| Kind of grain. | Pounds per bushel. | Price bid. | Freight to Minneapolis. | Net price. | Freight to Milwaukee. | Cost at Milwaukee. | Value at Milwaukee. |
|----------------------------|--------------------|---------------|-------------------------|---------------|-----------------------|--------------------|---------------------|
| | | <i>Cents.</i> | <i>Cents.</i> | <i>Cents.</i> | <i>Cents.</i> | <i>Cents.</i> | <i>Cents.</i> |
| No. 1 northern wheat | 60 | 66.25 | 8.70 | 57.55 | 12.90 | 70.45 | 69.50 |
| No. 2 northern wheat | 60 | 63.75 | 8.70 | 55.05 | 12.90 | 67.95 | 66.50 |
| No. 3 white oats | 32 | 22.75 | 4.16 | 18.59 | 6.08 | 24.67 | 24.50 |

Rates of freight on grain from Kinbrae, Minn., in effect the above date, as per supplementary tariff taking effect April 19, 1899, were as follows, in cents per 100 pounds:

| To— | Wheat. | Other grain. |
|-------------------|--------|--------------|
| Minneapolis | 14½ | 13 |
| Milwaukee | 21½ | 19 |

Prices per bushel bid for grain at Flandreau, S. Dak., October 26, 1899, by Milwaukee Elevator Company for shipment to Milwaukee, subject to Milwaukee inspection and dockage, and Milwaukee or Chicago weights; tariff rates of freight

to Minneapolis to be deducted; showing cost laid down at Milwaukee as compared with closing market value at Milwaukee the same date:

| Kind of grain. | Pounds per bushel. | Price bid. | Freight to Minneapolis. | Net price. | Freight to Milwaukee. | Cost at Milwaukee. | Value at Milwaukee. |
|----------------------------|--------------------|---------------------|-------------------------|------------------------|------------------------|------------------------|------------------------|
| No. 1 northern wheat | 60 | <i>Cents.</i> 68 | <i>Cents.</i> 9.60 | <i>Cents.</i> 58.40 | <i>Cents.</i> 14.10 | <i>Cents.</i> 72.50 | <i>Cents.</i> 70.50 |
| No. 2 northern wheat | 60 | 68 | 9.60 | 58.40 | 14.10 | 70.50 | 68 |
| No. 3 white oats | 32 | 23.25 | 4.16 | 19.09 | 6.08 | 25.17 | 24.75 |

Rates of freight on grain from Flandreau, S. Dak., in effect above date, as per tariff taking effect April 10, 1899, were as follows, in cents per 100 pounds:

| To— | Wheat. | Other grain. |
|-------------------|--------|--------------|
| Minneapolis | 16 | 13 |
| Milwaukee | 24 | 19 |

Q. What is the difference between the cost and the offer?—A. Two cents in that instance. No. 2 northern, price to be 66. Adding freight to Milwaukee makes it cost 70.50. Value at Milwaukee, 68 cents; 2½ cents less. No. 3 white oats 23.25 bid, making cost at Milwaukee 25.17. Value at Milwaukee, 24.75. Oats are handled on a very small margin always. Rates of freight from Flandreau to Milwaukee and Minneapolis are given in the same manner as in the previous statement.

Q. (By Mr. KENNEDY.) Do you say Mr. Armour is a director in the Chicago, Milwaukee and St. Paul Railway; does that road give him advantages over other buyers and shippers of grain?—A. That we have no means of knowing. We naturally infer when a man pays more for property in the country for shipment than it will net after paying freight, that he gets his money back in some way; and I will state in this connection that there is no means of getting that property to the seaboard at any less expense than by billing from the points of origin to Milwaukee and Chicago and billing it from those points to the seaboard.

Q. This territory is naturally more your territory than Chicago's?—A. Grain from that country more naturally comes to Milwaukee.

Q. (By Mr. C. J. HARRIS.) Do I understand you to say that he made bids on it delivered in Minneapolis?—A. No. He named a price in those bids from which the freight to Minneapolis was to be deducted and the shipper was to receive the difference. Mr. Armour pays the freight from the point of shipment to Milwaukee, and if he pays the tariff rates it costs what I have stated in these statements.

Q. Would not that territory more naturally ship to Minneapolis, and is not this additional price given to divert the trade to Chicago or Milwaukee?—A. This is competing territory between Milwaukee and Minneapolis, and the shipments from time to time are directed to either Milwaukee or Minneapolis, according to the price ruling in each. Sometimes it is more favorable to ship to one and sometimes to the other.

Q. (By Representative LORIMER.) The point you aim to impress on the commission is that the Milwaukee Elevator Company pays this higher price because it has an advantage with the railroads?—A. We can not tell where they get their money back, but the fact that they could buy the property at Milwaukee from 1 cent to 1½ cents and 2 cents per bushel less than it would cost to lay it down at Milwaukee, if they should pay the regular rates, would lead one to infer that they did not pay the regular rate.

Q. Is there any advantage in owning an elevator over renting or storing grain in a public warehouse?—A. To be sure, the owner of the elevator saves the storage; that is, the man owning the elevator does not have to pay storage to somebody else; but the elevators of late have been very little used for storing grain for the trade. They have almost gone out of use for the purpose of storing grain for the public. They are used by the proprietors to handle grain which they buy at the original point of shipment in the country and sell to exporters or consumers in the East.

Q. Then, without having any definite knowledge, you are of the impression that they have advantages in railroad rates over the average shipper?—A. That is the inevitable inference from the fact that they are paying more than they can buy the property for at Milwaukee. The fact of their having an elevator does not affect the value of the property in Milwaukee. It is not worth any more in Milwaukee whether it is bought there or in the country. The property is the same, and it is of equal value under either condition.

Q. What is the natural inference? Is it that this deduction is given over the road to Minneapolis or from Minneapolis to Milwaukee?—A. The grain bought under these bids is brought to Milwaukee. It is transported entirely over the line of the Chicago, Milwaukee and St. Paul.

Q. From the place of purchase?—A. Yes.

Q. What is the special point in compelling the owner to pay the freight to Minneapolis?—A. I can see no particular reason for putting the price in that way instead of stating the net price to the shipper at the point of shipment; but that seems to be the method pursued.

Q. (By Representative OTJEN.) Excepting that he is able to do it from the fact that he probably gets a lower rate from the railroad.—A. The question as I understand it is why the price bid was subject to a deduction of freight to Minneapolis when the property does not go to Minneapolis; that I can see no possible reason for. The more direct and more satisfactory method would be to name the price at the point of shipment. For some reason the price at Minneapolis is given, involving the necessity of deducting the freight to Minneapolis. The property is shipped to Milwaukee, the elevator company paying the freight from the point of shipment to Milwaukee, whatever it may be. I am informed by my traveling agent, who sent in these postal cards containing the bids, that the parties receiving them were in possession of letters from the Milwaukee Elevator Company to the effect that the freight to Minneapolis was to be deducted from the price named in the bids.

Q. Do any of the railroads centering in Milwaukee own their elevators?—A. The St. Paul road owns all the elevators at its terminals.

Q. Are they operating them for the road?—A. They are all leased to the Milwaukee Elevator Company, with the exception of a portion of one of the elevators known as Elevator E, which the company operates itself for storage purposes.

Q. Practically the bulk of the wheat handled through the elevators is handled by the elevators that are leased from the railroads.—A. It is handled by the Milwaukee Elevator Company. I will modify my statement as to their all being leased by the Milwaukee Elevator Company. F. Kraus & Co. lease one of the elevators, and the Milwaukee Elevator Company leases all the rest with the exception of a part of Elevator E, which is retained by the railroad company.

Q. (By Mr. C. J. HARRIS.) Is your system of public elevators much the same as exists in Chicago?—A. Substantially the same.

Q. Can the proprietors of elevators purchase grain the same as here?—A. Yes.

Q. (By Representative OTJEN.) What is he allowed per bushel for handling the grain through the elevators?—A. He buys the grain and puts it in the elevators and disposes of it to the best advantage he can.

Q. (By Mr. C. J. HARRIS.) What is the legal rate for storage?—A. There is no legal rate in the State of Wisconsin.

Q. What is the customary rate of storage?—A. The nominal rate which is charged by the St. Paul Railway Company in that part of the elevator which it operates is one-half a cent per bushel for the first 10 days and one-quarter of a cent per bushel for each additional 10 days, but in point of fact there is almost no grain put in the elevators for public storage.

Q. (By Mr. KENNEDY.) What is the belief among grain men generally as to the existence of an elevator combine in Chicago? What is the opinion at Milwaukee among the grain men of your acquaintance?—A. I don't think I can say in regard to that. There is a general impression that the owners of elevators in Chicago, as well as in Milwaukee, have advantages in the matter of rates and otherwise which are not granted to the public in general.

Q. By agreement between the railroads and elevator men of Chicago and other places?—A. Well, it is supposed to be fixed from time to time according to the varying conditions and circumstances, whatever the advantages may be. Of course, the public has no means of arriving at what is done between the railway companies and the elevator people; they can simply guess at it from results.

Q. (By Mr. C. J. HARRIS.) Do you find any such discriminations as you have presented here, apparent discriminations, in the territory which is not disputed territory with Minneapolis or other strong buying points? In other words, is this high price paid to the producer, as has been testified here, to bring that trade to Milwaukee and Chicago, where competition is very keen, we will say, with Minneapolis, and in the Southwest, with Galveston? Do you find any such conditions as you have presented in this statement in the territory that naturally comes to Milwaukee and Chicago?—A. We don't come across instances of this kind except in competing territory.

Q. Where competition is very close?—A. Whenever there are two or more roads coming into competition with each other, or paralleling each other, not only at intersecting points, but where they parallel each other, we frequently have convincing evidence that the elevator people who buy the grain have advantages,

special advantages in the way of freights. Not only in the territory in which we compete with Minneapolis, but in the State of Wisconsin we find that to be the case.

Q. Would their elevator privileges or their special methods of handling this grain account for the difference in any way?—A. Not at all, because that is entirely independent of the transportation. They can buy the grain in Milwaukee and Chicago and put it in their elevators to just as good advantage as they can buy it in the country. The only advantage of buying it in the country is whatever favor they may get in a special rate of freight or by means of a rebate.

Q. (By Mr. KENNEDY.) Do you believe that it would be impossible for this or any other commission to get at the facts as to whether there is a combination between the railroads and the elevator men of Chicago by which people of the alleged combine have an advantage over the independent buyers?—A. I don't know how it could be got at. Probably the Chicago people could tell you better in regard to Chicago than I can; but it is difficult to get at what the railroads do. I have known of instances, or at least instances have been reported to me, in which sums of money have been paid by railway officials to parties receiving and handling grain without taking any receipt whatever, and paid in currency instead of checks, which covers up any possible evidence.

Q. Looking to that end, would you favor an additional amendment to the interstate-commerce act providing for Federal inspection of the business of those quasi-public corporations like railroads?—A. I would, most assuredly. I would favor the railroad companies' books being examined by experts employed by the commission, as bank books are examined by bank examiners.

Q. And have full publicity?—A. Yes, certainly; but I don't believe that would unearth the methods by which rebates are paid, because they are paid in underhanded ways which leave no trace behind them.

Q. (By Mr. C. J. HARRIS.) You have been in business a long time. Is there at the present time as much complaint about rebates and discriminations as there used to be?—A. I think there is as much complaint in general. There appears to be as much of it going on as before, but it is confined to a smaller number—that is, the beneficiaries of these privileges and advantages and rebates are very much smaller in number. They have been concentrated into fewer hands. On this subject I will say that there is room for a great deal of manipulation of rates, as it is termed, on grain, in consequence of its being billed on what are called proportional rates. Grain is billed to Milwaukee or Chicago on a rate proportional to a through rate to the seaboard, and it is taken into these elevators on the supposition that it is to be forwarded to Eastern points or exported, as the case may be. It receives the benefit of these proportional rates, and it is left entirely to the elevator people actually to forward the property to the seaboard or export it or dispose of it in any other way.

Q. Would that account at all for this difference in the rates which you have presented here, supposing that that was shipped in here on an export rate?—A. It would not in this case, for the reason that there is no export rate to our Eastern points and there is no proportional rate in effect from either of those two points.

Q. Might not that billing be by way of Minneapolis, and cover an export rate of some kind which would allow for this difference?—A. No; the property was not billed to Minneapolis. It was simply provided that the rate of freight from Minneapolis could be deducted from the published rate of freight.

Q. That is true, but supposing there was an export rate from Minneapolis to the seaboard which would allow of all this difference you suggest?—A. It would not be in any way applicable to these shipments made direct from the point to Milwaukee, and there is no way in which the wheat when it reaches Milwaukee could be benefited by it that would not apply equally to wheat brought to the Milwaukee market and put in the elevator.

Q. (By Representative OTJEN.) Regarding the ownership of private cars, do you think that the ownership of private cars is a detriment to business generally?—A. It seems to me that it is a very fruitful way of affording benefits and advantages to those who own them by paying them more for the use of the cars than they are really worth.

Q. (By Mr. C. J. HARRIS.) Are there any private cars used in the grain business now?—A. Not that I am aware of in the grain business.

Q. That is, so far as the grain business is concerned, it is done away with?—A. No; it never has been put in practical use with reference to grain.

Q. (By Mr. KENNEDY.) Is there any sentiment among the members of the Milwaukee Chamber of Commerce in favor of Government ownership of railroads or telegraph lines?—A. Not very extensively, so far as I have been able to observe.

Q. There is some?—A. There are some few who favor railroad ownership, but it is a comparatively small number.

Q. Because they believe it is the only remedy for the evils if there are any in transportation?—A. That, I think, is the reason; but personally I am opposed to public ownership and I believe that the transportation of the country could be efficiently and equitably conducted if the Interstate Commerce Commission had proper powers and its orders could be properly enforced. I should want to see that experiment effectually tried before resorting to public ownership.

Q. Do the business men of Milwaukee believe that the telegraph and telephone rates are exorbitant?—A. I have not heard any particular complaint in regard to that at Milwaukee. There is some complaint in regard to the rates charged by the telephone company, but none of any importance as to the telegraph rates have come to my knowledge. There is one point that has occurred to me and that is the making of through routes and through freight rates by the commission. I wish to say I consider it a very important and very necessary power conferred upon the commission to require the making of through freight rates between connecting lines. It often occurs that owing to individual interests of separate lines they refuse to make through rates with each other, and debar the public from the benefit of the advantages of the shortest practicable lines between two points. I believe that the interests of the people require that the railroads should be compelled to make joint rates at their intersections wherever they may be giving the public the benefit of the lowest practicable rates by the shortest line.

Q. And if they do not make them the Interstate Commerce Commission should make them for them?—A. Yes.

(The witness subsequently submitted the following, to be incorporated with his testimony:)

While the application of the export rate of freight on wheat to the transportation of flour would obviate the disadvantage under which millers in the interior of the country are now struggling, millers at seaboard points would still be subjected to a disadvantage in competition with foreign millers equal to the difference between the export and the domestic rate on wheat from points in the West to the seaboard.

In relation to grain being billed from interior points to Milwaukee or Chicago on "proportional rates"—that is, the proportion of the through rate from point of shipment to the seaboard accruing to the lines west of Milwaukee or Chicago, the grain being taken into elevators at these points presumably for transfer—I wish to say that such grain should be held "in bond" under the care of officers of the Government until so transferred, in order to insure its being actually shipped to the seaboard, for which purpose the proportional rate of freight has been applied to the grain. This rate is often from 2 to 3 cents per 100 pounds less than the rate applied to grain for local use at Milwaukee or Chicago, or shipped therefrom to other than seaboard points.

CHICAGO, ILL., November 18, 1899.

TESTIMONY OF MR. CHARLES S. CLARK,

Secretary Grainers' National Association and publisher of the Grainers' Journal.

The subcommission on transportation being in session on the afternoon of November 18, 1899, Chairman Lorimer presiding, Mr. Charles S. Clark was sworn and testified as follows:

Q. (By Representative LORIMER.) Please state your full name.—A. Charles S. Clark.

Q. And your business?—A. Publisher.

Q. Are you in any way connected officially with the Grain Dealers' Association?—A. I am secretary of the Grainers' National Association and publisher of the Grainers' Journal.

Q. We have information that you have decided views on a system of national grain inspection?—A. I don't know where you got that information, because those are far from my views.

Q. You have no views on that subject?—A. I am decidedly opposed to national inspection. I don't think it is practicable.

Q. You don't think it is possible?—A. It is possible, but not practicable. The grades in the quality of grain vary too much to make any classification, unless you have an endless book of rules which apply to the markets having these qualities of grain.

Q. (By Mr. C. J. HARRIS.) I understand that you had some statement to make on the inspection of grain, especially before the commission.—A. I have not, except

that, of course, if you want to know what the complaints are, I can give them to you as they have come to me. I get a good many complaints from members of the association throughout the country and reports from different markets.

Q. We should like to hear what these complaints are.—A. Of course anyone who is familiar with the grading of grain knows that it is a matter of guess. It has not been reduced to an exact science. They have flaxseed inspection reduced to an exact science; they weigh before and after they eliminate all foreign matter from the samples of seeds by means of sieves of different sized meshes. Mr. Stevens, the man who devised that scheme, has been working on the same scheme to apply to grain, but has not brought it to a point where he is ready to give it out. Several times we tried to get him to talk about it before the association and he has done so twice. He is a man who is one of the oldest grain inspectors in the country, but the detailed work of carrying out his plan has seemed to discourage him and he has given it up. The grading of grain, as I said before, is guesswork. Mr. Noble, in his speech before the national association here in October, said that if a man inspected 100 cars a day and inspected those same 100 cars to-morrow he would probably grade some of them different. It is a matter of judgment, and there are some frightful errors made. Men are not always in the same mood; they have not always the keen perception which the grain inspector is supposed to have. They will naturally err. If we could have the grading of grain reduced to an exact science, then it might be practicable to have a national inspection.

The inspection departments now value grain or classify it quite differently from what the millers do; that applies to wheat only; of course on other grains there is no one else who passes on the grade excepting the buyers or consumers; and I would say that in the matter of barley grading in Chicago the rules and grading by the official inspectors have been ignored for years by the trade. Dealers may pay some attention to the way in which the sample is classed by the department, but they don't accept it themselves; they take the sample to their offices and there pass upon it in an entirely different light—that is to say, they grade it for different characteristics. A grain inspector, if he possesses the knowledge sufficient to make a competent judge of barley, would be in the barley trade almost invariably, and although in Chicago they have some inspectors scattered all around the city to meet the demands of the barley trade to-day all the best inspectors could do would be to take a sample and submit it to a good man at the central point, as in the inspector's office here in the city. Of course the present system of barley inspecting is utterly unreliable and we pay no attention to it. And wheat. The miller values the wheat for many points or characteristics which the inspector knows nothing about; for instance, its strength as to gluten, the amount of starch contained in it, and the market he is milling for at the time. Some markets want it strong in gluten and others want it strong in starch. It depends upon what they are after for their mixtures in the blending of flours. The miller is virtually the consumer of all good wheat, but the present method of classifying wheat is such that while the miller pays a good deal of attention to the classification, still he often pays a premium for a lower grade.

As to the other grains, I know of a case here last month with an Eastern shipper. We have a number of shippers here who ship oats to one of the markets that makes a specialty of them. He bought a grade of fancy oats—that is, he bought three cars which were so much better than other grain placed in the same grade by the inspection department that he paid 4½ cents more for that grade than the ruling market price at the time. He shipped them to an Eastern market and got the profit for them because they were so much superior to the average quality for that grade.

Q. Do you have a State inspector here?—A. Yes.

Q. You say that his grading is ignored by the grain buyers?—A. No; only in the barley trade.

Q. I understood you that the men who bought and sold ignored this State inspection and went on their own private inspector's judgment largely.—A. That is on barley; yes.

Q. On barley alone?—A. Yes; on barley alone.

Q. But on the other grains they have not that difference?—A. No; the outward characteristics of the other grains are a better index of the value of the grain. In barley it is quite different. You can take barley and polish it and get good grains wherein the germinative percentage of the sample will be very low, and barley is valuable to the malster only by the percentage of it which will grow, although, of course, on its plumpness and bright color depends how clear will be the resulting product.

Q. (By Representative LORIMER.) How many official grades of oats are there?—A. I don't remember how many there are; there is the white and the mixed—I think probably there are 7 or 8.

Q. Are they numbered?—A. Yes.

Q. (By Mr. C. J. HARRIS.) Is there any great difference between the inspections of different cities that are buying the products? What I mean is this: Could I ship grain from a Nebraska point and get a better inspection in Minneapolis than I could in Chicago, or could I get a better inspection in St. Louis than I could in Chicago, or vice versa?—A. I have known of some shippers at points that are in territory tributary to different markets having different rules who, knowing of the methods of inspection, would invariably ship grain of certain grades or of certain qualities to certain markets. The rules governing the inspections in each one of these markets are made for the purpose of classifying the grain in the territory tributary to that market which is supposed to come to that market. For a long time—I believe until the Northwest grain trade came into this market—we had no grades provided for the classification of that grain separate from the other, such as we have now. The Northwest, Minneapolis and Duluth, have no rules governing the grades of Kansas hard wheat; that is, I think they have not. They have no use for such rules. Then there are other grades. For instance, in Texas we have the Texas rust-proof oats; you will find some of them in Kansas and all through the territories. Rules governing the grading of that grain could not be of any use in Chicago or Milwaukee or any of the Northern markets. The rules vary considerably. We had one case a year ago where Kansas City, Kans., which was under the Kansas City inspection, admitted a No. 2 wheat where the grain weighed 52 pounds and over. In Kansas City, Mo., they required 59 pounds and over. Of course that made some difference; some grain just on the line would go to Kansas City, Kans., and be graded, although most of the grain was handled by Kansas City, Mo., dealers. It worked an injustice. I think the nearer we can get uniform rules for the grading of the same grain, the better it will be for the grain trade and for everyone interested in the business. It would simplify the matter a great deal.

Q. A No. 2 wheat in St. Louis ought to be the same as a No. 2 wheat in Chicago and ought to fill the same classification requirements?—A. Yes; if it is of the same character. In St. Louis they get one quality they don't get up here and Chicago gets much wheat that never finds its way to St. Louis; and as to No. 2 wheat, Chicago has several different grades of that; that depends upon the origin of the wheat. Several years ago, I think, Kansas City received wheat from the Pacific coast, and there was a movement on foot to have a grade of Oregon wheat that would include all of the soft wheats of the Pacific coast.

Q. That is the point I wanted to bring out. It is this: That the No. 2 Kansas wheat ought to be the same No. 2 wheat in St. Louis as in Chicago; or a No. 2 Northwestern wheat ought to be the same in St. Louis as it is in Chicago. There ought to be a national uniformity on these things and I believe there is, is there not?—A. All the markets do approach uniformity in their rules, but in the carrying out of these rules they differ just as the ability of the inspectors who attempt to carry them out varies. I had a case that came into my hands as secretary of the national association here not a great while ago and is now pending, in which a southwestern Iowa shipper sold corn subject to the Peoria weights and grades. Peoria had a blockade and the grain was taken to St. Louis before being inspected, and the broker who bought it claimed the Peoria inspection, he being an active member of the Peoria Board of Trade; it is a private inspection, not a State, and he could not have it inspected there. It is well known to the trade that a State inspection is much more rigid than the Peoria inspection; these cars all graded according to the contract which they were supposed to fill, except one, and that was graded down, and the shipper refused to accept the discount for the missing grade in the St. Louis market when he had sold it subject to the Peoria inspection and weights.

Q. The producer generally sells outright to the grain buyers at the railroad point?—A. Yes.

Q. So that he has little complaint to make in regard to the inspection that exists in the cities, because his grain passes out of his hands absolutely at that point?—A. Yes.

Q. The complaints would come from the grain buyers and dealers in the cities themselves?—A. Yes.

Q. (By Representative LORIMER.) Have you anything further to suggest?—A. Nothing, I think. Of course, here is something if you can bring it about. You remember we had a bill that was introduced in Congress repeatedly for the uniform inspection of grain, but it was never enacted; it provided for the uniform classification of grain. I think if the different markets are left to themselves they will work that out; because where the grain from one territory is going to any market, that market will, out of self-interest, invariably try to make its rules about the marketing of that grain favorable to it, and can not afford to inflict any discrimination against that grain as compared with other markets. If it does, then very naturally the grain will go to the other markets. There is that influ-

ence working all the time for uniformity and the markets must eventually, I think, come closer together.

Q. As a matter of self-interest they grade it as high as possible?—A. Yes; of course the grain dealers here have not so much direct influence in the matter as they would have at Peoria, where they have private inspection. Peoria is the only market of importance west of Chicago that has private inspection. All the other places have State inspection. Toledo has the same system as Peoria and so has Cincinnati, and on Eastern markets they are not governed by State laws; but there is not enough of that private inspection to work any great injustice, because grain is not forced to take those channels, and it would not do so unless the rules were favorable to its going there.

Q. You say there was a bill introduced in Congress?—A. Yes; there was a man who was the inventor of a steel storage system, and who worked earnestly and tried to have the bill passed several times; it was introduced at two or three different sessions, I guess. It provided for the uniform classification of grain. His system was, I believe, to provide for a national inspector at Washington, who should make a chemical analysis of the grains by samples sent him from the different sections of the country. And I believe, one of his plans was that any man could send a sample of his grain and have it classified; that is, have the inspector pass upon it as to the grade it belonged to; he could send these samples to the department at Washington, or wherever the branches might be established.

Q. (By Mr. KENNEDY.) Is your association opposed to that bill?—A. We never took any action on it. We have had several papers from different members of the association on uniform classification of grain. The members of the trade, I think, would work that out themselves in time and with probably better results than the Government ever could get, because self-interest will prompt them to carry it out carefully; and of course they are in the business all the time and know what is needed and wanted.

Q. Of what is your association constituted?—A. We have two classes of members. It is made up of commission men and country grain shippers principally. The country grain shippers are divided into two classes—that is, those who are what we call the regular members, and the attached. We have local associations wherein all the members become members of the national association; the local associations become affiliated with the national.

Q. Are the grain men of Chicago members of your association?—A. No.

Q. None of them?—A. None of them.

Q. Have you any complaint about the elevator system in Chicago?—A. Yes; we have made complaints repeatedly.

Q. Complaints have been made to your association or in your association?—A. No; never in our association. The Illinois association has sent delegations to Springfield several times to try to strengthen the old law and prevent the enactment of the new. The law itself specified that a public warehouseman should not deal in grain in his own house, which the supreme court will, I think, decide is in conflict with the constitution, article 13 of which was enacted right after the big swindle. We had false bottoms here that public warehousemen, in 1870, I think it was, say caused the enactment of that law, and all the debate and discussion which brought about the incorporation of that article in the constitution was that it was for the protection of the owner of grain, and that the warehouseman should not be recognized as a storer of grain in his own house. They could not have considered that that would ever be done, because the constitution does not specify that he shall not, and it does not recognize the possibility of that practice ever arising.

Q. (By Representative LORIMER.) Is there a case pending in the Supreme Court?—A. No; I think there is a case pending now before Judge Tuley.

Q. What case is that? Is that the case begun prior to 1896, prior to the passage of this law?—A. I think it is a case that was begun afterwards. The case begun prior to the passage of the law was upheld by the Supreme Court.

Q. (By Mr. KENNEDY.) It was stated here yesterday that the grain men of Chicago who were making complaints about these warehouses never had used them, and did not want to use them now. Do you know anything as to that?—A. You mean the commission men didn't want to use them?

Q. Yes.—A. Sometimes they have occasion to use them for their country shippers. Of course a commission man is not often an owner of grain himself; that is, he is not supposed to be. I think it would be to the best interest of the trade if we had some public warehouses which were operated as public warehouses and the people who owned them did not store grain in them. The most of the public elevators here are owned by the railroads; some of them are not.

Q. (By Representative LORIMER.) We have elevators that are exclusively public elevators, have we not?—A. They are so called.

Q. Are they not in fact?—A. I guess anyone can store grain there, provided they are not full; but the operators, I guess, generally put the grain in themselves. The impression is that most of the grain that passes through the elevators is owned by the proprietors of the elevators. Sometimes it is not.

Q. Have you heard of a cargo of grain in Chicago at any time within the last 10 years that the public elevators refused to take for storage?—A. I don't know that any case has ever arisen except when the house was full. Sometimes they have refused it. We had a case here, although I guess the house is not a regular public warehouse now. The case came up, I think it was yesterday, where the inspection department classed a grade as two or three, and it went to an elevator and they refused to accept it on that grade. Of course, the department had given that grade, but they would not take it on that classification.

Q. That was because they would be expected to turn out grain of the grade that the department had certified to, and they in fact believed it was grain of a lower grade?—A. Yes; they believed the inspector had erred.

Q. In other words, they did not refuse to take it because they wanted to exclude it?—A. No; I have not heard of that.

Q. (By Mr. C. J. HARRIS.) Would not that be a proper objection in some cases?—A. Most assuredly, for their own protection and the protection of the public at large.

Q. (By Mr. KENNEDY.) Are these so-called public warehouses that you speak of owned by men who are the great elevator men of Chicago, like Armour and Counselman?—A. Most of them are owned by the railroads.

Q. Most of the public elevators?—A. Some of them are not, and of course they are operated by individuals. Some of the railroad elevators are operated as private elevators, showing that there is no need of so many public elevators.

(Testimony closed.)

CHICAGO, ILL., November 18, 1899.

TESTIMONY OF MR. EDGAR H. EVANS,

Representative of the Indianapolis Board of Trade.

The subcommission being in session in Chicago, Representative Lorimer presiding, at 12.30 p. m., November 18, 1899, Mr. Edgar H. Evans was introduced as a witness, and, being duly sworn, testified concerning transportation as follows:

Q. (By Representative LORIMER.) What is your name?—A. Edgar H. Evans.

Q. Your place of business?—A. Indianapolis.

Q. Board of trade?—A. I am a member of it.

Q. What is your business address?—A. Hoosier State Flour Mills.

Q. Are you here as a representative of the board of trade?—A. I am.

Q. Will you please state in your own way any grievances or make any suggestions that you wish, as representative of the board or for yourself?—A. I invite your attention to matters of discrimination in the first place. You may know the freight rates of past years, but I will hastily run over them to bring out the point I wish to make. On November 10, 1898, the rate of freight from Chicago to New York was 20 cents on grain and grain products. On January 12, this year, that rate was reduced to 18 cents on grain and grain products, with this exception, however, that at the port of New York there was a discrimination of $1\frac{1}{2}$ cents on the hundred pounds; at the port of Philadelphia of one-half cent on the hundred pounds, owing to the change of the system of basing. This operated against the wheat miller to that extent, and the mills of the country made a protest to the traffic association, which was not regarded. On April 18 rate was made 17 cents on grain products, but on wheat and corn 11 cents, Chicago to New York. On September 18 a rate was made of 20 cents on grain products, but on grain for export 14 or 15, according to the tariff rates. On November 1 the rate was 22 cents for grain products and 20 cents on grain for export. I wish also to call your attention to the fact that from the Mississippi River, April 18, grain products were 19 $\frac{1}{2}$ cents and wheat and corn 12 cents. On September 18, from the Mississippi River to New York the rate was 23 cents on grain products, but on grain only 15 cents, or a discrimination of 8 cents a hundred. On November 1—I think—the Interstate Commerce Commission made a decree ruling that the rate from the Mississippi River is to be 24 cents on grain products and 20 cents on grain; a difference of 4 cents. This difference is still greater at points farther west, as you have been informed this morning. Now, to illustrate the effects of this, for instance on the corn miller, as we have 2 large corn mills at Indianapolis

as well as 3 large flour mills, I wish to submit a statement given to me by a miller the Cerealine Manufacturing Company, showing the cost of corn milled from 110 per cent points west. You will understand, Indianapolis being an interior point, its rate is a certain proportion of the Chicago to New York rate. Indianapolis rates are generally on the same basis as Chicago, except that the interior shipper can not get the benefit of the special low rates made for export, and he is thus cut out of the trade.

Grain loaded at 110 per cent points delivered at New York for export—basis, 22 cents.

| | Cost. | Per bushel. | Per 100 pounds. |
|---|----------|---------------|-----------------|
| | | <i>Cents.</i> | <i>Cents.</i> |
| 1,000 bushels corn, at 30 cents | \$300.00 | 30.00 | 53.57 |
| Freight, 56,000 pounds, at 22.5 cents | 126.00 | 12.60 | 22.50 |
| Delivered, New York | 426.00 | 42.60 | 76.07 |

Same milled at Indianapolis and product forwarded to New York for domestic use:

| | Cost. | Per bushel. | Per 100 pounds. |
|---|----------|---------------|-----------------|
| | | <i>Cents.</i> | <i>Cents.</i> |
| 1,000 bushels corn, at 30 cents | \$300.00 | 30.00 | 53.57 |
| Freight, 56,000 pounds, at 24 cents | 134.40 | 13.44 | 24.00 |
| Milling privilege, 56,000 pounds, at 1½ cents | 8.40 | .84 | 1.50 |
| Total | 442.80 | 44.28 | 79.07 |
| Grain delivered New York, as above | 426.00 | 42.60 | 76.07 |
| Net difference | 16.80 | 1.68 | 3.00 |

Q. (By Mr. C. J. HARRIS.) Net difference as against what?—A. In favor of corn for export. Now, as to its effect on flour mills—as to that I am a little more competent to speak—I would read a few letters that have been received, particularly showing the losses of business; and after this statement you can draw your own conclusions.

First, a letter from Manchester, dated September 6, 1899: "I regret that you could not see your way to book this little order, which was for the trade here. I offered the best price I could and am unable to advance on it. The competition of local millers renders business almost impossible at present American prices."

Next, a letter from London, dated October 31: "Sorry you could not see your way to accept our bid for 'Aurora.' As it turns out we do not think we should have done ourselves much good if you had. Winter wheat does not meet with the same demand it used to and is being rapidly displaced by English flour, which is in good demand. English wheat and flour have sharply declined and lost nearly all the previous rise. Of all the soft-wheat flours English is certainly the cheapest."

This from a Boston shipping firm which has a large export trade and also owns a mill: "Advices this morning from some of the principal ports are to the effect that local millers are turning out as good a sack of flour as any of the leading Minnesota mills, and selling it at considerably lower prices than the American mills are naming. This scores another base hit for the mill-ruining policy of the railroads. Hope before long something or other may turn up that will enable us to exchange more cheerful greetings."

Also a letter from Liverpool to corn mill: "But we regret there is not the slightest chance of any business at those prices. As regards Q. M. we are very sorry indeed that English makers are gaining ground from week to week, and somehow or other are underselling us right and left. We sincerely hope freights may soon come down again and that we can do a good business together."

To the same purport, on the 2d of August: "But it seems as if the present high freights are making it very difficult to get any orders through."

On the 25th of October, from the same firm: "Sorry there is no chance whatever to place any Q. M. at your present limit of 20/6, Liverpool. Makers here are underselling very considerably, and we simply have to look on. With present high freights we are afraid there is not much chance to do any business for quite a time."

From Amsterdam, August 1: "Your quotations didn't admit any business. It seems that competing mills are able to offer regularly lower than you."

Q. Some of these are corn mills?—A. Yes; some are from corn mills and two from flour mills.

Q. Is there much corn meal exported?—A. The export business to my knowledge has been growing very greatly in the past 2 years, and it is now a considerable business. It is not of as long growth as the milling of flour, because the European countries have been slow to recognize the value of corn for food aside from animal food; but it is very largely on the increase, through the efforts of the State Department, beginning about 2 years ago. Now, you can see from this that the business of the mills (I speak particularly of the interior mills) has been very considerably harassed. There has never been a time in the last 20 years—I am not competent to speak of so long ago, but I have it from others who are—there never has been a time in the last 20 years when the mills, at this time of the year, have been so largely shut down or running on half time. The millers, trying to get into the foreign markets, finds the foreign markets already occupied by the British miller; then he turns his attention to the domestic market, and, of course, that is all competed for, and competition brings prices down to a limit where he can run no longer, and he shuts down his mill—as has happened in Ohio, Indiana, and Illinois—shuts down to wait until the present crisis is over. This has meant to the railroad companies a loss of the handling of the coal to run the mills; it has meant to the manufacturers the loss of the sale of mill supplies; it has meant to the men employed a loss of wages; it has meant to the milling industry at large a very serious dragging down. Many mills have had to quit the business, and if this matter is to continue, they will largely have to go out of the business. But, on the other hand, the effect on the English miller: I was told by a gentleman who has just come from Europe in the interest of his mill that the English mills are running at a rate never before known; that their profits are large and they are getting trade that the American millers had worked for years to reach. In 1870 the American millers exported only 17 per cent of the total shipments of wheat and flour; the last few years they have exported between 40 and 50 per cent, varying with crop conditions here and abroad. The effect of this I should like to give from a letter sent to a milling journal by John J. Carter, of London: "The freight discrimination against flour is no doubt working very prejudicially against the trade, and is a fine thing for the English miller. It amounts to the same as if our Government should place a duty of say 6 cents per 100 pounds and allow wheat to come in free. This is what every miller here has been agitating for for years, in order to keep American flour out of our market. It hardly seems possible that such an anomaly will be permitted by your Government to last for any length of time. Other countries are paying their manufacturers bounties in order to encourage trade."

Along the line of the suggestion of the word bounty, a St. Louis miller makes the following remark: "As a side remark it is appropriate to remind the American miller that Germany puts a prohibitive tariff on American flour, but will import something like 35,000,000 bushels of wheat from America, which American railroads will ship at reduced rates to assist the German millers and consumers, while American millers are forced into idleness."

Now, how is this to be overcome? By putting wheat and flour, grain and grain products, on the same basis. We are met with the suggestion that railroads say it costs more. That has not been sustained either in the opinion of the trade or the opinion of the Interstate Commerce Commission, and I think further investigation will show that not only is the expense of transporting flour not more, but if anything a little less. I have seen a car of wheat come in from a country town to Indianapolis, loaded by a careful shipper, and yet when it reached Indianapolis, 30 miles away, it had lost 120 bushels, for which the railroads had to pay. If it had gone to New York, the trail of wheat would have left nothing, and the railroads would have it to pay. That is not the case with flour. In case of wreckage, the wheat is thrown on the ground; it can be scooped up, but there is wood and rubbish and stones in it, and it is valueless for anything but chicken feed; flour can be gathered up in sacks or barrels, and there is no loss.

Q. Do you mean to say they would ship the flour after it had been gathered up?—A. It is in bags, and can be sold at a close approximation to its original value.

Q. If the bags are burst?—A. In that case the flour is gone; but in the same case so is the wheat. They say the cars of flour are not loaded up as heavily; if that is the point, the millers are prepared, for export or any other trade, to load to a given limit; for they have agreed to, and have done so. I took a record of 16 cars from the books of the mill, and the average was 63,000 pounds to the car; I took the record of 9 consecutive cars, which would average 65,333 pounds to the car; very few shipments of wheat will excel this. We have loaded out from our mill 80,000 pounds in one car for shipment to Philadelphia. The pretext that it will cost

more is merely a pretext. When they were making this discrimination against flour from the regions in Indiana, Ohio, and Illinois, Minneapolis was getting 14 cents a hundred pounds less on flour than on wheat. In the first place no railroad has given a single reason that will stand, why flour, grain products, should be taken at a greater rate than grain for export. In fact, there have been numerous instances where the railroad men were opposed to it. When rates reach the low point, which was the case during the five months previous to September 18, several railroads, both East and West, refused to pro rate on that basis. I have talked with numerous railway officials, from the agents and the general managers of the roads to the traveling men who have been on the road for years and are thoroughly conversant with the situation, and without exception, in private conversation, they have agreed that the discrimination was wrong and that they would do what they could to overcome it. There was no reason that I have found to justify it. There was an explanation suggested to me by a railroad man, and it has been the only explanation that explains, and that is that some of the people are in some way or other interested in these large shipments of grain abroad. Of course, they could not lay their hands on the enormous amount of flour at once, but they can on a great amount of grain. Soliciting agents and general managers owe their position largely to the fact that they obtain a certain amount of tonnage for the railroads; whether for 2 cents or for 10 cents, they get their tonnage, and promotions are gauged that way. So long as that continues, so long will the financial interests of the railways be ignored and stockholders will have no voice. In support of that position I should like to read a letter from Mr. Ingalls. I wrote Mr. Ingalls as follows:

"Can your road and the other trunk lines afford to kill a business such as the inclosed clipping indicates? This you are doing most surely, and not simply by inches, but by long strides. At the present time there is not an export mill in the winter-wheat region, except a few that buy their wheat from first hands very cheap, that is able to do export business at any profit. There is not a mill that comes into competition with grain buyers of the East that is able to buy wheat and sell its output for foreign trade at a profit, and we are in that fix.

"Every year for the past 20 years, up to this time, we have been well sold ahead at this stage of the harvest. But what can we expect to do now? The British miller, the Dutch miller, the French miller, and the German miller are buying their wheat, bought in competition with us, at 6 cents a hundred less than we can afford to pay for it. We had hoped that the recent expostulations of the millers throughout the country and the facts brought out by the investigations of the Interstate Commerce Commission would have made the roads more reasonable. Instead of that they have adopted more arbitrary measures than ever, seeming intent to kill the milling business or, as has been hinted, in league with the large grain shippers.

"What logic there can be in giving grain the rate of 6 cents a hundred pounds less than the rate on flour for export we have not yet heard, nor can anyone, railroad man or layman, give any logical and just reason why there should be this amount of difference. We do not think your road can afford to adopt this un-American and unjust method of giving a bounty to the raw material. If the railroads are so enamored of carrying export freight at less than the domestic, and if they want to give a bounty to something, by all means give it to flour, and they will carry just as much freight and even more. All the American miller wants is to be put on the same basis, at least in approximation thereto, with the raw material, and he will take care of himself. But the discrimination that is now in operation not only robs him of his chance to live, but robs the railroads of a large amount of incidental freight.

"May we not count on your efforts to bring about a change in this at an early date? Your breadth of vision and true patriotism will surely show you the folly of subjecting such a large industry as the milling interest to such unfair and unjust disadvantage."

This letter was dated July 18, 1899. In reply I received the following letter from Mr. Ingalls, dated July 20, at Hot Springs, Va.:

"I have never been in favor of this reduction in the wheat rate. What ought to be done is to raise it to the same as the flour rate, and I hope shortly the railways will get tired of their insane competition and restore the wheat rate to a paying basis, and then the flour men can live. I will do everything possible to this end."

That, from a man who stands as high as any other man in railroad circles in the country, is worthy of the attention of every railroad man, and certainly of laymen. But apparently we are not able to bring this about by appeal to the railroads. The corn men had a difficulty. It was with them that the discrimina-

tion was first made some two or three years ago. They wrote and pleaded, but to no avail. They instituted a suit, and the railroads acceded to their demands and the suit was dismissed. Not long after that the discrimination was made again, and the corn millers ever since have been enduring it.

The Winter Wheat Millers, of which I am the treasurer, came before the Traffic Association here in Chicago. We were treated very courteously, and the secretary, Mr. Tucker, afforded us every opportunity to get the information we wanted. When we talked with the individual members, they were unanimously in favor of making the change in behalf of the mills. When they went into committee, the subcommittee voted for it; but in the general committee secret influence seemed to carry it adversely by storm, and nobody seemed to be willing to open his mouth to the contrary.

The only remedy we can see is in the way of giving the Interstate Commerce Commission more power to enforce its decrees. We shall then feel certain that if we have a grievance we can come before it and present our case, and shall get the justice that we should have. As it is, we have to deal with the railroad manager. If he wishes to make an experiment, he makes it, and there is no one to say him nay. It matters not if it disturbs the whole commerce of the country and brings disaster to any line of business—he has his say. The matter should be remedied so that no railroad should be allowed to disturb the commerce of the country, as it has been in the past, by action which has been shown to be indefensible, without previous legal authority, such as would be granted under an extension of the powers of the Interstate Commerce Commission.

One further discrimination I would invite your attention to, and that is the duty levied by foreign countries on grain and grain products. With the exception of England and Holland, and, I believe, one other European country, there is a discriminating duty levied on flour as against wheat. Of course, we are a protective country ourselves and can not blame them, but every commercial treaty is merely a matter of give and take. We give France a right to bring in wines, and in return for it she simply puts on a heavier duty. We tried to get up negotiations with Brazil, where there was a large trade in flour, and she turns around and puts on a heavy duty on flour as against wheat. The consequence is the millers in Brazil are developing very rapidly, and the entire line of shipping engaged in carrying flour there has been abandoned, and the trade which could have been worked up and kept up by proper negotiations through the State Department has been lost to the country; that has to be given up or crowded into other markets now already well occupied. Of course, the Department of State has been well filled up with business the past year; perhaps that is another reason for the establishment of the Department of Commerce to look after such matters. The Winter Wheat Millers in convention on two occasions have indorsed that movement very thoroughly.

Q. (By Mr. C. J. HARRIS.) You say you have presented your case to the railroad companies without getting any relief?—A. Yes.

Q. How long has this discrimination against manufactured grain products been in existence?—A. The discrimination has been in existence only since the first of the year—it was about February 1 the tariff was finally issued, making a discrimination of a cent and a half at New York and a half cent at Philadelphia. This was first shown in Chicago before the Central Traffic Association the latter part of February, but as I show from the list of changes in rates that evidently had no effect.

Q. The railroad companies could make more by carrying the flour from 100,000 bushels of wheat to New York at 22 cents than by carrying the grain at 12 cents, could they not?—A. That is one of the absurdities of the situation. The American millers are capable of grinding all the wheat in the country; running full time, their capacity is such that they could do it, but the grain is taken away from us under such conditions that there is no chance of life.

Q. Would a difference of 2 cents, according to the decision of the Interstate Commerce Commission, be satisfactory to the millers?—A. It certainly would be much better than the other; but the objection to that is the difference of 2 cents. That is supposed to cover the difference in handling at seaboard, but it is simply a pretext for a rebate to the shipper of grain.

Q. You think for the encouragement of the American manufacturers the rate should be the same?—A. The rate should be the same as a matter of public policy, if nothing else.

Q. (By Representative OTJEN.) It has always been the same heretofore?—A. It has always been the same heretofore.

Q. (By Mr. C. J. HARRIS.) In your article you simply allude to the traffic discrimination. You have no discriminations of a private nature in favor of one indi-

vidual as against another?—A. I think there is very little of that. When any rebates are made I think they have been very general as far as any specific locality is concerned.

Q. All ship on the published rate?—A. Yes.

Q. (By Mr. KENNEDY.) You said there has been no difference heretofore between wheat shipped East for domestic use and that for export; how long since the difference was instituted?—A. There was something done in 1896.

Q. They made a difference in 1896 against flour.—A. Not against flour.

Q. Against export grain?—A. In favor of export grain as against the domestic; but I think that also carried the flour with it. At least, we did not have much trouble until this year.

Q. When was it that you could get the same rate for shipping grain to the East that you had for flour, or the same for flour that you had for grain?—A. Up to the present year.

Q. Beginning the 1st of January last?—A. Beginning exactly on the 1st of February.

Q. (By Representative LORIMER.) Have you anything further to suggest?—A. One idea came to me when a former witness was speaking of inspection. Inspection at Chicago is a matter which dealers in my country are interested in. At times it is satisfactory, at other times not; it is dishonestly rigid and dishonestly lax—rigid coming in, lax going out. There are times when we have to bring down supplies from here, and we find that we get all kinds of wheat. When we ship up we have to have gilt-edge articles.

Q. Is not the difference a difference in grading between Indianapolis and Chicago; that is to say, is No. 2 wheat in Indianapolis graded as No. 2 in Chicago, or vice versa?—A. Under normal conditions; but during the Leiter deal in wheat you could not get into Chicago unless you had a strictly gilt-edge article. Wheat which ordinarily passed at No. 2 did not then.

Q. (By Mr. C. J. HARRIS.) Would wheat inspected at Indianapolis be received here at the same grade—would the Indianapolis inspection go here in Chicago?—A. I think it would as a normal thing.

Q. (By Representative LORIMER.) What do you attribute this discrimination to?—A. It is attributed to the efforts of the railroads to get traffic from territory that does not belong to them; in other words, the competition of the Gulf is the reason for it. But whether that is a sufficient reason is a matter more for rail-roading.

Q. Not the inspection?—A. No; I do not see that the inspection has anything to do with it.

Q. You say the inspection is lax going out?—A. As far as Chicago is concerned.

Q. You do not attribute that to the railroads?—A. No; that is merely a matter of inspection.

Q. What do you attribute that to?—A. We were entirely at a loss to know what to attribute it to. There were different ideas advanced, but probably none of them were worthy of serious consideration.

Q. Have you known of a cargo of grain graded at Indianapolis and shipped to Chicago and graded here below the Indianapolis grade?—A. Yes.

Q. By Chicago?—A. Yes. We ship our own wheat up here considerably, and in one or two instances the grade was cut, when in our market it would have been easily received.

Q. Did you protest?—A. It was in such a shape there was nothing to do but get rid of it at once. It was during the Leiter investment, and to delay it would have been to lose all the profit in it.

Q. Have you information of other gradings from your town?—A. I have known of instances, but I could not state exactly, not being interested in them.

Q. Do you have in mind any cargo of grain shipped from Chicago to Indianapolis graded higher here than its actual grade?—A. Yes; on a number of occasions. We did not make a written protest, as it would require a great deal of debate and a great deal of work, and perhaps even then we should simply be thrown over; it would come back to the board of inspection, and it is their position to sustain the inspector. It is a common feeling all over the country; they will not ship to Chicago when they can ship to any other market at the same price.

Q. Is the inspection at Indianapolis under State supervision?—A. No; under the supervision of the board of trade.

Q. Do you know whether the State supervision is rated higher or lower than the private supervision?—A. I can only give the impressions I have gathered from others, that the State supervision is apt to be very irregular, owing to the matter of political appointments entering into it.

Q. Do you know anything about the appointments in the Chicago grain inspection?—A. No; I do not.

Q. You are not aware that most of the men here have been in the service over 20 years?—A. No.

Q. Did you hear Mr. Clark state that the Peoria grain inspection was private and a poorer inspection than the State inspection?—A. I am not acquainted with that.

Q. (By Mr. KENNEDY.) Have you spoken for the Indianapolis Board of Trade on the subject of pooling, or could you speak for them on that subject?—A. Not for the board of trade. That subject has not come up in my recollection as a board matter. The feeling among the millers, speaking for myself, is that pooling should be allowed, but only under the supervision of the Interstate Commerce Commission.

Q. (By Representative LORIMER.) Do you know that the Chicago Board of Trade has a committee known as the arbitration committee?—A. Yes.

Q. To which protests on inspection are submitted?—A. Yes.

Q. And these complaints that you have suggested with reference to the inspection were never submitted to that board?—A. No; the difference was not great, and probably not enough to make a great fuss about; but it was not equitable.

Q. What was the difference?—A. One and a half to 2 cents a bushel on a matter of 2 or 3 carloads. It would not pay to come up here and make a protest.

Q. At 1½ or 2 cents a bushel there would not be so very much difference in the grade, would there? A man might honestly make that difference in the inspection?—A. Well, when it comes to the inspection, that is all the difference between No. 2 and No. 3 wheat at times.

Q. Is there not a difference in No. 2 and in No. 3 wheat—you get one grade in No. 2 that is better than another grade of No. 2 that you may receive on the same car?—A. There is a bottom limit on No. 2, but no top limit. From a certain grade up it is No. 2.

Q. So there might be a high-grade No. 3 and a low-grade No. 3, and a low-grade No. 2 so close to the high-grade No. 3 that a man might possibly honestly make a mistake?—A. That might be done.

Q. And might that not be the case in the instances you mention, without criminal intent?—A. It is either criminal or careless.

Q. Are you in favor of a national inspection?—A. I have not given the subject much thought.

Q. Do you think it possible to have a national inspection?—A. In a modified form only; I think it would be rather impracticable, on the whole.

(Testimony closed.)

CHICAGO, ILL., November 18, 1892.

TESTIMONY OF MR. CHESTER A. FULLER,

Norfolk, Nebr.

The subcommittee convened at 2 p. m., Representative Lorimer presiding. Mr. Chester A. Fuller was sworn, and testified concerning railroad discriminations as follows:

Q. (By Representative LORIMER.) Please state your full name, address, and business.—A. Chester A. Fuller, Norfolk, Nebr.; abstractor of titles. I will state to the commission that these remarks are in regard to the discriminations of the railroad companies in extending local freight rates to certain localities, to the detriment of rival towns, in respect to manufacturing and jobbing enterprises. The locality which I refer to is in the northeast part of Nebraska. In order to give a more definite basis of comparison let us take two towns, Norfolk and Fremont. Norfolk is credited with a population of 5,260, and was first organized about 1866. Fremont was organized about 1858, and is credited with 10,000 population. The territory tributary to Fremont is encroached on from the south and east by numerous other jobbing points, while Norfolk stands practically alone in the territory tributary to her. A circle drawn around Norfolk with a radius of 75 miles embraces no other town of equal population or railroad facilities. This region is well defined by river courses and by established railway lines. One line 485 miles long in northern Nebraska includes four tiers of counties, an empire in itself. Railroads diverge in five directions from Norfolk. Norfolk has among other thriving industries a beet-sugar factory wherein are handled annually about 32,000 tons of sugar beets, yielding a product of 3,500 tons, or 7,000,000 pounds, of the finest quality of sugar, awarded the highest standing in

the recent Trans-Mississippi Exposition. Its roller mill markets its products, and a specialty known as "Wheatling," in every Western State south as far as St. Louis. A foundry and manufacturing company furnishes an improved furnace and a practical gasoline engine and employs 20 men. A creamery company, with 20 skimming stations established in surrounding towns, has a capacity of 15,000 pounds of butter per day. Here is located a State insane asylum now accommodating 300 patients, and its full capacity is not yet reached. The city, in accordance with the socialistic tendency of the present day, owns and successfully operates its own waterworks. In the grain-shipping business only one small elevator is in operation, with a capacity of 9,000 bushels, but this is explained by the fact that upward of 2,000 cattle and 18,000 sheep are fed, affording a home market for the grain raised in the immediate vicinity. Mr. W. H. Dexter, of Lowell, Mass., operates here a butter and egg refrigerator, shipping the product to his Eastern home; his complaint is that the local rate from Sioux City to Norfolk is 75 miles haul, takes the profit, and instead of marketing in Chicago or in some other Western market, he is compelled to take advantage of the low rates between the Missouri River and the East in order to make a profit on his product.

In an educational and literary way Norfolk has a full complement of schools, including a \$20,000 high school, two daily newspapers and four weeklies. Referring to the map, you will notice that Norfolk's railway location is similar to that of Lincoln, in the southeastern part of the State, indicating a commercial center, and the geography of the State amply sustains the wisdom of this opinion. Fremont operates a foundry and machine shop, a brewery marketing its beer in this section, a butter-tub cooperage factory, a creamery, saddlery and harness factory, woolen mill, mill-machine factory, three elevators, a pickle works, and factories for the manufacture of cigar boxes, wire fence, hemp, and other small factories. Fremont is accorded a rate which in effect gives it an advantage over Norfolk, in that the rate from Chicago and other eastern points to Norfolk is computed by adding to the rate to the Missouri River the additional local rate of 45 cents per hundred on first-class freight, other classes in proportion; while the rate to Fremont is the same as that to the Missouri River. The effect of this can readily be seen in that Fremont factories and jobbers can ship into territory naturally tributary to Norfolk at an advantage over Norfolk institutions of the same character equal to the difference in the rate. We are told that the rate is reasonable; that the lower rate is accorded Fremont owing to competition. The roads entering Norfolk are controlled by one system and its Pacific coast connection. We are perhaps not prepared to say that the rate is not reasonable, for the reason that water transportation is not available and the ox cart and prairie schooner are out of date. It has been suggested that whereas the rate to Norfolk from the Missouri River is based on the distance to Sioux City, a distance of 75 miles, and the same rate is accorded to Omaha, a distance of 118 miles, perhaps the rate to Norfolk should be raised to correspond to the additional distance. This might prove a means of increasing the first cost of articles laid down in Norfolk, but if the rates were equalized by making the rate to Fremont proportionate to the additional distance and in the same proportion as to points beyond it would afford some relief. Through rates are now established arbitrarily by the railroads to certain favored points. Perhaps the advantage to the public should not be questioned, with the exception of their effect in building up one locality at the expense of another, naturally more favorably situated. Were the rates established by the Government instead of at the will and pleasure of the railway managers, it is a natural conclusion that points having the same general conditions would receive equal benefits under that arrangement.

Among other things, it is noted that the rules of the Interstate Commerce Commission in reference to the publication and display of tariffs of rates are constantly violated. In regard to rebating to individuals, I have not made any particular investigation but one leading dry goods firm assures me that so long as it secures a rebate of 25 per cent at the expense of its competitors it has no objection to the present status of rates. It is a well-recognized fact of trade that the grocery business, so far as jobbing is concerned, is confined largely to houses covering a very limited amount of territory. Some 10 years ago a wholesale grocery house established a jobbing branch at Norfolk. Its receipts during the year were \$155,000, and this on an average stock of \$12,000. This business was conducted on a basis of 25 per cent rebate, on the tariff existing at that time. Owing to a conclusion by one of the roads that it was not getting its share of this business the rebate was arbitrarily withdrawn. The company at once abandoned its local branch and handles this territory from Omaha, a distance of 118 miles. A through rate is made to Norfolk from Minneapolis, but none from Chicago except by adding the local rate to the rate to the Missouri River. This is also true of all other sources of supply in the East. I believe

Minneapolis is the only exception. The discrimination which is being practiced is detrimental not only to the immediate locality for which I speak, but in an equal measure to the East, from which we must secure our supplies, raw material, groceries, clothing, agricultural implements, etc., with which to develop this section, and especially to Chicago jobbers, who suffer because they are practically barred by the lack of the through rate.

We are told that the rate of 45 cents for 100 pounds from Sioux City and Omaha is the same as the rate to Fremont, and is a reasonable rate, and that we should not object to it; that is, 45 cents per 100 pounds, first class, from Sioux City and from Omaha to Norfolk. From Sioux City to Norfolk is 75 miles and from Omaha it is 118 miles. The railroads entering Norfolk are the Chicago, St. Paul, Minneapolis and Omaha from Sioux City, and the Fremont, Elkhorn and Missouri Valley road from Omaha; the branch of the Chicago, St. Paul, Minneapolis and Omaha road terminates at Norfolk, the other road running in is the Union Pacific. As I stated before, we are not prepared to say that this rate is not reasonable. This road here [indicating] is the northeasterly connection of the Union Pacific; they ship their coast business through here.

It has been suggested by the railroad companies, when we ask for a lower rate, that we have the 75-mile rate, but the truth of the matter is that Omaha is the base of supplies, and not Sioux City, and it is 118 miles to Omaha. As the matter now stands, Fremont enjoys a Missouri River rate, and a man shipping in his raw material from Iowa, or from Eastern points, to manufacture, gets the advantage of that rate, while the Norfolk man, if he ships from Iowa, or other Eastern points, to Sioux City, has to pay the additional local rate to get to Norfolk; that is to say, the Fremont shipper is saved the amount of the local rate from Fremont to the river.

Q. (By Mr. KENNEDY.) Where is Fremont on this map? It is pretty close to the river, is it not?—A. Yes.

The Chicago, St. Paul, Minneapolis and Omaha road has no tariff sheet hanging up in its office. No person knows what the rates are without going to the agent, and when one does he generally gets the impression that he is encroaching. They feel that perhaps he wants the rates in order to make trouble, and they don't care to have the other roads know what their rates are. The company, however, claims that it is practically complying with the law by having a card stating that the rates can be ascertained by applying to their agent, which card they have posted up in their office. In regard to reparation to individuals, I have not made any investigation along this line. I mention these things in conjunction with this question, and will say that I went down the street one day and got a list of 130 names; a large proportion of the business men pledged their moral support for the movement to secure more equitable freight rates. Many others absolutely declined to sign any such agreement to give their moral support, and they gave me to understand that they were satisfied with the treatment accorded to them by the railroad company. Then, in these particular cases, they had a rebate of 25 per cent on spring and fall orders.

It is a well-recognized fact of trade that grocery jobbing houses do the large business in their line and that a comparatively small portion of the local jobbing houses handle the goods within their territory, and the matter of freights is likely to give the retail merchant in marketing his produce a disadvantage compared with the wholesale jobbing houses and grocery jobbing houses, and the retailer has to purchase from the nearest jobbing house whatever he wants. In Iowa there are local jobbing houses scattered around all over the State, owing to the distance tariff enforced by the State board for Iowa, and they usually buy from the nearest jobbing house. These jobbing houses turn their money upward of twelve times a year, and with a very fair profit on the money invested in their business; and yet during the past and other years a smaller amount has been done from the Omaha and Sioux City houses, while the business has been handled through the nearest houses, handling their goods from Norfolk instead of from Omaha. Now, this matter has been taken up with the railroad companies. It was taken up first, I think, because there was a sentiment among the business men—while they did not want to have any hard feelings about it, they had no doubt they were discriminated against. The same road, the Chicago, St. Paul, Minneapolis and Omaha, running out of Sioux City has the rate of 22 cents for the 75-mile haul in one direction—that is, in Iowa, and except in the direction of Norfolk—the rate per ton down to the Black Hills, South Dakota, is 75 cents, or .0779 cents per ton per mile; the same local rate to David City, 78 miles, is .0641 cents per ton per mile, while from Sioux City to Beemer, 168 miles, the rate per ton is only .0524 cents per ton per mile. After going to the railroad company, they had a meeting at Omaha, inviting me and our business men down there to present our case to them, and after the first 15 minutes of conversation there was nothing said

about the railroads doing the square thing and reducing the rates, except that it would mix things up for them to change the tariff, and that they would have to adjust all their rates in that part of the country if they made a change. Then the matter was taken up with the State board of transportation. The Nebraska transportation law is copied very closely, I might say it is an exact copy of the interstate-commerce law, applied, of course, to the State. The State board took the position that these roads were shipping from Sioux City to Norfolk, and Sioux City being an Iowa point, it was a matter for the Interstate Commission, and the State board had no jurisdiction, and they dismissed the complaint. At this time there is a case which is now pending on that point before the Interstate Commerce Commission and which has not been reached for a decision.

Q. (By Mr. C. J. HARRIS.) How much of a place is Fremont?—A. Fremont has about 10,000 population.

Q. Has it increased rapidly in the last 10 years?—A. It has not increased rapidly, but it is growing steadily, while Norfolk has gained little, if any, in 5 years.

Q. What is the population of Norfolk?—A. Accredited to be 5,260. Perhaps it is a little more than that now.

Q. Is it not an increasing population?—A. Very slowly.

Q. Have you any complaint to make about your grain rates in Chicago?—A. No, sir; the complaints that have been discussed by the association have not been in regard to these Eastern rates—the grain rates.

Q. Do you have a board of railroad commissioners in your State?—A. Yes. But in the State of Nebraska the constitution provides that no additional offices shall be created by the legislature without an amendment to the constitution, and in effect this has caused the State board of railroad commissioners to be made up of the governor of the State, the secretary of State, the State auditor and the State treasurer. All of the State boards are composed in the same way of the public officials; but the work is done by secretaries appointed by the governor, who make their report as to the business they have transacted to the actual board of State officers, and their action goes on record as the action of the governor and the State officers as the board.

Q. Have you laid your case before your railroad commission?—A. In the State; yes.

Q. What was their reply?—A. Their action was to dismiss the complaint, from the fact that they thought it was a matter that was out of their jurisdiction and that it was interstate-commerce business instead of local business. Their opinion was this: They told us at the time of hearing the complaint that there was certainly something wrong, and that there was some means of adjustment for it, but that they had no jurisdiction of the matter, as it was interstate business entirely, Sioux City being in Iowa.

Q. Could they not regulate the local part of it? That part of it in your own State? It would be almost entirely in the State of Nebraska, would it not?—A. No; the rate is made from Sioux City, which is out of the State of Nebraska, and the rate advances very rapidly. That is, the rate is from Sioux City, which is just across the river, a matter of a mile, perhaps, and a difference of 5 cents is made there, which is due to the bridge across the Missouri. Down at Norfolk it is a mile and a half to the switch known as Hope siding. There is a difference in that rate to Norfolk of 3 cents for that mile and a half to Hope, where there are no facilities for handling freight whatever, so they go on to Norfolk and stop and unload the freight and then go back to Hope the next morning.

Q. That is one of the terminals of the line?—A. Yes; Norfolk.

Q. I understood you to say the Interstate Commission decided you did not come under the interstate law?—A. No; you misunderstood me.

Q. I was asking for information.—A. The State commission is the only one that has passed upon it.

Q. Did I not understand you to say something about the Interstate Commission?—A. Yes; we had a case before them for consideration, but it has not come up yet.

Q. I understood you to say you had some decision from them.—A. No; that was the State commission.

Q. (By Mr. KENNEDY.) Your complaint is against the Sioux City road and not the Omaha road?—A. Both roads come in there, although they are practically the same management. The shortest haul should govern the rate in any event. If the Sioux City road would reduce its rate on the distance basis and make that their tariff, as their tariff invariably and in such proportion to other places would seem to indicate would be correct, then the Omaha road would voluntarily reduce its rates, because of the Omaha shippers, and to allow the merchants of Norfolk

to purchase their supplies from them instead of going to Sioux City because of the lower rate.

Q. If you obtained your supplies from Omaha that would be in the same State and would come under your State commission. How are the rates from Omaha?—A. They are satisfactory; you can not complain of them at all on the ground of being unreasonable. I have some other items. In the discussion of this matter before our association it seemed that the creamery men were shipping butter to Sioux City by express, the belief being that the rate by express is as low as the rate by freight, and the expressman can come after the butter at the creamery and deliver it to the customer in Sioux City. Of course that was a very desirable arrangement. But as soon as the railroad company found it out they adjusted things, having the express rate raised so that the creamery men would have to ship by freight. There was a scheme devised at Norfolk, so far as the Northwestern was concerned, when the railroads became very arbitrary in the matter of freight rates, and they formed an agreement to have freight shipped from Chicago over the Illinois Central or some other road than the Northwestern, that would get the other end of the haul. That was met by the refusal of the Northwestern to receive the freight if you wanted to haul from Sioux City; in came the Omaha road, the Chicago, St. Paul, Minneapolis and Omaha road, with lines from Council Bluffs to Norfolk. By their line the distance would be perhaps 150 miles. You had to go up around by Emerson and back by Norfolk. That line still takes passengers and freight from Council Bluffs to Norfolk, but they refused to make their rate; there is no tariff made by them, and the rate would be the same from Council Bluffs to Norfolk over this 150-mile haul as it is from Sioux City over a 75-mile haul.

Q. Have the farmers of your community a competitive market for the sale of their grain; can they sell their grain to more than one dealer?—A. Yes.

Q. It is not monopolized?—A. No; there are two dealers there; one of them loads it on the car and ships it out; he has built a small elevator.

Q. He loads in cars and ships it out?—A. Yes; and the stock-feeding market furnishes a competitive market for grain, and especially for corn; they haul it out north to the surrounding towns.

Q. Do these dealers actively compete, or do they have an agreed price to pay for the grain?—A. I can not say as to that; I don't say that they compete very hard against each other, because I don't suppose they do.

Q. The farmers make no complaint?—A. I have heard none; there has been a complaint made by grain men and lumbermen that the railroads are encouraging the jobbing business in other towns from 3 to 5 miles away for the purpose of diverting the trade from Norfolk and sending it to the elevator men and lumber merchants in those adjoining towns, and in the lumber business that will eventually run some of the lumbermen out of business there. In the grain business it is for the purpose of avoiding the pooling features which are supposed to exist there, although the railroads are practically under the same management; that is, they have a different board of directors, but it is practically the same thing as one road. It is supposed that an agreement exists by which the Union Pacific receives the initial shipment, and they take 60 per cent of the tariff and divide the other 40 per cent between the two other roads, and these small elevators in control of Norfolk's grain business and the lumber dealers must submit to this for the purpose of allowing each road to handle this business separate, and without contributing to the pool.

Q. You say Norfolk has no complaint about the roads east from the State?—A. That has not been discussed in the situation; I don't know of any complaint in regard to them except—

Q. Any discrimination practiced against Norfolk?—A. Except in Fremont a man can ship his goods and market them in the Chicago market to an advantage, while at Norfolk the local rate out from the river, the Missouri River, is added to the rate between Chicago and the Missouri River; therefore, he must ship clear East in order to market his product to an advantage.

Q. Have you any opinion on the subject of pooling?—A. Only an opinion.

Q. Can you speak for the business men of Norfolk?—A. No, not as an association; I have heard individual opinions advanced; we have no proof of the pooling.

Q. I mean are you in favor or opposed to pooling?—A. I am opposed to it.

Q. Can you state your reasons for being opposed to it?—A. For the reason that while competitive practice naturally regulates these matters, pooling practically prohibits competition, or at least avoids competition.

Q. Suppose pooling was put under the supervision of the Interstate Commerce Commission and they had authority to make and adjust rates in any part of the country, would you be in favor of it then?—A. Yes; I think that under the supervision of the Interstate Commerce Commission it would be all right.

Q. Are there any complaints on the part of the Norfolk business men about the telegraphic service, particularly as to the charges made?—A. That matter has not been discussed in the business men's association; there are constant complaints as to the amount of tolls charged by the Western Union Telegraph Company on the out-of-town business, and also that the telegraph company makes the customers pay the revenue tax.

Q. Are you in favor of or opposed to Government control of the railroads and telegraph?—A. I am in favor of Government control.

Q. Do you think that expresses the sentiment of the business men of Norfolk, and that you speak for them?—A. I think the majority of them are in favor of it.

Q. Can you state your reasons for being in favor of Government ownership?—A. Only in a general way, but one reason is, that the postal service as administered by the Government is very satisfactory, both as regards the service and the cost and the condition of things among its employees. I understand the British Government operates the telegraph and telephone service exclusively, and I don't see any reason why the United States Government should not do the same thing.

Q. Have you any fear that the national Administration would undertake to perpetuate itself in office if it had control of the railroads of the country and the telegraph service; that is, if the Government owned and controlled them?—A. No.

Q. (By Representative LORIMER.) Have you anything further to suggest?—A. The rate from Sioux City, the nearest point to the Missouri River is Sioux City, and the distance from Norfolk is 75 miles by way of the Chicago, St. Paul, Minneapolis and Omaha Railroad; and we are charged the same rates for all classes of freight for that haul of 75 miles that are charged from Omaha, a haul of 118 miles; and the latter is charged at full local rates. As proof that this discrimination does exist it is only necessary to compare the rates from Sioux City to Norfolk with the rates between other points equidistant. Here are a few comparisons: The rate per ton per mile on first-class freight from Sioux City to Norfolk, 75 miles, is 12 cents; the rate per ton per mile from Sioux City to Alcester, S. Dak., 77 miles, is 0.0779; that from Lincoln to Dakota City, 78 miles, is 0.0641; while from Sioux City to Beemer, 168 miles, the rate per ton per mile is only 0.0524. These are some characteristic examples of the discrimination.

CHICAGO, ILL., November 20, 1899.

TESTIMONY OF MR. H. M. SAGER,

Secretary Northern Milling Company, Chicago.

The subcommission met at 2 p. m., Chairman Lorimer presiding. Mr. H. M. Sager, being duly sworn, testified as follows:

Q. (By Representative LORIMER.) Will you please state your full name?—A. H. M. Sager.

Q. And your business and place of business?—A. I am treasurer of the firm of Norton & Co., of Chicago, and also secretary of the Northern Milling Company, of Chicago; engaged in the milling business.

Q. Do you come in place of Mr. Eckhart?—A. Yes; Mr. Eckhart was unable to be here on account of a meeting of the commissioners of the sanitary board this afternoon, and requested me to take his place here.

Q. As I understand, he was going to testify as to grievances the millers of this section of the country have on domestic and export rates?—A. Yes, I believe so.

Q. Will you, in your own way, state to the commission what you have in mind with reference to these discriminations?—A. The difficulty that we labor under and that is depressing the milling industry more than any other, and that in the judgment of all millers, I believe, will destroy the milling industry so far as export business is concerned, is the discrimination practiced by the railroads (one of comparatively recent origin), whereby they give a lower rate of freight on wheat destined for export than on flour. We are obliged to sell our flour in Great Britain in direct competition with British millers who have mills at seaboard ports like Leith in Scotland and Liverpool in England and Dublin and Belfast in Ireland, and who mill very largely American wheat. They are enabled to buy that wheat in the Western part of the United States through brokers in this country, or direct from elevator proprietors, and carry it forward from point of origin to Liverpool, for a very much lower rate than the railroads grant on flour

going to the same markets. That of course enables the Liverpool or London or Leith miller to offer what is practically American flour, made from American wheat, milled by English and Scotch labor, very much lower than we can offer the same product delivered in the same market. That is driving us out of that market, and if continued will ultimately destroy the American industry of milling for export. Of course we feel that the American milling industry, being one of the largest industries in the United States, representing, I believe, an investment of about \$250,000,000, and paying wages to American labor to the extent of some \$27,000,000 annually, ought to be protected at least so far as to have the same rates of freight that are given to the English miller on an American product. We have no protection; we ask no protection; I mean no tariff protection. Our product, of course, all goes directly abroad, and tariff protection would be of no special advantage to us. But we do ask to be placed upon the same footing with the English millers in milling American products. The discrimination in effect at present is much less than it has been all summer, because, I think, of the ruling of the Interstate Commerce Commission that was published a few weeks ago.

Very early in the present year, until the 1st of November, the discrimination was so great as to practically prevent our doing any export business at all, speaking for my own firm at least. We did very little export business at all during that time, and what little we did do was on contracts we made before the first of this year, which we were obliged to carry out. Since the 1st of December the difference between wheat rates and flour rates has been modified; but there still is a difference whereby the railroads carry wheat for export at a lower rate than flour.

Q. (By Mr. C. J. HARRIS.) How much was that difference during the summer?—A. I believe the tariff rate from the Mississippi River to New York for export wheat, all rail, was 10½ cents at one time. I am certain it was as low as 12 cents from the Mississippi River for export wheat, all rail. The rate at the same time on flour from Chicago to New York, for export, all rail, was 17 cents per hundred, so if the rate of 12 cents was the lowest tariff it would make a discrimination of 5 cents per hundred, in addition to which the Chicago miller has to pay the rate from the Mississippi River to Chicago. The same rate was made from the Mississippi River to New York as from Chicago to New York on wheat, but on flour we were obliged to pay the rate from the Mississippi River here, and after milling it pay the higher rate on the product from here to New York. The rate to-day on wheat for export from the Mississippi River to New York is still the same as from Chicago to New York, whereas on flour we have to pay the local rate from the Mississippi River to Chicago. I mean the miller here would pay the local rate on wheat from the Mississippi River to Chicago, and then from here east he would still have to pay a higher rate on the flour than is paid on the wheat sent east to New York from the Mississippi River.

Q. (By Mr. KENNEDY.) The same rate Minneapolis would pay?—A. I am not so conversant with the rates from Minneapolis. I presume the proportion of a through rate from Minneapolis to New York for export wheat from the Mississippi River east would be the same as if we bought it in the same position at the Mississippi River, but I am not certain about that. I do not testify from positive knowledge upon that point.

Q. (By Representative LORIMER.) What is the local rate from the Mississippi River?—A. Do you mean the all-rail rate to New York?

Q. To Chicago.—A. I don't know. I believe it is about 5 cents per hundred. That would be about 3 cents per bushel.

Q. (By Mr. KENNEDY.) You said you had an export rate on flour from Chicago?—A. The rate on wheat from the Mississippi River to New York is the same as the rate on wheat from Chicago to New York. The rate on flour—of course none of our flour originates west of Chicago—but speaking from the standpoint of a Chicago miller, the rate on our product from the Mississippi River would be made up of the rate from the river to Chicago, or the proportion of a through rate which they would charge, stopping it here at Chicago, plus the local rate from Chicago east on flour. That rate is higher than it would be on wheat.

Q. (By Representative LORIMER.) About 10 cents a hundred the way you figure.—A. Not at present; no. The present all-rail rate from Chicago to New York on flour is 22 cents, whether for export or for domestic consumption. But the rate on wheat, all rail, from Chicago to New York, if intended for export, is 20 cents per hundred; and they make that rate of 20 cents per hundred on wheat also applicable from the Mississippi River; so that an English miller competing with us can buy wheat at the Mississippi River and get it taken to New York for 20 cents per hundred for export, whereas we have to buy the wheat delivered at Chicago, pay-

ing the freight from the Mississippi River here, and then pay 22 cents a hundred from here to New York.

Q. Then the difference in wheat on local freight is about 5 cents, you think?—A. I believe it is about 5 cents per hundred, not 5 cents per bushel. The difference between flour and wheat would be 2 cents. I think that would be it approximately.

Q. (By Mr. C. J. HARRIS.) It has been as high as 10 cents during the season?—A. They made a rate during the greater part of this year as low as 12 cents, or, I believe, as low as 10½ cents, tariff from the Mississippi River to New York on wheat for export, while the lowest rate we have had on flour from Chicago was 17 cents.

Q. (By Representative LORIMER.) So, then, you had at one time a difference of about 10 cents?—A. It made a difference of 7 cents between wheat and flour from Chicago east, besides the freight that we had to pay from the Mississippi River here. The Interstate Commerce Commission held a session in regard to that discrimination and issued a recommendation that the discrimination be stopped, and, I think, acting upon that recommendation, the railroads have modified the discrimination.

Q. (By Mr. KENNEDY.) Didn't the commission decide what the difference between wheat and flour ought to be?—A. I don't know whether they did or not. They certainly decided that there was a gross discrimination being practiced and that it should be done away with. Whether they made any special recommendation as to any difference or not I am not prepared to say. I presume they did.

Q. (By Professor JOHNSON.) I should like to ask Mr. Sager if the discrimination against the miller at the present time is not even stronger at intermediate points between Chicago and the river than it is at Chicago?—A. I really don't know. I am not acquainted with any millers between here and the Mississippi River, and don't know what their rates are.

Q. It would come about in this way, would it not: The Chicago miller in purchasing his wheat has the advantage of a competitive rate into Chicago and a competitive rate out, whereas the local miller would have the advantage of neither?—A. I think that is very likely true.

Q. I understand from what they told me in Milwaukee that the discrimination against the local millers from the Mississippi River points is very strong at present.—A. I think that is true.

Q. If that is true and is not modified will it not have a tendency to concentrate the milling interests in the large cities; that is to say, if the present condition of things is allowed to exist?—A. In so far as the millers in large centers have an advantage I think that would be true, and if this discrimination is allowed to continue my own opinion is, judging from our own business and that of those of our neighbors who have told me how it affected them, that the final outcome will be that it will lodge all of the export business in the hands of the English millers. I don't see how it can be otherwise. They at least have cheaper labor than we have, and owing to cheaper construction, owing to a less cost on account of cheaper labor in constructing mills, their plants have cost less than ours; and if they are to have the added advantage of getting American wheat forwarded to Liverpool cheaper than an American miller can get American flour forwarded they certainly will be able to undersell us in their own market and prevent us from doing any business in those markets. At the present time we have a certain recommendation for our brands over there, and those brands are being called for, and that has prevented the American flour from being entirely shut out of the English market. But as the trade there finds by experience that they can buy flour made from the same kind of wheat raised in Minnesota and Dakota, only milled at home, and for a lower price than we can offer them that class of flour for, they will gradually work over to the English brands of American wheat flour, and that, of course, will take away all the trade the American miller has in those markets. It could not be otherwise, because the competition in the business is very keen and the margin is very small, and a difference of 5 cents a barrel, which would be 2½ cents a hundred pounds, in selling prices, if maintained perpetually, would drive us out of the market.

Q. (By Mr. KENNEDY.) Have you an opinion as to the influences that operated to bring about this discrimination against the American miller?—A. That would be simply a matter of opinion. I never knew.

Q. Have you ever heard it discussed among millers?—A. I think millers believe, to a certain extent, that the railroads are interested in having the product go forward as wheat rather than as flour.

Q. Because they prefer to handle wheat?—A. No. I believe from interest in terminal facilities for handling the wheat; that they have interests in elevators and in the transfer facilities at the terminals whereby they have a profit on the

shipment of the product as wheat that is over and above the profit that the railroad secures for simply the carrying charges. I say that is simply a matter of opinion. I am not stating it now as a matter of knowledge.

Q. Is that the general opinion among millers?—A. I believe that is the opinion of millers generally. They can not account for discrimination against American industry on any other ground than that of a selfish interest. It seems incredible that the stockholders of the railroads, ordinarily speaking, would desire to see an industry destroyed that gives them a freight both toward the West and toward the East. It seems incredible that it would be done if there was not some special object in it for interested officials. The mills are centers of population. Wherever there is a large milling center there is necessarily a large population, comprised mainly of the operators, and this gives the railroads the handling of freight toward these mills, consisting of all the supplies for the employees and of the supplies for the mills, such as barrels and sacks, machinery, coal, oil, and the thousand and one things that are used and must be brought to the mill. Then, in addition to that we give them the outbound freight, which is the same they would have handled if they handled it as wheat. Why they should discriminate against such a large industry, as they are doing, to an extent which will virtually ruin the export milling business unless the officials of the road who control its policy profit personally by it the millers can not understand; and the only way they can explain it is on the theory that the officers are interested in some way in having the product go forward as wheat. Personally, I believe that to be the case, although I can not prove it. I do not state it as a matter of fact.

Q. (By Professor JOHNSON.) Would that refer to the handling of wheat or grain in Chicago and New York both?—A. Yes; particularly at such points as Chicago, and, possibly, Minneapolis and St. Louis and the junction points, where the grain is transferred, and an elevation is earned on wheat that they would not secure on flour.

Q. Would the millers be in favor of prohibiting the owners of elevators, public elevators, from buying grain?—A. They would, decidedly; yes.

Q. I have recently heard some complaints of the price of bran raising at the same time the price of wheat was falling. Do you think that is due to the lessened output of the American mills?—A. There are several things that affect the price of bran and mill stuffs generally. For instance, a short crop of hay would create a larger demand for other feeding stuffs, and would affect the price of bran; but, generally speaking, the price of bran is more or less influenced by the activity of the mills. If the mills are all running full capacity, there is an enormous output of bran, and that makes the price of bran to American feeders lower, because we are competing with each other to sell a big product. When the milling industry is languishing, and the mills are running only part time, or not at all, the output of bran is very much curtailed, and the competition among feeders to get it puts up the price. So that, while the price of bran is influenced considerably, as I have said, by such factors as a large or small crop of hay or corn, I think it is more influenced by the ability of the mills to run full capacity.

This is a rate notice, No. 149, and it specifies the rates on grain and grain products from the Mississippi River crossing east. It gives the rates to New York at present on grain and grain products, for local New York consumption at 25½ cents from the Mississippi River; wheat for export to New York, 20 cents from the Mississippi River, or 5½ cents less than on grain or grain products for domestic consumption in New York; grain products for export, to New York, 21 cents from the Mississippi River, or 4 cents per 100 higher on grain products from the Mississippi River for export than on wheat from the Mississippi River for export.

Q. (By Mr. KENNEDY.) That would mean flour?—A. Grain products mean flour, yes.

Q. What is the date of the circular?—A. October 13; and it says: "Under the rates taking effect November 1 the following are the proportions of the through rates applicable from all Mississippi River crossings from East St. Louis to East Dubuque inclusive." That would practically give wheat from the Mississippi River for export a preference of 4 cents per 100 as compared with the rate on flour from the Mississippi River to New York for export.

Q. The difference is 2 cents from this point?—A. From Chicago, 2 cents. In stating it is only 2 cents you want to remember the fact the rate from the Mississippi River carries clear through on grain from the Mississippi River for export to New York, while the flour rate commences here, and the rate from the Mississippi River to Chicago has to be added.

Q. (By Mr. C. J. HARRIS.) Have you taken this up with the railroads, millers' association, or others?—A. We have attempted to, but have not met much encouragement. That was why it was brought before the Interstate

merce Commission; that action was taken on the initiative of the Millers' National Association.

Q. This ruinous rate, as we understand it, has only been in operation a year, or less than a year?—A. Yes; commencing about the first of this year. Prior to that time we had a very large export business. The firm that I represent has been in the milling business since 1848—more than half a century—and ever since they entered the export trade they never have had as small an export trade as during the present year. As we are making the same class of flour and have the same friends on the other side, who continue to write that they would be very glad to handle a large volume of goods if they could do so and compete with the home millers, we think the reason is in this discrimination. If we were placed on the same footing with the English miller we believe we could still export as largely as ever. It seems to us, as millers, that looking at it purely from a national point of view it would be decidedly for the advantage of America to have this product go abroad in a manufactured form, because then you will sell all the American labor, whereas when the English miller makes the flour the American labor is not represented at all in the selling price. In other words, we deprive American labor of all the cost of producing this product if we drive the American mills out of the export business; and of course it is a large industry. It employs hundreds of thousands of people, and they have their homes and families, and a large investment. It seems to us that Congress could protect that investment and this American industry from this unfair discrimination on the part of public servants.

Q. What have you to say in regard to the claim that it costs more to handle the flour than the grain?—A. That claim has been made; personally I do not believe it. The millers would be very glad indeed if flour could be given the same export rate as wheat upon the express condition that they load every car given to them to its fullest capacity. We can put into a 60,000 pound car 60,000 pounds of export flour—do it very often—and as we load the flour ourselves at our own expense, if we can load the car to its full capacity I can not understand why it should cost the railroad company any more to haul that car to New York than if it was loaded by the railroads at their expense with wheat and hauled to New York. The claim has been made that it costs more because the cars are not loaded as heavily as with wheat. In the domestic trade, that might be true, because American buyers as a rule buy 150 barrels to the car. But that is simply because they have that privilege. The railroads do not require us to load more than 150 barrels in a car, and until recently they allowed us to load only 125 barrels, so the trade became educated to taking these small cars, not having to pay for more than 125 or 150 barrels at a time. That is simply a matter of education, and if the rate was based on the condition that we load to the full capacity, we would load to the full capacity every time.

Q. (By Mr. KENNEDY.) Have you any suggestion as to national legislation as a remedy for the discriminations you suffer?—A. I believe the Interstate Commerce Commission understand this subject, and agree with the millers that they are suffering a great injustice, and I believe their opinion should be mandatory. If legislation could be brought about whereby the Interstate Commerce Commission, instead of merely making a recommendation, could formulate a ruling that the railroads should be obliged to obey, it would very soon relieve the situation. The millers do not ask anything unfair; they do not ask any advantage; they simply ask to be placed on an even footing with grain shippers; and I believe if they can present that matter to the Interstate Commerce Commission, and convince them that the claim is just, the Interstate Commerce Commission will formulate such a recommendation, and if that could be made obligatory on the railroads, I think it would settle the question. At present the Interstate Commerce Commission simply make a recommendation to the railroads, and the railroads acquiesce if it is to their advantage, and snap their fingers at it if it is not.

Q. (By Mr. C. J. HARRIS.) How is it that the elevators would interfere with your business, that is, interfere to your detriment, in buying wheat themselves? You do not store your wheat in their elevators, do you?—A. Yes; we do, a great deal.

Q. Do you not have your own private elevators?—A. Yes; we have our own private elevators, but we are obliged at times to buy grain here in the Chicago elevators. There are times when the local receipts are very light, and when it is to our advantage to go into the open market and buy from merchants who do their carrying in public warehouses. And, as a matter of principle, I do not think it is right for the public custodian, who is being paid for storing other people's property to be allowed also to be a merchant in similar property, which he has stored in the same warehouse, and which he controls both as custodian and owner.

Q. You can buy as cheap as the elevator man from the producer, can you not?—A. That raises a very large question. I think that we would be favored by the producer with at least as low a price on the track at the country point, but when it comes to getting that product forwarded to Chicago, I fear we should not have as favorable consideration from the railroad. That, of course, is only a matter of opinion. At all events, our experience has been that we can not buy grain and bring it to Chicago in competition with the large terminal elevator interests.

Q. Would that be due to their superior facilities in buying and handling or to some other causes?—A. I think to other causes.

Q. Do you know anything definite in regard to that?—A. No positive knowledge; it is simply an opinion that has been formed from experience, from the fact that we do not seem to be able to buy wheat in the extreme West and deliver it at any given point as cheaply as the grain elevator companies.

Q. (By Mr. KENNEDY.) Do you mill the wheat raised in the Southwest?—A. We do not. We confine ourselves entirely to spring wheat. Mr. Eckert's company, the Eckert & Swan Milling Company, mill some winter wheat.

Q. Do you know anything about a few men in Chicago getting together daily and fixing the price to be paid for wheat in certain sections of the country?—A. I believe that has existed. I think, at least, it is generally understood that such is the case.

Q. Do you understand what their object is in doing it?—A. I presume that they may not compete against one another and name too high price to the farmer.

Q. You think it is not particularly in the interest of bringing the trade to Chicago?—A. No; I do not think so.

Q. (By Professor JOHNSON.) Do you think the agreement as to prices to be paid is confined to grain originating beyond the Missouri River?—A. I do not know as to that.

Q. You know that is the statement made by the men who made the combination; I did not know but you had reason to believe otherwise.—A. I do not know whether they effect an agreement as to the price to be paid in Iowa or not. I know it is generally understood that they meet together and reach a schedule of prices on which they are free to buy over night, but whether they limit that to special territory or not I do not know.

Q. (By Mr. C. J. HARRIS.) Suppose 4 or 5 do agree as to the price; that does not prevent you and the other firms from bidding on the same ground, does it?—A. No; certainly not.

Q. That would not prevent Minneapolis, St. Paul, and others from putting in bids?—A. Not at all.

Q. How could they agree on any price that would control the market except so far as they themselves were concerned?—A. Well, of course, they are more generally represented over a large section of the country than any individual millers or grain buyers. They make a business of quoting over night to hundreds of buyers, and if the same quotation comes in from 5 or 6 elevator people to any one of these buyers, somebody would get it that same night at that price, provided an outside industry had not happened to get that same man at that time.

Q. (By Mr. KENNEDY.) If they had the railroad facilities that you fear they have, through fixing a price they could kill competition wherever they might fix the price along such railroads?—A. Yes; so far as any advantage they might have would enable them to pay a higher price than anybody who expected to pay a different rate of freight.

Q. (By Representative LORIMER.) What per cent of the grain you use is purchased in Chicago from the elevator owners?—A. I can not tell you positively, but I should say that we are now buying in Chicago either from elevator proprietors or from other allied interests more than half of all we are grinding; probably more than three-quarters.

Q. Then for a part of your grain you are in the market with the farmer and the outside trader?—A. Yes.

Q. When you say allied interests, what are we to understand by that?—A. Well, there are interests here that call themselves, for instance, elevator companies, and there are also commission companies that are supposed to be very, very closely connected with these same elevator companies. We buy from the commission firm, and they invariably sell us the grain in the particular house with which it is supposed that firm is closely allied. So I speak of them as allied to the elevator interests, although they are separate organizations, and are maintained, usually, in separate offices; they are supposed to work together.

Q. Do they make whatever profits are made from the elevator owners, or, as commission men, from the farmer or the outside trader? In other words, are they

employees of the elevator owner or are they doing an independent business?—A. I think they are nominally doing an independent business.

Q. Does this statement as to your purchase of grain in Chicago apply year in and year out?—A. As to the men we are buying of here in the city? As to the amount we are buying here?

Q. As to the amount?—A. No; that varies. There are times when we buy more outside of Chicago than we are buying now.

Q. In large or small quantities?—A. In large quantities. There are times, for instance, when we find it very advantageous to buy in the large centers west of here, as for instance, in Minneapolis, or in Milwaukee, or in Omaha.

Q. Then in some degree you are competitors of the elevator owners?—A. Yes; in a rapidly diminishing degree, though.

Q. A limited degree?—A. Yes.

Q. (By Mr. C. J. HARRIS.) You probably use how much wheat in a year?—A. The two mills that I represent grind—

Q. I mean all the Chicago millers.—A. I estimate about 7,000,000 bushels, but I am not giving exact figures.

Q. What proportion of the grain or wheat coming into Chicago would that be?—

A. I do not know the amount coming into this market.

Q. Would it be half?—A. Oh, no; nothing like it.

Q. (By Representative LORIMER.) Does your statement apply practically to other millers in Chicago?—A. The question just asked me was so modified as to cover all the wheat ground by the Chicago millers, and my reply assumes that all the millers are running full capacity all the year; in such event they would grind about 7,000,000 bushels. In speaking of the Chicago mills, I include one at Lockport, a suburb of Chicago, where one mill is located; it is considered a Chicago mill. It buys its wheat here, and ships its flour from here, in the summer by lake.

Q. Can you get always the highest grade of No. 2 wheat from the elevators when you want it?—A. No; they are not obliged to give us the highest grade.

Q. Do they give you the grade you ask for?—A. You say the highest grade; there is a great difference in quality of wheat that is covered by the same grade. For instance, in a car of No. 3 wheat there is wheat that is almost good enough for No. 2, which is worth almost No. 2 price; and in the same car there is wheat almost poor enough to be called No. 4, and worth very little more than the No. 4 price. So the grade No. 3 may cover a range of 3 or 4 cents a bushel. It is on account of the range in the value of the wheat that we consider it to be improper for warehouse men to be merchants of wheat in the public elevators, because the temptation, at least, would be very strong, if I went with an order for No. 2 wheat, and they, at the same time, were loading out a cargo for themselves of No. 2 wheat, to put the best wheat on their boat and the poorest on mine. Both, of course, would have to be graded at No. 2; that is, the quality of the wheat in the poorest delivery would have to be such as to be No. 2, according to State rules of inspection; but in that same house they may have No. 2 wheat which may be worth some cents more, and still all be graded No. 2. We do not think it right for warehousemen to store our wheat and the wheat of a great many other people in common bins, and have the opportunity, whether they exercise it or not, to make a selection in case they were shipping wheat for themselves.

Q. I want to know whether you as millers suffer by these opportunities that they have to serve their own interests, and mix the wheat in that way?—A. Yes; we believe we suffer very much.

Q. (By Mr. C. J. HARRIS.) Could you not buy from the public elevator? There are public elevators here in Chicago, I understand.—A. In which the proprietors are not merchants? I think nearly all the proprietors of public elevators deal in grain; not necessarily through the elevator company, but through these allied interests I speak of.

Q. We have had testimony here that there are public elevators; are there public elevators or are there not?—A. Certainly, there are public elevators and private elevators. In the private elevators the wheat is practically all owned by the proprietors, and with these elevators we have practically nothing to do. Occasionally the owner of one of these private elevators will come to me and offer me wheat on sample to be loaded out of his elevator, and I buy it from him on that sample, and have dealings with him of that nature; but receipts in these so-called private elevators are not deliverable on general contracts. If I go on the board of trade today and buy 10,000 bushels of wheat to be delivered in December, the man who sells it to me must give me receipts calling for that amount of wheat in one of the public elevators, which are entirely separate and distinct from the private elevators; but these allied companies are interested very largely in the wheat stored in these public elevators, and what we object to is the fact that both of us may

receive on December contracts a certain amount of No. 1 wheat, the receipts all calling for the same class of wheat, and yet when I come to take my wheat out of this public elevator I have not got as good wheat as the other, who is closely allied with the elevator interests. He would be favored in the delivery of the grain. That has become so notorious that we never now accept any wheat on State inspection. We never would dream of such a thing now as sending a canal boat or train of cars to an elevator, and sending a receipt to the elevator office calling for a given amount of No. 1 wheat, and trusting to State inspection to get a fair average of that grade. But we send along with the cars or boat a private inspector, that we have to hire in addition to the State inspector fees, to see that we do not get the bottom of the grade. We can not, of course, expect to get the top of the grade, but we try to avoid getting the very bottom of the grade, and have to employ a private inspector for that purpose.

Q. If this grain is all mixed up in one bin, and another grade in another bin, would not one man be as liable to get a good carload out of it as another?—A. Yes; if it was all put in one bin; but in every elevator of any size there are hundreds of bins, and there may be a hundred bins filled with No. 1 wheat. At certain times of the year when the movement of the wheat is from the section where they have had a very, very fine crop, the cars coming in may all be put into one lot of bins at one end of the elevator perhaps. Later on there may be a large movement of wheat from another section of the country, good enough to grade No. 1, but nothing like as good as the first lot, and it is sent in and emptied into other bins; all of which could be very easily kept track of. Now, when two persons come to the elevator to take out No. 1, wheat, if one could get a cargo out of the first-mentioned bin, the difference in value might be, for a 100,000-bushel cargo, \$1,000 or \$2,000 between his grain and 100,000 bushels taken out of the other bin, although both receipts called for identically the same grade of wheat.

Q. (By Representative LORIMER.) And they are both the same grade?—A. They are both called by the same name; they are different in quality; one is the top and the other is the bottom of the grade. It is impossible, I suppose, to devise such rules that there would not be some difference in the grade, but we think all should be treated alike, and there should not be any temptation to discriminate. I mean, conceding it to be a fact that there is that temptation, we do not think the public official should be subjected to it.

Q. (By Mr. KENNEDY.) You fear the opportunity might be taken advantage of?—A. Yes.

Q. (By Mr. C. J. HARRIS.) I see this table (referring to paper previously handed to him by witness) runs from 15 to 50; the average would be about 25 or 30?—A. I specified that if they were running full capacity we could grind that amount of wheat. Unfortunately, owing to conditions, we do not run full capacity and do not grind anything like that amount.

Q. You are a serious competitor of wheat buyers for your own use?—A. Yes.

Q. (By Professor JOHNSON.) I took occasion, after Mr. Barry testified in Washington, to ask the Chief of the Bureau of Statistics to tell me whether export flour had decreased during this calendar year, or had increased as compared with the previous calendar year. I told him I got the impression from the testimony that there had been a diminution in the export of flour; he said he did not think so, and subsequently sent me the papers, which show that for the first 9 months of this year the exports of flour were heavier than for the same 9 months of the previous year.—A. That is very easily explained; for instance, in our own case, we were obliged to carry out a great many contracts early this year that were made last year, and an enormous amount of flour was exported that went to the seaboard last fall by lake and rail, and did not get away from the seaboard until January, February, and March of this year. But as far as my experience goes, and as far as the experience of the other Chicago mills goes, as I have talked with all of them, the amount of business—new business—that we have done this year in the way of making new contracts, is very, very much smaller than it has been prior to this year. Of course, contracts that we made last year, in October and as far back as August—because there are sometimes very serious delays in getting stuff forwarded from the seaboard—contracts made as far back as August, 1898, and during the balance of that year, might not go forward from the seaboard until the early part of this year. I think the movement of flour for export during this year, aside from what was contracted for last year, will show a very decided falling off.

Q. (By Mr. KENNEDY.) You are in favor, then, of increasing or enlarging the powers of the Interstate Commerce Commission?—A. Very much so.

Q. Are the millers of the country going to move in concert upon Congress for

the purpose of securing legislation of that character?—A. I think they will request their Congressional Representatives to take up that matter.

Q. They are going into politics to remedy the difficulty?—A. We find we can not get the relief from the railroads unless it is made compulsory, and, of course, the only power that we know of that can make it compulsory is the United States Congress. We look to Congress to protect such a large industry, and we believe that when Congress understands a large industry is being threatened, and thousands and thousands of operatives are in jeopardy of losing their life employment, they will know the matter to be of sufficient import to take cognizance of.

Q. Have you anything to say as to industrial combinations, great industrial combinations?—A. As a matter of opinion, I believe that is simply a question of the survival of the fittest, and the tendencies are all in that direction. I do not think these industrial combinations are necessarily all bad; I think a great many of them are bad, but I think it is a very strong tendency of the times, and I think industrial combinations can effect economies that will make it very difficult in time for private properties to compete with them. Whether it is within the province of Congress to check such combinations, I am not prepared to say.

Q. Do you think they would be very serious or injurious to the public welfare if they had not the power to compel transportation favors?—A. Well, I would not say that. I do not believe in monopolies. I do not believe it would be for the advantage of the country for any industry to be exclusively in the hands of one large corporation. Personally, I am sorry to see the tendency. I should be glad to believe that the small individual proprietor was going to continue as in the past. But we must recognize facts when they are put before us, and these industrial combinations certainly can effect great economies; and if they are legal, and if they can not be controlled, I think the ultimate result will be that they will wipe out all the small competitors. While that situation is one to be deplored, I do not see how it is to be helped.

Q. (By Representative LORIMER.) You know that all the public elevators are owned by persons who own private elevators in Chicago, are they not? They are owned or controlled?—A. I think controlled. As I said before, most of the so-called public elevators are operated by the same owners or the same interests that have private elevators or that are doing a grain merchandising business. They are organized under a separate firm name or corporation; at the same time it is very well known that they work hand in glove together and their interests are at least very much alike.

Q. Have you any objection to the owners of elevators purchasing and putting grain into private elevators that are exclusively private?—A. No; I do not think we should have any right to object to a business of that kind. The only thing that we think we could properly object to is the false position in which a man places himself when he assumes to act as a public custodian of property and also as merchant of his own property in the same house. I do not see why we should object to anybody owning all the private elevators he likes.

Q. It is the public elevators you complain of?—A. It is the fact that the people who control the public warehouses act as merchants of grain, either directly or indirectly, in these same warehouses.

(Testimony closed.)

CHICAGO, ILL., November 20, 1899.

TESTIMONY OF MR. A. B. STICKNEY,

President of the Chicago Great Western Railway Company.

The subcommission on transportation, being in session on the afternoon of November 20, 1899, Chairman Lorimer presiding, Mr. A. B. Stickney was duly sworn, and testified as follows:

Q. (By Representative LORIMER.) Please state your name in full.—A. A. B. Stickney.

Q. And your business and place of business.—A. I am president of the Chicago Great Western Railway Company, St. Paul, Minn.

Q. (By Mr. C. J. HARRIS.) You are a resident of St. Paul?—A. Yes.

Q. We will call your attention, first, to some of the questions proposed in our topical plan of inquiry. In regard to the wages of your employees; have you had any difficulties in that respect in late years?—A. The question of wages is one that confronts us, of course, at all times; we have had no contentions, no strikes, or anything of that kind, but the employees are constantly feeling that they

ought to have larger compensation, and the employers themselves say that they would have difficulty in giving it, and there is naturally a conflict going on all the time.

Q. There has been no contention in that way with your people?—A. No.

Q. You treat with organized labor for the most part?—A. We never hesitate to; we have never had any conflict that brought that matter into consideration; I never hesitate to talk over affairs of that kind with the men or anyone who requests me to meet the men or anything of that sort. I always hold myself ready to discuss that question.

Q. Have you any special regulation in regard to the hours of labor? What is the number of hours?—A. Ten hours is considered a day's work; of course you understand that different rules apply to train men, but as to the other employees, laborers on the sections and in our shops and offices, and everything of that kind, 10 hours is considered a day's work. I am not sure, however, that the office men work 10 hours.

Q. The train men run by the mile or trip?—A. Yes; and by the hour.

Q. Do you see any way in which railroads can run successfully without employing labor on Sundays?—A. Of course it would be possible; anything is possible, I suppose.

Q. Hardly probable is it, as one railroad president suggested to us in Washington?—A. It would make a revolution in things, at any rate to begin with. We don't intend to work our men Sundays any more than we consider reasonably necessary. We never work our men—that is, other than our train men—on Sunday, except in emergencies. Of course if we have a breakdown or a washout, we get it repaired as quickly as possible, and if it happens on Saturday we work Sunday on it.

Q. Have you any fund or provision for the sick or disabled that you take out of the wages of the men?—A. Nothing.

Q. Are you fully complying with the order in regard to automatic couplers, air brakes, and all these appliances required by act of Congress? A. I think we have practically all. I should not want to say every one of our cars would have an automatic coupler on it by the 1st of January, but we shall come pretty near it; and in regard to air brakes I think we have fully complied with the law.

Q. Is it your opinion that it will be a good thing for the railroads, although it may seem harsh at the beginning perhaps?—A. I don't know; I have no very decided opinion on that.

Q. Do you think where cars are constantly being interchanged between one railroad and another that it is well that that law be complied with, and that they should all have the same high class of appliances; does it not lessen accidents?—A. So far as that goes it rests entirely on theory; theoretically these automatic couplers and air brakes are going to lessen accidents; whether they will or not, as a matter of fact, remains to be seen. I should think that up to this time it probably had not had that effect. The fact is, the effect of the application of the first ones seems to me to have been rather to increase than to diminish accidents, but I don't know but that should be expected. With the introduction of almost any new thing the first effect is usually to produce that result; but, theoretically, when men become accustomed to it, and everything is complete, I expect they will result in the saving to the railroads of a considerable amount; probably lessen the accidents to men, and probably save some property.

Q. (By Mr. KENNEDY.) You would not want to say that the number of accidents has been decreased since these appliances have been put on, would you?—A. Of course there are no statistics on that subject, and anything a man might say would be his impression rather than anything else. My impression is that up to this time they have not.

Q. Don't you have to report all accidents to the Interstate Commerce Commission at Washington?—A. I don't know; I presume so; I don't know about that. There are accidents and accidents, you know; I have known several cases where we have had accidents—I have information although I could not designate just where they were; they have come up before me—several accidents that were directly traceable to the fact that we had a part of our train equipped with them and a part not.

Q. The secretary of the Interstate Commerce Commission testified that the number of accidents has been very largely decreased since the law went into effect.—A. I have stated my impression only; I don't pretend to have exact information on that subject, and I don't know of anyone who has.

Q. Should you think it a harsh law that would compel the railroads to report to the Interstate Commerce Commission the accidents that occurred and give the details in regard to these accidents?—A. I don't think it would give much infor-

mation. Now, when we have an accident on our road, any kind of an accident, say a collision; we undertake to investigate it to find out what the cause is, and when we get through we feel as if we know very little more than we did when we commenced as to the real cause of that accident. Of course, there is a class of accidents—for instance, we have a case of this kind: Two trains have orders to meet at a certain point; the engineers and conductors all get their orders; however, the engineer of our train—that is a supposition on our part, you will see—instead of reading his order to see what it is, supposes he knows what it is and puts it in his pocket. When he gets to the station where he is to meet the other train, the conductor finds he is running right by. The conductor gets out and undertakes to stop him with the brakes and all that kind of thing, and before they can stop him the two trains come together and the poor fellow is killed; and, the order having been found in his pocket, we conclude that he did not read it. With such an accident as that, of course, there is no difficulty in telling what the cause of it is; but nine-tenths of the accidents that come up, you investigate and investigate and inquire and inquire, and when you get through you come to the conclusion that it is probable this car broke down—perhaps this and perhaps that; that is about all there is about it.

Q. But if the record before the commission is favorable to such a law, what I wanted to know from you was if there would be any particular objection to the railroads being required to send in more detailed information in regard to accidents than they do at the present time?—A. It would not be any particular hardship, so far as I can see, to give such information as they have; but I hardly think it would be of any particular value to the public. There will be a stack of details, and all that any railroad can gather will be the conclusion that some man has done something. It might be that or it might be anything. You know how indefinite and uncertain conclusions are when reached from insufficient evidence.

Q. (By Professor JOHNSON.) In regard to this report about accidents, the law requires you to report to the Interstate Commerce Commission the accidents which happen. That is a part of your annual report, as I understand. The statement is frequently made that these reports on the part of corporations are very inaccurate. I should like to ask you if your practice is to keep a record of these accidents and whether you attempt and in what way you attempt to render an accurate report to the commission in respect of that?—A. I am afraid I am unable to answer that question, as that is a matter I never looked into.

Q. (By Mr. C. J. HARRIS.) Passing on to the passenger rates and the subject of passes, what is your opinion in regard to the giving of passes? Is it harmful or otherwise? Have you a law in your State forbidding the giving of passes?—A. Not in Minnesota; I think not. It is very hard to answer a question like that categorically, because so many things enter into it. The most familiar illustration that I can think of is the question that divides the political parties, the question of free trade. If there never had been any protective tariff, that is one condition; but having had a protective tariff for 30 or 40 years business of all kinds is used to that tariff, and even if you undertake to root out the tariff at once you will produce a great deal of injustice and you will disturb business relations for a good while. That is the way with this pass business. If it never had been or if there was some way to get rid of it without raising too much of a disturbance, I should think it was a good thing to get rid of, and I don't know but it is anyway.

Q. As a railroad man, taking your side of it, should you prefer to be rid of it?—A. Oh, Lord, yes; it is like Congressman patronage, which I should think every Congressman would be glad to get rid of.

Q. (By Mr. KENNEDY.) Do you give passes to members of Congress and members of the State legislatures of the States through which your railroad passes?—A. We sometimes do and sometimes do not. We have no fixed rule in regard to that. I will say this; that I never had a Congressman in any district through which our road runs, so far as I can recollect, make application for a pass for himself or request it.

Q. Don't you give them to them anyway?—A. No; we do not.

Q. Do you know what the practice of railroads is generally in that respect?—A. I don't know; I think sometimes Congressmen from other parts of the country ask for passes for people, some relatives or something of that kind.

Q. (By Professor JOHNSON.) Do the members of the judiciary of Minnesota and Illinois hold passes over your road?—A. I don't think they do; I am not certain about that. If any of them ask for transportation, they get it; we don't hesitate to give to men of that class if they ask for passes; we never feel at liberty to refuse.

Q. (By Mr. KENNEDY.) You say that if members of the judiciary ask for a pass they will get it; is there any reason why a judge of a court who gets a good salary should get a pass—that is to say, is there any greater reason than why John Smith should have a pass?—A. That depends upon what you would call a good reason.

Q. Is there any reason that would not avail so far as the general public is concerned?—A. Twenty-five years ago I had charge of a little bit of a road that was a sort of a subordinate of a larger road. I had occasion to visit the president of the superior road about something, and he said: "Mr. Stickney, I see that the sheriff of this county has a pass over your road. I should like to know on what principle you gave that sheriff a pass." I said, "I did it on the principle that he was a power, and I was afraid to refuse him." "Well," he said, "I refused him." I said, "You will wish you hadn't before the year is over." Sometime afterwards, and during the year, I went into the office to see the superintendent, but he was not in; I went into the general freight agent's office, and he was not in; I went into the general manager's office, and he was not in. So I then went into the office of the president and said, "What kind of a road have you got? Your superintendent is not here, your general freight agent is not here, and your general manager is not here." He hung his head down and said: "Do you remember that conversation we had about that sheriff's pass? He has got all these men on the jury and has got them stuck for about two weeks."

Q. That answer seems to indicate that railroads would be afraid to refuse for fear of the penalties?—A. I think the railroads find there is a class of men that it is to their interest not to refuse if they ask for passes.

Q. Is it not bad in morals that a judge of a court should get a pass in that way and that a private citizen could not get one?—A. I would rather not assume to be a judge of morals; let other men judge of that for themselves.

Q. Still, you say, you would like to be rid of the pass system?—A. Yes.

Q. (By Professor JOHNSON.) Would you like to have Congress prohibit the granting of passes for interstate traffic?—A. That might help things and it might not. Legislation on such things works an advantage sometimes, and sometimes it does not altogether.

Q. It seems to me that it would be useless to have such laws if you could not enforce them and punish the man who gives passes or the man who receives them.—A. Well, I don't know. I notice in England and on the Continent that they have a great many laws regulating these things, and you will see signs posted stating that such and such things are forbidden under penalty of 10 shillings or 20 shillings, and I notice they enforce these laws. Now, let Congress pass a law forbidding passes and impose a penalty of \$5 or \$15, or some sum like that, and there should be some possibility of enforcing it; but impose a penalty of 5 years' imprisonment or \$5,000, and I don't think you are going to get the American people to enforce any such penalties.

Q. (By Mr. C. J. HARRIS.) I would like to ask you what you have to say in regard to the law preventing ticket brokerage—ticket scalping. There was such a law as that passed at the last session of Congress. What was your attitude in regard to that measure?—A. My general attitude on all of these subjects is that Congress was not created to run the business of the country, either by law or otherwise; that business is an individual function and not a Congressional function. My general attitude on all of these questions is that the best law Congress could pass on the subject is to repeal the law or laws that it has already made.

Q. That would be very true to a certain extent, though it might be too sweeping, and you would perhaps be worse off, should you not?—A. No; I am speaking of laws regulating commerce and economic affairs.

Q. Then your idea is, as I gather it, in regard to the ticket brokerage law, that it is a matter to be left to the railroads and the public to settle?—A. Yes; I am inclined to think it is.

Q. (By Mr. KENNEDY.) Do you believe the railroads could do away with the ticket brokerage business if they chose to do so?—A. I don't know how they could. If you buy a ticket from here to Washington by way of Pittsburg, and when you get to Pittsburg you conclude you want to stay there and don't want to go on to Washington, I don't see any reason why you should not sell that unused portion of the ticket, and I don't know of any reason why a man should not buy it, and buy it for his own use or to sell again; although I know that is a rather unpopular view to take of such things.

Q. You mean it is unpopular with railroad presidents?—A. Yes; I think it is.

Q. (By Professor JOHNSON.) Why is there not an objection to the man's selling that unused portion of the ticket to the public instead of selling it back to the company from which he bought it?—A. There is no feasible way to sell it back to the company.

Q. Yes; to compel the company to redeem it?—A. That is easily said; but suppose you buy a ticket from St. Paul to New York, and you go east to Chicago, and then you change your mind and want to go somewhere else. You will, say, sell that ticket back to the company. Where are you going to find the company to sell it to? I sold mine to Big John, the porter at the Grand Pacific Hotel;

he always had some one right there who would buy it from him. I can not see by what right the law could stop the sale of such tickets.

Q. (By Mr. KENNEDY.) You were speaking about selling tickets yourself to the porter; did you learn then how to make money or save money by buying tickets in that way?—A. No, it was simply—I don't pay any fare now because I travel on passes; but there was a time when I didn't and when I had to buy my tickets. I would start from home—say I was going to New York; and when I got here to Chicago I got telegrams or something of that kind so that I didn't want to go on to New York but would go back home; there I had my ticket to New York, the train was going out, and I couldn't go and hunt around to find someone who was going out on that train; so I went to the porter and said, "John, here's a ticket to New York; what will you give me for it." He said, "I will give you \$15 for it," so I let him take it.

Q. Is it not a fact that by that process you reduced your fare to Chicago?—A. No, sir; I increased my fare to Chicago, although I reduced the amount that I should have lost if I had not disposed of the portion of the ticket reading from Chicago to New York.

Q. (By Mr. C. J. HARRIS.) Is it your opinion that there is anything immoral, if a man buys so much transportation, in using a portion of it and selling the remaining portion?—A. I can not see anything either illegal or immoral in it.

Q. (By Professor JOHNSON.) You say that no immoral discriminations result from the fact that the act is not immoral or illegal?—A. I don't know what you mean by illegal discriminations. I suppose I do know, too, what you mean, but I don't admit that there is any such thing as illegal discriminations.

Q. (By Mr. KENNEDY.) Is not the bulk of the business of the scalpers due to business given to them directly by the railroads?—A. I presume it is to a large extent, although I have no particular definite knowledge on that subject.

Q. (By Representative LORTIMER.) The bill that was before Congress providing a penalty or imprisonment for selling an unused portion of a railroad ticket. What is your opinion, as a matter of public policy, as to the passage of a law for the punishment of a man for buying or selling the unused portion of a railroad ticket that the seller owns?—A. I should think it was a most outrageous piece of barbarism.

Q. (By Professor JOHNSON.) Is not that a pretty strong word, if he can sell it back to the company from which he bought it?—A. I know my answer might be qualified, of course. I know I occupy an unpopular position in regard to that subject among the railroad fraternity.

Q. (By Mr. C. J. HARRIS.) Does your railroad have a published tariff of rates given to the public at large?—A. If I should answer that yes or no I don't think I could be, in either event, convicted of perjury, to say the least. We have the same as other roads have. If other roads have such tariffs we have.

Q. You follow the general railroad custom in that respect?—A. Yes.

Q. (By Mr. KENNEDY.) Don't you publish a tariff and file it with the Interstate Commerce Commission at Washington?—A. That depends upon what you mean by a tariff.

Q. Freight rates?—A. There is one provision of the interstate-commerce law that requires every railway to publish a tariff of freight rates between all the stations on its own road, printed and published in a certain way. There is another provision that requires joint rates—that is to say, rates between two or more interstate railways—to be published and filed with the Interstate Commerce Commission. The clear intent of that provision, it seems to me, was that they should be published in such a way that a man of ordinary understanding by inspecting these tariffs could determine for himself just what the tariff rate was between any two points. I don't think there ever was such a tariff made. If it has got to comply with the law, the law should be made in such a way that it will embrace all of the roads of the country, and if any are left out, your law becomes of no use. If I recollect correctly, there are about 180,000 miles of railroad in this country. Say there is a station every 6 miles—and I suppose that is true—that would make 30,000 railroad stations. Now, to make a rate on one class or commodity between 30,000 stations you would have 30,000 multiplied by 15,000, and that would be 450,000,000 rates. Now, there are 6 classes in the classification; that would be 2,700,000,000. There are 12 classes; that would be 5,400,000,000 rates of classification alone. There never was such a tariff and never can be. It is not possible.

Q. (By Mr. C. J. HARRIS.) My question was in regard to public rates. What I mean by the public rate is that you would give the same rate to the public, to one and all. Whatever rate you make to one is open and public to all; not necessarily published, but in the files in each station; and if a dozen men were going

to ship the same thing, they could come in and refer to your rate book and anyone of them find that rate?—A. I see that you are laboring under the same impression as almost everybody else. In the early days of the Interstate Commerce Commission, when Judge Cooley was chairman, and they were new and zealous in performing their duties, they subpoenaed the Western railways to meet them here in Chicago and exhibit their tariffs and say whether they published their rates or not, so that a man could ascertain, if he took the trouble, what the legal rate was. We met there, the traffic managers of the various roads. They were at a long table, as long as this room; and when the Interstate Commerce Commission came in each man sat there with his file of tariffs in front of him, about as large as an ordinary small trunk. The traffic manager of the Northwestern sat at the end of the table. They commenced to question him: "Have you your set here?" "Yes, they are here." "That pile?" "Yes." "How many tariffs are there?" "Well, I think there are a little over 3,000 of them." "Can an ordinary man, by inspecting these tariffs, ascertain the legal rate?" "I do not believe they could." "Can you, who are traffic manager of the road, by inspecting these tariffs, ascertain what the legal rate is?" "No; I can not." "How do you tell what the tariff rate is?" "These are distributed in cases, and we employ a lot of rate clerks whose business it is to keep track of it and say what the rates are. If I have occasion at any time to know what a rate is, I go and ask one of these boys, and he tells me, and I assume that is the tariff rate."

Well, after spending about an hour in investigation, the commission consulted together a few minutes and said: "Gentlemen, we have got something of importance to attend to, and we have concluded to adjourn this investigation until some time when we will give you notice of it." They never gave us notice of any other meeting.

Q. (By Mr. KENNEDY.) The members of the Interstate Commerce Commission have testified before our commission that the railroads do file tariff schedules with the Interstate Commerce Commission. Does your road file such a one?—A. We file the same as the others do.

Q. Can you state what that tariff is—what it embraces?—A. It is a voluminous thing. You will find in the Interstate Commerce Commission files probably 5,000 or 6,000 sheets that make up our tariffs and amendments.

Q. For your railroad alone?—A. For our railroad alone. You gentlemen might spend a year in inspecting these sheets, and I do not believe there is one of you that could come to a conclusion in his own mind as to what many of the rates are. Some of the rates may be discovered very easily, but I think a man who has not had any training would find great difficulty in discovering what many of them are. I am not speaking of our own road only, but of all the roads.

Q. If a man comes to you and wants to ship over your road and asks for your tariff sheet that pertains to the commodity that he wishes to ship, do you furnish him with your tariff slip or does he get a rate that is on that tariff slip?—A. I never see these men myself; the freight department has charge of these things.

Q. (By Mr. C. J. HARRIS.) In regard to this question of publishing rates, I was not referring so much to the one that you file with the Interstate Commerce Commission; we all understand it would be impossible for you to prepare a rate that would cover everything to every point; but here is a station, we will call it A. At that station there are certain lines of commodities shipped. When a rate on my commodity is sent to that office it not only applies to me, but to the public in general, does it not? That is, it is an open rate to all who ship that kind of commodity, the only difference being, perhaps, in regard to carload lots and less than carload lots.—A. I think that is the intention. I think it is so generally.

Q. (By Professor JOHNSON.) I should like to ask if you could legally give Mr. Harris a rate that you do not file with the commission. Could you legally give him a rate on any commodity without filing that rate with the Interstate Commerce Commission?—A. Provided it was an interstate shipment. You take a local station on our road; their shipments are largely agricultural products and very largely to one point like Chicago or Minneapolis. These rates are generally there. We intend they shall always be there, and I suppose they are. These rates almost any shipper can ascertain.

Q. Of course, you are familiar with the investigation the Interstate Commerce Commission made into the question of transportation of grain, and you know what was brought out there in regard to the way the Chicago and Northwestern secured what it deemed a fair proportion of the grain from Missouri points. As I understand, it was about the organization of the Iowa Development Company. Now, in your testimony, we should like to have information in regard to the relation of your railroad to the purchasing and selling of grain; I suppose that will be answered by giving us some account of the inception of the Iowa Development Company

and its relation to the Chicago and Great Western and the grain business.—A. There is nothing that I can say on that subject that has not already been said and printed. I feel, gentlemen, that you are skimming over the surface of the real question involved in this rate question. I feel that the Interstate Commerce Commission and the general public assume certain things to be true that are not true, and regard certain theories as facts while they are nothing but theories. If you will excuse me, I will state as nearly as I can what I know. I will read from an address made by Mr. Knapp, the president of the Interstate Commerce Commission, before the National Association of Merchants and Travelers, at this hotel on the 7th of last August. I read it, not for the purpose of criticising, although I do not agree with Mr. Knapp, but because he states the general assumption more concisely than I can do it myself:

"In commercial transactions concerning actual property, the products of labor and skill, we do not want—under present economic conditions at least—uniformity of price. The producer should be free to sell for all he can get, the purchaser equally free to buy as cheap as he can. The dealer should be at liberty to make one price to one person and another price to another person, or to vary his price to the same person as and when he sees fit. In the exchange of goods there should be the utmost freedom of contract between buyer and seller, for that freedom is the essence of commercial liberty."

Now, he states there the natural law of prices, the natural law of values. He seems to assume that the dealer should be at liberty to make one price; he seems to assume that the seller makes the price of things. Now, it takes two to make a bargain, and you can not make the price of anything by publishing a tariff of prices. You can state a price; the manufacturer may, every month, get out a catalogue of the goods he manufactures, and he sets a price—probably based on what he considers the cost and a fair profit. That is his catalogue price, but that is not the price of these things unless somebody will buy them at that price. When he goes to sell them, if he can not sell them at that price, he has to accept a lower price or keep them. It takes two, the dealer and the seller. Under the present condition the manufacturer comes pretty near setting his price, but a year ago the buyer came pretty near setting the price; he said what he would give and the manufacturer had to take it. That is the condition under which prices of goods are made.

Now, you take, for instance, Marshall Field—his retail store is a one-price store. You go in there to buy anything, and he quotes you a price for it. You can not do as you would on the Bowery or in France, begin to jew him down until perhaps he would take half what he asked for it. But, if he gets a line of goods that he can not sell at that price, to-morrow he will lower that price or send them to the bargain counter; every store has got to have a bargain counter.

That is the way prices are fixed, and it is the only way they can be fixed. You may make laws; you can pass a law that Marshall Field shall publish his price of goods, and file them with the Industrial Commission; and that there shall be a penalty of \$5,000 and imprisonment if he asks, demands, or receives more or less than that. But if you enforce it, you destroy commerce, you will destroy production, you will destroy everything.

Again Mr. Knapp says: "For this reason antitrust laws, so called, are defensible, perhaps necessary. But as respects public transportation, which is not property at all, but a service, we do want uniform charges—under like conditions—without preference or exception to any person."

Now, what we want and what we can get are two different things. That is a beautiful theory. It is a beautiful theory that the poor shall buy as cheap as the rich. During these distressing times from 1893 to 1894 there was a Jew, Strauss or some such name, who published an article in one of the magazines, showing how much more the poor paid per ton for coal, two or three times as much as the rich; and he started in to keep a store, at which he would sell coal by the bucketful as cheap as it was sold by the hundred tons. That was a nice thing to do, but the fact that he did not keep it up a great while shows that it was a charity on his part—it was not a business transaction. It is a nice thing that everybody should be treated exactly alike, but it is not done, and under our present civilization can not be done.

Q. (By Mr. KENNEDY.) Your argument, then, is that if a railroad company has transportation to sell and makes a price to-day for that transportation, a rate, and gets no business, it should be allowed to lower it to-morrow with the idea of attracting business?—A. I do not want to wait until to-morrow; do it to-day, do it right away. We have had this law in force since 1887. When it first went into effect it was very popular with the railroad companies, and an honest effort was made to put it in force; but it was a failure. It never has been enforced, and in my judgment, in the nature of things, it never can be enforced.

Another part of the law is, and Mr. Knapp speaks of that, that there shall be a just relation between the classes of freight and commodities. Now, what is that just relation? What is the basis of it? How are you going to find out what is the just relation between the rate on pig iron and the rate on stone? What is the just relation? What is it based on? What is the just relation between two places? What is that based on? How are you going to find it out? What is the basis of the just relation? What is a reasonable rate? What is that based on?

Judge Cooley, who, without speaking detrimentally of his successors, was probably the ablest man that ever occupied the position of chairman of the Interstate Commerce Commission, was certain that a reasonable rate was based on the cost of carriage; he was so certain of it that he would not listen to argument; he would not listen to anybody that suggested that by any possibility he might be wrong. There is no question but that he was wrong. The rates never were based on the cost of carriage and never can be; neither on the particular cost nor on the average cost. What are you going to base it on? Where are you going to get this reasonable rate and this true basis between the different classes? What is the true relation between the rates on first and second class goods? Is there any mathematical relation between them? If you place it on the cost of carriage, does it cost any more to haul first than second class goods, in a general way? Does it cost any more to haul a ton of pig iron than it does to haul a ton of dry goods? Certainly these rates never were and never can be based on the cost of wheelage.

Now, we have had associations; we have made an attempt to maintain these tariff rates; we have printed certain tariff rates, and have said, these are the tariff rates. What has been the result of those associations?

You recollect those Eastern trunk lines—the Joint Traffic Association. You recollect that the presidents of those trunk roads got together and were going to take the business of rate making out of the hands of the freight agents. They had a traffic association agreement and it was such a tremendous thing on paper it looked as though they had the world by the tail, so to speak. Senator Chandler got up in the Senate and denounced it as a fearful thing that was going to crush out American enterprise and everything else. I happened to be looking over some figures, and I struck some curious figures on that subject. That was dissolved by the decision of the Supreme Court in 1897, you know, and when the decision of the Supreme Court came out the stock market dropped, and investors were scared. The Financial Chronicle came out in a long article, that the “Result could only be industrial chaos;” the world was coming to an end because that traffic association had been knocked out.

Now, the object that traffic association was to hold up rates. Here is the fact I took the Lake Shore, the Michigan Central, and the Pennsylvania lines west of Pittsburg, as being most likely to reflect the influence of that organization, which was supposed to be the strongest organization we ever had. The average rate of the Lake Shore road. I picked out the four years that thing was in existence—its average rate decreased from 5.79 mills in 1894 to 5.2 mills in 1898, the Michigan Central from 6.87 in 1894 to 5.97 in 1898, the Pennsylvania west of Pittsburg from 6.5 in 1894 to 5.7 in 1898. You see the association did not maintain rates; they kept falling. Now, you take the accelerated ratio of decrease in rates during the four years of the Joint Traffic Association compared with the four years immediately preceding. During the four years the association was in existence the Lake Shore rate fell off 12.3 per cent, while during the four preceding years it fell off only 7.5 per cent; the Michigan Central rate, during the existence of the association, fell off 13.1 per cent, while during the four preceding years it fell off 1.1 per cent; the Pennsylvania west of Pittsburg rate during the four years that the traffic association was in existence fell off 12.3 per cent, while in the four preceding years it fell off less than 0.6 of 1 per cent.

Q. Please state the four years of the life of that association.—A. From 1894 to 1898, practically.

Q. (By Mr. C. J. HARRIS.) Was not that the period of depression in all lines of business?—A. Yes.

Q. Might not that account for this difference to a large extent?—A. That might account for it; but the object of the association was to maintain rates.

Q. (By Mr. KENNEDY.) You could not expect to maintain railroad rates in a period when all other rates were going down?—A. To be sure we should not; but they did. That was the intent of the organization. We should not expect it, but it was their intent to hold the rates up. Now it is a curious fact that they fell faster than they had before, in the previous year. The tendency from 1892 to 1894 was down; the panic was in 1893.

Now, this fixing of prices by law and by resolution reminds me: When I was a young man I lived in a town where one saw logs were the whole business. Along

and its relation to the Chicago and Great Western and the grain business.—A. There is nothing that I can say on that subject that has not already been said and printed. I feel, gentlemen, that you are skimming over the surface of the real question involved in this rate question. I feel that the Interstate Commerce Commission and the general public assume certain things to be true that are not true, and regard certain theories as facts while they are nothing but theories. If you will excuse me, I will state as nearly as I can what I know. I will read from an address made by Mr. Knapp, the president of the Interstate Commerce Commission, before the National Association of Merchants and Travelers, at this hotel on the 7th of last August. I read it, not for the purpose of criticising, although I do not agree with Mr. Knapp, but because he states the general assumption more concisely than I can do it myself:

"In commercial transactions concerning actual property, the products of labor and skill, we do not want—under present economic conditions at least—uniformity of price. The producer should be free to sell for all he can get, the purchaser equally free to buy as cheap as he can. The dealer should be at liberty to make one price to one person and another price to another person, or to vary his price to the same person as and when he sees fit. In the exchange of goods there should be the utmost freedom of contract between buyer and seller, for that freedom is the essence of commercial liberty."

Now, he states there the natural law of prices, the natural law of values. He seems to assume that the dealer should be at liberty to make one price; he seems to assume that the seller makes the price of things. Now, it takes two to make a bargain, and you can not make the price of anything by publishing a tariff of prices. You can state a price; the manufacturer may, every month, get out a catalogue of the goods he manufactures, and he sets a price—probably based on what he considers the cost and a fair profit. That is his catalogue price, but that is not the price of these things unless somebody will buy them at that price. When he goes to sell them, if he can not sell them at that price, he has to accept a lower price or keep them. It takes two, the dealer and the seller. Under the present condition the manufacturer comes pretty near setting his price, but a year ago the buyer came pretty near setting the price; he said what he would give and the manufacturer had to take it. That is the condition under which prices of goods are made.

Now, you take, for instance, Marshall Field—his retail store is a one-price store. You go in there to buy anything, and he quotes you a price for it. You can not do as you would on the Bowery or in France, begin to jew him down until perhaps he would take half what he asked for it. But, if he gets a line of goods that he can not sell at that price, to-morrow he will lower that price or send them to the bargain counter; every store has got to have a bargain counter.

That is the way prices are fixed, and it is the only way they can be fixed. You may make laws; you can pass a law that Marshall Field shall publish his price of goods, and file them with the Industrial Commission; and that there shall be a penalty of \$5,000 and imprisonment if he asks, demands, or receives more or less than that. But if you enforce it, you destroy commerce, you will destroy production, you will destroy everything.

Again Mr. Knapp says: "For this reason antitrust laws, so called, are defensible, perhaps necessary. But as respects public transportation, which is not property at all, but a service, we do want uniform charges—under like conditions—without preference or exception to any person."

Now, what we want and what we can get are two different things. That is a beautiful theory. It is a beautiful theory that the poor shall buy as cheap as the rich. During these distressing times from 1893 to 1894 there was a Jew, Strauss or some such name, who published an article in one of the magazines, showing how much more the poor paid per ton for coal, two or three times as much as the rich; and he started in to keep a store, at which he would sell coal by the bucketful as cheap as it was sold by the hundred tons. That was a nice thing to do, but the fact that he did not keep it up a great while shows that it was a charity on his part—it was not a business transaction. It is a nice thing that everybody should be treated exactly alike, but it is not done, and under our present civilization can not be done.

Q. (By Mr. KENNEDY.) Your argument, then, is that if a railroad company has transportation to sell and makes a price to-day for that transportation, a rate, and gets no business, it should be allowed to lower it to-morrow with the idea of attracting business?—A. I do not want to wait until to-morrow; do it to-day, do it right away. We have had this law in force since 1887. When it first went into effect it was very popular with the railroad companies, and an honest effort was made to put it in force; but it was a failure. It never has been enforced, and in my judgment, in the nature of things, it never can be enforced.

but they would not do it—would not haul it away for it. One day a man comes in and says: "Look here, Stickney, if you will make me a rate of so much, I will put up a factory here, and I will manufacture that stuff and ship it." I inquired into the business, about what it would cost him and what he expected to get for it, and I saw he could make a fair profit, if everything came out right, by having that rate. I corresponded, or had the freight department correspond, with the other roads, and we made him that rate, and the result has been he has been shipping a car-load a day of an entirely waste product.

Now, what is the relation between the rate on that and the rate on corn? Figure it out for me. You say you must maintain a certain relation; what is the relation between that and the rate on corn?

A man finds a stone quarry. He says, I can go into that stone quarry, and I can ship that stone, and I can make so much on it. It is a local station on our road; there is no other railroad; from that point of view, he has got to ship by our road, and he has got to pay what we charge him. But he has not got to quarry that stone. That is what some people call local freight, but it is competitive just the same. There is no such thing as noncompetitive business. That was competing with some other road running in some other direction, that has got some other class of stone. By making him a certain rate, we establish a certain industry and we get some revenue out of it. What are you going to say about it? Are you going to establish a law that we shall not do it?

Q. (By Mr. C. J. HARRIS.) Are you in favor of pooling?—A. I am a heretic; I am in favor of anyone pooling who wants to pool; I am in favor of free trade in that way; but I am afraid that the expectations of people in regard to pooling will never be realized.

Q. While you might not obtain perfection in that way, would not that come nearer to maintaining uniform rates to all parties under the supervision of the Interstate Commerce Commission, which would see that the pool didn't get the rates too high?—A. I don't think it would have any material effect one way or the other. I don't think, in the first place, that the pool would ever be formed or could ever be formed. In the second place, if it was formed, unless it embraced everything, it would produce the very evil you want to prevent. If a pool could be formed on roads between here and St. Paul the result would be that we should hold up the commerce of St. Paul; that is, we should hold the rates so high that it would be a discrimination against St. Paul and in favor of some other city. The object of that pool would be to maintain rates, steady rates, and really high rates; I don't mean excessively high rates, but what are called normal rates. If the normal rates were held up between here and St. Paul, and there was no pool between here and Kansas City, and the normal rates were not maintained between Chicago and Kansas City, it would have the effect of subjecting the commerce of St. Paul to a disadvantage, as compared with Kansas City. We used to make pools before the law forbade it. If the other fellows got the best of us when we came to settlement we would simply say, we will not stand it; you beat me and there is no law to enforce our contract. Now, everyone or anyone can make that kind of a pool, and, if you get beat in the trade, all that you have to do is to repudiate it. When you come to form a pool out of this business, amounting to millions and millions of dollars a month and put it under a binding contract, who is going to make that contract, some freight agent of a road or some president of a road? It is a combination that amounts to a consolidation of the earnings of the road. It is a delusion; it can not be done; it will never be done.

Q. (By Mr. KENNEDY.) Are you in favor of enlarging the powers of the Interstate Commerce Commission?—A. No; I think they have ample powers.

Q. Have they any powers at all?—A. I think they have all the powers they ought to have.

Q. Which is no power at all?—A. Well, I don't mean it in that sense; I don't think a commission situated and constituted as this one is should have the authority and power common to a court. You attend one of these investigations; there are speeches and statements about the matters under consideration, but there are no rules of evidence and no cross-examination; the people come in and testify and show that they don't know anything about it and swear to their opinions, that they are so and so; they appear in the nature of the prosecutors; they are the prosecutors; they appear and give their opinions and arguments and swear to them all, and I don't want to uphold any such courts as that. The ordinary investigation before the Interstate Commerce Commission, if regarded as a trial in court, is really a farce; it has had, however, more or less educational influence, as it has talked over these things, and they have appeared in the newspapers.

Q. You say it is really a farce. Did not the Interstate Commerce Commission recently investigate the question of the export rates on flour and grain and grain

products, and give an opinion, or decision rather, as to what the differentials should be upon the trunk lines? I should like to ask you whether you know what the result of the decision of the Interstate Commerce Commission on that question was, or not?—A. I don't know about the facts at all; I have read in the newspapers something about something of that kind, but I don't know what the facts are.

Q. (By Mr. C. J. HARRIS.) It has been said that the difference between the export rates on wheat and the export rates on flour varies anywhere from 3 to 10 cents per hundred. As a railroad man, is there any good reason for that; have the railroads anything to say on that subject?—A. So far as I am concerned, I don't know whether that is true, as a matter of fact, or not.

Q. The published rates would rather indicate that it was so, and if it was so I should like to know the reasons for it and whether there are any grounds for such discriminations?—A. I don't know anything about it; I don't know what the facts are or what the arguments are.

Q. You have no opinion on the subject whatever?—A. I know nothing of it.

Q. (By Mr. KENNEDY.) I should like to ask if you are in favor of having Government inspectors appointed to look into the affairs of railroads and make a report on them?—A. As I said before, I am opposed to the public or the Government meddling with private or business affairs any more than to exercise a police authority. I don't believe it is within the province of the legislature to do so.

Q. Don't you believe there is a growing sentiment among the people in favor of that sort of thing?—A. I don't know.

Q. (By Mr. C. J. HARRIS.) Would you object to the investigation of national banks on that same ground?—A. As I said once before, I am a heretic. I think it does more harm than good. I think the national-bank examiners have burst more banks than they have ever saved. I am a heretic.

Q. Under these conditions of affairs, as you have explained them here, would it or would it not be better for the Government to take hold of the railroads itself and run them?—A. I am inclined to think that if the Government owned the railroads and ran them itself you would find that even the Government itself would be controlled by these limitations that I have been speaking about. It was said in the last Census that the railroads' revenues are in the nature of a tax. That is a theory that I have developed a great deal, and I think it is so. What is the basis on which the Government raises its revenue for general purposes? They do it by levying a tariff on what they can. How do they go to work to fix the rate? They don't say it is 10 per cent on everything. They have to consider what the stuff will bear—how much they can collect. If the Government were hard up, they would have to consider every item and the rate on it which would produce the most revenue. When the Government has abundance of revenue, as our Government has, then they consider the question as a matter of public policy. They say, "We will levy a duty on steel rails of \$11 per ton, not because it will produce a cent of revenue, but because we want to protect American industry." But if they were hard up for revenue, instead of making a duty of \$11 per ton on steel rails they would have to see what rate per ton would bring them the greatest revenue. Eleven dollars per ton would not produce anything, while \$5 might do so. Now, will \$5 produce more than \$3? That is the question that we shall have to consider. If the Government owned the railroads, they would have to consider this question. What rate will produce the revenue on these different things? That is the only question there is, generally. All of our railroads have to produce revenue, and the question is what rate will produce the revenue.

Q. (By Professor JOHNSON.) Do you mean to say that that would be the only question which the Government, managing its own railroads, would have to consider?—A. Yes; that is the only question that they consider; the railroad also feels that it has got to collect taxes from some source to support the road. How the articles can be made to support this rate is the question to be considered.

Q. Do you mean to say that they have to charge the maximum revenue?—A. They would have to charge—not the largest rate always; sometimes the largest rate would destroy.

Q. I mean the maximum in revenue paid?—A. They have to consider what rate on each article will produce the greatest revenue, and then fix that rate; they have to consider that just the same as they do in making the tariff.

Q. (By Mr. KENNEDY.) Would they not also consider that they would not have to give such proportions out of the proceeds as now to the directors and stockholders, and also that they could get a president for less than ten or twenty or fifty thousand dollars a year?—A. It might be foolish and expensive business for them to do it. They might save a little in salary and lose more than that somewhere else.

Q. It would be the question of the profits that are made out of the railroads going to a great many persons.—A. Small interest on the cost at any rate.

Testimony closed.

CHICAGO, ILL., November 20, 1899.

TESTIMONY OF MR. WILLIAM BURKE,

Grain dealer, Friend, Nebr.

The subcommission on transportation being in session in Chicago, Ill., November 20, 1899, Representative Lorimer presiding, Mr. William Burke was duly sworn, and testified as follows:

Q. (By Representative LORIMER.) Please state your full name.—A. William Burke.

Q. And your business and post-office address?—A. Grain business, Friend, Nebr.

Q. We have received information that you can give the commission some information as to the effect of the elevator system in Chicago on the price of grain to the farmer. Will you, in your own way, state what you know about the grain business before or since the establishment of the elevator system in Chicago that exists at present, and which, I presume, you are familiar with?—A. Several years ago we used to send our grain to Chicago, and sometimes with very satisfactory returns; but for the last few years we have a system whereby we sell our grain mostly to elevator men in Chicago, Burlington, St. Louis, Galveston, St. Joe, and Kansas City. We find that way rather more satisfactory to us than to try to put our grain on the market ourselves. We avoid taking our chances of the market's breaking while we are in it.

Q. What effect has this new system on the price of the grain to the farmer?—A. I think it has a good effect on the farmer; we know exactly what we can pay him—how close a margin. Several years ago we used to buy the grain on a 5-cent margin—5 cents on every bushel. We had to have a good margin to save ourselves from variations in the Chicago market. Our bids to-day don't vary very much—St. Louis and Chicago or Burlington. Some days St. Louis is half a cent ahead, some days a quarter of a cent, and some other days Kansas City is ahead.

Q. (By Mr. C. J. HARRIS.) Do you represent anyone here—that is to say, any Chicago elevator?—A. No, sir; have just one elevator.

Q. You sell to whatever men and in whatever city you can do the business; is that it?—A. Yes; we sometimes sell at Kansas City. One day last week I was offered 25 cents for oats at Kansas City, when our bids from Chicago were only 24; and there is a difference in the freight of 4 cents a hundred; the rate from Kansas City to the river is 4 cents more a hundred.

Q. Suppose that rate goes up and down between the time you sell and the time the product gets to the market?—A. That, of course, is at the sellers' risk. They give us a limited time for shipment—10 or 20 days; sometimes when the rates vary they notify us to get it there by a certain time.

Q. If that is the general custom you have no particular risk yourselves?—A. No; we don't take any risk.

Q. You say the commission has been from 5 cents up?—A. From half a cent to 1 cent a bushel on corn; we don't buy corn or grain of any kind over 3 cents margin; some time ago we had 5 cents and it was as high as 10 years ago, but it now runs from 2 to 3, on wheat.

Q. (By Representative LORIMER.) Are we to understand that if wheat is selling in the Chicago market to-day at 70 cents a bushel that you would bid less or more than 65 cents for it to the farmer?—A. Yes; less freight years ago, but not now.

Q. Now what do you do?—A. From 2 to 3 cents—it depends on the quality of the wheat and the grade; we have got to allow a little for shrinkage.

Q. (By Mr. C. J. HARRIS.) Are there any other elevators in your town?—A. One.

Q. Suppose the farmer does not wish to sell to the local elevator or grain buyer? What are the facilities for his shipping to these large grain centers? Are his facilities as good as yours?—A. Just the same as mine. Several of our farmers have shipped their own grain this year and last fall. They shipped wheat last fall. Of course, this year wheat is not very good; they could not clean it, and therefore they could not afford to ship it so well; they have the same rates as I do.

Q. Do you clean the wheat there?—A. Yes.

Q. (By Mr. KENNEDY.) Do the general Chicago elevators buy from the farmers in competition with you?—A. I don't think they do; I am not sure; I have not heard of their making any bids.

Q. What line of road are you on?—A. The Burlington.

Q. Is this other grain elevator man in your town an independent man, or is he connected with some elevator in Chicago?—A. No; he has an elevator on the Burlington road and also on the Grand Island and St. Joe Railway.

Q. Is he operating in connection with any of these elevator men—Connselman or others?—A. No.

Q. Is there any belief that he is connected in any way with the Burlington road?—A. No, I don't think so; he has only been open two months. It had been run and operated by another man for several years.

Q. Does he do practically the same business that you do?—A. Sometimes he is ahead and sometimes I am.

Q. Do you believe you have the same shipping facilities on the Burlington that he has?—A. I think so, yes.

Q. He has no advantage over you?—A. No; I have really got the advantage over him; I have got the larger house and better machinery.

Q. (By Mr. C. J. HARRIS.) Is there any complaint among the farmers through your country there in regard to the price they get for their wheat; that is, that they do not get a fair proportion of the price from the buyers?—A. They are satisfied in this way: they say we pay as well as other elevators and other roads.

Q. If they were not satisfied they would ship it themselves?—A. They are not satisfied unless they get a dollar a bushel for wheat, then they would be satisfied with their own transactions.

Q. But are they satisfied that they get their fair proportion? Of course we understand they think wheat is not as high as it ought to be; if they are dissatisfied, if they think they are not getting their fair proportion, they can very easily ship their own grain, can they not?—A. Yes.

Q. (By Representative LORIMER.) You say you sell to the elevator people in Chicago?—A. Yes; and in other parts of the country.

Q. If you ship your grain from your place to Chicago, do you think you get the same rate to Chicago that the large elevator owners are getting?—A. That is something I could not answer; I presume I do.

Q. Do you ship any in that way?—A. I do sometimes; yes.

Q. When your grain arrives on the market, does it appear to cost you more than the market price here?—A. By shipping here we have got to pay a cent by commission, and by selling we save that.

Q. Is that the reason you prefer to sell to the elevator men?—A. Yes; we had rather sell to the elevator men or track buyers, because we protect ourselves. We get from 12 to 15 bids every night, so that what I buy to-day I can turn out in the morning and protect myself against the market's falling. We rather like the system, and that is the way we are handling grain now.

Q. How do the people you deal with feel about it, or have you ever discussed it with them?—A. Never discussed it with them. I presume they are pleased with the system.

Q. I mean the farmers.—A. They seem to be satisfied; they are better satisfied than they were years ago when we were buying and shipping and when we had to pay the Chicago market price at that time, and when there were 7, 8, and 10 shovel grain buyers in town. Of course, the shovel house buyers did not last very long; they could not stand it. I mean those who shoveled the grain into the car without cleaning it.

Q. (By Mr. KENNEDY.) Do you send much wheat to Kansas City?—A. Quite a good market for wheat.

Q. As much as you send to Chicago?—A. More.

Q. Do you send any to Milwaukee?—A. We don't ship wheat to Milwaukee; we ship barley to Milwaukee.

Q. Over what line do you send to Kansas City from your place?—A. Burlington.

Q. Burlington which ever way you go?—A. Yes; I had three elevators on the Grand Island road, but I sold these elevators; that is the road going from Grand Island to Kansas City and St. Joe.

Q. You spoke of your having a bid from Kansas City for a carload of oats, of a cent a bushel more than you were offered in Chicago. Did you ever get better bids for wheat in Kansas City than you got in Chicago?—A. At certain seasons of the year we do. This fall we were paid a good deal more in Kansas City than in Chicago.

Q. Why is that, do you know?—A. I could not say.

Q. Does that wheat go down the river and out by the Gulf?—A. I understand the mills of the country take the wheat and grind it into flour and send it down South.

Q. (By Professor JOHNSON.) You say you get 15 bids oftentimes in the mail or by wire?—Yes.

Q. Do you know whether the firms of Armour & Co., Counselman & Co., and others of the large grain exporters send in competitive bids?—A. Yes; they all send bids.

Q. Do these large export firms send different bids, or do they agree upon the price?—A. They vary from a cent to a cent and a half a bushel on wheat.

Q. All who are among the exporters?—A. I don't know what you mean by exporters; do you call Armour an exporter and Harris?

Q. I believe Armour handles grain?—A. I guess I don't know exactly what you mean; we get bids from Counselman, Harris, Armour, and others from Kansas City and St. Louis; they vary all the way from a cent to a cent and a half a bushel on wheat and one-half to one cent on corn.

Q. Do you get bids from Counselman?—A. No, we don't; I was thinking we did, but we don't now. We used to.

Q. (By Mr. KENNEDY.) We have had testimony here to the effect that these men get together every night and make a maximum rate.—A. It may be they do, but the bids don't show it. I don't see how they can make the rate when we get bids from Kansas City, St. Joe, Leavenworth, and once in a while from Galveston, Tex.; I have no proof that they fix the maximum rate, as their bids vary.

Q. (By Professor JOHNSON.) I think the experts agree upon that point, that they get together every 24 hours; I am curious to know who the competitive bids come from in Chicago?—A. Last Saturday night's bids from St. Louis were a cent over any Chicago bid, and it has been running that way for a month.

Q. The question is whether these large Chicago men themselves have different bids?—A. They don't all bid the same for corn, nor for wheat either.

Q. (By Mr. KENNEDY.) For wheat?—A. Nor for wheat either. They don't all give us bids on wheat. Kansas City takes all our wheat. They have not been up to Kansas City any time this year. We have not this year sold a bushel of wheat to come east; Armour & Co. and Harris & Co. are the Chicago bidders. All my wheat has gone to Kansas City; all the old wheat we shipped out to Kansas City, and they have also taken all of this year's crop.

Q. (By Professor JOHNSON.) Do you know whether it goes beyond the river?—A. It goes to Kansas City.

Q. (By Mr. KENNEDY.) You don't know where it goes to afterwards?—A. I don't know where it goes to after that, except what goes to the mills.

Q. (By Representative LORIMER.) Do you own a farm?—A. No.

Q. Have you ever been a farmer?—A. I farmed all my life until 20 years ago, when I quit it.

Q. In what section of the country?—A. Nebraska, and also Wisconsin.

Q. So you have had experience both as a farmer and as a buyer and shipper?—A. Yes; I have had a great deal of experience as a farmer; I was born and raised on a farm. I farmed 8 years in Nebraska.

Q. In your opinion are the farmers benefited or injured by this new system of elevator business in Chicago?—A. It is my opinion that they are benefited. As I said before, when we depended on the shipment of all our stuff to Chicago we bought grain on 5 cents a bushel margin, and when we now get from half a cent to a cent a bushel I think they are benefited.

Testimony closed.

CHICAGO, ILL., November 20, 1899.

TESTIMONY OF MR. A. C. BIRD,

General Traffic Manager Chicago, Milwaukee and St. Paul Railway.

The subcommission on transportation being in session in Chicago, Representative Lorimer presiding, at 5.45 p. m., November 20, 1899, Mr. A. C. Bird was introduced as a witness, and, being duly sworn, testified as follows:

Q. (By Representative LORIMER.) You may state your name.—A. A. C. Bird.

Q. What is your business?—A. I am general traffic manager of the Chicago, Milwaukee and St. Paul Railway.

Q. Your post-office address is Chicago?—A. My business office is in Chicago.

Q. (By Mr. KENNEDY.) Have you a paper?—A. No, I have not; I commenced to prepare one, but I have not got it here. I took that order of proceeding of yours and selected the topics that refer to subjects that come directly under my personal observation.

Q. (By Representative LORIMER.) Will you, in your own way, cover all the points you find there that you are most familiar with?—A. The first subject that attracted my attention was No. 21, "Effects of rate wars and unrestrained rate competition upon railway employment and railway wages." Anything which tends to reduce rates must have an unfavorable effect upon everybody on the railroad company's pay roll. How much effect, or what effect, would depend largely on the degree and duration of reduced rates, either freight or passenger. It is not possible to state that definitely, but only as a general proposition, that, given any cause which seriously affects the income of the property, it must come out of the property itself, and its employees, sooner or later, in a more or less direct manner. Under 26, "The practice of giving passes and reduced rates of fare to individuals;" I do not think there could reasonably be two opinions on that subject. The practice is vicious, because it can not apply to everybody alike, and as long as it does not it must effect discrimination in favor of some people at the expense of the majority.

Q. What do you favor doing with reference to that?—A. I favor doing what the railroad companies themselves are trying to do; limiting the issuance of free or reduced transportation to the bona fide employees and dependent members of their own families. Besides that, we issue exchange passes between railroad companies, to officers and agents who are necessarily traveling on the business of their respective companies. In that case it is merely an exchange; we each receive a direct benefit. There has been quite an effort made to abolish the exchange feature; it has never succeeded, and I do not know any good reason why it should succeed. There is no particular necessity for it, because if each company limited itself to the transportation of its own officers and employees, it would pay in the one case and receive the money in the other, and I think it evens itself up.

Q. (By Mr. KENNEDY.) Mr. Spencer, of the Southern Railway Company, says he hopes for the time when even the railroad president will have to pay his fare on the railroad.—A. Other than his own?

Q. His own road; and do you not think, if the system is to be wiped out, it would be well to wipe it out entirely, and not have employees or anybody else ride on passes?—A. If that could be made practicable, I suppose it would be.

Q. Is it not just?—A. Not altogether just; generally so.

Q. The railroad is a quasi-public institution; and has the employee of the railroad any more privileges or rights than any other?—A. Traveling on the company's business he should certainly be carried free.

Q. You would limit to that?—A. I should think so; I think that is proper.

Q. (By Representative LORIMER.) Then you would make it a question of facts. You would make an employee pay when he rides over the company's road when not traveling on its business?—A. It would really lead up to corruption; he would find an excuse for traveling on the company's business. I do not see how any good can be accomplished to the public or to anybody else by drawing, or attempting to draw, the line so fine.

Q. (By Professor JOHNSON.) I think it was President Spencer's idea that these passes granted to employees were disposed of to the general public, and for that reason it could be made a matter of bookkeeping for the railroad company to require its employees to pay for that transportation.—A. I do not believe passes issued to employees of the company are issued so as to affect the traveling public. There is not one case out of thousands where an employee misuses his pass or ticket. I do not believe that is true. I never heard of a case on our road.

Q. (By Mr. KENNEDY.) What is there to prevent your line, for instance, from shutting right down on the practice and not giving passes to the State and national legislatures or judiciary? Would any injury come to your road?—A. Unless the rule was universal. If the rule could be made universal, and some means found for enforcement, there is no reason why it should not be so. I have something to say on that subject, for it is touched on later on.

No. 27, "State laws prohibiting State officials from accepting or using passes." I know of but one State that has legislated on that subject and that is Wisconsin. Its law was made at the last session. The prohibition is very sweeping, and anyone in the employ of the State in any way whatever, every official holding office, is prohibited, and the penalty for accepting and granting is severe. That law took effect early in the spring. So far as I know it has been rigidly enforced. I do not recall any other case.

Q. Florida has such a law.—A. I spoke of our territory here, and not of any other States.

Q. (By Professor JOHNSON.) Do you approve of the Wisconsin law?—A. Yes.

Q. You would like to have other States follow the Wisconsin law?—A. Yes.

Q. (By Representative LORIMER.) Except you would go further and take in everybody, including those who hold office?—A. Yes; if a common carrier allows any person or class of persons to travel free and denies the privilege to others, it can only result in discrimination.

Q. (By Mr. KENNEDY.) There is an immense amount of discrimination going on in this country then?—A. That is my judgment.

Q. (By Mr. C. J. HARRIS.) Has the giving of passes decreased to any great extent in the last few years, in your opinion?—A. I think so. I think it has, although there have been short periods—I am speaking entirely of the district about here, 8 States through which our road runs—there have been short periods when the practice has seemed to be very large, but on the whole I think there are fewer cases of free transportation through the year than there were 5 or 6 years ago.

Q. (By Professor JOHNSON.) Is the power to grant a pass given only to certain designated officials of your road?—A. Yes.

Q. What officials have that authority?—A. Up to within a short period the authority was vested solely in the second vice-president. He has recently been appointed president of the company, and the practice continues; that is the general proposition. If I wish to issue a person a pass, I can do so as the traffic manager of the road. My recollection is, however, that I have issued 3, or not over 4, this year. As a general thing, whatever is done in free transportation of the public is done under the name and under the authority of the executive. I do not think, however, that is the rule in the district.

Q. (By Mr. C. J. HARRIS.) What percentage of your passenger traffic is done on passes, probably?—A. I have no means of making even an estimate.

Q. Would it be sufficient to affect passenger rates at all at the present time?—A. Free transportation from here to Omaha means \$12.75, or to St. Paul, \$11.50; so it does not take very many to make a substantial sum. But when you take the passenger earnings of the year, and find out how many were carried free, I imagine it would be a very small percentage.

Q. That is the testimony we have received from other roads.—A. It could not be 1 per cent, I think.

Q. I simply wanted an idea whether it was large in proportion to the whole passenger traffic, or an insignificant portion.—A. I do not think it could be figured out to show a material proportion.

Q. (By Professor JOHNSON.) During the sessions of the legislatures of the States through which you run, do you station a man at the capital with the pass-giving power?—A. That business has never come under my official supervision, and never came to my attention. Judging only by what I hear and what I see, I imagine that somebody near by can issue passes. It has never been in my jurisdiction, but has been handled, if at all, by the executive. There is no doubt that during the meetings of the various legislatures there is more or less transportation issued.

Q. (By Mr. KENNEDY.) By all the railroads?—A. All I know about.

No. 29, "Ticket brokerage." I suppose that ticket brokerage originated first from the fact that through fares for a ride over two or more railroads were less than the sum of the local rates between the several terminal points, each road having a coupon for its share of the rate, and that these unused coupons were taken up by brokers and sold at a profit, and yet at such a price that the buyer would save money on his fare. The constant effort to limit the use of through tickets has greatly reduced the profits, but there are sporadic cases now and then when low through rates are made so much less than the added locals that there is some traffic in that class of transportation yet, though not as much as formerly. Then there came to the front the dealing in 1,000-mile tickets, on the face of them nontransferable. Such a ticket is a contract with the buyer on the wholesale plan; he travels 1,000 miles in a certain number of months or days, and he gets the rebate on that ticket, which is known to everybody and published according to law. The limitations and descriptive features that have been added from time to time have restricted that traffic largely, and, I understand, in our territory there is very little scalping of 1,000-mile tickets. They have instituted a new system which has largely taken the place of that, a traveler's permit. He pays local fare, and it is put in a little book showing how much, and when he has traveled his 2,000 miles, he hands that book in, and gets the difference between what he has paid and the published rate. These tickets are interchangeable over

10 or 15 or more Western roads. He can travel over one road or another, and he goes to the person who sold him his permit to get his settlement. That is not susceptible of brokerage. It has the advantage, to a large class of mercantile houses, that by that means they can check the expense accounts of the traveling men and know where they have been. The worst feature of ticket brokerage is the connection that exists between the railroad company and the broker.

Q. Is not that the business on which the broker thrives the most?—A. It is the only business of any consequence left open to the broker. I think I can say on information and belief, with considerable positiveness, that in periods of rate disturbance, strong competition, the broker was originally allowed a reasonable commission for the sale of tickets, just as the railroad agents of connecting roads are allowed a commission. That in itself is not dangerous and not unreasonable; but it has extended and widened until, in many cases, the commission is so great that the broker can make a profit, and yet sell to the traveler at a less price than is made by the roads themselves over their own counter. Some brokers, and I think a great majority, are honest, reputable men; but there a few at least who are exceedingly dishonest, who encourage perjury and theft; that has been very clearly demonstrated.

Q. Would there be any of these forgeries in the ticket-brokerage business if the railroad companies themselves did not keep this fraternity alive by their patronage?—A. I do not think there is enough left in what you may call legitimate brokerage—the class of tickets I first referred to—to keep them alive. I do not think there is enough left in the 1,000-mile commercial ticket to allow them to keep their doors open a day.

Q. (By Mr. C. J. HARRIS.) Is there as much ticket brokerage here as there was a year ago?—A. I think there is not.

Q. (By Mr. KENNEDY.) Have not the railroads a remedy themselves without going to Congress to get legislation?—A. I think not. You take the railroads as a class, the Western and Northwestern roads from Chicago, and we are not any stronger collectively than the weakest line in the whole group. Whenever a road that is admittedly inferior, or is so regarded, makes a rate, whatever it may do to encourage business by this means, ultimately the stronger lines and those which deprecate the system are bound to be drawn in.

Q. So that if the weakest road in the many around here patronizes the scalper or attempts to put its business out through a broker the other roads are compelled to resort to the same practice?—A. Ultimately.

Q. (By Representative LORIMER.) If they can agree, and are honest in their agreement, that no tickets shall be turned over to brokers to handle at less than the regular rate they can do that, can they, in your opinion?—A. If they could, yes, but unfortunately it is like every other branch of business. I think the railroad people are no better and certainly no worse than people engaged in other classes of business, and the principle of competition rules just as strong, and in some cases, stronger.

Q. (By Mr. KENNEDY.) You would want Congress to interfere and make regulations for you?—A. Yes.

Q. You differ from Mr. Stickney in that respect.—A. In many respects. I have not heard Mr. Stickney's testimony in full. I think it is right that Congress should interfere. Congress assumes the right to legislate regarding railroads, as to what they shall do and as to what they shall not do. If that is the right of Congress they ought to legislate so as to give the railroads reasonable protection.

No. 32, "Unjust discriminations and undue preferences by railroads." I have a good deal to say on that subject.

Q. Are you freight or passenger traffic manager?—A. Both; general traffic manager. I presume the commission understands I am here without any conference with the executive management of our road and am giving a personal opinion only. I think I understand the policy of the company; while I am in sympathy with its policy and desires, still I am only here as an individual. I think there is a good deal of discrimination between persons, between places, and between articles.

As to discrimination between persons it is very hard to make any point with any certainty, because of the very nature of the case. On interstate traffic and on nearly all local State traffic the laws are strict, prohibitive; and on interstate business the penalties are so severe as to make it practically impossible, certainly very difficult, to get the truth. So we get our information secondhand, and generally from people whose interest it is to deceive and make us believe that competing roads are disregarding the law. I am therefore inclined to believe that there is very much less of personal discrimination than is popularly sup-

posed to exist, but that there is some, there can be no doubt. When I came into the room Mr. Stickney was referring to the subject of discrimination between persons and articles, and I am in sympathy with his testimony to that extent. I assume that the interstate act is based upon proper ideas and conclusions, that the common carrier should not discriminate in any respect unjustly. As to personal discriminations, I have very decided opinions as to what ought to be done, although they are merely personal ideas. I think the law was drawn in such a way as to make it exceedingly difficult to convict. The penalty is largely personal. It is made an infamous crime, subject to imprisonment, and there is a natural reluctance, in the first place, on the part of one railroad to testify against another. And, further, with such a penalty, if the company or individual does violate the law he does it in such a way as would be least likely to be discovered or proven. It encourages great ingenuity in covering up. Assuming that the practice ought to be discontinued, and I certainly think it ought to be, it seems to me that the way to prevent an evil or a crime is to remove the incentive. In the case of a corporation there is only one way by which it can be punished, and that is in its pocket, its treasury. If you take the individual official, I do not know anyone in my range of acquaintances who ever wanted business had enough to go contrary to what he believed to be the policy of his company. If you select any number of traffic men you could not find one who would venture to transgress what he believed to be an inflexible rule laid down by his management. After more than 30 years' experience in the traffic, more or less directly touching on these subjects, my conclusion is that the way to prevent it is to make the corporations themselves the agents of the law to prevent this practice. If there was a penalty assessed against the corporation for every conviction, a substantial penalty, it would be ruinous for any railway corporation to engage in this practice, absolutely ruinous if the penalty was sufficient; and the companies themselves would see to it that their employees complied with the law. I think that is the common-sense view of the case, and it is the only method, I believe, by which this law can be fully enforced. Certainly, so far as I am concerned, I would never dare to commit an act which I knew was sincerely and energetically prohibited by my company. I could not maintain my place 30 days if, by disregard of these laws, I placed my company in a position where it must suffer in its treasury.

I am associated, more or less, with the traffic men of various roads throughout the country. In many cases I am the competitor of a man who is a personal friend. I have known him for years, and have a high regard for him outside of competition and business affairs. It would take a good deal to compel or induce me to testify against these people if the result would be that they would be sent to jail. But if the Burlington, the Rock Island, or the Northwestern were cutting rates and diverting freight I should not feel the least reluctance to furnish testimony that would make it so unpleasant that they would never do it again if the penalty was in the way of a fine. That is not only my opinion, but the opinion of every traffic man of my acquaintance. It seems to me, if it is unlawful to indulge in personal preferences, that the law ought to be so framed as to make it an object for the railway companies to prevent it; in other words, remove the incentive.

Q. Do you agree with Mr. Stickney that the rates are not maintained, or do you agree with him that the rates can not be maintained?—A. I can not agree with him at all on this subject as to the maintenance of rates. I believe the law can be so changed as to bring about that result.

Q. I should judge you do believe they are not maintained.—A. As stated before, my information is based on hearsay, and the evidence almost wholly comes from people who want to produce the belief that rates are being cut. Speaking from general information and belief, I am satisfied that the rates are not maintained as the law requires; but the number of instances where it is violated, I believe, is much less than is generally supposed. The discrimination is very great, however, and so far as it goes it has this result: That when there is a discrimination by unlawful means it affects more people, it is more wide reaching in its effect, than it was before the interstate law. If an agent is going to be tempted beyond what he is able to resist, he is naturally going to find a place where he can get the greatest results. The favors will go to the man who controls the most business; the man who, perhaps, needs help less than others.

Q. What effect did the hard times have on the maintenance of rates?—A. I have theorized on that and studied the subject and heard the theories of others. It is generally supposed that when the railroad equipment is all in use in good times there is less liability to cut rates. When business is very dull some of the roads, many of them, must have about so much money anyway;

they have to have the business. I think that view is generally correct. Although there may be a very heavy movement of grain and country produce in one direction there is a temptation to manipulate rates in the opposite direction so as to load back the car. Generally speaking, however, good, heavy business steadies the rates.

Now, as to discriminations between places. I think I can safely say that 75 per cent of the rate disturbance in the West and Northwest originated primarily in the question, What is a fair relation of rates between competing markets? The interstate act does not give us any help except this: It says that rates must be reasonable. Practically, it says they must be relatively reasonable and not discriminative; but there is nothing in the law, as was said by the previous witness, in the nature of a criterion or rule by which one can determine what is a relatively reasonable rate.

Take the traffic from Chicago to St. Louis and Milwaukee to St. Paul. It has been for a number of years a bone of contention. We do not know how we are going to be able to determine that our rates are in full compliance with the act. That sort of a question applies entirely through the Northwest and Southwest. It is a continual struggle between the line from Kansas City to St. Louis, with no interest in Chicago, and the line from Kansas City to Chicago, with no interest in St. Louis. The carriers are always subject to constant complaint from the people in the terminal cities which they serve, and if a railway official, say in Chicago, fails to do that which the community here feel ought to be done to protect their commercial supremacy or equality he is a public enemy. There is no doubt that there is a great inequality of rates as between various competing distributing cities or market cities, and I think my statement that 75 per cent of our rate troubles have their origin in these questions is correct. If you will refer again to the question of rates between St. Louis and Chicago, Milwaukee and St. Paul, you will find the rate on a heavy class of goods—iron, hardware, etc.—from St. Louis is but a fraction more than the rate from Milwaukee. Milwaukee takes Chicago rates for reasons not necessary to go into here. The one is a distance of 325 miles and the other is about 600; the rates are within a cent or a half cent on the lower grade of freight, on property on which the rate is an important element in the sale of goods, articles cheap in themselves but heavy in transportation, where the rate forms a large per cent of value at destination.

We can not settle these questions, and the existence of discrimination in the tariff rate adjustment is always a strong incentive to protect your own market in some way. We have worried with that question for several years, and I suppose it has cost the railroads hundreds of thousands of dollars. The result, 5 or 6 years ago, was a compromise, which was much nearer a reasonable basis of settlement than it is to-day.

Now, we have had a number of cases where this same question has been before the Interstate Commerce Commission. I do not know of any case where the opinion and finding of the commission and its order have been fully complied with. I do not think, under the present law, the commission can expect to enforce its order unless it has power over a minimum rate as well as over a maximum rate. It can not, in the very nature of the case, create by its order and maintain a specific rate difference. For instance, in the case I have cited, the commission says there ought to be some difference between Milwaukee on the one hand and St. Louis on the other; you must make so much difference. It is comparatively an easy matter for the line from Chicago and Milwaukee to reduce its rate to St. Paul, but there is nothing to prevent the lines from St. Louis from reducing their rate just as much. There is no limit—no attempt to fix a minimum rate. Yet, since this commission under the present act can not enforce its order, I do not know whether the court could or not. So long as there is nothing to restrain the railroad company from making low rates, the very worst forms of discrimination will grow out of that very question.

That leads to the question whether the commission ought to have power to make rates; and that is a very difficult one, but this has occurred to me on that point: Neither the Interstate Commerce Commission nor the Government, nor any body the Government may choose to create, can make rates for the railroad companies in the sense in which the railroad companies now make them. They may, under complaint, thoroughly investigate by means that the law provides. The commission could, in such a case, make an order and enforce it if it had the proper authority. But this question of local discrimination can never be settled by any body now in existence until that tribunal has the power to control and limit rate reductions. It is the relative rate to this city and that city, competing cities, and the relation between articles from or to the same points, that make the real disturb-

ance, that occupy more time of the traffic men than any other class of business that we have to deal with. There is no doubt that towns are created or destroyed by a mere matter of relation of rates. I do not think that was intended; I do not think it ought to be so.

I have dwelt somewhat at length on that point because I wished the commission to understand what it is that underlies all these questions and that leads more or less to these abuses.

Q. (By Mr. KENNEDY.) You are not in favor, then, of giving the commission these enlarged powers without giving them the power to regulate or control the minimum rate?—A. I do not think any power could be conferred on the commission that would have any materially good effect on the people unless that power was included.

Q. (By Professor JOHNSON.) The Interstate Commerce Commission is of the same belief, is it?—A. I can only answer that I had some conversation with the chairman, and my judgment is that it is in full accord with that view.¹ I think it stands to reason that the prevention of discrimination against foreign or other markets can not be controlled until that power is vested in the commission. I have been led to that belief because of my belief that Chicago is discriminated against more than any other city I know of in the United States.

Q. (By Mr. KENNEDY.) I should like to ask about these discriminations between grain and grain products that are exported; what is the cause of those discriminations?—A. I can only answer that in the form of an opinion. It has, in fact, been my belief ever since the interstate act was passed, and it is an opinion that prevails in the minds of many railroad people, that that act does not apply to export business. This is one feature of the case that wants to be kept in sight; there are conditions of competition which may, and do in some cases, apply to grain in bulk that do not apply to package freight, like flour. I think the most notable example of that is from Minneapolis to Duluth and eastward as well as from Chicago eastward, wherever the rail carriers are in competition with water carriers. I think that is true very often; it is certainly so between flour and wheat. At Minneapolis the grain comes in from the great wheat belts; it goes to the elevators at Duluth or Minneapolis, is taken up there by boats from Duluth, or by the railroads running from Minneapolis to Duluth. That is a State haul. The grain is carried usually locally to Duluth from Minneapolis, and goes to the elevator. When it reaches the port it is carried to Buffalo by boats, which are not under the interstate act; that does not apply by water. These large dealers have their elevators at lake ports, at Buffalo and some other places in New York. The grain, when it gets to Buffalo, may be distributed to the interior more or less, where it is a State matter under the New York law; it may be carried by canal, so it is all water. Carrying flour from Minneapolis mills is interstate traffic and comes under the act, and there is not the same class of carriers handling it as those carrying bulk wheat and grain to Buffalo. The steamship lines under the control of the trunk lines are not situated in that way, so that wheat can go at a very small cost sometimes. To what extent that justifies the differences heretofore existing I don't know.

Q. (By Mr. KENNEDY.) There were no differentials between them until last February?—A. No; not to any material extent. I don't know of any reason why there should be a material difference between the rate on flour and the rate on wheat where the rail and lake or water competition is not a direct influence, excepting in one point. Under the modern methods and arrangements wheat can be loaded quite a good deal heavier than flour in a car. In fact, I think it is loaded much heavier than flour. As a matter of fact, flour is not loaded as heavily as wheat.

Q. Suppose a car has 60,000 pounds capacity and a miller at his own expense will load 60,000 pounds of flour on that car; is there any reason why he should not have the same rate that the elevator man has?—A. In the absence of direct water competition, I know of no reason. Our own railway runs in the wheat belt through Minnesota, and we would rather have the flour manufactured at some point on the line, because it builds up local industries and we get the benefit of it. I feel the same with regard to the country at large. I don't see any reason why wheat grown in Minnesota, Iowa, and Dakota should be carried for export at so cheap a rate that the foreign miller can compete with our own miller in the manufacture of wheat into flour from wheat grown in our own country.

Q. Wheat has been carried to Buffalo in the lake steamers for many years, has it not?—A. Yes; but not to the extent that it has been in the last 4 or 5 years.

¹ See Eleventh Annual Report of the Interstate Commerce Commission, pp. 25, 143; Twelfth Annual Report, pp. 23-27.

Q. Is it probable that lake competition has anything to do with the matter, in view of the fact that there was no difference in the cost until last February?—A. That difference began early in this year and is a question quite separate from the one I referred to at Minneapolis. I am not able to testify positively, but my impression is that that condition grew up as a result of the controversy between or on account of the various Atlantic ports—Philadelphia, Baltimore, Boston, New York, Newport News, etc. In other words, that differentials proposition seemed to have been working to the end wherein it was shown what the effect was, and the rates were made on export business. I think there was an impression abroad that the Interstate Commerce Commission hadn't very much to say about export business, and freight competition was naturally confined more to that channel than any other. It was a fight for the supremacy.

Q. (By Professor JOHNSON.) Do you think the Eastern lines tend to stimulate the traffic in grain instead of flour because of the terminal charges at New York?—A. I don't know; I am at sea on that question; I don't think I am competent to answer it with any attempt at certainty. What effect that terminal charge has I don't know. I don't think it is a ruling basis, except perhaps with roads that connect with the trunk lines; they have to make a rate to New York on export business, and the question is how will that rate be divided. Take the rate from Kansas City to New York on grain for domestic purposes. I don't know that it makes much difference what it costs to handle it in the port there. The aggregate rate itself is what the public must consider, and that is the one that affects the welfare of the trade at large. The deduction of 1, 2, or 3 cents before prorating is a matter that concerns us very much, but I don't see how it affects the public.

Q. In this way: Might not the managers of the railways, because of being the persons who receive the terminal charges—and they are very profitable, I believe—continue to insist upon rates that would cause the traffic to go in the shape of wheat instead of flour? It comes to the question whether or not the profits coming from these terminal charges go into the pockets of the men who determine the rates.—A. I hardly think that is true.

Q. (By Mr. C. J. HARRIS.) Would there be terminal charges on flour the same as on wheat?—A. I am not clear upon that point.

Q. I should like to ask one more question about pooling. I should like to hear what you have to say upon that subject.—A. I am very much in favor of pooling, provided sufficient authority is given to the Interstate Commerce Commission to regulate the pools and the rates made thereunder. I don't believe as an economical proposition that it would be right, or advisable at least, to legalize pooling without placing it under the supervision of a Federal commission. It has seemed to me that if pools could be legalized, and the companies could sue and be sued under the pooling contracts, if the commission had the right to legalize pools provided they approved of the rates, if the commission had the right also to discontinue a pool at any time because of the rates made by the pooling parties, then it would be beneficial to everybody. I can see only two real objections to a pool from a public standpoint; first, that the carriers would be favorable to such contracts as could be made under excessive rates; but if the commission was authorized or empowered to make a pool illegal the moment it found the rates were unreasonable, that would remove that objection. The only other objection to the pool that I think would be made, would be by people who hope in the absence of pools to get a decided advantage over someone else. As a matter of fact, the interstate act is very specific in its declaration that rates shall be reasonable; for instance, they, by inference, hold that rates, not only as between places, but as between articles and persons, shall be reasonable. But the rules are such to-day that everything which is necessary to accomplish that end is specifically prohibited. There is not a thing that the railroad company can do to comply with the spirit and purpose of the interstate act that is not made unlawful. I think that should be changed. I think there should be some way by which rates could be regulated fairly in the general interest of the carriers and the people, and so that both parties should be protected in their rights. That is all we ask. If I sit down with 3 or 4 gentlemen, freight agents or traffic managers, to discuss what rates should apply between any two competing points, it is a violation of the antitrust act, and the penalty is severe, not only upon the person, but upon the property. A fluctuating rate can not benefit anyone in the end. It is the most disastrous thing that can happen to the commercial world, and more country traders have been broken up by fluctuating rates than by excessive rates—one hundred times over. If a country merchant stocks up on staple goods when the rate is 30 cents per hundred, and by and by someone gets a rate of 15 cents per hundred, his business is gone and his profits are gone, and sometimes, more than

that; his property is gone, because he can not compete with the man who has purchased the same staple goods at a 15-cent-rate when he has paid 30. This has happened repeatedly. I think what the country at large needs, and is entitled to, is reasonable and stable rates. It doesn't seem to me that the country has any right to complain as long as rates are reasonable and stable.

Q. (By Mr. C. J. HARRIS.) You would advocate a pooling law, subject to the proper supervision?—A. Yes.

Q. (By Mr. KENNEDY.) I should like to ask in regard to private cars.—A. There is so very much to be said on that subject that I don't like very well to enter upon it, not having had an opportunity to reduce my opinions on the subject to order so that I can state them clearly. There is a great deal to be said, and I suppose I should say something as to how private cars originated, why they were necessary at one time, and why they are continued. There has been a great advance made in rolling stock. When I first commenced railroading, at the close of the civil war, there was a very severe penalty upon the station agent if he allowed a car to be loaded over 9 tons. Now we frequently load 30 tons, and some of the older roads load 50. The cars we have on hand now are good, serviceable cars of all suitable dimensions; that has grown up recently in the extension and enlargement of cars. Take, for instance, in the first place, a manufacturer who wants a large car and who can not get a car from the railroad that is suitable for his business. Some of the more wealthy ones put in a few private cars to accommodate their own business. Up to the present time I don't know of a railroad that has cars enough of its own to meet the emergency in the average busy season, and they are glad to take a car of a man who has it to accommodate his business. Take the furniture cars, cars of special dimensions. Then the next move of any importance was the move in the extension of the packing business, and especially that of dressed meats. I doubt very much whether it would be wise or safe for railroad companies even at this day to own or control the kind of cars which are used for the shipment of fresh meats. I have ascertained during the last 4 or 5 years that a car may appear to the uninitiated in a perfect condition for the shipment of fresh meat or dressed beef, and 24 hours' run might ruin the property. It may be a moldy car; it may be musty; perhaps it has not been properly scalded to clean away the dirt, and such a car is absolutely unsafe. If the railroad companies should own or control these cars I think it would be very expensive, and if they were required to do it now by law there would not be cars enough to handle the business, because they would have to be handled with regularity and precision, so that I am in doubt in regard to cars used for a particular purpose, especially perishable property, and more particularly fresh meats. There is no doubt that the building of private cars has grown to a very great extent, and that it is bound to be burdensome. There is neither any doubt that a large manufacturer having cars of his own, if he has not too many, can keep them running with sufficient regularity to make a profit merely from the ownership of the car. In other words, the mileage of a car that is kept going all the time is a profitable affair. Of course, that is because of the price paid. There has been some reduction in car mileage, but it is not what it should be.

Q. That is in the nature of a rebate, then?—A. I don't think the particular idea of a rebate would apply to that; he has his money invested in cars and he is entitled to something for the use of them.

Q. Is he entitled to any advantage as against any other shipper on account of the allowance made by reason of the private cars; by reason of the private cars can he ship any cheaper over a line of road than any other manufacturer can ship over the same line?—A. Well, I don't know; if a farmer has a good wagon and a good team, and another farmer has not, I don't know that the one who has a good wagon and team is doing any harm to the one who has not. If a manufacturer spends his money for the facilities that are necessary to the business, he is entitled to the benefit of the equipment he furnishes; he is entitled to a fair compensation for the equipment that is used in the business; I think that is a business proposition. If one gentleman in the grain business in Nebraska has a first-class elevator holding 50,000 or 150,000 bushels, with modern equipment for moving the grain cheaply, that does not interfere with the rights of a man who has a warehouse that will hold two or three cars.

Q. Do you think it is good public policy that one shipper is permitted to have an advantage, because he is allowed to use these private cars, as against another shipper that has not that same right and who must use the company's cars?—A. I don't feel quite competent to go into that, as that is a very serious question. I think, however, if the railroad company is not able to supply itself with cars that it needs and someone else does, then the man that does is entitled to a fair price for the use of his property.

Q. (By Representative LORIMER.) Do you think you pay more in mileage for private cars than it would cost the railroad company if they used their own cars?—A. There are different classes of private cars that are used by the railroads; the refrigerator cars and what we call the ordinary cars, the common cars that require no special treatment. For the latter we pay the owners the same price that we pay connecting railroads; I think it is 6 mills a mile; it was a cent, but a few years ago it was reduced to 6 mills. Cars that cost a few years ago, before the last rise in price, say \$400 or \$425, would be 6 mills for every mile run. Cars of that description make an average of about 50 or 60 miles a day in actual use. Now, the refrigerator car costs probably twice as much; while we pay \$400 for the standard box-car, or \$425, a well-equipped refrigerator car costs from \$900 to \$1,000, and it has been receiving usually 1 cent a mile. I think that is the prevailing price. It is a question of whether we are to pay more or are paying more on common cars than we ought, and more than we collect on our own cars when they are used by other people. It is all we collect when other people use our cars; in the sense that is reciprocal, I presume the price is tolerably fair.

Q. (By Mr. KENNEDY.) Would not many of the railroad men of the country be glad to be rid of the private-car system if they could?—A. Undoubtedly; our company would be very glad to be rid of them. About 3 years ago we commenced to build cars. We built 10 a day for nearly a year, or the full capacity of our shop. We are now building theirs. If we had all the cars we could use we would not pay anyone else for the use of them, but we have not got them. I am in doubt as to the propriety of owning refrigerator cars for perishable property. I don't know what is best. I should regret to make the experiment of owning these cars and being responsible for their condition. But when it comes to ordinary cars it would be best for us to have all the cars we want of our own.

Q. The roads that don't appreciate or meet the requirements of commerce are largely responsible for the private ownership of private cars?—A. Very likely; none of the roads were ever yet able to meet the requirements for equipment anyway. The demand is always a little ahead. That is what causes the use of the private cars during the busy seasons. They have been very useful in this way, that we have been able to handle business we could not otherwise have obtained. I think the company should own the ordinary cars for the use of its own road, but I am in doubt as to the use of the refrigerator cars. Take Kansas City, for instance, a packing point where a large number of private cars are used. The biggest owner is the packer, who owns enough of them to take care of his business, but there is no railroad company that owns enough cars especially constructed to take its share of the business of the packers. The number of cars actually used in that particular business is much less than it would be if every company solicited that business and had a sufficient number of those particular cars to take care of its share of that business. That fact has created quite a problem in the matter. It is a practical question.

Q. Is the meat in the private cars at the owner's risk?—A. The meat in the private cars is at owner's risk excepting where there is a wreck or an unnecessary delay caused by some act for which the carrier is responsible. If the train is not wrecked and the car is moved with usual and average precision and the meat is destroyed, the individual loses; there has never been a claim under such circumstances that I know of. I have known of many cases where a train loaded with fresh meat might pass over our road with usual precision and reach its destination in due time, and when it reached its destination the meat would be unfit for use; but that is no concern of the carrier. Had we owned these cars it would have been a matter of investigation as to whether the cars were properly scalded and were put in proper order, or to show that something had not been done that ought to have been done whereby the damage was caused; and there would have been no escape from payment of damages if it could be shown that it was our fault or negligence. I think in the 17 years I have been in Chicago in this railway business we have never been asked to pay a claim for damages to property when the car went through on the ordinary time.

I want to touch more upon that question of flour and wheat for export, if you please, that the commission may know, if it desires to know, to what extent the order of the Interstate Commerce Commission has been complied with. As soon as we received that order we undertook to follow it.

Q. State what the order was.—A. The differentials ought not to be greater than 2 cents per hundred. We are dealing with the Atlantic seaboard rate now; that is the one thing that affects us. We undertook to find out what, if anything, would prevent us from complying with the order; we understood that the rate from Chicago on the Eastern lines was in violation of the commission's order.

Q. From Chicago eastward?—A. Yes; but I understand that the rates from Mississippi River points are not in line with ours, for reasons which may easily be explained to this commission. We felt compelled to make some rate from Savannah, where we cross the Mississippi River; but we can only make such rates as the Eastern trunk lines are willing to participate in. I believe that the rate on export grain from the Mississippi River to New York and other Atlantic ports is more than 2 cents less than domestic rates. We can not reduce the rate on domestic business from Savannah, where our road crosses the river, without the consent and cooperation of the Eastern roads. We can not advance the rate on export wheat from that point unless the other roads advance it from the Mississippi River crossings, or we lose the business. My recollection is that the difference between export wheat and flour from Mississippi River crossings is about 4 cents. I think that is the difference. We are prepared to comply with the law whenever it is in our power to do so. I reported that fact to the commission. We are prepared also to publish the rates which will apply on export business and to adhere to them; to adhere to the published rate. From the Missouri River to the Mississippi River we are accepting the same rates on export traffic as on domestic traffic of the same class.

Q. Is that not a farce? In view of Mr. Stickney's testimony this afternoon, it is a farce for the railroads to send their tariff sheets for filing with the Interstate Commerce Commission in Washington?—A. I can only answer that question with reference to what I have testified to. I don't think it is.

Q. You don't think it is?—A. No. If it has any effect whatever it has a good effect. The Western roads, as a rule, have an agency at Washington for the sole purpose of examining the tariffs of other roads, as they have a right to do, and as any citizen has a right to do, as it is a public office. And that has had a very beneficial effect. There have been a good many complaints—I don't know how well founded—of what is known as midnight tariffs. It was said 2 or 3 years ago that someone here issuing a tariff sent a copy to the Interstate Commission and kept a copy that was not posted up, and no one knew what the rate was, except the commissioners, on the tariffs of that company that issued them. On the other hand, I don't know of a case of that kind. I know it was very often complained of. It was often stated that that practice was prevailing, and after some conferences with the commission we hired a man and put him there as agent, and he sees every tariff that comes in and reports on it, and we find out if there is any fraud in it. I think it is beneficial. I understand that the position of the commission and the courts is that in any trial that comes up, or investigation in regard to interstate traffic, any attempt to introduce a tariff as evidence is barred unless it appears that it has been duly filed with the commission in accordance with law. I was in the United States court two weeks ago to-day, as a witness, where this issue was raised by the judge: That the tariff filed with the commission according to law stands for itself as a fact, and this will operate. If Mr. Stickney's evidence be true, there is fraud in all of that. I hope your honors will not ask me to substantiate his testimony.

I want to make a statement in regard to classification, because I think it is a matter that should have careful attention on the part of this commission, and on the part of Congress when the time comes.

I was for 3 years one of a committee of 15 that had in preparation a uniform classification. We were instigated to that work by Judge Cooley, who was then chairman of the Interstate Commerce Commission, and also by resolutions passed by the various national conventions of State and Federal commissioners. There are 3 principal classifications in the United States. One is known as the Official; that applies on the Eastern roads east of the Mississippi River and north of the Ohio River; the second is east of the Mississippi and south of the Ohio, called the Southern; the third is the one that interests us in this district, and is known as the Western. It applies generally from Chicago and St. Louis west and north; I believe it goes clear to the Pacific coast, except that there are exceptions in what is known as the commodity rate.

Q. Exceptions also made by State laws and State commissions?—A. In our district very little. Of course, the State commissioners always reserve their right to make their own classification, but as a rule they substantially conform to the Western classification. Now, we have a great variety of conditions. We find the Official classification with so many classes, 8 I think, was probably adjusted to meet the conditions in the territory in which it was applied: it fitted the business, and the business had grown up to the classification in some respects, and the classification to the business in others. So in the South and so in the West. But they were greatly at variance. We found it was necessary that we should have on freight from New York State or Pennsylvania the same classification on shipments to Mississippi River points, applying to traffic going beyond, as was made

to other Mississippi River points, such as St. Louis. It was necessary to equalize not only rates but classifications, the Eastern classification being much lower in many respects, fitted to the shipping out of manufactured goods in the interest of the manufacturer shipping his goods westward. That classification was made for that purpose. But the roads from Chicago to St. Louis could not equalize the rate to Kansas City without equalizing the classification; so the basing also occurred on the crossing of the Mississippi River. The rate begins at New York and ends at the river. We apply our Western classification from the Mississippi River west, and the Eastern from the East to the Mississippi River.

To note the effect of that in one case, a shipment of whisky from Detroit to some Mississippi River crossing, our crossing at Savannah, was lower than the rate locally from Chicago to that crossing, although the Chicago distance was only 138 miles on our road, because on that classification the rate was very low and put it in the third class, while ours was comparatively high on the other classification and put it in second. So the third class from Detroit to Rock Island was less than our second class from Chicago to Rock Island. I found a case where whisky was shipped from Cincinnati to St. Paul, where the rate was less (I am speaking of carload lots) than the rate from Milwaukee to St. Paul, the latter distance being 325 miles. The whisky from Cincinnati was fourth or fifth class in small lots, and whisky at that time under Western classification was first class.

That difficulty exists more or less throughout the country. It applies to a great variety of articles. Our tariffs and classifications are made with some view of promoting business in our own territory, building up manufacturing points, and that is just exactly what the Eastern trunk lines are trying to do. They want their rates made so as to dump their surplus products in the West against new industries, and they are continually clashing. Many things are rated higher in the Official classification than in the Western classification, and vice versa. It is true also of the classification in the Southern States. So that to make a uniform classification, we had to give and take; that is all there was about it. We worked upward of three years at intervals of 3 or 4 months, sometimes 6 months, between meetings; but we kept at it until we perfected a classification which we unanimously recommended to the various roads. The roads west of Chicago agreed to accept that classification if the Eastern trunk lines would, and the Southern roads agreed to accept it if the Eastern trunk lines and the Western roads would; but it was defeated by the vote of one or two, possibly three, Eastern trunk lines. I do not know who they were, but it was defeated.

Q. Defeated in the interests of Eastern manufacturers?—A. It might be uncharitable to say so, but it was defeated. My recollection is the majority of the Eastern trunk lines favored the adoption of that classification.

Now, that applies only in part to the classification. Though we should adopt that uniform classification, still the roads would have to make special commodity tariffs on grain, lumber, coal, iron ores, and that class of business—tariffs made to meet the conditions in the territory in which the tariff is to be used. It would not, in any material sense, militate against the use of tariffs as a general proposition; it would settle these difficult questions.

Q. What privileges do the business men and shippers have before the Western classification committee?—A. It has been several years since I attended a meeting of the Western Classification Association, but my understanding is the association itself chooses a representative, from each of the roads in interest, upon a subcommittee, which meets before the regular committee—whose meetings, I believe, are now held once in 6 months—and people who have any proposition to make can come before that subcommittee and make their statements in writing or orally, and they are considered. The applications are generally in the nature of demands for some special consideration for some special business; the manufacturer of some certain article finds that if he can get this special classification in his territory he can get some other person's business. Like most other propositions, they are for his own benefit against somebody else.

Q. Are they not sometimes in the nature of demonstrating whether a business can live or not?—A. Those questions are often considered, because we have frequently reduced classifications, when we did not do it because we wanted to, but because it seemed to be necessary on what appeared to be good argument. I do not understand that any business or commercial men come before the joint committee; I do not think they have recently, but they do have access to the subcommittee which passes on all these questions, and arranges them in due order and form, and makes its own statement of what it thinks ought to be done. I have received many applications myself, which I have invariably referred to the subcommittee for consideration. There would be very little progress made if these joint committees were thrown open to the public; one man wants something for his class of business, and insists that it be not granted to another.

Q. We have complaints from very large manufacturing interests in Ohio, one of the largest in the country, that the representation of the business men before these classification committees is not sufficient.—A. We do not know about that; that is the official committee, and we do not participate in it.

Nos. 44 and 45, "Joint traffic associations and pooling contracts." I have touched on pooling contracts, but not on so-called freight associations.

The term association is a misnomer, and has been for 4 or 5 years. Although it is claimed by some that what is done at these meetings might be considered to be in violation of the antitrust act, there is no other way to prevent wrong discrimination and violent fluctuation of rates, but to have some sort of conference to find out what each is going to do. Of late years nothing has been done but to discuss what ought to be done—what is proper. One man says, "I think this ought to be done, and I am going to do it unless somebody has good reasons against it." That is about all they can do at present, it is all they can amount to under the present law. If you will take the matter of rates from Omaha to Chicago, on grain alone, it is fairly illustrative of the situation. If there is not to be any unanimity of action by agreement as to rates between Omaha and Chicago, one will publish one rate and another another. Leaving entirely out of the question the effect upon the railroads of the unknown character of the rate to Omaha, the rule again touches the people east of Omaha where the long and short haul question comes in, and where the rate made by the Burlington, for instance, is the maximum for any intermediate point. There may be, without conference, a lower rate published, say, on the Rock Island, from Omaha to Chicago, than by our road. For 21 miles we are absolutely side by side; east of that point, we diverge a little, but still at a close distance, 4, 5, or 6 miles up to 10 or 12 miles apart. They would have a lower rate from Omaha than we have, and as it is a maximum rate at intermediate points, the rates at stations along their line south of ours are lower than the rates at opposite points on our road. We may not know it for a little bit, we may not find it out, but in the meantime the towns along our road are suffering a local discrimination as between themselves and other towns only a few miles away. So it goes all through the country. There is an absolute necessity of some conference, not for the purpose of making rates, but to know ourselves what the other rates are to be. I do not see how we can escape a chaotic condition without some sort of railroad conferences. I think we have pending suits amounting to over \$1,000,000 for excessive rates, and the only condition on which the cases can be made, is to make it appear to the court that these rates were made by agreement between competing railroads contrary to the antitrust act. They never have been in that territory, in no instance have they been by agreement; but we have met frequently to compare freely and say what these rates are on each road. If a man says my rate is so and so, and another thinks it is too low, all he can do is to put his rate down. As to a combination of roads to maintain rates, there is nothing of the kind. Judge Shiras said, in a preliminary hearing, that if it could be made to appear that these rates were made under an agreement in restraint of competition, it was unlawful; but how much too high, it was, he said, impossible for the jury to determine. A jury may decide so and so to-day, and to-morrow the same question may arise in another case before another jury and the decision may be entirely different. There would be no stability of rates, and could not be under the jury system.

These associations are, in this district to-day, nothing but conferences to find out what has been done; they have had no power since the trans-Missouri Freight Association case.

The real point I wish to make is this: As far as the associations are concerned they do not do much good to the railroads. They help us to compare notes and get our rates reasonably in line to prevent local discrimination, but they are no permanent remedy; a man can change the rate whenever he pleases.

As to the other branch of that topic, "The policy of legalizing pools," it seems to me more essential than this. It seems to me, in conclusion, if the commission could be vested with sufficient power to regulate rates, leaving with the carriers the same right that other people have, the reasonable right to go to the courts, but in such a way as not to embarrass the proceedings or impair the usefulness of the commission, it ought to be made lawful to pool competitive business, if the commission is clothed with the power I have suggested.

A law to clothe the commission with universal power to make rates anywhere and everywhere, at all times, I think, would defeat itself.

Q. They do not desire that power?—A. I do not think the commission do—it would be inoperative. To put that immense amount of responsibility on the Interstate Commerce Commission, or upon the Government through any bureau, would, in my judgment, be absurd.

Q. If they are invested with the right to readjust rates under complaint, subject to appeal, would you have their decision go into effect immediately?—A. That treads somewhat on the legal aspect of the case; I do not feel competent to say further than this, that if the railroads are to be regulated by law they should have all the protection that other people have from legal regulation; they should have all the rights that any other citizen has, no more. I think the method of investigating and getting at the facts should be changed, and in a case of this kind the commission has made the point to good effect, that the case should go to the court on appeal with the same testimony, unless some new issue has been raised, as in ordinary practice.

I think the commission ought to be strengthened. I say this on the assumption that the law regulating railroads has come to stay, and is intended to regulate railroads to a reasonable degree. If this is so, it ought to be modified and changed, so that the commission can regulate them, and so we can get some relief from this local discrimination.

I can not but repeat that the provisions of the act, the prohibition and the penalty, have been framed in such a way as to defeat their own purpose; it seems to me that the true idea of removing an evil is to remove the cause, and I do see how you can very effectually remove the cause by laying such a severe penalty on the corporation that the corporations themselves will be the policemen or guardians of this proposition. I never heard a shipper discuss that question so far as I know. I believe that thinking business men will approve what I say.

Testimony closed.

CHICAGO, ILL., November 21, 1899.

TESTIMONY OF MR. C. C. EMERSON,

Produce dealer, St. Paul, Minn.

The subcommission on transportation being in session in Chicago, Representative Lorimer presiding, at 11:15 a. m., November 21, 1899, Mr. C. C. Emerson was introduced as a witness, and, being duly sworn, testified concerning transportation as follows:

Q. (By Representative LORIMER.) Will you kindly state your name, address, business, and place of business?—A. C. C. Emerson, St. Paul, Minn.; produce business; 26 East Third street.

Q. Will you, in your own way, state to the Commission any complaints that you have?—A. I do not think I would enter into the matter of rates, or very little, if at all. Our great difficulty in shipping vegetables in bulk, potatoes and other vegetables, is that we meet with great shrinkages at destination, and we feel, sometimes unjustly perhaps, the blame is on the part of the party unloading the car; and if we could have railroad supervision of the discharge of cars, a great deal of that would be saved. Another point, the Western Railway Association are very stringent in collecting their freights on loading weights rather than discharge weights, and we have quite a large number of shippers over that part of the country; there is quite a heavy traffic in that line. We should have some redress in some way; they should not accept the word of the loader as absolute fact and not give any credence to the word of the party unloading.

Q. The receiver?—A. The receiver. I think the ground for it is that the receiver or middleman is not there. The shipper loads the cars himself, or by some representative, at point of origin, and he will say, for instance, that he has loaded 600 bushels of potatoes, 36,000 pounds, into the car. The party that receives it will report back 32,000 or 34,000 pounds, as the case may be—sometimes a less shrinkage than that, and not impossibly a larger one; he produces positive proof, in his own opinion, that that is what the car contained. The railroad people, through their weighing association, insist on the payment of freight on 36,000 pounds under such conditions, they having turned the car over to the man who received it, in bulk, and giving no supervision whatever, no counting of the number of loads discharged from the car, or the weight of them, and leaving us with the loss of the goods if there were any, and compelling us to pay the freight on the weight as reported at the loading station.

Q. (By Mr. CONGER.) Is it not true, as a matter of fact, that there is an actual shrinkage in potatoes?—A. There is apt to be a slight shrinkage; we figure quite carefully that 2 per cent is a fair estimate of the natural shrinkage. Of course, there is more or less moisture absorbed, and more or less sand or soil that may

have adhered, and may be rattled off, but in unloading cars the past season, loaded by some of my men, I have had them turn out within 100 or 200 pounds in the car-load, discharge weight. It is generally conceded among shippers that 2 per cent, if proper care is given at both ends, will cover the shrinkage.

Q. How do you account for this shrinkage of 4,000 pounds, from 36,000 to 32,000 pounds?—A. There are sometimes men who are a little neglectful in their methods, and I think I can safely say that there have been cases where a load has been accidentally omitted from the report.

Q. A wagon load?—A. A wagon load has been omitted from the report because of no supervision of the party unloading.

Q. Do you think that is a proper matter for the railroads to control? Is not that a matter between the seller and the buyer?—A. It is impossible for the seller to be present. Take a man handling 10 or 20 cars a day, as more or less of us do in busy times of the year. It is impossible to have a man at the destination unloading these cars.

Q. (By Mr. C. J. HARRIS.) How would it do for the railway company to weigh the car at the terminal point? It has track scales?—A. Then they are track weights; there are great discrepancies in them.

Q. Do you find railway weights satisfactory; are they accurate?—A. Not accurate. I will give you an illustration of that that occurred 2 or 3 days ago. I had a car loaded on the Milwaukee road; my own men loaded them, weighed them on team scales. They were hauled into St. Paul and weighed on Milwaukee track scales under Western railway supervision, and they made them weigh 3,710 pounds more than the team-scale weight. We ordered the car over to the Northern Pacific, and requested them to weigh them under the same conditions on their track scales, Western railway supervision, and they weighed 210 pounds more than my team scale, making a discrepancy of about 3,500 pounds between their two weights the same day.

Q. You find a discrepancy between the actual and the marked weight of the car?—A. When weighed light.

Q. This was the loaded car?—A. This was the loaded car.

Q. Now then, they took the marked weight of the car?—A. Yes.

Q. Not the actual weight?—A. In both instances, I understand. There would not be any other way but to take the marked weight of the car for tare.

Q. Is not that marked weight the weight after the car came out of the shop, and when it has been out a year, has not the actual weight changed?—A. It is very apt to be so. Very often we ask to have the car weighed empty, to find a remedy. We think that if the railroad people say, "we have hauled 600 bushels for you in the car," and compel us to pay freight on 600 bushels, on the assertion of the man that loaded it that he put that much in, they should deliver us 600 bushels.

Q. Do you have much trouble with discriminations and rebates in St. Paul, railroads giving advantages to one shipper more than to another?—A. Not very much complaint of that, I think.

Q. Less than there used to be?—A. I think we hear less of it than we used to; especially last year I know it has been very strict.

Q. Are you acquainted with the grain trade there?—A. No, I am not; it is out of my line.

Q. You have elevators in St. Paul?—A. Yes, one or two, not many; the grain trade of St. Paul is very light, except on the track.

Q. (By Mr. CONGER.) Where do these shipments of potatoes and produce, that you handle, generally originate?—A. We handle them from points on the St. Paul and Duluth, or Great Northern, the Northern Pacific, and more or less from Wisconsin, on the Wisconsin Central.

Q. The destination is St. Paul?—A. The destination is likely to be any town; our shipments are all over the country.

Q. Do you ship to Chicago?—A. Very little; some, of course, as crop conditions require the product of one locality in another. At the present time our shipments are running southeast and east, to Virginia, Washington, Louisiana, Kentucky, Indiana. A great many times they go southwest; but this year the crop conditions are such that we can not get into that territory. We find our greatest difficulty in the medium sized markets; the difficulty in the small markets is very slight, and in large markets, like Chicago, the railroad people do superintend the discharge of cars, and while we do get some shrinkage, they account for it by tare or something of that kind, and accept payment of freight on the basis of their discharge weights. It is all run over their team scales in markets like Chicago, St. Louis, New Orleans, and a few of the larger markets. We have the greatest difficulty in markets such as Peoria, Evansville, and other places of that size. The shippers

feel if the railroads were interested with us to have the discharge of these cars superintended, so that no drayman could get a load out of the car without giving a receipt for it, then we should have a check not only on the companies, but on the freight, and might know very nearly accurately what we were doing. In other words, we should have some reason why there was a shortage from the point of shipment to destination. It is very burdensome sometimes.

Q. The railroads have a system of supervising the discharge of freight in the large markets, and you would like that extended?—A. We would like to have it extended to every station.

Q. Do you think that can be done by legislation, or must it come out of the evolution or progress?—A. (Interrupting.) I do not see why legislation would not be the remedy that we would have to look for.

Q. Do you think the railroads under the present rates could afford to have these men employed to supervise the discharge of freight?—A. I do not think it would necessitate the employment of many more men. Even if we had to pay something, we would rather pay for that supervision than not have it. We should be money ahead by having to pay a certain amount for that supervision, although we believe rates are profitable.

Q. Do you know of any specific case in your experience where shipping over the same road you have been favored with this supervision in a large market, and could not get it in a small market?—A. Yes, I could give you instances of that kind.

Q. If you can, I think you might as well do so.—A. Take the Burlington road; they give that supervision in St. Louis; they claim everything is weighed from track scales. I could give you a particular illustration of one car; I can not give you the exact number of bushels, but this particular car I shipped from Princeton, Minn., to St. Louis. The party loading it gave very good proof of putting in, say, 480 bushels. I have the written statement of the agent at St. Louis that only 420 odd bushels was discharged from the car. Of course I had to settle on that basis with both parties, the loader and the shipper, in that particular case, because I had that evidence.

Q. That was a case where supervision was not particularly satisfactory?—A. It was not as satisfactory to the loader, but it left me right. Now, whether the agent was careless in his supervision or not I would not undertake to say; but it relieved me of carrying the burden—the road accepted freight on the discharge weight.

Q. Did you have to pay the loader, or the person of whom you purchased, for 480 or 420 bushels?—A. Four hundred and twenty. He had not evidence nearly as good as I had of the discharge.

Q. The point I was getting at, the illustration I asked if you could give me, was whether the Burlington road gave this supervision in St. Louis and did not at a smaller station?—A. I am sure they do not at Peoria; for instance, they allow the cars to be turned over to the receiver there with no supervision whatever of the discharge of the car; the car is simply delivered to the buyer in bulk.

Q. In other words, your contention is that in the case cited you were able to settle with the railroad by paying freight on 420 bushels, whereas, if you had shipped that same car load to Peoria, you would have had to pay freight on 480 bushels?—A. Yes.

Q. (By Mr. C. J. HARRIS.) Have you any other complaints to make except as to potato shipments from St. Paul?—A. The minimum weight on perishable goods is quite an injury to the traffic, especially in fruits—California fruits; they have raised the minimum on that. We find that not only in the winter time, when it is not necessary to ice the refrigerator cars, but also in the summer time when it is, a car of that character heavily loaded to the roof comes in in very poor condition. There is a certain amount of heat and it rises to the top, and if there is no escape it settles back and must of necessity decay the fruit. The heavy loading causes the shipper to commence icing at least 30 days earlier than under the old way of a lighter minimum. It used to be 20,000 and now it has advanced, I think, to 26,000. In the case of cars from the South in the summer time, melons, tomatoes, and all things of that kind, if a car is loaded heavily to the roof, we get very poor results; the fruit is in unsatisfactory condition. It is not only a loss on the car, but it has a demoralizing effect on the market. A carload of oranges came into St. Paul Saturday morning, loaded so you could not put another box of oranges in the car. The temperature of the car was 70° this season of the year. Fortunately, the fruit was not overripe and it did not injure it; but had it been ripe fruit, there would have been a shrinkage of from 10 per cent to 25 per cent.

Q. Are they special cars?—A. Yes; made for the purpose.

Q. Ventilated?—A. I could not tell you as to this particular shipment; I did

not see it myself. I presume it was a ventilated car, a regular refrigerator car, I understand, with the ventilators open.

Q. (By Mr. CONGER.) Are these cars usually owned by the roads or by the shippers?—A. I think a large share of them are owned by these great companies like Armour cars and Fruit Growers' Express.

Q. (By Professor JOHNSON.) Does not the railroad company give you the same rate on the 26,000 as on the 20,000?—A. We must pay a higher rate for the 20,000, or pay for 26,000.

Q. You get 26 at the same rate as you would 20?—A. The rate on 20,000 is higher per 100 pounds than on 26,000. They can load into the car any number of thousands of pounds above the minimum, and pay same rate per car. In this car there were 370 boxes; not over 26,000 pounds; that was just loaded to the minimum. We find in potatoes the same difficulty—putting 30,000 the minimum. A car with 400 bushels, 3 feet deep, will carry with much less liability of decaying heat than one loaded with 500 bushels, which would necessitate loading it between 4 and 5 feet deep. While they are new and in an immature condition they are very susceptible to heat, and decay is very often caused by the necessity of loading heavy. If, unfortunately, we get a small car that we must load nearly to its capacity, that loads it very deep.

Q. (By Professor JOHNSON.) Have you made these complaints before the railway associations that have classification in charge?—A. No; we have only made these to the different general agents of the roads over which we do business.

Q. These matters of minimum and maximum carloads are determined by the classification committee, are they not?—A. I think so; I understand so.

Q. Well, would not the classification committee listen to an appeal of this kind?—A. They have not, so far.

Q. (By Mr. CONGER.) Have they been asked by you?—A. We have an association of potato shippers; it is not very old, but they went before them once in regard to this matter, and different parties, different shippers, have been before them. I myself have never been to their classification committee; I have only appealed to the roads with which I have been doing business.

Q. (By Professor JOHNSON.) Do you have a feeling that the large association of shippers, including St. Paul and Minneapolis, would not be able to secure from the railroads a modification of such a rule as this?—A. Yes; because our business extends over such a wide country and beyond these particular roads. For instance, take the Southern roads. A great many potatoes are shipped from our country to the South—Louisiana and Texas—and they turn our appeal down by saying they can not control the classification or minimum of the connecting lines. They have got to load in such a way that the connecting lines will receive the cars in the same condition; and we must protect ourselves by knowing their requirements and loading accordingly.

Q. Would a uniform classification for the whole United States, promulgated by the Interstate Commerce Commission, if necessary, answer your needs?—A. I should think so.

Q. Should you be in favor of a national uniform classification?—A. Yes; I should.

Q. Subject to the amendment and control of the Interstate Commerce Commission?—A. I think so.

Q. (By Mr. CONGER.) Do you think a uniform classification for the entire country feasible?—A. On our commodities, I do not see why not. We find now, under certain conditions sometimes, when there are no special rates in effect, that potatoes for New York and New England points take a higher classification east of Chicago than west, and consequently there is an advance in rates.

Q. Did it ever occur to you that possibly, because of the volume of shipments of a certain product in certain portions of the country, the railroads were justified in making a different classification for it?—A. Could they not reach that in their rate, making special rates covering these differences, rather than in the classification? Have they not done so?

Q. No; I think it is done generally in classification.—A. So far as I have been able to discover they have been made special rates upon occasion. For instance, at the present time the Western roads from St. Paul to Montana points have reduced their rates. Possibly they would call it through their classification, but they do not so notify us. Potatoes have been 75 cents a hundred from St. Paul to Helena. The 15th of November they notified us of a reduction in rate to 60 cents a hundred.

Q. You do not object to that, do you?—A. No; but the classification, where it is on one line of road—perhaps they just put it down. I did not look that matter up; but I think—

feel if the railroads were interested with us to have the discharge of these cars superintended, so that no drayman could get a load out of the car without giving a receipt for it, then we should have a check not only on the companies, but on the freight, and might know very nearly accurately what we were doing. In other words, we should have some reason why there was a shortage from the point of shipment to destination. It is very burdensome sometimes.

Q. The railroads have a system of supervising the discharge of freight in the large markets, and you would like that extended?—A. We would like to have it extended to every station.

Q. Do you think that can be done by legislation, or must it come out of the evolution or progress?—A. (Interrupting.) I do not see why legislation would not be the remedy that we would have to look for.

Q. Do you think the railroads under the present rates could afford to have these men employed to supervise the discharge of freight?—A. I do not think it would necessitate the employment of many more men. Even if we had to pay something, we would rather pay for that supervision than not have it. We should be money ahead by having to pay a certain amount for that supervision, although we believe rates are profitable.

Q. Do you know of any specific case in your experience where shipping over the same road you have been favored with this supervision in a large market, and could not get it in a small market?—A. Yes, I could give you instances of that kind.

Q. If you can, I think you might as well do so.—A. Take the Burlington road; they give that supervision in St. Louis; they claim everything is weighed from track scales. I could give you a particular illustration of one car; I can not give you the exact number of bushels, but this particular car I shipped from Princeton, Minn., to St. Louis. The party loading it gave very good proof of putting in, say, 480 bushels. I have the written statement of the agent at St. Louis that only 420 odd bushels was discharged from the car. Of course I had to settle on that basis with both parties, the loader and the shipper, in that particular case, because I had that evidence.

Q. That was a case where supervision was not particularly satisfactory?—A. It was not as satisfactory to the loader, but it left me right. Now, whether the agent was careless in his supervision or not I would not undertake to say; but it relieved me of carrying the burden—the road accepted freight on the discharge weight.

Q. Did you have to pay the loader, or the person of whom you purchased, for 480 or 420 bushels?—A. Four hundred and twenty. He had not evidence nearly as good as I had of the discharge.

Q. The point I was getting at, the illustration I asked if you could give me, was whether the Burlington road gave this supervision in St. Louis and did not at a smaller station?—A. I am sure they do not at Peoria; for instance, they allow the cars to be turned over to the receiver there with no supervision whatever of the discharge of the car; the car is simply delivered to the buyer in bulk.

Q. In other words, your contention is that in the case cited you were able to settle with the railroad by paying freight on 420 bushels, whereas, if you had shipped that same car load to Peoria, you would have had to pay freight on 480 bushels?—A. Yes.

Q. (By Mr. C. J. HARRIS.) Have you any other complaints to make except as to potato shipments from St. Paul?—A. The minimum weight on perishable goods is quite an injury to the traffic, especially in fruits—California fruits; they have raised the minimum on that. We find that not only in the winter time, when it is not necessary to ice the refrigerator cars, but also in the summer time when it is, a car of that character heavily loaded to the roof comes in in very poor condition. There is a certain amount of heat and it rises to the top, and if there is no escape it settles back and must of necessity decay the fruit. The heavy loading causes the shipper to commence icing at least 30 days earlier than under the old way of a lighter minimum. It used to be 20,000 and now it has advanced, I think, to 26,000. In the case of cars from the South in the summer time, melons, tomatoes, and all things of that kind, if a car is loaded heavily to the roof, we get very poor results; the fruit is in unsatisfactory condition. It is not only a loss on the car, but it has a demoralizing effect on the market. A carload of oranges came into St. Paul Saturday morning, loaded so you could not put another box of oranges in the car. The temperature of the car was 70° this season of the year. Fortunately, the fruit was not overripe and it did not injure it; but had it been ripe fruit, there would have been a shrinkage of from 10 per cent to 25 per cent.

Q. Are they special cars?—A. Yes; made for the purpose.

Q. Ventilated?—A. I could not tell you as to this particular shipment; I did

Q. And soon meet it?—A. Yes. I think that crop illustration I was speaking of was to enforce values from the West, from Washington, to the East, at a time when we handled a great many potatoes from that section. We shipped them through, and we had a rate from Washington. The original rate was 90, and they reduced it to 60 cents, and then let in a large amount of potatoes that otherwise could not have been handled.

Q. What has been your experience as to the consequence of these reductions in rates; in other words, take 1897, when the rate was reduced from 60 to 40 cents to New England points; when the next season came was the lower rate or the higher one put in force?—A. I wish to say right here that I would not be positive about this; of course I know 40 cents was the rate of the reduction; I would not be positive; it would depend very much upon the crop condition of the country. For instance, we should not have been able to do anything this year on a 40-cent rate; it would not have let us in there at all; it has had no effect before this year.

Q. Has the tendency of the rates been upward or downward?—A. They have been very firm during the past season.

Q. By that you mean during the past 2 or 3 months?—A. Yes; there have been no special rates made.

Q. Covering a period of years, how do the rates of the past year compare with the rates of 5 or 10 years ago? In other words, do you think that transportation charges are as much now as they were 10 years ago?—A. No, sir; I don't think they are; the volume of business from our part of the country is much larger than it was 10 years ago, and rates have not been as high during the past 3 or 4 years as they were previous to that time.

Q. As I understand, then, you haven't much complaint as to the rates; your particular complaint to-day is that you wish to have the supervision of the unloading of cars?—A. Yes; we want the same supervision of goods shipped in bulk in our line that is granted where goods are shipped in packages. Carloads of apples are always checked out; we have no difficulty in checking out a carload of apples and keeping our account with the railroad people with a carload of apples shipped in barrels, but with potatoes we have not had the business checked.

Q. Do you ever ship potatoes in barrels?—A. Very infrequently, but quite often in sacks.

Q. Do you have supervision of them when they are shipped in sacks?—A. We find it much easier to get supervision of them than when they are shipped in bulk.

Q. (By Mr. C. J. HARRIS.) You make a statement of so many bags, don't you?—A. Yes; it is very seldom you can get a bill of lading indicating the number of sacks. They sometimes have a book, though they really don't account for anything, and they don't give you an absolute bill of lading; and at some of the smaller stations they don't even do that in loading.

Q. (By Mr. CONGER.) Is not right there a remedy for this whole fault; that is to say, the enactment of a law that would compel the road to give an accurate and definite bill of lading for so many pounds or so many packages, as the case might be?—A. Very likely that would cover the thing; I should expect it would. Then we should have something to go by, that we could produce as an absolute fact.

Q. It would seem to me evident that to get direct to the supervision would be a difficult thing to do, and I think many difficulties would be met with in connection with legislation; but I should think that supervision would very quickly follow the enactment of a law that would compel the railroads to give an absolute bill of lading.—A. Yes; I think that would do.

Q. The bill of lading would become a contract to deliver at destination, and the man who receives the freight should receipt for it at the place of shipment?—A. Yes, I think that would do the thing; of course that would necessitate State supervision or something of that kind, of weighing, etc., but if Congress will do that I think it would give us the remedy, especially if enforced. But there are so many different sides that it may take a long time to get it in proper shape.

Testimony closed.

CHICAGO, November 22, 1892.

TESTIMONY OF MR. J. H. HULBERT,*Farmer and grain dealer, Fontanelle, Iowa.*

The subcommission on transportation met at 10.30 a. m., Hon. William Lorimer presiding. Mr. J. H. Hulbert, being duly sworn, testified as follows:

Q. (By Representative LORIMER.) Please state your name in full.—A. J. H. Hulbert.

Q. And your business and post-office address.—A. My post-office address is Fontanelle, Iowa; my business is what might be called that of a farmer, although I deal in grain, banking business, etc.; but my principal business is that of a farmer.

Q. Please state, in your own way, just what your information or opinions are about the present elevator system and its connection with the grain business.—A. I don't know a great deal about it, as I have not given the matter my close attention; but I should think that it was an advantage from what I know.

Q. (By Mr. C. J. HARRIS.) How long have you been in the grain buying business?—A. Seven or 8 years.

Q. On what margin or per cent of profit do you handle and buy and sell wheat at the present time?—A. We are not in a wheat country.

Q. Well, corn then?—A. Cent and a cent and a half.

Q. Eight years ago, when you first went into the business, what was the margin at which you handled it; more or less?—A. More.

Q. How much more?—A. There was not so much shelled corn to handle then as there is now, and on this we had 3 or 4 cents at that time. A great deal more now is handled as shelled corn. It comes from the farmers shelled.

Q. Did I understand you to say that the margin then would be 3 and 4 cents a bushel?—A. Yes.

Q. To what do you attribute the lessened margin at the present time?—A. When we bought it we bought it at its market value and changed it right there. At that time when we bought our corn there was snow in it; it was wet and some of it poor corn, and we had to clean it and get it ready for market.

Q. Did you shell it?—A. Yes.

Q. Does your elevator do shelling and cleaning?—No; there are four different elevators, and we have one sheller in the bunch.

Q. (By Mr. CONGER.) Did you 8 years ago?—A. Yes; it was put on a grade then.

Q. And the 3 or 4 cents margin at that time included the cost of shelling?—A. Yes; cleaning it and getting it ready for market. It was not nearly so clean then as it is now.

Q. (By Representative ORJEN.) Where is the shelling done now?—A. With the farmer.

Q. With the farmer?—A. Yes; he does it to save hauling. When it is hauled to town shelled he gets a load of 50 or 60 bushels at a time of shelled corn, whereas if the corn were not shelled he would only have 25 or 30 bushels; and then he has the cobs, which he keeps at home, and he uses a good deal of them.

Q. You are not interested in any of the elevators you speak of?—A. No; just our own.

Q. (By Mr. C. J. HARRIS.) Will you tell us to whom you sell your grain?—A. Well, the most of our grain is sold to Harris & Co., of Chicago, and we also sell—I can not remember the others—Perry, Armour, and different ones.

Q. Do you have bids from other cities?—A. Yes.

Q. How many bids do you generally get during a week?—A. I can not say how many different bids; 5 or 6; sometimes more and sometimes less; sometimes they average 1 or 2 a day. We have daily bids.

Q. Is there any truth in the statement that two or three men in Chicago, grain men, control the price of the different grains throughout the country?—A. Well, I could not say as to that.

Q. Suppose two or three men in Chicago should get together and set a price on grain, what effect would that have on other markets? Would it affect the Minneapolis, St. Louis, or Peoria markets?—A. I don't think it would.

Q. Then it would be impossible for two or three men in Chicago to set the price on grain?—A. Well, the prices range differently. In St. Louis sometimes it would be a cent a bushel higher, and at Peoria the same way, and at other times Chicago is the highest market. This firm of Harris & Co.—I don't understand their grain comes to Chicago at all; in fact, I understand that it does not.

Q. As Chicago put a low price on grains, you could, instead of shipping it there,

ship to other markets; is that your understanding?—A. I understand we can sell to Harris or Armour to better advantage than we can ship it here and sell it on the track.

Q. But if they attempted to put a price on grain and should bear the market, the result would be that you would ship to other cities?—A. Yes.

Q. (By Mr. KENNEDY.) You say you can sell to them to better advantage on the track there than you can bring it to Chicago and sell it on the track here; is that what you say?—A. Yes; we sell the most of our grain on the track there—put it on the cars there.

Q. At the elevator?—A. To these two firms, yes. While the majority of it goes to these two firms, we sell some at Peoria.

Q. (By Mr. CONGER.) Are there any other local buyers in your market; in other words, do you have competition?—A. Yes.

Q. Are there more than one there in the town?—A. One visits just one town.

Q. Where does he sell?—A. To the same places as we do.

Q. In Chicago?—A. To Harris & Co., and different buyers. The American Commission Company ships to Louisville sometimes.

Q. Sometimes to Louisville?—A. Yes.

Q. When this grain is shipped to Louisville is it sold on the track at your town?—A. Yes.

Q. What exception could you make to the statement you just made, that you can sell to better advantage on the track at home than you could to send it here? In other words, is it your opinion that Armour and other grain men of Chicago—that is, the larger dealers—have a better freight rate than you can get?—A. I don't know that they have; I don't know anything about that. My idea has always been that men who buy like these Louisville men, that they buy for seaboard inspection and weights, and that they go over lines that give them a better freight rate than we can get; but I don't know.

Q. Your idea is that it is offered on track at your local market rate and then pulled out to the seaboard on another rate?—A. Yes; that is the way it is, probably. A great deal of our grain is wheat from—

Q. (By Representative OTJEN.) It does not come here and go into the elevator, or anything of that kind?—A. No; not that I know of. We shipped grain in August, and our weights did not come in until day before yesterday. It was shipped and sold to parties in Des Moines, and it has been out since August. We just got the weights day before yesterday.

Q. (By Mr. CONGER.) That is 3 months or more?—A. Yes; it is a long time.

Q. Did you have to carry them 3 months?—A. No; we drew what is known as a bill of lading for the amount of it.

Q. Where this grain is shipped on a through bill of lading on the other road, what mention is made as to the destination in the bill of lading?—A. I could not answer that question, for I have not paid enough attention to it.

Q. What roads do they generally ship over?—A. Harris ships over the Burlington. I also think P. B. Armour has the Burlington, but I am not sure of it. I am sure Harris has.

Q. (By Professor JOHNSON.) Do they bill from your place through to the seaboard?—A. I understand so. The firm or firms we sell to bill out over the Burlington from Mississippi River. Now, we send grain to St. Louis, which is the Mississippi River terminal.

Q. Have the farmers of your section any grievances against transportation companies, so far as you know?—A. No; I don't think so.

Q. They are entirely satisfied, are they?—A. Seem to be. It is very hard to satisfy a farmer, however.

Q. What complaints do those who are not satisfied make?—A. The complaints they would make would be about cars. Sometimes it is very hard to get cars, and when you get them you have to load in 48 hours. For instance, a farmer would order his cars and shell his corn and then the cars would not come. Sometimes he would have his corn shelled a week or 10 days before he could get a car. Those are the complaints they make against the railroad companies.

Q. (By Mr. CONGER.) Is that true this year, and has it been true for several years?—A. It has been true for several years.

Q. (By Professor JOHNSON.) You say the farmer has only 48 hours in which to load his cars? That keeps him from shipping to a large extent, directly, does it not?—A. You can fill the cars in one day if you are a dealer, and have your grain right there, but the farmer can not do that.

Q. Why?—A. Because his corn is out in the country, and he can not shell his corn and bring it in in one day, and if he does bring it in maybe he can not get the cars, so it makes it difficult for him.

Q. (By Mr. KENNEDY.) Are you a member of any farmers' organization?—A. No.

Q. Have the farmers in your part of the country an organization?—A. I don't think so.

Q. The Grange has no existence there?—A. No.

Q. Have you ever shipped your grain to Chicago and sold it in the competitive market here?—A. Yes; lots of it.

Q. Could you do better under that system than under the present one?—A. I don't think so.

Q. (By Representative LORIMER.) What was the advantage of shipping it here to commission men, as against selling it to people on the track at your place?—A. Well, we got more money out of it to sell it there. It would be a cent or so a bushel more there.

Q. Did you get more by selling it at home than you would get if you shipped it here?—A. Yes.

Q. Do you know whether that condition still exists?—A. I do not.

Q. You sold it there at the Chicago market price, did you?—A. We got a card bid every morning with daily price. Of course we compared it to the Chicago market.

Q. (By Representative OTJEN.) Is it higher or lower than the Chicago market?—A. Take the freight out and it is higher.

Q. But if you take the transportation out, it is lower than it would be in Chicago?—A. Yes.

Q. (By Mr. CONGER.) How are these dealers able to do that—to pay you more for the wheat at your market than it is worth here after the freight is paid?—A. I don't know that.

Q. Does it follow that they are able to get that grain in here at less than the tariff rates?—A. Well, I could not say as to that. I don't know anything about it. Harris or any of these elevator men can handle it to much better advantage than we can. For instance, our wheat comes right from the farmer; it is mixed up with dirt and is right from the machine; it is brought right to the car and sent to them and they can make a grade out of it. That we could not do, but they can, as they have the machinery to do it with.

Q. Is that true of corn as well?—A. Yes; to a great extent. And it is the same now about the billing of these cars of grain; they bill out at the actual weight or take the minimum car weight.

Q. The minimum?—A. Yes.

Q. Do you often put in more grain than that weight would indicate?—A. At some of the stations we weigh and put on the bill every bushel that goes in the car, and usually they are the minimum weight. On a car of 60,000 pounds we put, say, 56,000 pounds and from that to 60,000; but in the last 2 or 3 months we have been very scarce on cars and we have had instructions from the railroad company to load them 10 per cent more than the capacity.

Q. Where they were loaded in that way did they in paying the freight pay for the actual weight?—A. I suppose so.

Q. (By Mr. C. J. HARRIS.) You don't know anything about that?—A. No.

Q. You don't pay the freight?—A. No.

Q. What is corn quoted at at your place to-day, or the last quotation you have had?—A. I could not say.

Q. You don't know the freight rate per bushel here?—A. No.

Q. You say these men in Chicago pay you more for grain at your place than you could get by shipping it in here yourself—that is, that the price of grain at your place, with the freight added, is more than you could get in Chicago for it?—A. Yes.

Q. What do you base such a statement as that upon?—A. I know from what we have done. We have shipped a good deal of grain here. My recollection is that our corn rate was 17 cents—but I could not say definitely; that is my impression—for 100 pounds.

Q. Seventeen cents per 100 pounds?—A. Yes.

Q. If your price for corn at Fontanelle is 30 cents a bushel, and your freight on a bushel is 10 cents to Chicago, that makes 40 cents a bushel here in Chicago?—A. Yes.

Q. Now, do you mean to say that the market price of corn in Chicago at that time would be less than 40 cents? You say you buy on weight there and add the freight to it and ship it to Chicago, and that the price of corn in your place with the freight added amounts to more than you can sell it for in Chicago—more than the market price in Chicago?—A. Yes; that is what we think, at least.

Q. You say you don't ship your grain to Chicago now?—A. When we consigned it ourselves we sent it to Chicago, St. Louis, and Peoria.

ship to other markets; is that your understanding?—A. I understand we can sell to Harris or Armour to better advantage than we can ship it here and sell it on the track.

Q. But if they attempted to put a price on grain and should bear the market, the result would be that you would ship to other cities?—A. Yes.

Q. (By Mr. KENNEDY.) You say you can sell to them to better advantage on the track there than you can bring it to Chicago and sell it on the track here; is that what you say?—A. Yes; we sell the most of our grain on the track there—put it on the cars there.

Q. At the elevator?—A. To these two firms, yes. While the majority of it goes to these two firms, we sell some at Peoria.

Q. (By Mr. CONGER.) Are there any other local buyers in your market; in other words, do you have competition?—A. Yes.

Q. Are there more than one there in the town?—A. One visits just one town.

Q. Where does he sell?—A. To the same places as we do.

Q. In Chicago?—A. To Harris & Co., and different buyers. The American Commission Company ships to Louisville sometimes.

Q. Sometimes to Louisville?—A. Yes.

Q. When this grain is shipped to Louisville is it sold on the track at your town?—A. Yes.

Q. What exception could you make to the statement you just made, that you can sell to better advantage on the track at home than you could to send it here? In other words, is it your opinion that Armour and other grain men of Chicago—that is, the larger dealers—have a better freight rate than you can get?—A. I don't know that they have; I don't know anything about that. My idea has always been that men who buy like these Louisville men, that they buy for seaboard inspection and weights, and that they go over lines that give them a better freight rate than we can get; but I don't know.

Q. Your idea is that it is offered on track at your local market rate and then pulled out to the seaboard on another rate?—A. Yes; that is the way it is, probably. A great deal of our grain is wheat from—

Q. (By Representative OTJEN.) It does not come here and go into the elevator, or anything of that kind?—A. No; not that I know of. We shipped grain in August, and our weights did not come in until day before yesterday. It was shipped and sold to parties in Des Moines, and it has been out since August. We just got the weights day before yesterday.

Q. (By Mr. CONGER.) That is 3 months or more?—A. Yes; it is a long time.

Q. Did you have to carry them 3 months?—A. No; we drew what is known as a bill of lading for the amount of it.

Q. Where this grain is shipped on a through bill of lading on the other road, what mention is made as to the destination in the bill of lading?—A. I could not answer that question, for I have not paid enough attention to it.

Q. What roads do they generally ship over?—A. Harris ships over the Burlington. I also think P. B. Armour has the Burlington, but I am not sure of it. I am sure Harris has.

Q. (By Professor JOHNSON.) Do they bill from your place through to the seaboard?—A. I understand so. The firm or firms we sell to bill out over the Burlington from Mississippi River. Now, we send grain to St. Louis, which is the Mississippi River terminal.

Q. Have the farmers of your section any grievances against transportation companies, so far as you know?—A. No; I don't think so.

Q. They are entirely satisfied, are they?—A. Seem to be. It is very hard to satisfy a farmer, however.

Q. What complaints do those who are not satisfied make?—A. The complaints they would make would be about cars. Sometimes it is very hard to get cars, and when you get them you have to load in 48 hours. For instance, a farmer would order his cars and shell his corn and then the cars would not come. Sometimes he would have his corn shelled a week or 10 days before he could get a car. Those are the complaints they make against the railroad companies.

Q. (By Mr. CONGER.) Is that true this year, and has it been true for several years?—A. It has been true for several years.

Q. (By Professor JOHNSON.) You say the farmer has only 48 hours in which to load his cars? That keeps him from shipping to a large extent, directly, does it not?—A. You can fill the cars in one day if you are a dealer, and have your grain right there, but the farmer can not do that.

Q. Why?—A. Because his corn is out in the country, and he can not shell his corn and bring it in in one day, and if he does bring it in maybe he can not get the cars, so it makes it difficult for him.

lower the charges for transportation, improve the service rendered, and advance wages. The facts will show that the large systems of railways pay better wages as a rule than the small roads pay. As a general proposition, the employee of a large company is more justly treated and there is less favoritism shown than on the smaller lines. This is easily accounted for by the fact that on the small roads the officials in charge get better acquainted and have more intimate relations with employees than is possible on the large systems.

Passenger rates in the United States will average lower and the service better than in any other country in the world. The rates are somewhat higher in the West than in the East, but the difference in fares is not nearly as great as the difference in density of population.

Passes are given for many reasons, almost all of which are bad ones. There should be no passes printed. Even railroad officials or employees traveling on other lines than those they work for should be required to pay fare. The chief reason that stimulates a man to ask a railroad company for a free pass is that somebody else has it. Passes are given for personal, political, and commercial reasons, and in exchange for advertising; for services and for various other reasons. I am in favor of the total abolition of railroad passes, and this view is held by a large number of the railroads of the country, as will be seen by the extract, quoted below, from the proceedings of a meeting of executive officers of Western, Northwestern and Southwestern railroads, held in October last in St. Louis:

"Recommended:

"First. That all free or reduced transportation of every description, both State and interstate, with the exception of that to railroad employees, be discontinued.

"Second. That reduced or free transportation to railroad employees be very much restricted.

"Third. That a joint meeting of all the leading American lines be called for the purpose of considering this subject, with the end in view of entirely stopping the pass abuse.

"Fourth. That a copy of these recommendations be submitted to all lines, with the request that they each go on record as to their views, and, if they favor discontinuing the practice of issuing free transportation, state how many railroads they believe should subscribe to the movement in order to make it effective."

The foregoing recommendations were submitted to the executive officers of 265 railroads, representing a mileage of 184,000 miles—practically all of the mileage of the country.

Replies in favor of radical action in either abolishing or restricting the issuance of free transportation have been received from 129 of the railroads thus addressed, representing 150,590 miles.

While this indicates that a large proportion of the railroads want to shut off the free pass abuse, I doubt if anything ever comes of it until Congress passes a law prohibiting it.

There should be no unjust discriminations in rates of freight or fares in favor of individuals or localities.

Transportation is a public service and the charges are in the nature of a tax. They should be absolutely fair to all. Almost any kind of legislation that will insure this will be wise.

One great difficulty that the railroads have to contend with is the adjustment of relative rates from competing distributing points. Much money has been wasted in contending for differential rates in favor of this place or that, and there ought to be some tribunal—such as the Interstate Commerce Commission—empowered to settle such disputes. Many of the rate wars of the Western country have been caused by such contentions, and the result has generally been a restoration of old conditions, an arbitration, or a slight concession of some kind or another.

I am one of those who do not believe that the American railroads ought to put lower rates on imported or exported articles than on domestic except where forced to by foreign competition.

I think that to a very large degree the excessive competition that has existed on export traffic has been between the American carriers, and that the rates have not been justified by the competition from foreign countries. I am of the opinion that there must be some elasticity in rates on manufactured goods for export in order to extend our markets in other countries, but I do not see why these rates should in any way interfere or be considered in connection with domestic rates. We produce cereals as cheap as any other country, and such products, it seems to me, can, when exported, pay our regular domestic rates.

I make a distinction between our agricultural products and our manufactures,

because in agriculture we already lead the world, while in manufactures we are only getting ready to do so.

I think freight rates are generally published and posted conspicuously in accordance with the law, but I think the posting is a good deal of a force and an unnecessary burden on the railroads. I mean by that the posting in the freight offices and at the stations. I am safe in saying that there is not one intelligent man out of a hundred that can go into a railroad station, where all the tariffs of that company are properly published and posted, and, without assistance, get for his own use any given rate in any given time under 24 hours, and that he would not be sure he had it after he got it. I have been in the railroad business 25 years, and am tolerably familiar with the publication of tariffs and the making of rates, but I should hesitate to go into the office of any other railroad and try to find a rate there for myself; I don't think I could do it.

I am not in favor of governmental establishment of maximum and minimum rates, unless at the same time maximum cost of wages, rails, ties, fuel, and other supplies are arranged for. Transportation is in every respect a composite service, and unless the prices of the component parts are fixed, the idea of fixing a maximum price on the whole seems unreasonable.

Take the present situation: After several years of depression the railroads find themselves with the lowest published tariffs in force that ever existed. These have been caused by hard times and light business. The revival of trade has resulted in an advance in prices of all kinds of material. Steel rails have doubled in price and all articles of iron have made a similar advance. There has been an increase in the cost of all the supplies a railroad uses, and it is estimated, if the present prices are maintained, that it will amount to \$300 per mile per annum for all the railroads in the Western country. This is equal to an increase in fixed charges; in fact, it comes ahead of interest. We have to pay our operating and maintenance charges before we pay our interest.

I think there are more freight classifications in use than there ought to be, and believe in a universal classification, although the effort to bring about such a change failed because of the various opinions respecting classification held by men from different parts of the country. The Pittsburg man was in favor of very low rates on articles of iron, because they comprised a large portion of the tonnage on his road, while the California man thought the Pittsburg man's proposition was too low, because his line in California only hauled iron incidentally and it constituted a very small proportion of his tonnage. Thus it was with many other articles. I favor the appointment of an expert commission to make a railroad classification, and believe, once adopted and adjusted to our commerce, that it would be a wise measure.

I am in favor of railroad associations and legalized pooling. The chief object of the interstate-commerce law was to prevent unjust discriminations between individuals or communities. In prohibiting pooling the same law went a very long way in obstructing the result most wished for.

Legalized pooling will come nearer creating stability in rates than anything yet proposed. It would put a premium on honesty, and make it expensive for the railroad company that cuts a rate or pays a rebate.

Legalized pooling will come nearer insuring the small shipper and the small town a fair opportunity to grow than any other plan yet proposed. It will necessitate a fair deal all around, and I contend that it is in the interest of every shipper who wants nothing but equality in freight rates.

Legalized pooling will afford protection to the railroad investor. About one-fifth of the wealth of the United States is tied up in railway securities, and this enormous property ought to be reasonably and equitably treated.

Legalized pooling among railroads is not in restraint of trade, and differs materially from legalized combinations in the sale of merchandise. The Government undertakes to regulate the railroads, and various States undertake to fix the rates to be charged. This of itself makes legalized pooling in transportation a very different proposition from a pool in other commodities where prices are fixed by individuals.

Legalized pooling will stop unrestricted and disastrous competition, and ought to result in preventing a reduction in the wages of the railroad employee. There are about 1,000,000 men directly engaged in the transportation service of the country, and they are well paid. It is of no small importance that the sources of the incomes of these men be not impaired.

Legalized pooling will give the small town a better chance to grow. There are already sufficient magnets in our large cities to induce the people from the country to leave it, and it is of great consequence that the tendency should not be stimulated by unreasonable transportation advantages.

Unless legalized pooling is authorized by Congress, the railways of the country are more than likely to pass into the hands of a few owners, and then, without being legalized, a pool of the earnings is accomplished.

In view of the poor outlook for legalized pooling, this concentration of ownership has already commenced. I am in favor of it, and think that such a combination would insure better service to the public without any unreasonable advances in the rates. In fact I think the rates would be lower.

I believe the Interstate Commerce Commission, or some similar body, has come to stay. I am in favor of its having proper authority, and am willing, under legalized pooling, that it should be empowered to pass, subject to review, upon the reasonableness of rates. I go further than most railroad officers in stating that I should like to see all transportation, both State and interstate, subjected to the supervision of a Federal commission.

There is too much conflict between States to suit me. I do not like the idea of a State railroad commission taking action to nullify an order issued by the Interstate Commission. I do not believe that any State should endeavor to so adjust its rates of transportation as to unjustly discriminate against shippers outside of said State. For this reason I believe the public generally, and the railroads too, would be better off if a Federal commission could pass on all matters pertaining to our inland transportation. I want to emphasize this point and to add that I doubt very much if a Federal commission can accomplish what it ought to and what will be expected of it unless it has control of State rates. The State and interstate rates are so interwoven that they must necessarily be considered together.

I am opposed to governmental ownership of railroads. Where it occurs, rates are higher and service is inferior to our own. The introduction of politics into the transportation of the country would be followed by serious complications, in my opinion.

I think the American transcontinental lines, and the American wage-earner, should be protected against the inroads of a foreign carrier. If our coastwise commerce is to be confined to ships carrying the American flag, and foreign bottoms are to be excluded from that traffic, then I insist that the commerce by rail from one State to another should be confined to our own railroads, and that any law, or absence of laws, that permits the Canadian Pacific Railroad to carry freight from one State in the United States through the Dominion of Canada to another State in the United States is unreasonable and unfair; and especially do I think that it is altogether wrong that the Canadian Pacific line should engage in this traffic and at the same time demand that the American lines shall do the business direct and charge 10 per cent higher rates than they say they will.

There are many who believe that, left to competition and other natural laws, the railroad problem would adjust itself, and I am of that opinion; but the large majority of people do not recognize this and therefore Federal regulation is with us undoubtedly as a permanent condition.

This being the case, I think that railway construction should be subject to supervision of the Federal authorities. I do not believe that new roads should be built unless a good reason can be shown for their necessity.

One of the chief causes of our two last panics was an overconstruction of railroads. The unnecessary paralleling or duplication of lines, the invasion of territory already well served, and new railroads projected to blackmail existing lines should not be permitted.

In revising the interstate-commerce act, this should be well considered. If it is fair to regulate the transportation lines of the country, it is likewise just that they should receive ample protection.

Q. (By Mr. C. J. HARRIS.) I suppose that the legal interpretation of that posting was that he must keep a book of rates subject to the call of anyone—subject to inspection by the public?—A. They have them posted up around. The Interstate Commerce Commission decided that we had to have them hung up outside of the depot office for the inspection of the public, and where anyone might come in and look at them and make out the rates if he can. Rates are published from one station to every other station, and it makes it very bulky. They are hung up all over the inside of the station principally for the average citizen to look at, and then he is obliged to ask the agent to find out what the rates really are.

Q. Do you think they would cover all the sides of a room of this size?—A. Yes.

Q. (By Professor JOHNSON.) Would it not be possible to publish these rates in such a way that they could be clearly made out?—A. It would be if they would not try to publish the rate from one station to every other station in the United

States. The railroads of the country are paying hundreds of thousands of dollars every year for the unnecessary publication of rates, I think. This is supposed to be for the information of the general public, but, as I said before, I have been in the railroad business for 25 years, and I would not trust myself to pick out the rate from one of our own tariffs. I would consult with the rate man and ask him to tell me the rate to such and such a point. The general public can not feel itself safe in undertaking to tell the rates from the published tariffs.

Q. Do you testify, then, that the rates can not be told from the schedule?—A. I think that if a man will invent a schedule from which the rates can be more intelligently understood he will be doing a great favor to the railroads. I don't believe that a universal distance tariff would do it, and I don't know of anything else that would.

Q. (By Mr. C. J. HARRIS.) There has been testimony that the rate from England on manufactured articles is less than from some American points.—A. I have known the rates from Hamburg to Denver to be less than from Chicago. I say that is unnecessary and is a reflection on the intelligence of the American railroad managers. It ought not to be. But when it comes to a rate from Hamburg to San Francisco, which can go entirely by water, it is a different thing.

Q. (By Mr. KENNEDY.) Mr. Morton, do I understand you to say there should be no unjust discriminations between communities; did you use the word unjust?—A. Yes.

Q. Are there unjust discriminations at the present time?—A. I think there are.

Q. Do you know whether there are or not?—A. I know there are.

Q. Could you specify a few instances for the benefit of the commission?—A. I prefer not to.

Q. I should like to have your idea as to what you mean by just discrimination. Is that set out in your paper, do you think?—A. I think it is a matter of fact what a just or an unjust discrimination is. The word discrimination is a broad term. It is a question of judgment. By unjust discrimination I mean preferential rates. I do not think one man should have lower rates than another under the same circumstances and conditions.

Q. Do you think a man who has one carload of grain to ship from a point in Iowa to Chicago, for instance, should have the same rate as the man who ships 100 cars?—A. That would be hardly similar conditions, but I think the one-car man should have the same rate as the 100. I think the railroad can handle 100 cars for 100 different men just as cheaply as for one man.

Q. That would not be the same for less than a carload.—A. I think the carload should be the unit. Those shipping in less than carload lots should have the same rate and those shipping in carloads should have the same rate.

Q. (By Mr. C. J. HARRIS.) Do you think there is as much discrimination as there used to be some few years ago; that is, A getting one rate and B another?—A. In one way there is more; in one way not as much. I think there are fewer people who receive the benefits of preferential rates than there used to be, but I think there is just as much business, or more, that moves on preferential rates.

Q. (By Representative LORIMER.) The cargo is greater?—A. I think so.

Q. (By Mr. C. J. HARRIS.) Do you not think that applies more to the Western roads than the Eastern?—A. No; it is pretty general; probably less of it in the South than anywhere else. That is my general observation.

Q. (By Mr. KENNEDY.) Do you agree with the president of a Western railroad, who stated that the Interstate Commerce Commission at present is a farce, and that the rates as published are not maintained?—A. I think it is very unfortunate that the Interstate Commerce Commission, as now constituted, has not more authority than it has. I do not think it is a farce by any means.

Q. (By Mr. CONGER.) Do you think the published rates are a farce?—A. No; I do not think the published rates are a farce, as a general proposition, but I think published rates are sometimes departed from by secret understandings between railroads and shippers.

Q. What methods are used to give the shipper these favors?—A. About all the methods that human ingenuity can devise.

Q. Is the payment of a commission one of the new ones?—A. That is not a new one; it is a very old one.

Q. Is it coming back into favor?—A. Not particularly. There are a great many people who think it is proper and lawful to pay commissions on tickets, and likewise legal to pay commissions on freight.

Q. (By Mr. C. J. HARRIS.) To come back to the Interstate Commerce Commission, do you not think its decisions in the way of recommendations are generally, to a certain extent, followed by the railroads?—A. They have been.

Q. Has it not had a beneficial effect in that respect?—A. I think it has. The

decisions have, with very few exceptions, been followed, and they have generally been wise decisions. I am one of those who believe the Interstate Commerce Commission is the mediary between the public and the railroad, and is a good thing for both.

Q. I understand from the testimony here that it is very important that the rates should be sent on to the commission in Washington, because it gives each road a check upon the others, and is of great use to the lines themselves.—A. I think it is held properly that all rates in effect should be filed with the commission. I think that ought to be done. In what I said about rates being made public, I was referring to the posting of rates. I objected to the unnecessary filing of rates in local railroad offices where nobody can get any advantage from them.

Q. I was speaking of Washington.—A. I think that is eminently sound and ought to be done.

Q. The posting of rates you think impracticable?—A. I think it unnecessary.

Q. (By Mr. CONGER.) You refer to both passenger and freight rates?—A. I refer to freight rates; it is all right to post passenger rates.

Q. The passenger rates that are posted; that is, the schedule?—A. The local rates; if a man wants to go from a small town down here on our road to some station up in the State of Washington he will have to ask the agent what the rate is. It is impossible to post all these rates. Under the law, I suppose we are expected to do it, but in fact we do not do it: we post our own local rates.

Q. On your own line of road?—A. Yes; on our own line of road.

Q. In your testimony, where you say that the public are unable to get any intelligence from these posted rates, you referred to the freight schedule?—A. Yes.

Q. It is possible for a person of ordinary intelligence to find the passenger rate?—A. As a general thing they have a local rate, which is about 3 cents a mile; this the people know.

Q. From the schedule as posted they can get the fact?—A. Yes; I think so.

Q. (By Mr. KENNEDY.) If the officials of one railroad believe the Interstate Commerce Commission is a farce and state the rates are not maintained, we must conclude that that railroad does not maintain the rates as published?—A. You are perfectly sound in doing so.

Q. Does it follow that the railroads in the same section of country must follow the same method?—A. Unfortunately, one railroad with such ideas can come pretty near demoralizing rates for all of us. It is just a question of forbearance. It is simply a question of how much of your business you are willing to let the other fellow come in and take away from you.

Q. (By Mr. CONGER.) If the volume of business that road is carrying continues to increase, is not a war, so called, likely to follow?—A. A point is bound to be reached where things will snap. At the present time business is good, cars are scarce; we all of us have more demands for cars than we have cars, without cutting rates, and it is more a question of capacity than it is of making a bid for business in the way of cut rates; but in the long run a cut rate takes the business.

Q. Could you suggest any authority that could be given the Interstate Commerce Commission that would reach this case or similar cases?—A. It is a very difficult problem; it is a matter that we have all considered, and the only successful way of getting rid of competition of that kind is to buy it up.

Q. That means consolidation?—A. Consolidation, and perhaps another road to buy up later on.

Q. Even under present laws, are not the officials of that road liable to Government indictment for cutting rates?—A. I think so. There was a case made once. There were a few of the railroads here that started out to absolutely maintain the interstate-commerce law in every respect, with the intention that other roads should do the same thing. They made a case against one road, and the president of the road, when he was put on the stand, admitted everything that was charged. Nothing was ever done with him.

Q. It has been contended before this commission in Washington that the competing or suffering railroad or railroad officials would be more inclined to push the case against the competitor, the road that cut the rates, if the penalty of the law were made a financial one; in other words, fine rather than imprisonment. We should like your opinion on that subject.—A. I do not like the imprisonment clause of the interstate-commerce law because it is not operative, and if it was operative I should probably like it less. We should be perfectly willing to stop it if the other railroads did, and I would not hesitate, so far as I am concerned, to report other railroad men that were found cutting rates, provided everybody would do it.

Q. You are not inclined to push the cases now where there is a criminal clause?—A. I think a very heavy penalty on both the shipper receiving the cut rate and the railroad making it would be much more effective.

Q. (By Representative OTJEN.) And more easily enforced?—A. More easily enforced, and would come nearer preventing it.

Q. (By Mr. KENNEDY.) How would the shipper, in view of your former statement, know whether he was getting a cut rate and violating the law?—A. They would know. These cut rates are given on shipments of some heavy freight; they know whether it is a cut rate or not; a man who is shipping nothing but steel, or coal, or lumber, dealing in some specialty, is better posted on the rates on that particular commodity than the railroad men are. The railroad man has got to know about everything; he has to know the rates on all kinds of commodities. There is never any question about the fact of a man's knowing whether he has a cut rate or not except in cases of mistakes that are liable to happen.

Q. (By Representative OTJEN.) You have testified that you favored legalizing pooling; of course, these restrictions would have to go with the law or they could cut just the same as they do now, could they not?—A. I think under legalized pooling the commission should have power to say what the rates should be. I think it ought to be just as incumbent on the commission to say whether a rate was unreasonably low as whether it was unreasonably high. I know of rates being made unreasonably low for the purpose of getting something that the railroad ought not to have. I have known a railroad to come in and make a rate on some commodity that it never hauled and never expected to haul, and which some other line had every reason to haul; make it so low for the purpose of getting a proportion of the business.

Q. You would, then, give the Interstate Commerce Commission authority to revise rates?—A. Prima facie, revise them. I think the railroads should have the right of appeal to the courts, the same right that any citizen would have.

Q. In case the commission decided upon a rate, you would have that stand until it could be reviewed by the court?—A. I think that is a matter that is not very material; I think that is not worth sticking for. I should personally feel as if the decision of the commission should stand temporarily, should be accepted by the railroad on the basis that the railroads were allowed to make contract obligations with each other for a division of the earnings. Of course, if we got legalized pooling there would be no way of getting railroads into the pool; there is nothing compulsory about it.

Q. (By Mr. C. J. HARRIS.) If one railroad holds out and will not go into the pool, you are entirely helpless?—A. Yes; it is then a case of fight.

Q. (By Representative OTJEN.) If, then, the Interstate Commerce Commission had authority to fix rates, you could largely correct some of these difficulties?—A. I think so.

Q. Provided there were penalties attached to the law that could be enforced?—A. Yes. The trouble with the pooling that we used to have was that it was not legalized; no railroad could commence suit against another railroad for balances; it was entirely a matter of good faith.

Q. A matter of honor, largely?—A. Yes.

Q. (By Mr. CONGER.) I was going to bring out a distinction between the power to revise the rates that it is sometimes proposed to give the Interstate Commerce Commission and the right to fix the rates in case of pool. It has been contended by some that if pooling is to be legalized the Interstate Commerce Commission should be given authority to absolutely fix the pool rate; that in cases where a pool is not entered into by the roads they should have the power of revision as regards differentials. The power of revision is practically the power to fix the rate, is it not?—A. I can conceive cases where it would not be.

Q. What protection would you give the public against exorbitant rates if pooling is to be legalized?—A. That very protection—the power of the commission to revise them.

Q. But the commission at present has no power whatever to lower or raise a rate.—A. We have not got the authority to pool either; I think the two should go together.

Q. (By Representative OTJEN.) That is, the law should be amended to cover these two points?—A. Yes.

Q. (By Mr. CONGER.) Some have contended that if pooling is to be legalized the Interstate Commerce Commission should be given explicit authority to fix the rates between the points where the pool is operative; let me ask first if that would be your view?—A. My view is, they should have control of the rates; not necessarily fix them, but have power to revise them under the pooling contract. I do not believe that the Interstate Commerce Commission wants to be charged with the work of fixing the rates, but in case of complaint—in case it can be proven that the rate we are charging under this pool is higher than it ought to

be, unreasonable, that the commission shall pass on it and revise it if the facts warrant.

Q. You mean have it lowered if necessary?—Yes; and I think if the case was that somebody complained a rate was too low, they should have the right to advance the rate, if they thought it was discriminating against localities. I have known of industries starting up at some point and doing quite a business—perhaps a brickyard at St. Paul, doing a very handsome business—and the railroad would come in and make a rate abnormally low in order to bring in brick from some other place, and thereby, perhaps unjustly, discriminate against some locality. In other words, rates can be unreasonably low as well as unreasonably high.

Q. You testified in your paper that you favor an expert commission to arrange a classification schedule?—A. Yes.

Q. Now what is your idea there as to the expert commission? Should it be an official commission, or should it be one appointed by the railroads among their own traffic managers?—A. The railroads at one time appointed a universal classification committee, which consisted of representatives, as I remember, two from New England, two from the Atlantic coast, two from the Middle States, two from the far Western States, and two from the middle Western States. I was one of the committee representing this particular section of the country. This was over 10 years ago. As I remember, we agreed upon a classification, but it never was adopted because of these local influences I speak of. I am inclined to think it would be to the interest of the railroads and the shipping public if an expert commission should do that work; some commission under the supervision, say, of the Interstate Commerce Commission; some body that they might appoint or select, I think they could do it better than either the railroads or the shippers could.

Q. If universal classification would be to the interest of the railroads, why did they not adopt the one prepared and presented to them?—A. I think it would have been to the interest of the railroads generally, but there were some features of the classification that some particular roads in some particular sections of the country objected to; and they did not object to the same features.

Q. Different geographical conditions?—A. The Pittsburg man wanted a very low classification on iron—iron constituting a large proportion of his tonnage; but the California man, whose road only hauled iron incidentally, objected to any such classification of iron, because his principal traffic was composed of some other commodity.

Q. Are not these conditions so various and so greatly diversified in various parts of the country that a universal classification would be practically impossible?—A. I think not.

Q. You think the railroad in California can haul iron ore, while they get but little of it, at practically the same rate as the road in Pennsylvania?—A. Iron ore is not now hauled on the classification. In quantities it is always hauled at commodity special rate.

Q. Is that equally true of grain?—A. It is always hauled as a commodity; it appears in the tariffs under the head of grain. That is true also of the coarser freights—lumber, salt, live stock.

Q. You think your opinion is shared by the majority of the leading railroads?—A. I find the opinions of railroad men are like the opinions of lawyers, they differ.

Q. Coming back to the question of legalizing pooling, you stated that in your opinion if pooling should be legalized rates would be lower. Why do you think that?—A. I do not think I testified to that. I testified that under concentration of ownership I thought rates would be lower. My reason for thinking that is that concentration of ownership means great economies in the management and operation. There is more money wasted in the railroad business than in any other business I know of. We are all spending large sums of money for advertising, for soliciting freights; we each have expensive offices on Broadway in New York, say, with high-salaried agents; we are always running at certain seasons of the year unnecessary trains. With concentration of ownership that would be unnecessary. The service could be just as good and could be done with great economy.

Q. I think you testified that in your opinion to legalize pooling would check consolidation?—A. I say that unless legalized pooling comes concentration of ownership will come. I think if we had had legalized pooling years ago there would have been more systems of railroads; the necessity for combination and concentration of ownership would have been less.

Q. And if we do not have it in 5 years now, we shall have fewer systems?—A.

One of three things is likely to occur—legalized pooling, concentration of ownership and consolidation of railroads, or Government control.

Q. Which of these three is the most desirable?—A. The first one.

Q. Legalized pooling?—A. That is the one we are nearest to; the second is likely to come, and it may bring the third.

Q. (By Mr. C. J. HARRIS.) Legalized pooling, under the supervision of the Interstate Commerce Commission, as I understand your testimony, would do away with discriminations?—A. I think it would; I think there would be fewer discriminations than there are now. You ask which I prefer of the three; I prefer concentration of ownership.

Q. That was what I concluded from your testimony: you think that would be the most desirable for the good of the general public, and that was what I wanted to bring out.

Q. (By Representative OTJEN.) Would not classifications by sections be practicable?—A. That is practically what we have now. There is what is called the Western classification, which, practically, is everywhere west of the Missouri River, except on transcontinental business, and there the transcontinental classification applies; then everything east of the Missouri River is the Eastern classification. There are fewer classifications now than there were 10 years ago.

Q. Is it your opinion that a universal classification would be better than the sectional classification?—A. I think it is possible to have a universal classification, but it would mean, to some extent, a readjustment of the rates. You can make the rates to fit any classification. A universal classification might be applied everywhere in the country, but the rates would be sectional.

Q. The rates might not be the same all over the country; the rates would be different in different sections of the country?—A. Yes; the rates will vary with the cost of doing business; it costs more to do business in the Rocky Mountains than in New England.

Q. The classification really has not anything to do with the rates?—A. No, not necessarily; it has a good deal to do with the rates, but the rates can be adjusted regardless of classification.

Q. (By Mr. KENNEDY.) By concentration of ownership, do you mean management by one central body of officers?—A. Not necessarily that; that would come, I think.

Q. Do you mean also by concentration of management the concentration of all the roads in one system?—A. Not necessarily.

Q. Would not that follow?—A. The roads engaged in competition for certain traffic would be concentrated; say, the transcontinental lines, or the Missouri River lines, or the lines leading to the Gulf, or the Southern lines. That might be done sectionally, and ultimately, I think, if it was done in that way, there might be a parent company that had to do with all of them.

Q. I will ask you if you do not state some of the arguments in favor of Government ownership when you speak of these great economies that would be effected by concentration of ownership in itself. Are these not the arguments used by those who favor Government ownership?—A. I think perhaps the most extravagantly managed business is the postoffice business managed by the Government. For instance, we have an agent in a town who is doing a tremendous business; he is handling thousands and thousands of dollars' worth of goods, and we pay him \$125 a month; the postmaster in the same town is probably getting \$300 a month. We have a station house costing us perhaps \$3,000 or \$4,000, and the Post-Office Department will have a Government building costing perhaps \$150,000.

Q. All the people of the United States are treated alike by that system; it is superior to the railroad system in that?—A. Yes; there is no difference in the price of postage stamps; one man can get them at the same price as another; and I contend that should be so in the railroad business.

Q. If that were to come about, there would be no advocates of Government ownership, or very few at least?—A. There might be the greatest kind of discrimination in case the Government had control of the railroads and the roads got fewer.

Q. There is no such discrimination in the postal system as against sections or people?—A. Nor in import duties; custom-house rates are the same to everybody; but there are discriminations in the railroad business.

Q. (By Professor JOHNSON.) To what extent is the financial management of the railroad business being consolidated in great banking houses?—A. I think they are getting nearer together all the time, but I do not think there is any actual consolidation.

Q. To what extent does the banking house of Morgan & Co. and its allied interests control the Eastern railway systems of the country?—A. I could not answer that question; they have very little interest in the Western roads.

Q. Do you not think this concentration of financial control in big banking houses represents an important phase?—A. I think anything in the way of concentration that will do away with preferential rates, and the unrestricted competition that causes these rates, is a good thing for the community and the railroads.

Q. Do you think this concentration of financial control is having a steadying influence?—A. I think it is.

Q. Would it be a good thing for the West?—A. I think it would.

Q. Can you present figures to show the relative height of passenger rates in this country and in others?—A. I can.

Q. I should be personally glad to see this, because evidence has been submitted contrary to yours.—A. I shall be glad to submit that to you. Furthermore, in that connection, not only are the passenger rates lower in this country, but the service is superior, and the sleeping-car rates are very much lower than they are abroad. Sleeping-car rates are not only lower, but the sleeping-car accommodations in this country are infinitely better than they are on the other side.

Q. (By Mr. CONGER.) How about freight rates?—A. Freight rates are lower.

Q. (By Mr. C. J. HARRIS.) Considerably lower?—A. Considerably lower. That is the chief reason for the great inroads that we have made in capturing the markets of the world—our cheap transportation.

Q. (By Mr. KENNEDY.) You say the post-office business is the most extravagantly managed business in the country, yet we hear no complaint from the people?—A. I have no authority for that statement, except my own observation.

Q. Do you know of any considerable complaint from the people because it is a high-priced business?—A. The people are getting a good service for very little money, and I do not think many of them know that there is a big deficit ever year. As long as they are fairly treated they do not care.

Q. Do you not think if these discriminations against communities and individuals and other evils, such as the giving of passes, are not done away with through Government control that the people will be willing to stand a very extravagantly managed transportation business rather than bear these discriminations and evils?—A. Possibly; but I think it would be extravagant. I think private individuals can conduct the transportation business for much less money than the Government can do it itself. I believe the rates would be lower; and compared with other countries that do run their own railroads the service is better and the rates lower.

Q. (By Mr. C. J. HARRIS.) Did you ever know any railroad run by any State government to be managed at all successfully from a railroad point of view or any other point? We have no State railroads here, but there are some through the South.—A. We have no State railroads in the West. I think the Michigan Central started out as a State railroad and was sold years ago to private parties.

Q. You do not know of any railroad run by the State successfully?—A. No. No; I do not know of any railroad run by the State.

Q. (By Representative OTJEN.) As you see it, what are the principal objections to Government or State ownership of railroads?—A. My objections all come from observations of results in countries where it obtains; the rates are higher and the service is not as good, and as the political question would be involved—

Q. (By Mr. CONGER, interrupting.) The postal service has been cited as an example of the Government operation of a public service. Now the Government carries a letter 1 mile or 3,000 miles for 2 cents; would that be possible or practicable in the railroad business?—A. I do not think so, unless the Government was prepared to meet a big deficit, as in the Post-Office Department.

Q. Would it be possible to put in a mileage rate or schedule?—A. It would be possible, but it would cause about the same kind of revolution that a very vigorous change in the tariff would, and a great deal more; the country would have to adjust itself to the change.

Q. (By Representative OTJEN.) It would disturb business for the time?—A. Very much indeed.

Q. (By Mr. CONGER.) Would a mileage tariff be practicable under individual ownership where the various lines of road are owned by different corporations?—A. It would be; it is very remote though, and I do not think anything of the kind would ever happen.

Q. You mean to testify that you think it practicable for a road in the far West,

or in any sparsely settled district, to carry freight at the same rate per ton per mile, that it can be done for by the New York Central or the Pennsylvania road?—A. No. I mean to say a distance tariff is possible, but it would have to be so high to reach all the different railroads in the different sections that it is remote.

Q. (By Mr. C. J. HARRIS.) Impracticable?—A. It is possible, but improbable, very improbable.

Q. (By Mr. CONGER.) Now, in the matter of discriminations; are they ever necessary, in your judgment, in freight traffic? For instance, railroads sometimes make rates to meet crop conditions; are these things justifiable? As an illustration, if you like, yesterday it was testified before this commission that in 1897 certain of the railroads reduced their rate on potatoes from, I think, 60 to 40 cents a hundred from Minnesota to New England, because of crop conditions; was that justifiable?—A. I do not know the exact circumstances of the case, but I think crop conditions have got to be considered in making a rate.

Q. The crop conditions were that there was a very heavy crop of potatoes in Minnesota, and under existing rates they could not be moved and sold and give the producer and dealer anything for their services. Without a change in the rate a carrier would be without that traffic, and the producer would have that crop on his hands.—A. So long as the rates were made to everybody, I do not see where there is any discrimination.

Q. The point I desire to bring out is this: I think such a change in rate seems desirable, and is generally approved, or at least not disapproved; would that be possible under Government ownership, and if possible, or permitted, would it not make it possible for the party in power and controlling these rates to discriminate for or against some section of the country that was not with them?—A. No doubt about it.

Q. (By Professor JOHNSON.) How would the rates be controlled under Government ownership?—A. I presume the rates would be controlled just as the price of postage stamps is.

Q. Would it be by general legislative enactment, or by an expert commission?—A. It would have to be, I presume, just as Congress decided it; I would not undertake to say. I think the Government ownership of railroads is very remote and very undesirable. I think the complications you would get into the moment the Government undertook the control of railroads—politically commercially, and financially—would be very great.

Q. (By Mr. CONGER.) On the theory that consolidation would bring the public the best service, and also accepting your theory that legalized pooling would retard or check that, do you still think legalized pooling desirable?—A. Yes; I think legalized pooling is desirable and expedient. I do not think it is possible to have concentration of ownership for years to come.

Q. It is now going on.—A. It is now going on, yes; and I do not see any objection to legalizing pooling even if there was a concentration of ownership. The chief object of the interstate commerce law was to prevent discriminations between communities and individuals, and legalizing pooling will assist in bringing that about.

Q. (By Mr. KENNEDY.) And that object would be subserved by having legalized pooling after you have brought about concentration of ownership?—A. There might be a concentration of ownership of the railroads in a certain section, and in some other section there might be a concentration of ownership also, but by different people. In different sections of the country the roads might be concentrated, and there might be a competition between the various systems. There is an element of market competition always in the railroad business that we have to contend with. We may have a railroad without a competitive point on it, a line with industries; people who are manufacturing sewer pipe, or brick, or articles of iron, or making salt, or doing anything in the line of industry; notwithstanding the fact there may not be a competing point on that railroad, it is competing all the time with the markets furnished by other railroads; with the product furnished by other railroads.

Q. (By Representative LORIMER.) It seems to be your idea that pooling is the nearest at hand?—A. Yes.

Q. That benefits will come more rapidly to the people by pooling, but concentration may follow and if it does follow, we shall get more benefit from that than through pooling?—A. Yes.

Q. But you believe that pooling is the most feasible because the people are probably better prepared for it at this time, and because it can be done without any financial interference. Is that the idea?—A. That is right.

Q. I think you stated that if we have a pooling act all the railroads will not necessarily go into that pool?—A. Not necessarily.

Q. And if one railroad remains out a fight would probably follow. Would you authorize the Interstate Commerce Commission to fix the rate for the road that refrains from going into the pool?—A. Yes.

Q. Then if the Interstate Commerce Commission had authority to fix the rate, and made the same rate that the pool agreed upon, how would this affect the business of the roads that had gone into the pool; or would it give the road standing out any advantage over those who had pooled?—A. I think the roads that comply with the law and maintain the published rates should be protected against a railroad that was inclined to deal with the other roads in a piratical manner.

Q. If the Interstate Commerce Commission, then, had authority to fix their rate, and fixed the same rate the pool had agreed upon, would that have the effect of protecting the pooling roads as against those standing out of the pool?—A. All the pooling roads would want would be that the road outside of it should have equality of rates—should not give secret rates, preferential rates.

Q. Could a pool exist under that condition?—A. It could; it has, prior to the interstate act. I have known of certain roads pooling their business, where there was one road outside; that is, they acted as a unit in meeting the competition of this outside line. It was the exception, though, rather than the rule. The general theory under which pools used to be made was, "One out, all out."

Q. Then you seem to think that by clothing the Interstate Commerce Commission with proper authority, the complaints of discrimination could be practically wiped out?—A. It could be very much lessened; coupled, of course, with legalized pooling.

Q. (By Mr. CONGER.) Should you have any objection to giving the Interstate Commerce Commission authority to examine the books and accounts of the railroads, by duly authorized official examiners, for the purpose of getting evidence that they had paid rebates?—A. No, I should not; I think the more publicity the better. In other words, I think it is to the interest of the Government itself that there should be no discriminations in transportation charges.

Q. You see no objection to an official examination of books and accounts?—A. The merchants of Chicago would not stand it for a minute if they thought the merchants of New York were getting lower import duties than they were; the business men here would not tolerate the purchase of postage stamps in Washington for any less price than they pay; and here is a matter of a great deal more consequence than the postage business, or the import tariffs, where there is more or less favoritism going on which ought to be stopped.

Q. (By Mr. KENNEDY.) I should like to ask a question on the subject of ticket scalping. Is it true that the only class of trade that comes to the ticket scalpers is that which is brought by the public in the way of unused coupons, etc.; or is it true that business is furnished by the railroads themselves?—A. Of course there has always been more or less transportation furnished to the ticket brokers by dishonest employees of the railroads.

Q. What I want to ask you is, do you believe the ticket scalpers should continue in business and live on the business that is brought to them by the public and also do this business you speak of?—A. I feel that there would be fear of that. I think that if the railroads had never secretly assisted the scalpers and ticket brokers there would not be so much business as there is now.

Q. The larger per cent of the business they have is business given them by the railroads in this way, is it?—A. No; it is a less proportion of their business than the public gives them. If the railroads would combine and refuse to give business to the ticket scalpers a good many of them would be driven out of business. I think the railroads have it in their own power to make the business of the ticket broker unprofitable if they would only take the proper means to do so.

Q. (By Mr. CONGER.) Why don't they do it if they don't want it?—A. Because certain of the lines have relations with them—use them.

Q. In other words a small minority of the roads can defeat the purpose of a large majority; is that the idea?—A. Yes; it is a great wrong that these brokers should buy tickets for less money than the traveling public, and yet it is continually done. The brokers buy the tickets and make a commission on them.

Q. (By Mr. KENNEDY.) Do you favor the movement which the railroads have been making for the last few years to secure from Congress legislation on the subject, while at the same time they make absolutely no effort to secure any action by the Interstate Commerce Commission for the abolition of the pass system?—A. I believe the entire matter should be considered as one proposition. I was in favor of and have worked for an antiscalping law, but I think it is a waste of time to try to get any legislation on that subject until the entire transportation matter is taken up and the interstate-commerce law is amended.

Q. You believe it is calculated to discourage the railroads when they attempt to get this one passed?—A. No; I think the railroads are entitled to that legislation. I think it is a wise thing for the public, and I think that it should have been obtained from Congress without any asking. I think as a matter of protection of the public that it ought to be passed.

Q. You have organized labor on your lines?—A. Yes.

Q. Do you believe that it is as necessary for the laborers to combine to protect their interests as it is for the railroads to concentrate?—A. I think the organization of labor has been a benefit to labor.

Q. Has the organization of the engineers, brakemen, conductors, and trainmen generally been a benefit to the railroads also?—A. There are two sides to that question; I don't know whether it has or not. I think that is a debatable question, although I believe in the organization of labor.

Q. (By Mr. CONGER.) Is overcapitalization an evil in the railroad field?—A. My observation has been that there is or has been overcapitalization; the price of the securities has generally indicated it.

Q. Would you favor the prohibiting of the increasing of capital stock of interstate railways without permission from the Government; I mean the watering of stock by interstate railways without governmental permission?—A. I don't believe in the watering of stock; I think it is all right, though, to issue new stock for new property.

Q. Would there be objection to making it necessary to ask the permission of the Government?—A. I should say not.

Q. You think there would be no objection to that?—A. I don't think it would be necessary to ask the permission of the Government; I don't see what would be gained by it.

Q. (By Mr. C. J. HARRIS.) Do you believe the investor takes care of himself?—A. If the stock is watered the price shows it.

Q. (By Mr. CONGER.) How far has your road complied with the recent act of Congress as to automatic appliances—couplers and safety appliances?—A. Very fully; I think we have a few cars not equipped, but very few.

Q. Did you ask for the extension of time that was provided for?—A. Yes; we are one of the roads that asked for the extension. That is in the operating department, which I have little to do with, and I could not say what the facts are in regard to that, except in a general way. We have complied as well as anyone with the act of Congress.

Q. That time was extended to December 1 or January 1?—A. I really don't know. I think it was extended 2 years; I know we have complied with the law.

Q. You have or will have by that time?—A. Yes.

Q. (By Representative LORIMER.) Have you anything further to suggest?—A. Do you want to ask any questions about this conflict I spoke of between the interstate and State railway commissions?

Q. (By Mr. CONGER.) I should like to ask if you have any instances or can give us any specific information?—A. I know in a general way that there are two States that I have in mind that attempt to regulate their rates so as to confine the business to their States and to their own people; Texas is one of them.

Q. They undertake to favor the State road?—A. Yes; State road and State management and State shippers and the residents of that State generally. The Texas people tell us in so many words that they are there to protect the people of Texas, and if the rates from New York to St. Louis or Chicago are reduced by order of the Interstate Commerce Commission, or for any other reason, they will make a corresponding reduction in their rates.

Q. It is a little surprising to find that provision carried out to such an extent as it is in Texas?—A. It is a domestic tariff incidental to private protection.

Q. (By Mr. C. J. HARRIS.) It is distinguished as being against the Constitution?—A. They don't recognize that; they are States' rights people.

Q. (By Mr. CONGER.) They only feel it locally?—A. That is all.

Q. Which is the other State?—A. The grand old Republican state of Iowa has about the same idea.

Q. (By Professor JOHNSON.) How is Nebraska?—A. They go in for the same doctrine, and it is, I presume, a parent of the protective tariff.

Q. I don't think the United States Government has any remedy.—A. There is no remedy unless the Constitution is amended. And I bring up the point that it is impossible for a Federal commission to make the interstate rates of this country so long as they have no control of State rates that are so interwoven; for instance, rates from St. Louis, Mo., to Kansas City, Mo., entirely in the State of Missouri, are on the basis of rates from Chicago to Kansas City. The rates from Davenport, Iowa, to Council Bluffs, Iowa, are practically on the basis of the rates from Chicago to Council Bluffs.

Q. (By Mr. KENNEDY.) You say you believe it is a parent of the protective tariff principle; is it not more probable it is the result of the main principle of self-protection?—A. It is principally the father of the protective tariff idea.

Q. You could hardly expect anything to be a parent of the protective tariff in the State of Texas?—A. You can raise almost anything down there.

Q. (By Mr. C. J. HARRIS.) Would larger powers given to the Interstate Commerce Commission, gradually extending its territory to State lines on the transportation question, do away with this objection that you have raised to the powers of the commissions of these States? To ask the question more directly, Would not giving the Interstate Commerce Commission more power do away with that feature of it?—A. I think it might to some extent; the point I want to make is this: The shipment of grain from a point in Iowa to Burlington, Iowa, is entirely a State shipment; that is quite apt to be an interstate shipment before the grain is finally disposed of; and the shipment of cotton from Fort Worth, Tex., to the city of Galveston, entirely within the State of Texas, is quite apt to be an interstate shipment, because it is not going to be used at Galveston; it will find its way to the cotton markets of New England before it gets through. A shipment of dressed meat from Kansas City, Mo., to St. Louis, Mo., is a transportation that occurs entirely within the State of Missouri, and that dressed meat may be sold to the soldiers in Cuba before it reaches its destination. The point I make is this: I think it is impossible for the Federal commission to regulate the commerce of the country properly unless it has charge and supervision of the State shipments and State railroads which may conflict with the interstate.

Q. (By Mr. KENNEDY.) Do you know that the chairman of the Texas State railroad commission stands with you on the question of pooling?—A. I know he does; I have talked with the old gentleman a good many times on that subject.

Q. (By Mr. CONGER.) You speak of this matter as an evil; have you a remedy to suggest for it?—A. The only remedy is a Federal commission of transportation, and the declaring of this traffic to be interstate, and the putting of these roads under the authority of the Federal commission, instead of having 46 or 47 States each trying to adjust the freight rates to suit its own peculiar ideas.

Q. (By Professor JOHNSON.) Do you mean to say that Congress has the power to make such a declaration?—A. I meant to say by an amendment of the Constitution of the United States Congress could have that power. But I do mean to say that Congress can not regulate what it is supposed to have power over, that is, all interstate business, while this undercurrent of State regulation exists and conflicts.

Q. (By Mr. CONGER.) Do you not think it is a matter of lack of supervision within the State as to what shall fall under interstate commerce? For instance, take a shipment of cotton from Fort Worth to Galveston; that carload shipped from Fort Worth can not pay much more under interstate commerce than any other carload which originated at Galveston, can it?—A. Take this view of the case: under the interstate-commerce act there should be no discrimination between individuals, no preferential rates, no unjust discriminations. Here is a big shipper with 1,000 carloads of freight to ship to some interstate-commerce point from Chicago; he also has 1,000 carloads of freight to ship to various stations in the State of Illinois. He uses the State business; he sells out to the highest bidder, and in that way gets a lower rate on his interstate business than he otherwise would. Now, is not that a misuse of business entirely within the State, for the purpose of getting a preferential rate on interstate business? How is a Federal commission going to right a case of that kind, unless it has charge of the State rates?

Q. He gets a lower rate within the State because he gave the railroad the interstate-commerce business?—A. You asked me a little while ago what methods were employed to get preferred rates and discriminating rates. I told you about the methods by which a shipper could defeat the purpose of the law, and this is one of them.

Q. (By Mr. KENNEDY.) Does Congress have authority to put under the control of the commission that commerce which originates in the State with the intention of going into interstate commerce?—A. My opinion is that you can never tell when a shipment moves whether it is State or interstate transportation.

Q. That is, it may go to some point entirely within the borders of the State where it originated, and there be sent out as an interstate shipment?—A. It is quite likely to.

Q. In the case of the cotton, if it was going to the cotton mills, as there are no cotton mills in the State of Texas, you would know it was going to be interstate commerce?—A. Yes; although the cotton cloth into which it is made might be shipped from place to place in the State. There is only one other point upon which you don't cross-examine me, that is railroad construction. My testimony

was that I think that in case the Federal authorities were going to regulate the railroads—and I believe they are—the subject of new construction should be passed upon. I don't believe new roads should be built unless necessity is shown for it.

Q. (By Mr. C. J. HARRIS.) That at present is entirely under State charter?—A. Yes; except in one case in Indiana.

Q. (By Mr. CONGER.) I think in all the States there are provisions intended to restrict the construction of railroads?—A. I guess there are.

Testimony closed.

CHICAGO, ILL., November 22, 1889.

TESTIMONY OF MR. WILLIAM J. STRONG,

Attorney-at-law, Chicago, Ill.

The subcommission on transportation convened at 2 o'clock, November 22, 1889, at Chicago, Ill., Chairman Lorimer presiding. Mr. William J. Strong, being duly sworn, testified as follows:

Q. (By Representative LORIMER.) State your full name, please. —A. William J. Strong.

Q. And your business.—A. Lawyer.

Q. We have information that you have a large collection of information with reference to blacklisting. I will ask you to state in your own way what information you have on that subject?—A. In the fall of 1895 my attention was first called to this question in the case of Fred R. Ketcham against the Chicago and Northwestern Railroad Company. The suit had been brought by other attorneys, who came to me and asked me to take the case off their hands. I had never heard of it before. They did not seem to know how, and in fact they said to me that they did not know how, to get at the question; and it interested me very much. I took up the question and began to make an investigation. I was called into the trial of the Ketcham case before Judge Edmund Burke in the fall of 1895 on 3 days' notice, with no time for preparation whatever, and introduced but four witnesses. The jury disagreed, standing 6 to 6, which necessitated a new trial. After coming into the case and seeing what there was in it I began to investigate, and put an advertisement in the Chicago Evening News asking any men who thought they had been blacklisted to come to my office and make their statements to me and bring such letters as they had that they thought were evidence of this blacklisting agreement. After spending some time, without exaggeration 3 months continuously, to the neglect of every other class of business, in taking statements of men who came to my office, I made up my mind what the agreement was; and that there was such an agreement to blacklist was apparent from the evidence which was produced before me. That evidence I formulated into a charge, which I incorporated in the amended declaration in the case; and the substance of the agreement which I claim was formed between the railroads is set forth in the pleadings in the cases which I have since brought. In the month of June, 1896, I filed some 50 cases, containing this charge of blacklisting, against nearly every railroad in the city of Chicago, I believe, with one or two exceptions, some being in the hands of receivers; and I did not bring suit against them, although I charged them with being parties to the conspiracy.

There is a voluntary association of railroads having lines running into the city of Chicago, the legal title of which is the General Managers' Association of Chicago. According to their constitution, which I have had in court, and of which I have a copy here, the object of the association is "especially the consideration of problems of management arising from the operation of railroads terminating or centering in Chicago." The beginning of this combination among railroads for the purpose of blacklisting employees was over a year before the strike of 1894, according to the testimony which I have here, in my judgment; and it has been the judgment of three different courts that it was evidence of the conspiracy. It was first mooted in March, 1893, when the committee of the General Managers' Association was appointed, the committee consisting of—I have not got their names here, but they are the general managers. I left the papers in my office, but can give you the names afterwards.

Q. (By Mr. C. J. HARRIS.) I don't think it is material.—A. I have the names; they are particular names; I have them in a number of papers I did not bring, as I did not wish to bring any more than were necessary. This committee "was appointed to tabulate the rates of pay by all roads centering in Chicago, and to

report on the formation and maintenance of an employment bureau for the employment of railroad employees, and to formulate a set of rules for the government of all railroad employees, so as to bring about uniformity in those respects among all the railroads running into Chicago," being 24 roads. These railroads, according to the testimony given by the secretary and chairman of the General Managers' Association in three different cases which I have tried, are as follows: Chicago and Eastern Illinois; the Atchison, Topeka and Santa Fe; the Baltimore and Ohio; Chicago and Erie; Chicago and Grand Trunk; Chicago and Western Indiana; Chicago, Burlington and Quincy; Chicago Great Western; Chicago, Milwaukee and St. Paul; Chicago, Rock Island and Pacific; Cleveland, Cincinnati, Chicago and St. Louis; Illinois Central; Lake Shore and Michigan Southern; Louisville, New Albany and Chicago, Michigan Central; New York, Chicago and St. Louis; Pennsylvania Company; Wisconsin Central; Union Stockyard and Transit Company; Calumet and Blue Island; Belt Railway Company of Chicago; Pittsburg, Cincinnati, Chicago and St. Louis; Pittsburg, Fort Wayne and Chicago; Chicago and Northwestern Railway Company; and the Wabash Railroad Company; being 24 railroads which were members of this General Managers Association. In March, 1893 (the exact day I have not with me), they appointed a committee, as I have said, upon these questions, and on May 18, 1893, that committee made a report to the General Managers' Association, which I compelled them to produce in court by subpoena duces tecum, and of which the following is a copy of the material parts, to show the combination: "First, with reference to the tabulation of wages, they have classified all classes of railroad employees below the rank of division superintendent and superintendent of motive power to general master mechanic. In classifying the employees it has been necessary, in order to secure uniformity, to adopt certain terms in describing a man's employment, and the committee requests the cooperation of the general managers, in so far as possible, in using these terms instead of a special term that may be used in some particular locality. It will be found that the terms recommended by the committee are synonymous with those in use, and are only introduced so as to make the wage tables on the different roads readily comparable.

Second (and this is the important part of the subject upon which I care to give any testimony), "in the matter of the establishment of an employment bureau, the subject has been discussed at great length"—(this is stated in this report)—"and it is the opinion of the committee that such a bureau would be of advantage to the association, first, in assisting them in the procurement of men both under ordinary conditions and in times of emergency; second, in assisting the roads to guard against the employment of a man who has been proved unworthy on some other road; third," (and like a great many other insects the sting is in the tail. It says) "in abolishing the state of affairs with which we are all familiar, that is expressed when a man is disciplined, by the statement that 'your road is not the only road in Chicago,' and that employment can readily be obtained on some other road, although an offense has been committed."

That second and third clauses of the report are the reasons why they think it is a good thing to establish this employment bureau. They show, in my judgment, the purpose of this organization, namely, to abolish the state of affairs with which they are all familiar, which is expressed, when a man is disciplined, by the statement that he can readily obtain employment on some other road, and that the road he has worked for is not the only road in Chicago. That shows, in my judgment, that they attempted to get together at that time and adopt some method by which a man could not readily get work on some other road. One can readily understand that if there is a difference between an employee and his immediate superior, perhaps a personal difference—perhaps a tyrannical boss might say some things to him that a spirited man would not care to take, and he would ask for his time and tell him that he didn't have to take that kind of talk from any man, that he was a good railroad man and skilled and sober, and that his was not the only railroad in Chicago and that he could readily obtain work on some other road. They say they are familiar with that sort of statement made when they discipline a man. Now what they may be pleased to call "discipline" we don't know, except as we gather it from their different statements and writings. It may be for some trivial offense; for instance, a draw-bar pulled, and they may discipline a man by fining him 5 or 10 or 30 days or something of that kind; or if he should corner a car in the switchyard, not running it in far enough, so that a train would come along and knock off the corner; or some little accident of that kind. As has been developed in the trial of these cases, these charges against the most of these men for those offenses proved to be untrue, and they fined the wrong man; and often men in the protection of their fellow-men would refuse to disclose who the culprit was, or the one that had been negligent, and they would discipline the wrong man

for it. Those conditions became very onerous to the employees in many instances. There is only one way, in my judgment, in which a man, if he had any spirit, could be made to refrain from saying that he could get work on some other road. That would be for him to gain the knowledge that he could not get work on some other railroad unless his present employer gave his consent or approval. I do not see how they were going to abolish the state of affairs in which a man of spirit would say that, unless they fixed it so that he could not get work on any other railroad, and brought that to his knowledge. Having a family dependent on him, if he knows that he can not get work on some other road, he is going to submit and say nothing about it; but unless he knows that, he is bound to make that statement, if he is a man of any spirit.

That was the foundation of the conspiracy between the railroads. Previous to that time it is a matter of history that there had been in the city of Chicago, which is the greatest railroad center in the United States, strikes and lockouts. Differences had arisen between the employees and employers; the struggle for supremacy had become bitter, and these two forces were striving to gain an advantage; the railroad men formed themselves into what they call grievance committees, and, where a man was unjustly treated, requiring of the railroads that they rescind unjust rules or fines, and preparing, in case they did not do it, to strike; that is their only remedy. On the other hand, the railroads clearly, from the testimony which I have been able to produce, determined that they would adopt some method to forever stop strikes. The railroad attorneys have clearly foreshadowed this in arguments in this case. Even in the last case I tried the attorney for the Chicago and Northwestern Railroad told the jury the time would soon come when there would be no more strikes, and asked them to keep their hands off and let the railroads and the labor unions settle this between themselves.

Other testimony was offered of the proceedings of the General Managers' Association, of which I have not an exact copy here, but which showed that the formation of this bureau was for the purpose of centralizing the employment of the men in one office. Every railroad was to send the names of its employees to that office, and that office was to keep a record of every railroad employee, and whenever a man applied to one of these railroads for employment he had to go to this office and get the O. K. of the manager of this office, thus centralizing employment.

This was brought up, I think, on June or July 20, 1893, and voted upon. Thirteen out of 20 railroads present at that meeting voted for the adoption of this thing; but the rules of the association provided that whenever any scheme was proposed that required any expenditure of money, as this did, it should not take effect unless it was unanimous. Seven having voted against it, it was defeated; to be perfectly fair with the statement about what was done.

The point of that resolution is this: They state in the opening that the subject has been discussed at great length, and they follow these three provisions with a statement like this: "Your committee is opposed to any idea of blacklisting, but it insists on the right of the different roads to know the previous history of any man who presents himself for employment." The reasoning I draw from that is that they never would have put in the word "blacklisting," immediately following this, if something preceding it had not suggested the word. Their attempt to exclude from this any idea of blacklisting was the best evidence that they knew that it meant blacklisting. There was no occasion for them to say they were opposed to blacklisting unless they did know that it meant blacklisting; the French proverb, "He who excuses, accuses," applies.

The evidence that I have gathered shows that no occasion arose to put that idea of blacklisting into effect until the strike of 1894, known as the American Railway Union strike, when the different railroad employees in this city, through the American Railway Union, sought to get the railroads to interfere and use their influence with the Pullman Company to arbitrate its differences with its employees.

Much stress is laid by the railroads upon the fact that this strike was purely a sympathetic strike, and that men strike without having any grievance of their own. They claim that because it was sympathetic it was wholly unwarranted. Of course, we reply that human sympathy is one of the noblest motives that ever prompted a body of men, and that it was entirely unselfish on their part. The public records show that within ten or twelve days after the commencement of the Pullman strike there were 1,600 families in the city of Pullman who were absolutely destitute of the necessities of life, who had been employees of the Pullman Company from five to twenty years, and who were dependent on public charity for support; showing that these families had not been able to accumulate enough out of the pittance received by the wage-earners in all the years that they were in the employment of the Pullman Company to last them 2 weeks when on strike.

The Pullman men were members of the American Railway Union; owing to their close connection with the railroad companies, the American Railway Union sought at several conferences with the general managers to get the railroads to interfere and induce the Pullman Company to adjust or arbitrate the differences. They refused to interfere, claiming they had contracts with the Pullman Company that prevented them from interfering in any way, and that they did not propose to interfere; and then the strike was declared, for the purpose of getting the railroads to do this, the purpose of the strike being wholly to prevent the handling of Pullman cars until Mr. Pullman would arbitrate with his employees.

That was the purpose of the strikers as given to me in all instances. They had no idea that it would tie up the railroad traffic of this city to any extent—only for a few days, at least, until they could get some action taken to relieve these strikers in Pullman. But the strike grew to great magnitude, and a bitter feeling was engendered between the strikers and the railroads, probably more than in any strike that ever took place in the history of this country.

There was no such destruction of property, however, as the public was given to understand. The Labor Commission investigated the strike and heard the testimony of railroad men and others, and they reported from the testimony that the railroads lost in property, including the hire of 3,000 deputy marshals and other incidental expenses, a total of \$685,783. That was the total cost to all the railroads, including the hire of 3,000 deputy marshals; and the Chicago fire department, investigating the amount of loss by fires, report that the total loss by fires, including cars and all merchandise and everything else burned, was \$355,612.

Q. (By Mr. C. J. HARRIS.) Have you the number of cars burned?—A. I have not the report as to the number of cars burned. There was not any such considerable number as the public was led to believe, as has been developed since in the testimony of different cases, and many of these were very old cars. I have gone into that question to some extent, as the attorneys for the railroads use this in every case they try as an excuse.

Q. (By Representative LORIMER.) The report of the fire department is included in the Labor Commission's report?—A. I think not. \$355,612 by fire.

Q. (By Mr. C. J. HARRIS.) That is, outside of cars?—A. Including cars, merchandise, and everything. There was some other loss by overturning cars, repairs, and so on, but the total loss to the companies was \$685,783, including the hire of United States marshals and all incidental expenses.

During this struggle Mr. John Egan was selected, as proved by the general managers themselves in a case I tried, to take charge of the whole strike and to get employees for all the different railroads. It was put in the hands of one man, which was practically the adoption of the scheme of this employment bureau. It was carried out practically when it came to the strike, as recommended here.

The first case tried was the case of Fred R. Ketchum. He charged that the railroads entered into an agreement through the general managers' association that they would not employ any man who had quit the service of any of the roads during that strike or who had committed any offense or who was a member of the American Railway Union unless that employee obtained what the railroad men commonly called a clearance, which was the approval or consent of the road that he was working for at the time that the strike broke out.

He obtained work from the Chicago Great Western just before the close of the strike; having heard of the blacklist, and to test it to see whether it was so, he obtained work from the Chicago Great Western, and made one trip as freight conductor from Chicago to Dubuque, Iowa, and back. Previous to the time when he obtained this work, about July 3, 4, or 5 of that year, Mr. J. C. Stuart, the superintendent of the Galena division, came to his house, and asked him to take out a train. Mr. Stuart testified that he was one of the first men out of 75 freight conductors that he went to to take out a train, and he told him he could have any brakeman he pleased. Ketchum said his former experience in the strike of 1891, where he had taken a train into the stock yards, with a revolver in each hand, was sufficient for him, and he did not propose to take any chances. He, at that time, was not a member of the American Railway Union, but simply stayed at home, and told Mr. Stuart that he did not feel that he was under sufficient obligation to the Chicago and Northwestern Railroad Company to jeopardize his life. Whereupon Mr. Stuart threatened him that if he would not, he would be enjoined with the blanket injunction, and would be arrested; that he felt sorry for his family, and that if he did not take out the train he would find hard work getting a job from any other road.

That prompted him to go and make this application before the strike was over. He made this one trip to Dubuque and back, and on the morning of his return he was arrested by a United States marshal and taken to the United States Court

and kept in custody for a week before he could give a \$3,000 bond. He had sent word by his wife to the railroad company, as an excuse, that he was sick, in order to hold his position. When he went back to the Great Western he was told by the superintendent, Mr. Kelly, that they had no further use for his services. Mr. Ketcham asked why (and this testimony is corroborated by Daniel Cash and by another man by the name of Baxter), and Superintendent Kelly told him, "Because we have received word you are a Northwestern striker." He asked if his services had not been satisfactory on the run he had made, and was told yes, that he was a first-class man, and he would like to keep him. Mr. Kelly said further: "I am obliged to discharge you, if you can not get a clearance from the Chicago and Northwestern, I should be glad to restore you; but it comes from above me. You will have to go to Stuart, and he will know what to give you."

Mr. Cash, who was also an applicant for work, then submitted this letter, which I have here, to Mr. Kelly, and Mr. Kelly said that was not a clearance.

This is a letter not dated at all, but the testimony was that it was given August 6, 1894, the day the strike was declared off. Ketcham had his letter at the same time. After giving the record of his employment for about 10 years it says, at the foot: "July 8th, 1894, during A. R. U. strike, left his post and was active in persuading others to do likewise. When he returned to duty his place had been filled."

Mr. Ketcham had a letter of exactly that wording, showing 10 years' service. Mr. Kelly said that was not a clearance. Then Ketcham asked him if he was blacklisted. Mr. Kelly said: "You can call it that or anything you've a mind to. I can not put you back to work unless you bring a clearance from the Northwestern. I am sorry, but it comes from above me."

That is the substance of the testimony of Mr. Ketcham, corroborated by Mr. Cash, Mr. Baxter not being here to testify. Mr. Kelly denied that he said all that. He admitted that he said some of it, but denied that he said he was blacklisted. Mr. Ketcham then afterwards applied to two or three roads, among them the Wabash, and showed them this letter, and although they said they needed men, they said they could not employ him, and refused to employ him.

Q. (By Mr. KENNEDY.) Can you name the other roads?—A. He applied to the Wabash—he only applied to two or three roads, and he heard everybody else was having the same experience and quit. I think he applied to the C. B. & O.; that is my remembrance.

Mr. Ketcham's testimony was corroborated in every particular by Mr. Daniel Cash. Mr. Ketcham also said he got work on the drainage canal, and worked for the city of Chicago, running a steam roller, and finally got work on the Michigan Central grain elevator, at Kensington, and just before the trial was discharged from there. The pretended cause was that business was slack, but the elevator was running full time, and there was no charge made against him for incompetency as a stationary engineer; he was a very fair engineer.

J. D. Green, a former conductor on the Illinois Central Railroad, testified that he quit during the strike, and afterwards applied for work to J. B. Strong, train-master of the Chicago Great Western; that Strong told him he could not hire him unless he had a clearance, and asked him if he had a clearance, and he said No, but that he could show him a lot of railroad passes showing that he was a railroad man. Strong said, "We hired a man by the name of Ketcham without a clearance and we got hell for it, and had to discharge him when we found out he had been a striker. I don't care if you have had wrecks, or accidents, or have been drunk, or anything else, if you can only bring a clearance from that strike I can hire you. We don't care whether you have been careless or anything of the kind."

He was denied employment also by the Chicago & Alton and several roads to whom he never got a chance to make formal application. They asked if he had a clearance, and he said no.

He went to the Illinois Central after several vain efforts to get work and got a letter, which I have here, written by Mr. J. W. Higgins, superintendent of terminals of the Illinois Central, dated January 16, 1896. After searching for employment for a year and a half he got him to write a letter to Mr. C. L. Nichols, superintendent of the Chicago, Rock Island and Pacific Railway, at Blue Island, Ill., which was as follows: "Mr. J. D. Green, formerly a conductor on this road for eight years, left the service and went with the Lake Street Elevated Railroad about the time it opened, and is now desirous of making a change," covering up the fact that he quit during the strike. "As there are no vacancies in our service, business being reduced, he desires to make application to you. I think you will find Mr. Green a competent train man."

He took this letter and went to Mr. W. E. Green, train master of the Alton road,

whom he knew, having failed to get work from the Rock Island. He got Mr. Green, the train master of the Alton, to write a letter on it to Mr. Willis E. Gray, general superintendent of the Alton, at Bloomington, which is as follows: "I have known the bearer, Mr. J. D. Green, for the past 6 years, and can recommend him as a first-class man in every way."

He presented that letter to Mr. Gray at Bloomington and attached it to his application for work, and Mr. Gray told him that in the morning he would report to him—he would have his application investigated; said they needed men. Finally, on February 24, he received the following letter from Mr. Gray: "Answering your communication of February 17, I beg to advise that as soon as a favorable opportunity arises I will let you hear from me as to employment. At present our business is dull and we have a good many extra men." A few days before that he had said they needed men.

A few days later Mr. Gray returned the letters, saying his application was not satisfactory, and for that reason he could not employ him. He was never able to get work on any railroad. They all said they could not hire him unless he had a clearance.

J. H. Dungan, another very important witness, testified that he had been an employee of the Northern Pacific, which is outside of the General Managers' Association, and that he had sought work from a good many railroads, but had been denied; that he had obtained temporary jobs, but was discharged because his application was rejected, until, finally he got a job at Argentine, Kans., in charge of a switch engine, and worked from the fall of 1894 through the winter of 1894 and the spring of 1895, when he was discharged and told by the yard master that it was because his application was rejected. He had referred to the Northern Pacific Railroad. He then sought to be reinstated, and wrote a letter to Mr. H. U. Mudge, general superintendent of the Atchison, Topeka and Santa Fe Railroad Company, being the road he had worked for, asking why he had been discharged after working so long and giving such satisfactory services. Previous to this he had received a letter from John Z. Roraback, superintendent of the Atchison, Topeka and Santa Fe Railroad, dated at Kansas City, March 21, 1895, on the regular form of that railroad, as follows: "This is to certify that John H. Dungan has been employed in the capacity of switchman at Argentine, Kans., on the Kansas City Terminal Division, from August 23, 1894, to March 18, 1895; was discharged on account of previous record unsatisfactory; services while here were satisfactory."

He went to Topeka and pursued Mr. Mudge, who was on the move constantly, until finally he had to write to him "on the line," on March 27, 1895. This road at that time was in the hands of the United States court, and the officials of the United States court, Aldace F. Walker, John J. McCook, Joseph C. Wilson, receivers, were in charge of the road, showing that even the officers of the United States court were a party to that conspiracy. The letter was on the regular form of the company, Eastern Grand Division: "Mr. J. H. Dungan, Argentine, Kans. Dear Sir: Acknowledging receipt of yours of the 21st, I have investigated the matter and find that immediately upon your being employed letters were written to ascertain your record with the Northern Pacific. The delay is entirely due to the fact that they neglected to reply earlier to references. It is against the policy of the receivers to have any man who was mixed up with the strike; and if we intended to do so, there are certainly a large number of men who had worked for this company who should be given preference over men from other roads. In being allowed to work five months you were more fortunate than most others, and I regret to say that I do not see my way clear to do anything further for you in this case. Respectfully, H. U. Mudge, General Superintendent."

There were so many witnesses who testified to similar experiences, and who had similar letters, that I will ask leave to incorporate, as a part of my testimony, an article which I wrote on this subject and which is published in the Arena for March, 1899, containing excerpts of the testimony of other witnesses, in order to save time. It is taken from the testimony, what I consider the material parts, and contains photographs of 4 letters and the front page of what we claim is the Illinois Central blacklist. I should like to incorporate it.

BLACKLISTING: THE NEW SLAVERY.

An American jury, composed, with one exception, of employers of men, the foreman of which was an ex-banker, and not one of whom was a member of a labor union, after a trial lasting nearly three weeks, before Judge Richard Clifford, in the circuit court at Chicago, recently returned a verdict for \$21,666.33 against the Chicago and Northwestern Railway Company for blacklisting one of

its former employees who left its service during the American Railway Union strike of 1894. The plaintiff in the case was Fred R. Ketcham, who had been in the employ of the road as a freight conductor for a period of about ten years preceding the strike.

The principle involved in this case was much more than personal injury or vindication; it was one of human liberty. As but \$1,850 actual loss was proved, the amount allowed in excess of this sum by the verdict was for exemplary damages, or "smart money"—an emphatic assertion by the jury of this view of the case.

The character of the jury emphasizes the enormity of the offense as proved and shows what a jury of American business men think of a conspiracy to deprive a citizen of his right to earn a living in his own chosen calling. People who do not know the facts shown in this case may think the verdict excessive, but had they this knowledge they would consider it too small. The issues involved are of the highest importance, not merely to organized labor, but also to the great mass of our people, as the conspiracy was one of the most infamous ever known in this country. It is to make the facts known that this article is written.

Divested of legal verbiage, the charge was that all the railroads entering Chicago had agreed and conspired to keep each other informed of the names of all their employees who belonged to the American Railway Union or who quit work during the American Railway Union strike of 1894, and that no such employees should be employed by any of these railroads without first having a release or consent (commonly called a "clearance") from the road by which he was last employed before the strike; that the plaintiff voluntarily left the employment of the defendant during said strike and afterwards obtained employment from the Chicago Great Western Railway, but was discharged from its employment because the defendant notified the Chicago Great Western that plaintiff was one of its strikers, and because he did not have a "clearance" from the defendant; that the plaintiff had requested such "clearance," which was refused by the defendant for the malicious purpose of preventing plaintiff from securing employment in the railroad business, for which he was well qualified, and that for said reasons the plaintiff was denied employment by all the other roads, and that by reason of said conspiracy, and for no other cause or causes, the plaintiff was prevented from securing employment in his chosen occupation as a railroad man.

It is not within the scope of this article to publish all the evidence given at the trial, but facsimiles of some of the letters introduced and excerpts from the oral testimony given will show, beyond question, that the jury were justified in finding the defendant guilty.

Benjamin Thomas, chairman of the General Managers' Association, testified that his association was a voluntary association of all railroads running into Chicago; that it was organized in 1892 and supported by contributions from all the roads belonging to it; that its meetings were held in secret; that its objects and purposes were the discussion of problems of railroad management, and that while the different roads were not legally bound to adopt the acts of the General Managers' Association, they were morally bound to do so.

The first two articles of the constitution of the General Managers' Association were then offered in evidence and are as follows:

ARTICLE I. *Title*.—This association shall be called The General Managers' Association of Chicago.

ARTICLE II. *Object*.—The object of this association shall be the consideration of problems of management arising from the operation of railroads terminating or centering in Chicago.

Here is the record of the proceedings of The General Managers' Association at its meeting of May 18, 1893, then produced:

"The chair then called for the report of the committee, to which had been referred at various times (1) Tabulation of wages; (2) employment bureau; and (3) Rules for government of employees.

"Thereupon Mr. Wall, acting chairman of said committee, read the following:

"REPORT OF COMMITTEE.

"CHICAGO, ILL., May 18, 1893.

"Mr. E. ST. JOHN.

"*Chairman General Managers' Association, Chicago Ill.*

"DEAR SIR: Your committee appointed to tabulate the rates of pay paid by all roads centering in Chicago, and to report on the formation and maintenance of an employment bureau for railroad employees, and to formulate a set of rules for the government of all railroad employees, beg leave to report:

"1. With reference to tabulation of wages: They have classified all classes of

railroad employees below the rank of division superintendent and superintendent of motive power, or general master mechanic. * * * In classifying the employees, it has been necessary, in order to secure uniformity, to adopt certain terms in describing a man's employment, and the committee requests the cooperation of the general managers, in so far as possible, in using these terms instead of the special term that may be used in some particular locality. It will be found that the terms recommended by the committee are synonymous with those in use, and are only introduced so as to make the wage tables of the different roads readily comparable.

"II. The matter of the establishment of an employment bureau: The subject has been discussed at great length, and it is the opinion of the committee that such a bureau would be of advantage to the association.

"First. In assisting them in the procurement of men, both under ordinary conditions, and in times of emergency.

"Second. In assisting the roads to guard against the employment of a man who has been proved unworthy on some other road.

"Third. In abolishing the state of affairs with which we are all familiar, that is expressed, when a man is disciplined, by the statement that 'your road is not the only road in Chicago,' and that 'employment can readily be obtained on some other road,' although an offense has been committed.

"Fourth. Each railroad shall designate to the manager of the bureau the name, or names, of its officer, or officers, empowered to approve applications for employment and certificates of transfer or dismissal.

"III. On the matter referred to your committee, relating to the adoption of rules for the government of all classes of railway employees, we beg to report progress."

The plaintiff, Fred R. Ketcham, testified that he quit the employment of the defendant company during the railway union strike, and remained at home, not going near any railroad during the trouble; that about July 3 of that year Superintendent J. C. Stuart came to his house and asked him to take out a train; that he refused, as he considered it dangerous; that he was not at this time a member of the American Railway Union, but afterwards joined it about July 20; that he had been in the employ of the defendant company about ten years; that upon his refusal, Stuart "threatened him with arrest, adding that he had sympathy for his family, and that if he did not take out the train he would find hard work getting a job from any other road." Having heard of the blacklist, he went to the Chicago Great Western Railway and secured a situation as conductor of one of its freight trains July 28, and made one trip to Dubuque, Iowa, and back, arriving home July 31, at 5; that at 7 he was arrested by a United States marshal and kept in custody several days until he could give a bond for \$3,000; but was never prosecuted, no evidence being offered against him; that August 6 he went to Superintendent Stuart and asked for a clearance, and was given a letter showing how long he had been in the employ of the Chicago and North Western, but at the bottom was the following: "Left his post during American Railway Union strike, and was active in persuading others to do likewise. When he returned for duty, his place was filled." On the same day he returned to the Chicago Great Western for duty and was told by Train Master J. B. Strong and Superintendent J. A. Kelly that he was discharged, Superintendent Kelly telling him that he was a good man and he would like to keep him, but could not unless he first obtained "clearance" from the North Western. When asked why he was discharged Kelly said, "Because he had heard he was a North Western striker." Ketcham then asked where he got his information, and Kelly replied, "From the one we all get it from." Ketcham then asked if he was blacklisted, and Kelly replied, "You can call it that or anything you're a mind to. I can't put you back to work unless you bring a 'clearance' from the North Western. I am sorry, but it comes from above me."

Daniel Cash, who was with Ketcham, had a letter exactly like Ketcham's, and showed his letter to Kelly. Kelly said that was not a "clearance," so Ketcham did not show his own letter. Ketcham's testimony was corroborated by Cash.

The following facts also appeared from Ketcham's testimony. After being discharged from the Chicago Great Western he applied to several other roads for employment, but was everywhere refused, and never secured railroad employment after the strike. In the autumn of 1897 he worked as stationary engineer at the Michigan Central Railroad elevator at Kensington, but was discharged about two weeks before the trial, for the alleged cause that business was slack, though the elevator was running full time, and continued to do so after his discharge just as it had been doing previously.

J. D. Green, a former conductor on the Illinois Central Railroad, testified that after the strike he applied for work to Train Master J. B. Strong of the Chicago

CRYSTAL RAILROAD COMPANY.

Office of Superintendent Terminals.

Chapman, December 23rd 1895.

Great Western, that Strong told him he needed men but could not hire him unless he had an Illinois Central clearance from the strike. Strong added that he had hired a man by the name of Ketcham without a clearance and had had to discharge him, and that he (Strong) "got hell for hiring Ketcham without a clearance."

About 85 other men who had quit various roads during the strike testified that they had applied to all the roads in Chicago, were told they needed men, but were denied employment because they did not have clearances. Many of these men had letters showing years of faithful service and good habits, but whenever a letter said they had "quit during the strike" they were told "that is not a 'clearance'" and were denied employment. Some were given work and required to make out written applications showing what road they had last worked for. In a few days they were discharged, and when they asked why, were told that their "applications were rejected."

Among several letters placed in evidence as corroborating this testimony was the following significant and unequivocal official declaration of the position taken by the Wabash Railroad Company:

J. H. Dungan testified that at the time of the strike he was in the employ of the Northern Pacific Railroad, and quit with the men; that after the strike he secured successively several positions, but was discharged from each in turn because his applications were rejected; that he finally obtained a situation in Argentine, Kan., on the Atchison, Topeka and Santa Fe Railroad, put in an application referring to the Northern Pacific as the last road he had worked for, worked for about five months, when he was discharged; that he wrote the superintendent, H. U. Mudge, about it and received the reply which is reproduced herewith. This letter shows that even officials of the United States court were parties to the conspiracy.

Burnham testified that after seeking work in vain for more than a year and being denied because he had no clearance, he went to J. W. Higgins, superintendent of terminals for the Illinois Central Railroad, told him his family was starving and he could not get work without a clearance, and begged Higgins to give him a clearance, whereupon Higgins gave him the letter reproduced herewith. He asked Higgins why he (Higgins) couldn't give him employment, and Higgins said, "I can't; that's all." He went to Robert Cherry, general yard master of the Nickel Plate Railroad, and asked if he needed any men. Cherry said, "Yes; I can use a man or two. Have you a clearance?" Whereupon Burnham said, "Yes," and showed him the letter above mentioned. After reading it, Cherry said, "Burnham, that's a good letter, but it is not a clearance. I can't hire you on that letter." Burnham further testified that he had traveled all over the country and had shown that letter to railroad officials who were hiring men, yet was denied employment and had never been able to secure any employment on a railroad since the strike of 1894.

All the other witnesses related similar experiences, covering nearly every railroad in the United States. Not one of the witnesses for the plaintiff had ever committed any violence or violated any law. All were shown to be sober, careful railroad operatives, and all had good letters of recommendation from their respective roads. No charge was made save that they "had quit during the American Railway Union strike."

SUPERINTENDENT MUDGE'S EXPLANATION.

Michael Driscoll, who had first-class references for twenty-five years' service as a railroad man, testified that he left the Pittsburg, Fort Wayne and Chicago Railway during the strike, and that after the strike he secured a position on the Chicago and Western Indiana Railway by telling Mr. Warner, the superintendent, that he was in New York during the strike. He was required to make out an application and gave the name of the Pittsburg, Fort Wayne and Chicago Railroad as the road he had last worked for, having had the promise of Mr. Belz, of the Fort Wayne, that he would recommend him. After working a short time he was discharged. When he asked Mr. Warner why he was discharged, he was told that the Fort Wayne objected and that "it was the Fort Wayne which kept him from working." He called on Mr. Belz, of the Fort Wayne, and asked him to write a letter to Mr. Warner in his behalf. Belz said "if he did so it would be the price of his own head."

Frank Deyer testified that he quit the Michigan Central Railroad during the strike. He subsequently obtained several positions, but was discharged from them all because his application was rejected, though his services were entirely satisfactory. Becoming discouraged in seeking work under his own name, Deyer

secured several letters belonging to his brother-in-law, W. G. Cherry, who had quit the railroad business before the strike. Under the name of W. G. Cherry he obtained a position with the Chicago and Erie in January, 1896, which he has held ever since. A similar story was told by H. F. Elliot, who testified that he was working for a railroad under an assumed name.

Andrew Stader testified as follows: He did not belong to the American Railway Union nor to any other labor organization. He had been in the employ of the defendant railway four years before the strike. When the strike broke out he was off duty on a leave of absence. He was called to take out a train to Milwaukee on the night of July 6, during the height of the trouble, and promised he would go, but when his wife, who was in a delicate condition, heard he was going, she became nervous and frightened and begged him not to go. Yielding to her entreaties, he went to the foreman and told him of his wife's condition, saying that under those circumstances he could not move the train. The foreman abused him and accused him of sympathizing with the strikers. He again reported for duty on July 10, when the master mechanic, John Heath, discharged him. After the strike he again applied to the defendant for employment, but was refused. An alderman interceded for him with General Manager Whitman, who ordered an investigation. After the investigation the superintendent had him reemployed as an extra man, and he worked as such during the winter of 1894-95, but was discharged in the spring of 1895 owing to slack business. After he was discharged and paid off he asked the master mechanic for a clearance, so that he could get work on some other road, whereupon he was given the letter reproduced herewith, which speaks for itself.

This letter is the necessary "clearance," the explicit written consent of one of the conspirators, without which employment was, by the terms of the conspiracy, denied to any worker even suspected of the temerity of joining his fellows in a demand for better conditions. It can be explained on no other hypothesis than that the master mechanic knew that Stader must have this permission before he would be given work on any other road.

Proof was made at the trial that the superintendent and the general attorney of the Chicago and Northwestern Railway Company had tried to bribe the witness Stader to leave and not testify in the case; and a pass given him by the superintendent to Green Bay, Wis., and return, good for 30 days, was offered in evidence. Stader has since been discharged by the Chicago and Northwestern. His testimony is believed to have cost him his place.

The secretary of the General Managers' Association testified that the general manager of the defendant railway had a copy of the proceedings of the General Managers' Association, and the defendant was notified to produce this copy for inspection, an affidavit having been filed alleging that it would show the blacklisting agreement of the railroads. The defendant refused to produce the records.

Norman Ford testified that in August, 1894, he was employed as a messenger boy in the office of J. W. Higgins, superintendent of terminals of the Illinois Central Railroad, and was instructed to make 50 mimeograph copies of a list of 524 names, containing 13 sheets; that he made the same and mailed 49 copies; that a copy was sent to the officials of the Illinois Central Railroad who hired men; also that a copy, marked "Private," was sent to every railroad in Chicago, and that he addressed and mailed these.

An original of this list was introduced in evidence. Herewith will be found a photographic reproduction of the first page of the list.

Despite this damaging documentary evidence, many railroad officials, including eight general managers, sworn by the defendant, testified they had never received or sent out such a list, that they knew of no blacklisting agreement, and had never heard blacklisting discussed in the General Managers' Association.

Almost the last witness introduced by the defendant was Mr. Atwater, of Detroit, Mich., superintendent of the Chicago and Grand Trunk Railway. He was shown the Illinois Central blacklist, and asked the stereotyped question which had been asked of all the other officials: "Did you ever see a list exactly like this in all respects, except that it was not addressed to J. T. Harrahan?" He naively replied to the railroad's attorney: "Never until I saw one in your office this morning." At last such a list had been located in the hands of a railroad official not an official of the Illinois Central, and Norman Ford was corroborated.

The defendant's attorney sought to break the force of Ford's and Atwater's testimony by the side remark that he had simply "had a copy made," insinuating that the paper which Atwater had seen was simply a transcript of the list shown in court, and not one of the sheets mailed by Ford. He did not testify to this view of the facts, though challenged to do so, obviously wishing the jury to accept it as the correct one. Next day, when plaintiff wanted to show, in rebut,

CHICAGO & NORTH-WESTERN RAILWAY CO.

MOTIVE POWER DEPARTMENT.

OFFICE OF THE MASTER MECHANIC.
WISCONSIN DIVISION.

On file 9/10/1892

tal, that the list introduced in court had been in the custody of the clerk, and could not have been copied, defendant's attorney admitted that the list exhibited in court was not the original of what he had shown Mr. Atwater. He then produced a blank form of Illinois Central order No. 1324, without any date, signature, or names, and said, as a side remark, that that was what he had shown Mr. Atwater. He did not testify to this, though at the time challenged to do so, but closed his case, leaving the Ford-Atwater evidence in full force.

I go into this detail here to show the effects put forth at the trial to conceal the existence of a black list, indicating a keen sense of the significance of that device, if proved to be in use.

A jury of business men, deliberating but two and a half hours, found the defendant railway guilty as charged, thus establishing as a fact the existence of the conspiracy.

The state of affairs disclosed by the above evidence is a serious one, deserving the attention of every American citizen.

I do not believe that all the directors and stockholders of the railroads countenance this crime of their general managers. It is too atrocious to be approved by any conscientious man. If all the suffering of innocent women and children caused by this conspiracy could be laid bare; if the cases of homes sold under foreclosure, of husbands separated from wives, and of strong and willing men forced to assume false names, or driven insane by this criminal deprivation of employment, could be published, such a protest would be heard from every lover of fair play in the land that these criminal officials would be driven from power by honest stockholders and directors, and officials with some instincts of humanity put in their places.

It will not do to say that most of the men who were in the strike have been taken back, for it is not true. Out of the 30,000 in Chicago who were proved to have struck, only about 31 were proved to have been reemployed. Many of these were brought from other cities to testify for the defense. Fully one-half even of these were men who returned for work before July 10, when notified by the roads to do so; hence they were really not strikers.

If the blacklist be necessary, as some of the railroad officials claim, to prevent strikes and to enforce discipline; if private corporations can not administer our railways without depriving American citizens of the liberty guaranteed by the Constitution, without starving innocent women and children because their husbands and fathers sympathized with the American Railway Union strikers and generously tried to help them, then it is high time the Government became the owner of the railroads, put the employees under civil-service rules, and secured them in their positions during good behavior.

Strikes, to be sure, inconvenience the public, and they may be mistaken sometimes; but what other remedy have laboring men when aggrieved and refused all redress? It is important that the business interests of the country should not be interrupted, but it is more important that our citizens should be free. The victims do not complain that the roads they were working for at the time they struck did not reemploy them. They admit that the roads had a right thus to refuse them. They complain that their old employers not only refused to employ them again, but vindictively pursued them, and prevented them from getting employment anywhere else. "Once a sailor, always a sailor;" once a railroad man, always a railroad man. The most skillful railroad men in the country are usually unfitted for any other work. The public are interested in having men of this class—careful, sober, and skilled—to operate our railroads.

The evil criticised can not be justified under any of the specious excuses offered.

No one questions the right of a railroad to report to another road the name of a drunken or careless employee. This is not only their right but their duty, as the public is interested in having sober and careful men operate trains. But when a railroad official sends the names of such employees to other roads than his own, it must be done in good faith and for good cause. If railways combine to keep from work men who have simply struck to better their condition, violating no law, their act becomes unlawful and dangerous to public welfare. A combination of employees to vindictively injure employers in any similar fashion would be equally wrong and unlawful. Both should be condemned as un-American, without discriminating in favor of any one class as against the other. "What is sauce for the goose is sauce for the gander."

If public conscience can be aroused the people will put a stop to this iniquity and corporations will be taught to obey the law. Corporations have their place in the industrial development of the times, being at present necessary elements in our economic system; but they should be the servants and not the masters of the people.

The street-car companies have joined in a national organization. They claim the right not only to form corporations, which are combinations of capital, but also to form a national combination of such corporations; yet they, or many of them, refuse their employees permission to form a union or any combination whatever, under penalty of dismissal. During the autumn of 1897 the Chicago City Railway Company refused to allow its employees to join a union and discharged those who did join.

A railway vice-president, in discussing these questions, recently said to the writer: "The people who own this country propose to run it." Asked if by "owners" he meant the corporations and the wealthy class, he replied: "I mean those who own the property." He then repeated the above remark and gave permission to publish it over his name. I refrain from giving his name from personal considerations. The instance merely shows the sentiment of many capitalists.

Capital can not in justice insist on its right to form combinations and deny the same right to labor. A corporation can not reasonably insist on treating with its employees only as individuals, while itself joining other corporations in disciplining laborers. Either organized capital must recognize organized labor, dealing with labor organizations as entitled to recognition like organizations of capital, or the conflict between labor and capital will produce results more serious than have yet occurred. Confronted by a great organization of capital, the individual employee is helpless. If his demands are backed up by the power of an organization of his fellows, he has some chance of securing just concessions and correcting the abuses of which he complains. When the rights of both labor and capital to organize and to act in their organized capacity are recognized, mutual concessions will be made and many of the antagonisms which now occasion strikes and lockouts will be unknown.

If our workingmen are to be independent, manly citizens, and not obsequious vassals, blacklisting must be done away with. Involving conspiracy to thwart most sacred rights, it is dangerous to public welfare and contrary to the common law.¹

The Supreme Court of the United States, at the last term, in the case of *Allgeyer v. Louisiana*, held that the word "liberty," as used in the fourteenth amendment to the Federal Constitution, means not merely the right to freedom from physical restraint, but also the right to pursue any livelihood or calling. If, then, a man is denied the right of contracting for his labor, he is denied the liberty guaranteed him by the Constitution.

If a man who quits the employ of another can not get work in his chosen occupation without first obtaining the consent of the man whose employ he has left, he becomes a slave. He will not dare resist any oppression his employer may see fit to impose upon him. His wages may be cut to the starvation point; he may be called upon to work extra hours; yet he dare not complain, as he knows he can not leave and get employment elsewhere. If he protests, his employer will say: "Very well, if you don't like it, you can quit." The man having a wife and children to support will bow in submission, knowing that his master has him in his power and that he can not support his family if he is defiant, as he can not get work elsewhere without the consent of his employer.

This is slavery pure and simple, yet it is without exaggeration the condition of most railroad employees in this country to-day. The blacklisting system is also being adopted in nearly all other branches of corporate employment, such as the large packing houses, street railroads, clothing manufactories, and coal mines. It is one of the growing evils of the present era of combinations and trusts, menacing the liberty of a large class of our citizens. A recent illustration shows this. In 1897 the Chicago City Railway Company, as I have mentioned, forbade their employees to join a union, and discharged such as did join. The men having freshly in mind the terrible suffering and privations of the American Railway Union men who struck out of sympathy for the oppressed employees of the Pullman Company, also knowing that winter was coming on, yielded to the tyranny of the company rather than bring misery and distress on their wives and children.

The railroads use the blacklist not only to punish those who have been discharged, but to coerce and intimidate those still in their employ.

How long will it be, if blacklisting is allowed to continue and spread, before the laboring masses of the country, having become the helpless fools of these mighty masters, will do their bidding in the exercise of the elective franchise?

¹ See Cooley on Torts, page 326: "Every person has a right to make use of his labor in any lawful employment on his own behalf, or to hire it out in the service of others. This is one of the first and highest of civil rights."

We shall then have a government of corporations, by corporations, and for corporations. The wage-earner who feels his little children tugging at his coat-tails for bread, will fear in voting to assert his manhood and resist oppression. Can a republic made up of such citizens long endure? Are such mere tools fit to be electors in a government of the people? These are serious questions, which must be wisely answered by American voters at the ballot box, or the answers will be blood and revolution.

Blacklisting is thus seen to be a chief agency in fostering anarchy. It destroys manhood in citizens and makes them slaves. There must be a change. The love of liberty is too deeply rooted in the hearts of Americans long to tolerate this dangerous abuse. It is peculiarly against public policy, because when men can not find work they become paupers and public charges, if not criminals.

The conspiracy proven is the most subtle device ever devised by the brains of man to subjugate and oppress labor and make it bow to the dictates of capital.

If it is held by the courts of our land to be lawful, other employers will be swift to take advantage of it, and it will be but a short time when the liberty, independence, and patriotism of the American citizen will be but a mere tradition that our children will talk about, but not understand; and labor which hewed this nation of freemen out of the wilderness, will bow its head to the dictation of corporation bosses. The mission of the United States is to enlighten and civilize the world. It is the knight errant of liberty and justice. If it fails in its mission, the world will relapse into barbarism. This question is the greatest question facing our courts to-day. On the action of our judiciary in this case depends the salvation of the Republic, the preservation of our liberty.

WILLIAM J. STRONG.

CHICAGO.

Here is a letter introduced on the trial of the case, a letter written by the Wabash Railway to one John Snider, which was proved to be written by J. B. Barnes, superintendent of motive power and machinery of the Wabash Railway. It is proved in court to be his genuine signature. I have the original here. Mr. Snider had difficulty in getting work and wrote to Mr. Barnes asking for his record, and he gives him his record here: "February 19, 1896. John Snider, 4205 Atlantic street, Chicago, Ill. Dear Sir: Replying to yours of February 14, below please find your record while with this company: Employed as fireman October 30, 1882; promoted to switch engine February 6, 1888; resumed firing April 6, 1888, account of slack business; promoted to switch engine June 2, 1888; assigned to road engine March 25, 1893; August 1, 1892, 5 days, violation of smoke ordinance; quit July 1, 1894, giving as a reason that it was not safe to run on account of mob violence; allowed to resume work July 19, 1894; discharged August 3, 1894, for being in sympathy with strikers; worked only a short time in July and August. Yours, truly, J. B. Barnes, S. M. P. & M."

He testified he was not able to get any work on any road on account of that sympathy with strikers.

Q. These letters are all originals?—A. Yes; the signatures have all been proved in court. I have not read anything except those proved in court to be genuine signatures.

Q. (By Mr. C. J. HARRIS.) What was the gist of the statute under which you proceeded?—A. It was under the common law, not under the statute.

Q. There was no statute?—A. There is a statute in the State, but I prefer to rely on the common law as being broader. That they entered into a conspiracy the object of which was to deprive any man who committed an offense, or any man who was a member of the A. R. U. or who quit work during the strike, of the right to earn a livelihood by his trade, and by the power of their combination they were enabled to prevent them from getting work at the only trade they knew. Our claim is that that conspiracy is a criminal conspiracy and punishable as a misdemeanor. Whenever the private individual has been injured or damaged as a result of a criminal conspiracy he always has an action on the case for damages, and wherever a man has been deprived of a legal right damages are presumed. That is the theory upon which we proceeded in this case. The legal questions involved are now in the Supreme Court in the case of *McDonald v. The Illinois Central Railroad Company and the Chicago and Northwestern Railway Company*.

Q. What was the result in the lower court?—A. The Ketcham case? \$21,666.33; and that jury was a very remarkable jury in this, that 11 out of the 12 were employers and only 1 an employee. The foreman of the jury was a banker, and there was one man on the jury who had as high as 150 to 200 men in his employ; the 1 employee was an employee of the Adams Express Company, and the other

11 were employers. They deliberated only about 2 hours, and that was over the amount of the verdict—most of the time.

As I gather it from the testimony here and from the counsel of the railroads in the trial of these cases, the objection seems to be more especially against the heads of the union; any man who was a committeeman, or who acted as a vice-president, or took any part as an official of the union, seems to have incurred the especial enmity of the railroads. Now, I gather from that that the object of the railroads is to destroy the labor union by striking at the heads of the union. No labor union can exist without officers and committeemen to do its work, and if they are to be singled out and punished, men will hesitate before accepting these positions; they have got the employees of the railroad companies to-day, probably between 900,000 and 1,000,000, absolutely terrorized. I find from the evidence brought to me outside of the men who were in the strike of 1894, men who are now employed, that they do not dare even to present a grievance any more, for fear of being discharged and blacklisted; that the punishment and suffering of the men who went out during the strike—and there were over 30,000 in the city of Chicago—has been so severe that they do not dare to form another union or present a grievance; that they are burdened with extra duties, and do not dare complain. They say that the railroad men who are now employed are afraid to exercise or assert their rights.

Q. (By Mr. CONGER.) Do you think men have been blacklisted for other offenses than participation in this strike?—A. Yes.

Q. Have you any evidence?—A. I have, but I did not bring it here, because I thought you particularly wanted to hear about this strike; any offense is sufficient. The truth is that if any man has committed any offense, no other road would employ him unless he first obtained the approval or consent of the road he last worked for.

The system by which they did that, I have been unable to prove, with one exception; the Illinois Central stopped over and sent out a list, a photograph of which I have here, in which they make the direct request that the under-noted men shall not be employed without first conforming to General Rule No. 636 of the Illinois Central, which was adopted in 1891 by nearly all the railroads, I think. It was, that no man who had been discharged from one department shall be employed by any other department, without the consent of the head of the department from which he was discharged, without the approval of the general superintendent or some other officer.

They say that only applied to their own employees, but I proved by the boy who made this mimeograph copy, that he made 50 copies of it. The Illinois Central required 27 copies to give to all their own officials. I do not claim it is improper for them to send this to their own officials, but the remarkable circumstance that comes out in the trial of the case was that 27 of these copies were required to cover their own road. The men mentioned in the upper left-hand corner, which left just 23, from this boy, Norman Ford's testimony, to make the 50. Twenty-three is the exact number required to send to every other road of the General Managers' Association; there are 24 members, and leaving the Illinois Central out, there are 23. This boy did not know how many they did send out to their own officers, but the 23 left were just enough to go around, and that he mailed it to every railroad in the city of Chicago. His testimony is unsupported except by Mr. Atwater, superintendent of the Chicago and Grand Trunk Railway, of Detroit, Mich. Mr. Atwater was at that time, I think, the superintendent of the Chicago and Grand Trunk Railway, but since, I think, the Michigan Central. He was put on the stand by the defendant and this stereotyped question was asked: "Did you ever see a list exactly like this in all respects, except that it was not addressed to J. T. Harrahan?" He said, "Never until I saw one in your office this morning." You must remember he was being asked this question by the general attorney of the Chicago and Northwestern Railroad. The inquiry arose, how did that list get to Mr. Osborne's office? The list has on it a place for addressing it, 3 lines for addressing, and the question was put: "Did you ever see a list exactly like this in all respects, except that it was not addressed to J. T. Harrahan?" I asked him if he knew who it was addressed to and he said he did not remember, but he admitted it was in all respects like the one introduced in evidence and on several sheets of paper. He said that he saw that in the office of the Chicago and Northwestern Railroad Company. They tried to break the force of that testimony by saying that they had had a copy made, but they did not produce the copy, but came in the following day with 2 sheets of paper, without any signature, no dates and no names on it, and only a sheet with names the same as on the second page of the black list, and said that was what was shown to Mr. Atwater. Next day, when the plaintiff wanted to show in rebuttal that the list introduced in court had been in the cus-

tody of the clerk and could not have been copied, defendant's attorney admitted that the list exhibited in court was not the original of what he had shown Mr. Atwater, and then produced this list without date, signature, or names, and said that was what he had shown Mr. Atwater. That was the only proof we had—Mr. Atwater's testimony—to corroborate Norman Ford as to any of those lists being found in the office of another railroad.

The system by which this was done was nearly uniform. In some instances, and in fact I think in every instance after this strike was over, most required the men to sign what they called an application. This application for work contained a lot of questions about the man's previous record, especially for the last 5 years, the last road he worked for, and what division of that road. In some instances they would put a man to work pending the result of his application, or on probation as it were, until they could learn the result of the application. The testimony of the railway managers themselves was that they had a custom of writing letters of inquiry to each other whenever a man applied for work, and of answering each other; and they claim they were exonerated from liability because they told the truth. But it was remarkable that every witness who went on the stand testified that whenever an answer came back that a man was implicated in the strike or belonged to the American Railway Union his application was rejected; and whenever one of these men showed a letter to that effect his application was rejected and he was discharged, although he might be told that his services were entirely satisfactory. The man who discharged him would withhold the reason of his discharge, or would be unable to give the reason, though he would say the orders came down from above—we assume from the general managers—and no one would know what the reasons were. The communication was, in some instances, through the telephone, and one of these men heard it over the 'phone. It is very easily seen how effective it could be made, on account of its secrecy. When a man applied for work they would send a letter and get a reply, although they never signed their names, or they would telephone and the man would be discharged. They don't say they need men any more. Before these suits were commenced and before this matter had been stirred up, they wrote these letters that I have produced here, and said a great many things that they guard against now. When a man applies now they don't say they need men; they did before the matter was agitated. Now they ask a man if he has a clearance, and if he has not they tell him they can not employ him unless he gets a clearance. That was the uniform answer—"We can not employ you unless you get a clearance"—according to the evidence of the men who gave us their sworn statements in the matter. Since these things have been agitated they don't say whether they need men or not, but they say: "We will take your application and will put you to work pending the application, and if the application is approved, all right." They did hire at the close of the strike some strikers; a great many of them, in fact. It was absolutely necessary that they should, for they could not have conducted the railroad business without them. The testimony of Mr. W. G. Brimson, of the Calumet and Blue Island, was that he secured a good many of these strikers work on other railroads. I asked him if he thought it was necessary for him to use his influence in getting them work, and he said it was, and admitted the matter, and testified that in many instances in reply to inquiries made to his road about men who had struck from his road, he left out the fact they were in the strike in order to enable them to get work. He said he did that for the express purpose of helping them to get work, and practically admitted that if the fact had been known that they were in the strike they could not have obtained work. Some of them boast now about the efforts they made to secure work for the strikers on some other road. This shows that until the consent of these men was given in some form or other, by letter or something of that kind, the men could not get work. The proof of conspiracy consists of such a mass of testimony that it is impossible to detail it before this commission. I don't know how far I ought to go in stating what I believe from the disclosures of the evidence and my analysis of it and study of it. I don't care to give my opinions about it.

Q. (By Representative LORIMER.) We should be glad to have your opinion as to a remedy.—A. It seems to me that no fair-minded man could hear this evidence and have a particle of question about the truth of the charge that there is a black-listing agreement among the railroads to prevent the employment of any man who leaves a road without its consent or who violates any discipline, unless the last road he worked for gives substantially its approval or consent.

Q. (By Representative OTJEN.) And that is practiced even now?—A. Yes; at the present time, and the system is adopted for the deliberate purpose, in my

judgment, of the subjugation of labor. I don't think there is any question about it. I have never been the attorney for any labor organization or any labor union, and I recognize the tyranny of labor in many respects as much as anyone. This system is, however, so iniquitous that it practically makes slaves of the men, the worst kind of slaves—it destroys their manhood, takes away their independence, and makes them afraid to assert their rights in any way, and goes to the root, in my opinion, of civil government. No man can be a proper elector in a government of the people, for the people, and by the people who is afraid to say his soul is his own or to assert his rights in any way; and it will come to that pass, if it has not already, when they will not dare to exercise the elective franchise according to their will. I phrase it in this brief, which I filed in the Supreme Court, in one sentence: "That when my right to work depends upon the will of any man, I am that man's slave." It is insidious, because it can be worked in secret. It is difficult to prove from the fact that it can be done secretly. It can be entered into tacitly, without any formal agreement. There can be a general understanding, and it is very difficult to prove because of that fact. All the railroads having acted in the same way, and having made the same statements in regard to the same thing—denying employment to men who have the best kind of letters of recommendation, and who have rendered good service for years, and against whom there has never been a charge of carelessness—requires some explanation other than the mere fact that they did not need men, because they said they did. I will call the attention of the commission especially to one letter; it is the letter of Louis Burnham, a man with whom I am very well acquainted, and who is as ideal a personality as I ever met, in appearance, habits, dress, and manner, and everything else. He is a fine-looking fellow, about 35 years of age, and of fine health and physique and a quiet gentleman. He tried for a year and 4 months to get work; he quit during the strike. Being one of the former employees of the Illinois Central, he went to Mr. Higgins and told him he could not get work without a clearance, and begged him in a very forcible way to give him a clearance so that he could get work. Mr. Higgins gave him this letter of December 23, 1895. You will notice that the letter is eloquent in the holes that have been worn in it from the handling it has received through being carried around the country. He carried it all around the country in trying to get work, and anyone familiar with the writing can see how the letter has been worn. It reads as follows:

"ILLINOIS CENTRAL RAILROAD COMPANY,

December 23, 1895.

"The bearer, Louis Burnham, was employed by this company from 1887 to 1892 as a freight brakeman and conductor; from 1892 to 1894 as a switchman in the Chicago yards. During that time he was sober, steady, and performed his work satisfactorily. Unfortunately he was influenced to leave the service, but so far as I am aware he was not actively aggressive, did nothing to hinder the transaction of this company's business. I believe he now regrets his action, and as he has been out of work a long time, has an invalid wife to care for, I would be glad to see him given employment, and feel satisfied he will make his employers a valuable man.

"J. W. HIGGINS,

"Superintendent Terminals."

He was never able to get work on that letter; he was told by different railroad officials that there was reading between the lines. He went to Mr. Cherry, the yardmaster of the Nickel Plate in this city, and asked him if he needed any men. Mr. Cherry said yes, and asked him if he had a clearance, and he said yes, and handed this letter to Mr. Cherry to read. Mr. Cherry read it and said, "Burnham, that is a d——d good letter, but I can not hire you because it is not a clearance." It is something very strange when the railroads will refuse a man who presents such letters as that, when they need men; and it began to excite my curiosity to know what kind of a clearance it was that they wanted. I finally ran across this letter of Mr. Andrew Stader's, which is published here (referring to page 284 of the Arena, of March, 1899). I have long since known Mr. Stader; he is as sober and trustworthy a man as I ever met in my life. I have trusted him and never found him wanting. He was a Chicago and Northwestern fireman; he was off on a leave of absence at the time the strike broke out, and they sent for him at his house on July 3 or 4—I have forgotten the exact dates, but it was the 4th, 5th, or 6th of July—to take a train to Milwaukee and to report at the roundhouse. They have a custom of sending a call for a man at his house to let him know when they want him to go out. His wife was sick and in a delicate condition at the time

when the call came for her husband, and she became frightened. When he came home she told him the caller had been there and left word for him to go down to the roundhouse, and begged him not to go. However, he went down to the roundhouse and reported, and told the foreman of the condition of his wife and her fears, and refused to go out unless he had protection. He really sympathized with the strikers, although he was not a member of the American Railway Union. The moment he told them he would not go out the foreman got mad and told him he was a sympathizer with the strikers, and he was discharged by the foreman and by Master Mechanic Heath. He stayed out during the rest of the strike, and when the strike was over he went back and tried to get work, but was refused it. Finally, Alderman Stanwood, of the Thirteenth Ward—I think he will corroborate the story—interceded with General Manager Whitman in his behalf, and got him to make an investigation of the matter. After making a satisfactory investigation he was allowed to go back to work in the winter of 1894 and 1895 as an extra man, but was discharged in March of 1895. He then went to Mr. Heath—that is his testimony—and asked him to give him a clearance, so he could get work on some other road. They tried to offer an excuse for this letter, saying it was only a leave of absence, and that he was not discharged, but he testified that Mr. Heath told him he was discharged, and he said it was the custom not to pay the men except on regular pay days, if they were still with the road, but that he got his pay as soon as he was let out, and at a time when it was not the regular pay day. This letter can have no possible excuse; it can not possibly be explained unless it was the understanding that he had to have it in order to get work, because he asked for a clearance so that he could get work on some other road. This is what they gave him. [Reads letter:]

CHICAGO AND NORTHWESTERN RAILWAY COMPANY,
MOTIVE POWER DEPARTMENT,
OFFICE OF THE MASTER MECHANIC, WISCONSIN DIVISION,
Chicago, April 26, 1895.

To whom it may concern:

It is to certify that the bearer, Andrew Stader, has worked for the C. & N. W. Co. since July, 1890, as a locomotive fireman. Mr. Stader has been laid off on account of depression in business causing reduction in force. He has permission to obtain work elsewhere, providing he can obtain a position that is satisfactory to himself, but in the event of not getting work elsewhere he can return to us for service when we have work for him. Any favors shown Mr. Stader will be appreciated.

Yours, truly,

JOHN HEATH, M. M.

(Page 284, Arena of March, 1899.)

He has permission "to obtain work elsewhere." They had discharged him and he was laid off on account of reduction in force by reason of slack business, and yet when he asked for a clearance they gave him permission to obtain work elsewhere. It seems to me that it is impossible to put any two constructions upon that language.

Q. (By Mr. CONGER.) Was he able to get work on that letter?—A. He tried one or two places, but they said they did not need any men, and he went down South; he had heard that they wanted men down in the Mississippi Valley. He went down there and spent one winter, and came back and went to work for the Northwestern Railway Company, and never had occasion to present it to any other road for employment—that is his testimony. He has, however, since obtained work from another road on that letter.

Q. Do you think these are simply exceptional cases?—A. You can appreciate the difficulty of getting hold of a letter on which a man has secured work; the moment he gives up the letter he loses his job.

Q. How many letters have you there; you have introduced some dozen, have you not?—A. Yes.

Q. How many railroad operatives were thrown out of employment during that strike?—A. About 30,000.

Q. Would you say 100 letters out of 30,000 who didn't get employment, or something like that?—A. Yes, I think more than that.

Q. How many?—A. There are over 500 sworn statements and letters corroborating them. But the fact is this Ketcham suit was commenced within a few days after the strike closed, and it warned them, so that Mr. Stewart and others said: "We will quit giving letters."

Q. There is one other thing: When did you put that advertisement in the paper?—A. In the fall, a year afterwards.

Q. After the strike?—A. Yes; they were largely scattered then.

Q. And in answer to such advertisements as that you could get 400 or 500 dissatisfied, discontented men in Chicago in any line of business, I presume?—A. If that were the situation I should have discovered it very quickly. I have made these general managers admit upon the stand that these men were first-class men; they admitted it, and could not give any reason for discharging them, or for not employing them. If you had heard the cross-examination of the general managers you could have seen that there was no excuse for these discharges, on the one hand, and for the refusal to employ by the roads, on the other. Then, another thing, railroad men are very chary about giving up such letters as these. They did not know but I might be an agent of the railroad companies trying to get these letters in order to prevent them from obtaining their rights; even to this day some of them appear to be suspicious of me. It has taken very great effort on my part to get them to have sufficient confidence in me to leave these letters with me. There are hundreds of others I could not get; I could not say how many. The men have told me of other and similar experiences, but on account of the reasons I have related I could not get them to have enough confidence in me to leave their letters with me. There are so many of them that I could not have given the matter the time to take statements from all of them.

Q. You say the railroad men are not now organized into unions?—A. No.

Q. Is there not a brotherhood of railroad trainmen?—A. Yes.

Q. And conductors, for instance?—A. The engineers are organized under Mr. Arthur, who adjusts their affairs with the railroads. They did not have much difficulty here, I understand.

Q. How about the conductors?—A. I think they belong to the Brotherhood of Railroad Trainmen; they did not do anything.

Q. Brakemen and firemen?—A. They have no organization that I know of now.

Q. (By Mr. KENNEDY.) There is a very strong organization of brakemen?—A. They belong to the organized trainmen.

Q. I mean independently, as brakemen?—A. I don't know as to that.

Q. (By Professor JOHNSON.) There are something like 30,000 railway conductors—the O. R. C.?—A. Yes, that is their organization; the Brotherhood of Railroad Trainmen takes in the trainmen, brakemen, etc. The switchmen have no organization.

Q. How long since?—A. I don't think they have ever had any since this strike. I was told by men to-day—switchmen—that a grievance committee had been appointed to go to headquarters and make a complaint, but they were afraid to go for fear of the blacklist. They were switchmen employed in the Chicago yards.

Q. What is the Junior Switchmen of American?—A. I don't know of the organization. It may be there is one, but I never happened to hear of it.

Q. (By Mr. KENNEDY.) There are departments of labor and transportation employees who are not tyrannized over so much as you describe certain classes to be—conductors and engineers, for instance.—A. Of course my experience has not extended to many of the engineers. I have among the letters that have come to me a few engineers, but not many.

Q. Members of the Brotherhood?—A. Yes. Their difficulties are adjusted by Mr. Arthur, and the railroads, from all I can learn, have so much confidence in Mr. Arthur's opinion on these questions that when he tells them a certain thing has to be done they practically do it; so I understand, although in many instances, I am told by engineers, they think that Mr. Arthur keeps them from getting their rights. He manages to be a sort of compromise between the railroads and the engineers. His influence has been very strong, and he has kept down trouble, in some ways, very ingeniously.

Q. Do you think they have in the organization as many as 80 per cent of the engineers?—A. I don't know as to that. My knowledge as to that is very limited.

Q. (By Professor JOHNSON.) What class of employees have you been dealing with?—A. Switchmen and freight conductors, passenger conductors, and brakemen.

Q. (By Representative OTJEN.) Do they include any firemen?—A. Some firemen; not many; more switchmen, brakemen, and freight conductors; a few passenger men, and a limited number of switchmen. If a person is at all familiar with the situation in Chicago he must realize that the duty of a switchman is one of the most difficult and hazardous of all the branches of railroad employment. If you were acquainted with the complicated system of switches on the railroad tracks in the city of Chicago you would see how impossible it is for a man who is not skilled to do that work and do it well.

Q. (By Professor JOHNSON.) Are the firemen who have come to you members of the Brotherhood of Locomotive Firemen?—A. I don't know.

Q. (By Mr. C. J. HARRIS.) Do you consider it tyranny for a man or a corporation to require a man asking for employment to give some sort of a statement in recommendation of himself before being employed?—A. Not if it is done in good faith and for the purpose of gaining information as to a man's skill and ability.

Q. Would you hire an employee of any sort unless you knew something about him, either by letter or inquiry, beforehand?—A. That is the contention of the railroads in this fight, and our reply to that is this—that they don't ask this in good faith; and when men have presented good records, showing their qualifications, skill, and sobriety, and that they have every good quality an employer should ask in giving a man employment, and exhibited their inclination to go to work, they still deny him employment because they have combined and agreed that they will terrorize and punish these men for the purpose of preventing future strikes. If they asked it in good faith, and refused employment from a good cause, such as carelessness or drunkenness, or anything that would affect the qualifications of a railroad man, that is perfectly justifiable.

Q. If a man's recommendation or testimonial of character shows that he suddenly quit without warning or notice, and left his employer and his interests without any grievance of his own, but simply on account of sympathy with some outside party, perhaps in the Philippines, we will say, is not that—— —A. There are inside parties now, are there not?

Q. Is there not a certain amount of consideration to be given such a custom on the part of the railroads?—A. The evil complained of is this: By the power of combination, which is so vast, they are able to deprive men of the means of livelihood. You and I and every citizen are interested in having men earn a living at the trades with which they are familiar; and they have the right to work at those trades. If that right is taken from them they become paupers or criminals and fill our almshouses or our penitentiaries. It is for the welfare of the State that men should find work, if they know how to work in any special branch of business, and that they should not be deprived of that work by any power or combination. Every man should have an equal opportunity to get employment at his trade with every other man, without being forestalled by a great combination which prevents him from getting work. As I said before, that is the evil complained of. Speaking of these questions you have put to me, I would say that private considerations must step aside in the government of the people for the public welfare. I don't want to make criminals of these men and half the other men in the country. If all the men in this country who have made a mistake once in their lives were to be starved to death because of that mistake, then the most of us would be skeletons. The motive that prompted these men to strike was a most unselfish and honorable motive; it was no selfish motive; it was done to help their fellow-men. If, for actions prompted purely by sympathy for those who were downtrodden and starving to such an extent that 1,600 families were dependent upon charity within 10 days from the commencement of the strike, men are to be deprived of the right and opportunity of earning their livelihood and the livelihood of their famished families, it is time we had a new charter of liberty in this country, I think.

Q. I don't see that you have answered my question. I asked you when you hired employees if you did not either demand letters, or, by personal investigation, satisfy yourself that they had a reasonably good record.—A. I think that is perfectly proper if a man does it in his individual capacity, in good faith, and for the purpose of ascertaining whether a man has the qualifications for the job he applies for.

Q. (By Representative LORIMER.) And not in conspiracy with anyone else?—A. Not in conspiracy with somebody else and for the purpose of impoverishing him. But if it is done in pursuance of a conspiracy, not in good faith for the purpose of ascertaining a man's qualifications, but for the purpose of punishing him and setting him up as an example so that others may be terrorized, then it becomes unlawful and against public policy.

Q. (By Mr. C. J. HARRIS.) Suppose the recommendation has a serious flaw in it, such as having left his employer without any notice, or carelessness, or intemperance?—A. If you will confine it to any one of those I will answer it. If he is careless or intemperate I should say he should be excluded from employment.

Q. Suppose his record shows either one or all of these facts. It is not a conspiracy if he goes to the other men in this room and fails to find employment from them. That is the fault of his record, is it not?—A. That depends. If a man is a drunken or a careless employee the public welfare again comes in and demands that he shall be excluded. Lives and property are in danger every time we get on a train, and we have a right to know that careful and safe men are employed on the railroads. Whenever a man is denied employment by reason of such a thing

affecting his qualifications I think the denial is proper. But I have no sympathy with these sentiments, covertly expressed by you and directly expressed by the railroads, that because they were not loyal in time of need they should be forever barred from work. I have not reached the position where I believe the railroads have the right of coercing the citizens or of attempting to subjugate them. I believe the railroads are the servants of the American people; that they are given these franchises for the purpose of serving us, and when they attempt to exercise the right of governing us the people have a right to say something about what these public servants shall do and what methods they shall adopt in regard to the employment of men. I will answer something further in your question which is in my mind before I forget it. A man is not under a contract to stay a moment under the form of employment. He can leave any day. They exercise the right of discharging men without any notice whatever. Your question conveys the idea that if a man exercises a similar right he is blameworthy; that if these men quit without a moment's notice it is wrong. They are simply, in so doing, exercising a right which the railroads exercise in discharging them, and they think they have the same right that the railroads exercise. That a man leaves a railroad without giving notice does not in any way affect his qualifications as a railroad man. I think it is not only wrong, but iniquitous. It is destructive of the very principles upon which this Government is founded to require men to observe regulations not observed by the roads themselves and to conspire against them. The evil complained of could not be accomplished by individual action; it can only be effected by a combination of all, and by the power of combination they are enabled to crush the individual, who has the right of an equal contest with his fellow-men instead of being confronted by the greatest combination of brains and capital that the world ever saw.

Q. Did I understand you to say the public traveler is concerned in the question whether a man is intemperate or careless or not?—A. Yes.

Q. And that it is not concerned in these strikes?—A. I did not make any such statement; I did not intend to convey that idea.

Q. Suppose a person was passing through Chicago, as I was at that time, as passenger through to the West, and that his car was attacked by mobs with missiles, and there were burning cars all along the line. Is not that a matter he would be as vitally interested in as in a matter of intemperance?—A. Undoubtedly the public are interested in having public travel unimpeded; but when it comes to a question of depriving 1,000,000 men in this country of their liberty or being inconvenienced one should not be weighed against the other.

Q. One more question I want to ask. Out of the 30,000 men who struck here I understand from your testimony that a very great number are working and have been since?—A. A great many have been taken back to work since the suits were commenced and they saw what damages they were liable to for not employing them. In fact, they are trying their best to get witnesses to go to work and give up their cases. In many instances they come to them and ask them to go back to work, and these men have come to me and said that their families were in such distress that they had to go back to work. I have allowed them to dismiss their cases and go back to work.

Q. (By Mr. KENNEDY.) Is it not probable that the railroad companies could not find enough employees to do their work without employing some of that large number of strikers?—A. They had to take them in order to teach the new hands.

Q. And while there may have been a small number of cases like this, they were sufficient to teach these men who were given employment their business with the railroad company?—A. Further than that, the railroad men who were taken back were taken back by the very roads they quit. There is another consideration. On July 10 a notice was sent out that if they did not go back to work their places would be made vacant, and a large number went back and were reemployed. Nobody claims that a man is blacklisted because the road by which he was employed before the strike did not hire him back. The Northwestern striker does not complain because the Northwestern does not hire him, but because other roads do not hire him for the reason that the Northwestern line will not give its approval. They do not complain of their former employers, they lost their rank and were willing to commence as new men, or even as extra men, but they were denied that privilege and have lost their homes. I have the names of 12 who have been driven insane; about 20 who have been separated from their wives and families and have been made tramps; some have contracted consumption; several have frozen their feet in hunting for work. It is a harrowing tale. That such punishment should be meted out by the railroads, owing to the power of combination, should not be possible in a country that pretends to be free.

Q. (By Mr. CONGER.) I think you started to give us your conclusions.—A. My

conclusion is, and I have not a particle of doubt, that the railroad managers have determined that they will forever prevent strikes. As a means to prevent them they have adopted this method of terrorizing, and after the men are subjugated a little more they can cut wages, they can add additional hours, and the men will not dare to resist, because they have the picture of the sufferings of those men who struck once before; and in future years the million of railway employees will become obsequious serfs.

Wendell Phillips portrayed it years ago. Referring to the evils in New England manufactories, he predicted that a new slavery, far worse than that of the negro in its effects, would be developed. It is a system of encroaching on their franchises, and this is a sample of it. If it is not stopped on the railroads it will spread to others, and it threatens the liberty of the toilers of this country.

Q. We come now to the remedy.—A. I have some very radical ideas on that question. I think there is but one real remedy. There are palliatives, like the bill which Mr. Lorimer introduced in Congress. I think his bill does not cover it. I believe I wrote Mr. Lorimer, and he did not honor me with a reply. That bill was submitted to me by Mr. Michael Driscoll, who was connected with the anti-blacklisting association, and I wrote Mr. Lorimer a letter on February 8, as follows:

"Your letter of February 5, to Michael Driscoll, containing draft of your blacklisting bill, has been handed me for criticism, with the request that I write to you. After a careful examination of its provisions I am satisfied that the bill as drawn is not as good as the present common law. The exceptions in lines 13, 14, and 15 give the roads a loophole to escape punishment in every case, as it is very easy to trump up some charge of doing an unlawful act on the part of the striker. Besides, it is wrong in principle, as a man ought to be punished according to law for any unlawful act he may do and not be starved to death as a punishment, and this bill gives the railroads power to starve him, if a striker, by claiming he has done something unlawful. A bill, to do any good, should also contain a provision defining what shall be received as evidence to prove the conspiracy. I could draw such a bill, but do not desire to force my views on anyone, and I should not have written you this letter had I not been requested to do so. The railroad companies could not, in my judgment, ask any greater favor than to have this bill passed in its present shape. With all due respect, I am, very truly yours,—Wm. J. Strong."

I think that bill is entirely inadequate, and I do not think it covers the question in any way, to a practical lawyer who has tried one of the cases. It gives jurisdiction to the United States courts.

In my opinion, and I have given a good deal of study, and honest study, to it, I think there is but one remedy, only one way to settle this contest between labor and capital regarding public transportation. The only way in which that contest can be settled is for the Government to take control of the railroads and put the men on a civil-service list. Under civil-service rules we shall have independent, self-respecting citizens.

Other remedies may be suggested, but the delays in courts and the corrupting of juries—which the railroads undoubtedly do, and have the machinery for doing; it is impossible to detect it—will wear these men out in their contest to secure their rights.

Q. (By Representative LORIMER.) In the absence of Government ownership have you any remedy?—A. Make it a felony, prescribing what evidence shall be necessary to prove it, and give the United States court jurisdiction; or a board of some kind.

Q. (By Mr. KENNEDY.) Meaning the Interstate Commerce Commission, as is proposed to be done? Have you any suggestion?—A. I have not considered that proposition at all. It ought to be made a felony, and the general managers or any officers who were indicted in such a combination as that ought to be sent to the penitentiary. I do not believe any remedy will stop these men short of physical violence or incarceration. I think they are men who are so heartless and lost to the duties of citizenship that they do not care for anything short of personal violence or incarceration.

Q. (By Representative LORIMER.) What is your general opinion as to the number of men who were blacklisted in Chicago; was it half or two-thirds of the men?—A. Fully half of the men who went out here. Some of them have since been taken back to work through fear of these prosecutions. It has been very expensive to the railroads to defend these suits, and the necessities of getting skilled men has forced them to take them back. The president of the Nickel Plate, formerly superintendent of the L. S. & M. S., Mr. W. H. Canniff, testified that some of the men who went out in the strike were among the best railroad men in the United States; he admitted it on cross-examination. The evidence is

clear, from all of the letters I have introduced in evidence, that there was not one of these men who have commenced suit here but had the best of qualifications, habits, and everything else. I took pains to see to that before bringing the suits. There was no excuse except that some of them were committeemen or vice-presidents of a union, and, of course, if they can hit the heads of the union they can destroy the union, because the union can not act without officers.

Q. (By Mr. CONGER.) You say the bringing of suit caused the taking back of quite a number of employees?—A. I know it has; any number of cases.

Q. Has it not had an influence in deterring them from continuing the operation of this blacklist?—A. I have evidence up to within 3 months that a blacklist is still in force for the most trivial offenses—until within 3 or 4 months of this time.

Q. Do you think this system extends all over the country?—A. The evidence shows that it extends to all the principal railroads in the United States. There are some minor lines that have not adopted it, but very few. What they call "jerk-water" roads will hire almost anybody. All the principal lines in the United States adopted this.

Q. And have it in practice to-day?—A. Yes; and even down into Mexico.

Q. (By Representative LORIMER.) Have you known of employees discharged for the same reasons that these men were discharged for, finding employment after the strike under an assumed name and continuing?—A. Yes; and a very striking instance is the case of Mr. Frank A. Dryer, who testified in this Ketcham case, that he was discharged from five or six railroads, although his services were said to have been satisfactory to them, because he did not have a clearance. He finally went to his brother-in-law, a man named W. G. Cherry, who lives on the West Side. Cherry had formerly been a railroad man and quit the railroad business in 1893. He asked Cherry for his letters which he had obtained from the railroads he had worked for, and he applied to the Erie Railroad under that assumed name, the name of W. G. Cherry, and got a position at once, and had no difficulty in retaining the position until the day he testified in the Ketcham case. Immediately after his testifying in the Ketcham case—I did not bring this fact out, that he did not give his own full name. He got off the stand and got nearly out of the court room, when he was stopped by the attorney for the railroad and asked whether he was working for a railroad company now. I had taken him in his direct testimony up to January 6, 1896. I protested against his being compelled to answer the question now, and urged the attorney to withdraw the question. The court compelled him to answer the question, and he testified that he got discouraged trying to find work under his own name, and borrowed the letters of his brother-in-law, and was working for the Erie road under that name. He was discharged immediately after that, under the pretext that his work was unsatisfactory.

I interviewed Mr. Coe the very next day; he is the general superintendent of the Erie. I asked him if he did not think it remarkable that they had discovered his incompetency at just that time; how he thought that would look to a jury; did he think it would be considered genuine or due to this disclosure? He admitted it would look pretty bad, but said that this man really had been negligent. I said, "I have come here to tell you that if you do not reinstate that man I shall have to make an example of him; this is so outrageous that I shall commence suit against your road for \$100,000, and shall prosecute that case in preference to any other case on my calendar." He called me up by telephone shortly afterwards, and I met the general manager and Mr. Coe at the general counsel's office, and we had a very pleasant interview. He asked me if I did not think my threat was very violent, and if I would not agree to pass the case I had against their road if they put him back to work. I said, "I have only one case against your road, and I will pass that case, and not make you the trouble of trying it until I get these other cases through." They put him back to work the next day and he is working now. Under that agreement I passed the case I had against them until I got through with the others. I have never told about this before.

Q. (By Mr. KENNEDY.) Mr. Cherry is likely to lose his position, now, after your telling the whole story?—A. I do not know; I will tell it and take my chances. I will say further, I know of probably 60 others who are working or have worked under assumed names. I can recall one, Mr. H. F. Elliott; another, Joseph O'Day; and another, Desenfants. I know probably 50 or 60 of them; a large number.

Q. (By Representative LORIMER.) It was a similar case that caused me to introduce the blacklist law. A man and his family came down from Minneapolis and lived in the street just back of where I live. My wife found, after a while, that they were in destitute circumstances, and she investigated and found that he had been employed by the railroad company and they had discharged him. They

came to the house, back and forward, and the people in the neighborhood all helped the family, and finally he said to my wife, "I have a proposition made to me by a very firm friend who is a railroad man, to change my name, and he will get employment for me, and," he said, "I do not know whether to do it or not." My wife talked to me about it, and I told her that in order to keep his family from starvation—it was apparent they would starve unless the community took hold of it—he had better change his name and get his job; and he did, and got the job and had it all winter.—A. That is true. I do not think that system of blacklisting was instituted for the purpose of punishing the men in the A. R. U. strike especially, but as a warning to strikers; that the officials made up their minds that these strikes had assumed such proportions that they must make an example of these men. They employed as many new men as they could, and used them one against another. They tried to make the punishment of these men so severe that the men in their employ would not dare to strike. It is to prevent strikes and to subjugate their men that this system is adopted.

Q. (By Professor JOHNSON.) Why is it that the large brotherhoods do not proceed vigorously against this blacklisting?—A. They are afraid to; they are even afraid to subscribe money to assist in the prosecution, and do not dare to do it for people who have applied to them, because they think they are spotters and will give them away to the railroads.

Q. (By Mr. CONGER.) Do you care to say who has borne the expense of these prosecutions?—A. It has been raised by different labor unions subscribing different amounts for writing up testimony, and most were brought without costs, and I have borne my own expenses. I have not even had enough to pay for writing up the testimony; it has cost me 2 or 3 hundred dollars.

Q. You brought Mr. Ketcham's suit on a contingent fee?—A. They are all brought on a contingent fee.

I have said to the railroads that if they would stop this I should be very glad to dismiss these cases and leave it to any man to say what fee I should have and settle all for less than it would cost them to fight the cases, and I have done everything I could. They say, practically, that they can not admit the thing exists, although in the supreme court of this State the attorneys claim they have the right to do just this thing; that they had a right to absolutely preclude any man who struck from getting work without the consent of his last employer. They say they are justified in not hiring at all, consent or no consent. They take the position that whenever a man strikes they have a right to combine to prevent him getting work, because he is not loyal. To my mind that is an assertion of sovereignty; that they shall be the judge, and nobody has a right to interfere. It is an assumption of power that I think no corporation should have in this country. They admit the men have a right to quit, and are not violating any contract or any law when they do quit.

Testimony closed.

CHICAGO, ILL., November 22, 1899.

TESTIMONY OF MR. F. J. O'ROURKE,

Switchman, Chicago, Ill.

The subcommission on transportation being in session on the afternoon of November 22, 1899, Representative Lorimer presiding, Mr. F. J. O'Rourke, being duly sworn, testified as follows:

Q. (By Representative LORIMER.) Please state your name.—A. F. J. O'Rourke.

Q. And your post-office address.—A. 5254 South Halstead street, Chicago.

Q. What is your business?—A. Switchman.

Q. (By Mr. KENNEDY.) Are you working as a switchman at the present time?—A. Not for the past 60 days.

Q. Will you give the name of your union?—A. Switchmen's Union of North America, No. 36.

Q. What is the membership of that lodge?—A. It is possibly 65, but I will not state positively; somewhere between 65 and 70.

Q. Have you several other local unions in Chicago?—A. Yes; 3 or 4 besides ours.

Q. (By Mr. C. J. HARRIS.) How long have you been railroading?—A. In train service since 1877, and served as an apprentice in the machine shop before that.

Q. (By Mr. CONGER.) State your experience in railroading, if you will.—A. I think the situation between the employee and employer in railroad service at the present time is this: There are 1,000,000 men engaged in operating 186,000 miles of American railroad, in which is invested one-fifth of all the invested capital in the United States. That great number should justify any one of these men in speak-

ing upon subjects which concern their general welfare. We have had notice that an investigation is being made before the Industrial Commission. As we have been able to get at it through the press, very little attention has been given to the effect of rate raising or rate reduction upon the employees. I am thoroughly convinced from my point of observation and experience in railway service that it would be for the happier existence of railroad labor if a closer association between the employer and employee could be had, and a more complete organized union among railroad men. I am firmly convinced that all the forces which are calculated to separate them and cause antagonism between them, and hostile feelings, are wrong, and I believe those who in every way encourage it are the foes of labor. The railroad presents itself to me as being an honorable business, and should have encouragement in the means of transportation; but rate wars and rate reductions, which our present system of laws seems to encourage, place these mighty forces in opposition to each other, and consequently bring about a great deal of profitless service. I am satisfied that where labor is engaged in profitless service it diminishes the earning power of the employee. I believe that each day's labor must result in profits to the laborer and to his employer or destruction will overcome the purchaser of labor. I see our great lines paralleling each other, and employees performing service for much less than it is worth. We have some of the weak lines accepting business at figures that they can not possibly afford if they pay their employees living wages. I find big lines that prefer to move the crops from different localities at a loss rather than allow their equipment to remain idle, thus putting into effect a system under which labor is compelled to perform a profitless service; and organized labor has always been opposed to the performance of profitless service. I am free in the belief that there is a community of interest between the employer and employee, and that there should be a community of feeling. I don't know that I have any suggestions to make as to remedial legislation, but I am well satisfied of the fact in the present disorganized condition in tariff and rate wars that the earning capacity of my class of people is threatened, and if there is lacking community of feeling it is from causes which have no rightful existence.

Q. (By Representative LORIMER.) What is the remedy?—A. Men of my class are not capable of suggesting a remedy, I believe. While my associates and myself do not agree in these matters on all points, yet they have agreed with me on this one point: That railway organized labor, which is now stronger than it was ever before known to be in the history of the unions, can not possibly withhold from their employers that which they ask for themselves—the right to organize for the purpose of protecting earnings. In all rate wars, wherein lines parallel each other, they move freight at a loss, and labor is caused to be an unwilling participant in these wars. Whatever legislation would have a tendency to put a stop to irregular rates or would have a tendency to strengthen the earning power and capacity of the company would be beneficial to the man who works for it; that is the way we all feel.

Q. (By Mr. CONGER.) Is it your experience and observation that the stronger railway corporations are the better wages they pay. In other words, that the stronger ones pay better wages than the weaker?—A. The most prosperous corporation is the most agreeable one and most profitable one to work for.

Q. Your idea, then, is, if the railroads were willing to cooperate, that if pooling were legalized to the end that the roads might earn more money, organized labor would be able to secure better pay for the employees?—A. The stability of rates is essential to the general welfare of the community at large, and is of great importance to the men who perform the services.

Q. (By Professor JOHNSON.) Do you know how many local unions there are among the switchmen?—A. 158.

Q. Do you know what the membership of the Switchmen's Union is?—A. I could only give it from an impression, although I have good reason to believe that, as a lodge, we have about 7,000 members.

Q. Has the union been growing during the past 5 years?—A. Wonderfully.

Q. You reorganized in 1894 after the strike?—A. Yes; and we retained men who are connected with us now; we retained the old membership to a large extent—the old association—and have kept it alive.

Q. So it was kept in existence?—A. Yes.

Q. You have indigent relief—indigence insurance features have you?—A. Yes; that is one of the prime objects of the organization.

Q. I suppose the Switchmen's Union of America generally, as a union, has the insurance feature?—A. We have arranged with an insurance company outside of our organization, and they do all of our insurance business; have all of our members in their insurance.

Q. You differ from other railroad organizations in this respect?—A. Yes; we have completed an organization which we hope will be prosperous and not perish.

Q. When did you make this arrangement with the outside insurance company?—A. It has been completed now about 3 months.

Q. What company is that?—A. The Imperial Mystic Legion is the name of it; it is an insurance company doing business under the laws of the State of Nebraska.

Q. Is it something that has been in business for some time?—A. I am led to believe so.

Q. It is not a part of your union?—A. No.

Q. You have local relief in your local unions, have you not?—A. Yes; sick benefits.

Q. Is that in accordance with a regular system, or does it differ in different local unions?—A. The local union itself arranges that according to its own ideas.

Q. A man who is sick receives from the local union a definite, stipulated amount?—A. Yes; in case of death or injury we pay a stipulated sum.

Q. When was your last annual report?—A. Our last annual report was about— I can not give you the date, but it was some time in last May.

Q. You can get a copy of it for us, I suppose?—A. Write to J. E. Tipton, of Kansas City, Mo.

Q. (By Mr. C. J. HARRIS.) You say that the organization of railway employees is as great now as it ever was in the history of railroads; I understood you to make that statement?—A. I did; yes.

Q. (By Mr. CONGER.) Do you think as large a proportion of the employees of the railroads who live in Chicago are organized now as were organized previous to the strike here in 1894?—A. Not in these local unions; no; I don't.

Q. You are speaking, then, of the whole country?—A. I am speaking of the United States at large.

Q. (By Professor JOHNSON.) Would you count in the American Railway Union as one of the organizations?—A. I am taking them into consideration when I speak; yes.

Q. When they were in existence there were more men in railway unions than there are since they are disrupted, were there not?—A. You may be in possession of statistics and I am not; but my idea is that we have to-day more men in active service, that are members of the various unions, than there ever were before. You must remember, if you will permit me, that I should feel safe in saying that one-third of the members of the American Railway Union at that time were not in active service when they were members; it was not necessary to be in active service to be a member of that union, so that a great many of the members of that union were not in active service.

Q. (By Representative LORIMER.) What was the reason for their inactivity; why were the members not in service?—A. Scarcity of opportunity; slack business. You must remember that in the last of 1893 and the first of 1894 there was great business depression, and very little business was done.

Q. (By Professor JOHNSON.) Do you include shop men in your list; do you have all the railway service?—A. I do.

Q. They constitute a considerable per cent of the membership of the American Railway Union, don't they?—A. I think so; especially here in this immediate locality.

Q. (By Mr. CONGER.) You say you are a member of the Switchmen's Union now?—A. Yes.

Q. But you are not employed in railroading?—A. Not at the present time; no.

Q. How long since you have been?—A. Two months.

Q. What is your present business?—A. I am in business for myself.

Q. Merchandising?—A. Manufacturing.

Q. And what were you engaged in previous to 2 months ago?—A. Switchman.

Q. How long have you been engaged as a switchman?—A. I have never really been out of the business or service in the transportation department in some capacity for, say, 20 years; that is, sometimes as conductor, as brakeman, sometimes as switchman and yardmaster, yard clerk; whatever I found I could do.

Q. Were you employed in railroading at the time of the strike here?—A. No; I was sick in bed.

Q. You don't know from experience anything about this matter of blacklisting upon which we have just taken some testimony?—A. I have never felt its effects.

Q. Do you know of your own knowledge that such a system was in existence or operation?—A. I don't know that I use the word "blacklisting" as you people do. I really don't know; I know there is in effect a very well-perfected system of looking up a man's record and his character before he will be employed; whether that is blacklisting or not, it is true there is a dispute in different minds.

Q. (By Representative LORIMER.) What would you term blacklisting; what is your definition of the word "blacklist"?—A. The way I have always looked at the word "blacklist" with the railroads has been that if a man's name had been published with the different railroad lines, and he was looked upon as an objectionable character and a man they did not wish to employ. I should consider that a blacklist. A man who has his record with some other railroad showing that he has not been kept by a certain line and showing that they don't consider him worthy of employment, is blacklisted.

Q. If the information came to them otherwise than on a published list, came to them in any way, that he had been employed by a corporation and they wished no other incorporation to employ him, should you consider that a blacklist?—A. Yes; when I said published, I meant the circulation or distribution of his name.

Q. In any way?—A. Yes; that is what I meant; I didn't mean as published in the shops, anything of that kind; I meant general distribution and circulation. I should consider that blacklisting.

Q. Do you think there is such a system of blacklisting in vogue now by the railroads?—A. Yes.

Q. As this plan outlined?—A. Yes. I am satisfied of that.

Q. Do you think it is a serious complaint? Do you think it works against the laboring man?—A. No; I don't.

Q. (By Professor JOHNSON.) Why not? What is the reason for your answer?—A. I believe our present system for securing employment has a tendency to place a premium on good character and good conduct and good service, and has a tendency to shut out the fellow who is not worthy of employment.

Q. (By Mr. CONGER.) Don't you think it opens the door for railroad officials who might have a grievance against a man to shut him out of employment on any other road?—A. In that case it undoubtedly would.

Q. In that way it would be an evil system, would it not?—A. In an individual case it might. I am talking now of the general army of railroad employees in the United States. I know the situation here in Chicago has been more disagreeable than exists in any other portion of the United States.

Q. Do you think the majority of the railroad employees take the same view of the system that you do? Do you know whether a great majority do or do not condemn it?—A. That I could not say. Those among my surrounding associates, I feel sure, fully agree with the statement that I have made to you.

Q. (By Representative LORIMER.) If the union you belong to had a grievance against any railroad company and for any reason went out on a strike, and you went out in the strike with your fellow-workmen, do you believe that the railroad company that employed you would have a right to send notices to other railroad companies that you ought not to be employed because you went out on the strike? Would you believe that meritorious as a policy?—A. I have undoubtedly failed to make my statement clear; I am one of those who hope that the time has come when there will be no such thing as a strike. The men we associate with are applying for industrial peace. We believe that there is a means by which these disturbances can be avoided. I believe that in all the difficulties that take place between employers and employees, some one has to bear the expense, and in ninety-nine cases out of a hundred labor has been the one that has stood the brunt.

Q. Have you any well-developed scheme to prevent strikes?—A. I have in my own way; yes.

Q. How would you prevent them?—A. Closer association, better understanding, more harmonious dealings between employer and employee.

Q. But that is general; you have nothing specific?—A. No.

Q. (By Professor JOHNSON.) I should like to ask you whether you and other men who were not connected with the great strike of 1894 are rather more than willing that the employees who were then engaged should be kept out of the railway labor market?—A. I am free to say to you that it stands according to my mind that in the growth of the organized railway labor to-day no shelter is being given to the agitator; just to what extent the organizations may be moved along that line I don't know, and I don't care, particularly.

Q. It is a fact, is it not, that by shutting out a considerable number of men who are qualified for service the rest of the men have a chance for a better labor market; they don't have so much competition?—A. I can assure you this much, that the Switchmen's Union of North America are to-day demanding that the men in making application for membership must show as good a character as any railway company has ever asked of any man.

Q. Perhaps I don't make my question clear: I want to know whether you men who were not in the strike don't think you can get better wages by shutting out

from employment those who were in the strike?—A. I don't think that question has ever been given out among the organized railway employees; I don't think it has; I have never heard of it.

Q. (By Representative LORIMER.) When a switchman submits his application for membership to your union, and you find out that he was in the strike of 1894, is he excluded from membership?—A. Well, in the majority of cases he is; but I would like to qualify that statement further by saying that we have no place in our organization for what is termed a professional agitator.

Q. (By Mr. CONGER.) Do you class every man who took part in that strike as an agitator?—A. I don't; no.

Q. But yet you do say that in the majority of cases where applications come from men who were engaged in that strike they are refused admission to your union?—A. If they were engaged, yes; but I want to qualify my statement: If they can prove to our satisfaction that they are not fomenters of strife or trouble or difficulties, and did not help to lead their coworkers into that difficulty at that time, in a majority of cases we admit them into our union.

Q. (By Representative LORIMER.) Is that a condition of the majority of the switchmen of this country, that they are agitators or fomenters of strikes?—A. No.

Q. (By Mr. CONGER.) Do your local unions all over the country follow this same rule?—A. As to that I could not say; I don't know what they do; it is what we do here in Chicago.

Q. (By Mr. KENNEDY.) Don't people who denounce organized labor look upon every one connected with it as a professional agitator in the way you speak about?—A. A great many look upon them in a false light, but we are trying to overcome that.

Q. Do you believe there were 100 persons connected with that strike in 1894 who were what you would call professional agitators?—A. I don't know; there may have been that number.

Q. You don't believe there were any more than that, do you?—A. No.

Q. Didn't more than 90 per cent of the switchmen of Chicago go out in the strike at that time?—A. I think I should be safe in saying that there were fully that many.

Q. What per cent of the men who were in that strike of 1894 are members of your union now?—A. A great number. The exact percentage I can not give you; but a great number of the switchmen who were identified with the 1894 strike in Chicago are at work in Chicago, and they are members of the organization, and they are men who are not classified as agitators.

Q. (By Representative LORIMER.) About what per cent of them?—A. I think two-thirds of them are at work.

Q. Two-thirds of the men who are working now, employed as switchmen, are members of the switchmen's organization in Chicago?—A. No, I don't understand that by your question at all; I understood by your question that you asked how many men who were in the trouble of 1894 at the present time are switchmen.

Q. Members of your organization then?—A. That I can not tell you just now.

Q. (By Mr. C. J. HARRIS.) The switchmen here, or members of your organization, or local lodges in Chicago, only organized a few months ago you say?—A. Yes.

Q. (By Mr. KENNEDY.) Do you believe the officers or members of the A. R. U. are professional agitators?—A. A great number of them.

Q. A great number?—A. Yes; especially here in Chicago.

Q. Would you say all of them?—A. No, I would not.

Q. (By Professor JOHNSON.) Were any of your local unions participants in the strike of 1894?—A. Do you mean the local lodge of switchmen in Chicago?

Q. You say you have about 65 members in your lodge; were any of these among the strikers in 1894?—A. Yes, quite a number of them.

Q. They were not debarred from membership?—A. No.

Q. Why not?—A. Because they are decent, respectable fellows.

Q. (By Representative LORIMER.) What per cent of your present lodge were among the strikers in 1894?—A. I could only answer that in the way of general belief; it would be stated on the books, but I have never made an active investigation of the matter. As I have it from those I am personally acquainted with, I judge, say one-fourth of them.

Q. (By Mr. CONGER.) And three-fourths were not?—A. Whether it amounts to more or not, I don't know; I have not investigated the case.

Q. (By Mr. KENNEDY.) What line is your lodge on; are you on any particular line, or on several lines?—A. No; we have members from different railroads.

Q. And you say you have about 60 in your lodge, and there are four or five others that you don't know the membership of—other lodges as large as yours?—A. I understand they are doing very nicely; yes.

Q. What would you say is the entire number?—A. I could not give you any idea; I know they have no heavy lodges.

Q. The others are as good as yours?—A. I do not know that; I could not say.

Q. What per cent of the switchmen in Chicago organized with your local unions here?—A. I don't believe we have a quarter of them.

Q. Are the others unorganized?—A. I know many of them are members of other organizations. A great many are members of the conductors' organizations and a great many are members of the trainmen's organizations.

Q. While they are switchmen?—A. Yes; members of the conductors' organization who did not have employment, and who came to Chicago and got employment in the yards as switchmen.

Q. Do you know how many switchmen there are in Chicago, approximately?—A. I never figured out; never asked; I judge between 900 and 1,000.

Q. And if there are five local unions, and if each had a membership of 65, you would have, approximately, 325 in the switchmen's unions, as against between 900 and 1,000 in employment in that line of work?—A. Yes.

Q. (By Mr. CONGER.) What is the attitude of the railroads toward your unions at the present time?—A. So far as I have discovered it is very friendly.

Q. Has your union or any of the local unions, so far as you know, gone to the railroad officials with grievances?—A. No; we have had no grievances up to this time.

Q. Have you had occasion to ask for better wages or better conditions, or anything of that sort?—A. Here, in the city of Chicago?

Q. Yes.—A. No.

Q. Are the wages entirely satisfactory?—A. They are.

Q. (By Mr. KENNEDY.) What are the wages?—A. They are 25 cents an hour for what they call plain switching during the day and for helping, and 27 cents at night.

Q. (By Mr. C. J. HARRIS.) That would be about what per day?—A. A great many railroads are working their men 12 hours, and some 11, and some as low as 10, and some work 15 and 16.

Q. (By Mr. KENNEDY.) Don't you think, if you take into consideration the great railroad system here in and about the city and approaching the city, that you have put the number of switchmen here rather low when you say 1,000?—A. Well, when I stated that I said I really didn't know; never had given it very much attention, and never had figured it out. I am just making an estimate as to what I judge it is.

Q. (By Representative LORIMER.) Has there been any complaint in Chicago among the railroad men for the past 5 years about wages?—A. Not that I have heard about; no.

Q. There has been no grievance as to wages since the A. R. U. strike, or for quite a while before, has there, in Chicago?—A. No; not that I know of.

Q. (By Mr. CONGER.) How do wages compare now with 2, or 3, or 4 years ago?—A. Same.

Q. No change either up or down?—A. No.

Q. (By Mr. KENNEDY.) Good times; ever any increase?—A. Gradual increase; yes; that is, a great many more men employed than there have been, and they are working more hours; that is the only increase. There are more men employed on the railroads now in America than has ever been known in the history of the railroad world; we have had good crops and have needed men and equipment to handle them.

Q. (By Mr. CONGER.) You testify that the switchmen work from 10 to 16 hours?—A. Yes.

Q. Did they work that number of hours 2, or 3, or 4 years ago?—A. If the business demanded it, they did; but business at that time did not demand it. Now the lines are more pushed with work.

Q. (By Mr. C. J. HARRIS.) Do your men prefer these long hours, or would they like to have a 10-hour limit?—A. Some prefer to go on with the long hours and make more, and others would rather have less and work only 10 or 11 hours, as it gives them more time to knock around for recreation.

Q. There is no complaint about the long hours?—A. No. If there was they might change to shorter runs.

Q. (By Representative LORIMER.) When a man makes application for admission to your union, if you find that he is an industrious and sober man, and if you also find that he was on the strike, do you refuse him admission to your organization?—A. According to my understanding, no.

Q. (By Mr. CONGER.) I understood you to testify a short time ago that men are frequently refused admission.—A. I mean men of good, honest character, men of

sobriety, and heads of families; they have a general interest in the welfare of the world at large and of the community, and are not agitators, and are not refused admittance.

Q. (By Representative LORIMER.) You said 50 per cent of those applying were refused, which would indicate that 50 per cent—A. (Witness.) I don't believe I made that statement, that 50 per cent of the men applying for membership were refused admission.

Q. Then you misunderstood my question.—A. I certainly did, then. If I made the statement that 50 per cent of the men who were engaged in the strike of 1894 were refused admission because they were agitators, then I did not understand the question.

Testimony closed.

CHICAGO, ILL., November 23, 1899.

TESTIMONY OF MR. GEORGE F. STONE,

Secretary of the Chicago Board of Trade.

The subcommission on transportation met at 11.20 a. m., November 23, 1899, in Chicago, Representative Lorimer presiding. Mr. George F. Stone was introduced as a witness, and, being duly sworn, testified concerning transportation as follows:

Q. (By Representative LORIMER.) Will you state your name in full?—A. George F. Stone.

Q. Your business and official connection?—A. Secretary of the Chicago Board of Trade.

Q. Will you, in your own way, present to the Commission what you have in mind?—A. I had in mind—it was suggested in some way, perhaps because it was a subject that I had thought of a little more than I had on a good many others—the subject of pooling. In order to save time, I have prepared a paper on the subject, which I thought would be more satisfactory than to depend on interrogatories and perhaps ill-considered replies to them. (Reading:)

Commerce consists in the exchange of commodities, generally of that which one has in superabundance for that which one needs or wishes and which is possessed by another in superabundance; or in the exchange of commodities for money, measured by the value placed upon such commodities by the possessor and agreed to as a proper valuation by the one who wishes to exchange his money for such commodities.

In either case, transportation is generally and almost without exception involved, and constitutes an important if not a preeminent factor in commerce. On the one side, transportation lines representing immense interests of a varied and important character are charged with the administration of a railway system in this country stretching, with numerous connecting lines, between the two oceans; and on the other side, an active, ambitious, and restless mercantile life, properly and legitimately sustained and promoted under the inspiration of an ambitious American citizenship.

The importance of the subject of transportation to the varied industries of the country can scarcely be exaggerated. The people of this country determined in 1887 by act of Congress that there must be a governmental supervision of railroads; that the enormous railway system of this country must not be wholly controlled by the railroads themselves; that so vast a system directly related to the welfare of the people—a people working under the inspiration of citizenship in this Republic for individual and general commercial progress and greatness—must not be absolutely dominated by those who are directly interested in its management. Wisely they thus determined, and the law stands to-day, though against it have been arrayed railroad denunciation and insidious efforts of lobbyists and legislators. It has had too often but a reluctant compliance with its mandates, and in many instances it has met with a studied and skillful evasion of its requirements.

The doctrine is unmistakably laid down that contracts, agreements, or combinations for the pooling of freights are opposed to the public welfare. In order that we may have a proper appreciation of this—one of the chief provisions of the interstate-commerce law—and of the magnitude of the evils which were sought to be removed and which led to the enactment of the pooling clause, let us look briefly at some of the conditions of transportation immediately preceding the enactment of the law.

There was great activity in railroad construction following the war, and many abuses consequent upon such activity led to the inauguration of what is known as the "Granger movement." The supporters of this movement rapidly acquired great influence, and controlled the legislatures of Illinois, Wisconsin, Iowa, and Minnesota.

Then arose in most threatening proportions an evil which became characteristic of that period, and became one of the most outrageous abuses of railway management. This movement was developed in the Eastern States. "It is doubtful whether any contrivance ever threatened to subvert long-established principles of the common law more completely than this." In a short time the baneful influences of this iniquity, extending over the whole country, exacted an enormous tribute from its commerce, exasperated merchants, exhausted their patience, and wellnigh paralyzed every form of industry. The proposition to establish pooling is not by any means new, and we are, therefore, not left in doubt as to its effects upon the business interests of the country.

The first prominent pool was the Chicago-Omaha which was formed in 1870 and was found in its operation immensely profitable to railroads, so that in the year 1887 practically all competitive traffic was pooled. During those years business suffered, localities and shippers were discriminated against, secret rebates to a greater extent than ever before or since were granted. Discrimination in favor of industries in which some of the parties to the pool were financially interested placed other industries under great and sometimes fatal disadvantages. One of the most mischievous and demoralizing pools that were established about this time was the Southwestern Railway Association, a vampire which for a decade sucked the lifeblood of the commerce of the Missouri Valley. The Southwestern Railway Association solved the problem of how to get rid of competition and to rob the people within the letter of the law. Kansas City built a line to the South and thought she had a line that could be used to fight this pool. It had not been in operation a year before this association with subsidies had it bound hand and foot. Another outlet to the East via Omaha and Council Bluffs was also shut up, leaving the Missouri River country absolutely at the mercy of the pooling lines.

Such instances might be multiplied, but sufficient is shown to indicate the nature of railway pools; they are in restraint of trade; they prevent competition; they are monopolistic in purpose and effect; they are odious in law; they are subversive of the very interests which railways were created to conserve, viz: the general welfare, in so far as that welfare relates to the functions and obligations of a common carrier.

The law itself was largely the result of such evils which grew out of pooling. These pooling arrangements, although ostensibly for the equalization of traffic compensation, for the encouragement of feeble lines, and opposed to any unfair and unjust proportion of remuneration received by great and controlling trunk lines, degenerated into a reckless and unscrupulous abandonment of the terms of such agreement, creating confusion, distrust, an unsettling of freight rates, antagonism, and a general warfare, resulting in disaster to many of the parties to the pools, as well as to business interests generally. It is now proposed not only to cease to forbid pooling, but actually to install it in the body of the law itself. This is a high-handed proposition, and attacks the very citadel of the law, contemplating practically its overthrow. It would infect the law with a ruinous infirmity.

The United States court of appeals, in condemnation of pooling contracts, says: "The contract removes every incentive to the company to offer the public proper facilities, for there is no inducement for a railroad to furnish good service or carry at reasonable rates, when it receives as much, or more, for poor service as it would for good service and an energetic struggle for business.

President Roberts of the Pennsylvania system, at one time testified: "That under the pool there is no incentive to improve equipment and service. We get our percentage anyway. The pool suppresses activity and development." It is only proper to say that I believe President Roberts has changed his views, but I quote them notwithstanding, as I believe them sound. I do not wish to misrepresent anyone.

The New York court of appeals, in deciding against a pool of canal boats, said: "Indeed, the consequence of such a state of things would be that freighters and passengers would be ill-served just in proportion that carriers would be well paid."

The Hon. Charles A. Prouty, of the Interstate Commerce Commission, says: "The common law declares a pooling contract illegal, as against public policy; and, while there is current both in and out of Congress a good deal of nonsense upon the subject of trusts and monopolies, it is pretty generally conceded that the monopoly of a necessity should be guarded against. In this regard, I think

it may be said that there are few, if any, combinations of capital which present a better opportunity for the abuse of combination than railway pooling." Again, "A transportation trust is the most dangerous of all trusts, because it absolutely dominates the situation."

It is claimed that the reduction in freight rates which has taken place during the last 25 years was accomplished by the railroads. The railroads never voluntarily reduced a rate. The forces of competition reduced rates and compelled railroads to conform to those trade conditions which all industries must recognize, if the common prosperity is to be secured and the turbulent and disintegrating effects of monopoly averted.

I warn you, gentlemen, against this concentration of power under the protection of the Government, by corporations organized for the common welfare, and I warn you in the name of the great valley of the Mississippi. The forces of competition can not be stayed; they are as irresistible as the procession of the seasons; they will break down every barrier erected in their path; they will destroy those who oppose their unhindered and beneficent sway; they will shatter all legislation that disputes their proper influence in fixing rates for the transportation of persons and property.

Competition! Under its inspiring and enlightening influence, a mighty force is imparted to human activity; it touches with its quickening power every industry and stimulates every energy of man; it arouses every capacity to increased skill and to higher and larger exercise; it studies and solves the problems presented by experience and education; it gives us products of finest quality at minimum cost; it increases luxuries and multiplies industrial facilities, reduces cost of travel and transportation, and places our products in the markets of the world without curtailing the requirements of civilized labor; it constructs a vast lake marine which astonishes the world; it spans great rivers or finds a safe and commodious way beneath their depths; it climbs the Rocky Mountains and binds together two great coasts in bonds of social and commercial life; it makes the lightning its messenger, and is in constant communication with every market throughout the world; it harnesses giant locomotives to cars freighted with commodities and drives them across the continent; it builds great steamers that plow the seas; it plants cities with warehouses, homes, schools, universities, and churches along the wonderful pathway of commerce from prairie to port. It everywhere presides over the manifold and magnificent forces of mercantile life.

When it is considered that there are more than 180,000 miles of railroad in the United States, 4,000 competitive points, 12,000,000 rates to be passed upon, and 300 pools to be supervised, no man can admit the practicability of the proposition to place pooling under the control of the commission in any sense that would protect the vast business interests of the country.

The business men of the United States are opposed to the proposition to create a vast railroad trust representing \$11,000,000,000, which is one-sixth of the national wealth—a trust extending into every portion of the country, dominating railroad rates and to a large extent controlling the railway highways of the country, which highways belong to the people, were built for the people, to carry on the business of the people; under the natural and unhindered operations of commerce, adapted to its wants, subject to its demands; those demands being created by the varying conditions of the markets of the world.

The representatives of the people, in my opinion, will never vote for such a proposition. They will never dare to insult the intelligence of the people by ranging themselves upon the side of monopolistic railway management and dictation, exercised independently of the forces of competition. Let the railroads take their chances in the great world of commerce. Let competition in all the activities of business hold undisputed sway. Then will be fostered that intercourse of mankind which inspires emulation, excites and gratifies curiosity, and promotes in an important sense the commercial welfare.

This discussion is in the main because of the business depression, which has now, happily, passed away. Men in dull times try to find fault with something or somebody. No plan has been or ever will be devised for uninterrupted prosperity in any line of industry, and certainly no plan of legislation. This is not the ordained order of things in any department of business.

This Government is not only one of the people, but remember also that it is one by the people, and it will continue to be one by the people. This is a poor time and this is the last country on the face of the earth in which to trifle with the prerogatives of the people.

Men, in dull times, as I have noted, try to find fault as a natural thing with some system or somebody or some legislation or some rule; it seems to be the experience of the business world and of men in general. The dull periods in business

life, particularly those in the last 4 or 5 years, have been brought about more than anything else, I think, by excessive stocks, excessive supply, and undue proportion of the supply of things of all kinds to the demand for such things. Railroads have suffered in this regard and for these causes as other departments of industry have suffered. In the case of railroads, that condition of dullness has been brought about by excess of railroads in different parts of the country, and that excessive supply of railroads, I think, was the result of the operation of the system of pooling, which encouraged building roads where the business really did not authorize the construction of such roads; by the operation of pooling, the roads that did not pay a satisfactory dividend and make a satisfactory return were aided in making a satisfactory dividend or satisfactory return by those roads that were more prosperous. Out of that condition of things there grew a larger supply of railroads than the business of the country demanded. Happily we are getting into good, prosperous times; business in almost every direction is improving, and there is less complaint. There is not to-day, I suppose, a larger supply of railroad facilities than the business and growing prosperity of the country demand. We hear less complaint on account of discrimination, less complaint of injustice in the management of railroads, less complaint of rates, when business is good, when times are prosperous; and I think that to-day, perhaps, so far as I am able to inform myself, there is very much less cause for complaint in the management of railroads and very much less unjust discrimination than there has been during the last 4 or 5 years, and perhaps during the decade just about closing.

Mr. Chairman and gentlemen, I object to pooling by railroads—

First, because it would be odious to law.

Second, it would smother competition.

Third, it would be against public policy.

Fourth, it would create a vast and dangerous monopoly under the protection of the Government itself.

Fifth, it would take away from the interstate commerce law one of its foundation pillars.

Sixth, it would be subversive of the common good and the highest interests of the people.

Seventh, it would be opposed by a great majority of the people.

Eighth, it would be class legislation.

Ninth, it would be in its every feature contrary to the genius of republican institutions and would be a constant menace to that public tranquillity which is a condition precedent to commercial prosperity.

I do not know that it is expected that any intelligent gentleman or student of political economy would advance the theory that these evils, incident to commercial life in its various departments, can be altogether cured by legislation. There is no way of making any rule or law that will give an uninterrupted prosperity to any industry, to any business, to any life. It seems to be the organic law of things that changes shall take place; that prosperity and adversity, as the preachers say—prosperity in business and dullness in business shall take place from time to time, but that in the end the force of competition will work out beneficent results.

The fact of it is that the alertness and ambitious character of American labor, the ambition of the American citizen, of the mechanic, of the scholar, are so great that we produce, as a general thing, a great deal more of our products, our manufactures, than for the time being there exists a demand for, and we get ahead of the natural law, which is that the demand should wait on supply and not the supply seek the demand.

It is a good deal like the man who went hunting and got on track of a hare and followed him as long as he could keep track of him. Presently the hare and the dog disappeared at a turn of the road, and, coming up to that place, he asked a farmer if he had seen anything of a dog and a hare. "Yes; the dog was a little ahead when they passed me." Our supply has got ahead of the demand in this country in regard to a great many of our products, and I suppose there is no doubt in the minds of many of us that this is the cause of the depression which has prevailed until very lately.

Q. (By Mr. C. J. HARRIS.) You consider perhaps the most dangerous thing in the railroad situation to the public is discrimination?—A. The discrimination, want of uniformity in rates, is undoubtedly, in my view, an unfortunate condition.

Q. It has been suggested that pooling, always with the proviso that the Interstate Commerce Commission should have power to revise the rates of a pool, set the minimum and the maximum, would perhaps do away with discriminations more than anything else. Do you believe that there is anything in that proposi-

tion?—A. I do not think that would correct the evils. I should not be in favor, in the first place, of any plan which would interfere with the natural play of the forces of competition. I do not think that the plan of permitting lawful pooling under the control of the Interstate Commerce Commission, or under the control of any bureau, would be practicable. I do not think the immense interests involved could be supervised to the extent of preventing that unjust discrimination which is liable to occur in dull times, and which does not occur to any great extent in prosperous times. I do not think it would correct that, or that any commission or any board, however able that board may be, can really control and remove the evils of which we complain.

Q. Do you think that there now exists any great discrimination in rates?—A. I do not think there is at the present time. I am not so closely in touch with trade as a merchant, but I have made special inquiry of late, and it is my conviction that there is not any very large discrimination in rates of freight at present.

Q. As secretary of the board of trade you would hear of such complaints—they would be made through you or your transportation board?—A. I certainly should hear of them if they were at all serious; but no such cases of complaint have come to me in any official way.

Q. (By Representative BELL.) If there should be a discrimination, is it not more likely to be in favor of a great railroad center like Chicago than against it? That is, if there is a general discrimination exercised, is it not usually exercised in favor of great trade centers like Chicago, for instance, over St. Louis?—A. I am not so sure about that, and yet I would not be pronounced in regard to it. My first view is that in a place like Chicago or any large city the merchants are more watchful, more alert, and commonly more sensitive to surrounding conditions than people in smaller places, and there is not apt to be, it seems to me, so much discrimination as in smaller places. I think railways would be much more cautious about allowing discriminations in any form where there was a searchlight, such as public opinion furnishes in an active business community, than they would be in a place, for instance, where there was a large manufactory, one large business that stood by itself, and most of those engaged in the same kind of business were comparatively small merchants without very much influence.

Q. That would be so as between your own merchants, but how would it be as between Chicago and Kansas City, Chicago and Omaha, as to localities? That is a very important point whether one locality is to stand on its own bottom or whether it is to get the great business industries, the great corn industry, and all the great industries centered, and the business done by men interested in railroads who discriminate in favor of one locality as against another.—A. I should not think discriminations would more readily and more largely exist in the large than in the small cities.

Q. Do they not have favored points, generally, where the railroads try to throw the business?—A. I do not know much, really, about what they do.

Q. You know as a matter of history that when the Santa Fe went into the hands of a receiver, it was shown up that it had given in drawbacks and discriminations some \$7,000,000?—A. I am not aware of that.

Q. Where did the discrimination go?—A. I do not think I am able to give you any information on that line. I certainly have no data in my possession that would enable me to do more than express my general views.

Q. I understand your chief objection to the pool by law is that it would deter competition and the incentive to improved methods?—A. Yes, generally.

Q. Is it not a fact that when the pool is maintained, the division for the succeeding year is based on what each railroad moved, in freight or passengers, the preceding year? Has not that been the system of pooling from the beginning?—A. I can not go into details about pooling arrangements or agreements, but the principle that prevades pooling, as I understand it, is that every line has a certain proportion.

Q. According to what it hauls?—A. If there is a line that does not pay a certain amount that may be agreed upon by the pool, that deficiency will be made up out of the general fund of the pool.

Q. I think you will find that every pool is built on the amount of traffic that each road carried the preceding year; its proportion is arranged according to the proportion of traffic it hauls.—A. I think that is so.

Q. Then the same incentive would necessarily exist under a Government pool that did exist under a private pool; because the more it hauls, I understand.—A. (Interrupting.) I am not in favor of the private pool; I am not in favor of any pool at all.

Q. You do not believe that ruinous competition is good for any business?—A. You can not say as an abstract proposition, and I would not say, that anything that

would bring about ruin is desirable; but I will say that on the whole, as the result of the whole thing, not taking one special time into consideration, competition brings about very many more advantages than disadvantages. There are disadvantages in any kind of a plan which you may devise. These disadvantages can not be entirely removed and may exist in any sort of a plan or any legislation, in my view; but, on the whole, I contend that the forces of competition bring about in the end salutary results, and that to deprive any business of the effect of the natural forces of competition would in the long run be ruinous.

Q. But if my assumption is right—that each individual road would share in the pool each year on the basis of the amount of freight and passengers it carried the preceding year—it would not affect in any material degree the incentive to improved methods, improved roads, improved facilities for travel and transportation. That, as I understand, is not in contemplation under Government control; it is to leave all these incentives full play. The idea is to absolutely stop this discrimination and these drawbacks, both as against communities and persons, and to make the pool lawful.—A. Yes; I understand that is the proposition.

Q. Now, have you any other reasons to urge against the advisability of a legal pool as against an illegal pool?—A. I have not any more propositions to present; but I would object to its being placed in the form “as against an illegal pool.” I would not advocate pooling under any circumstances.

Q. Is it not your judgment that there is always some kind of an understood pool as between railroads, just the same as between the grocery merchant and others in the same line of business?—A. No; I do not think so; I was not aware of that.

Q. Do you not believe these pools that have been admitted to be maintained in the face of the law were illegal?—A. They have been decided to be illegal.

Q. The railroads say these are absolutely necessary for them to do the business in an orderly and honest manner, and it is argued now that they be made legal, and that a legal body take charge of them. As I understand you, your only objection of any consequence is that it destroys competition and the incentive to improve facilities. If my assumption is true, in all pooling the incentive to haul more goods and give better service, to haul more passengers and give better service, is not interfered with, because the 1st of every January the pool is made for the next year, and the proportionate amount is based on the amount that each road has hauled the preceding year.—A. You think it would not interfere?

Q. It has not among pooling companies. That is the condition of the pool. A man who has hauled one-third one year, gets one-third of the profits. If he can build up his road and get up to one-half the next year, then it will be based on one-half instead of one-third.—A. I do not think that plan would do away with the disadvantages and bring about the highest results. I suppose that we will concede that the facilities for the transportation of persons and of property, as developed in this country, have been much better—that the time of travel has been reduced to a greater extent—than in any other country.

Q. You had a greater country to develop.—A. The fact remains, they did it. It has not been because we have had a bigger country altogether. It may be ascribed to the extent of the country that we have had such a large number of miles of railway constructed, but the development of railroading, using that in the comprehensive sense, comprising conveniences, luxuries of travel, reduction of time in travel, and in various ways. These have all, in my opinion, been brought about by the play of the forces of competition in this country. Our wonderful inland commerce, our export trade, which now, happily, is increasing; these, all connected intimately with transportation, have been developed, have attained their present proportions, and have in them such promises for larger development, as a consequence of the forces of competition. I think that these have not been the result of pooling in any sense.

Q. Do you think it helps a railroad to build a parallel line beside it?—A. It may. Now, for instance, I suppose there is no doubt of this fact: That the most prosperous lines of railway, the most uniformly reliable railway lines in this country, are the great trunk lines running from the West to the Atlantic seaboard. Those lines come in direct competition with the cheap transportation along the Great Lakes and along the Erie Canal. The lesson is, and the doctrine is laid down by the experience of business men, that profits are larger upon the basis of a small percentage of profits and a large volume of trade. The railroads that feared their profits would be interfered with seriously by lake transportation have had the volume of their business increased to such an extent by lake transportation as to entirely overcome the reduction which they were forced into in rates of freight.

Q. If that be so, if the Government would take hold of this question and fix a reasonably low rate on both traffic and passengers, it would help the roads, on your theory?—A. No.

Q. I understand you to say competition did it.—A. Competition will fix these rates better than the Government can fix them, in my opinion.

Q. When the country has one railroad that can do all the business, and by the regulation of this Interstate Commerce Commission it can fix a reasonably low rate, is it not preferable to forcing a useless parallel line to come in merely for the purpose of reducing rates and convincing it that a lower rate will make more profit?—A. I think we can not abandon the theory that a man or set of men desiring to build a railroad or a steamboat must be allowed to build a steamboat or a railroad on their own responsibility and take the results.

Q. Is it not your main point that you do not believe in any Government interference with railroads at all? Is not that your contention?—A. No, I would not state that; I am only speaking on the subject of pooling. I do not think the Government or anybody, the State or the United States Government, can fix the rates of freight in such a salutary way as competition can. I think the ordinary force of business competition will, in the end, arrive at a more equitable settlement of rates than the Government could.

Q. How long do you want to wait for this? Do you believe it is right to wear out a generation or two rather than have the Government intervene?—A. I am not in favor of wearing out generations. This country has not worn out its generations in the last hundred years.

Q. We have before this commission very strong evidence that a generation has been worn out in trying to stop the rebates on shipments of oil; that when the same parties reached a country where the Government controlled the railroads they made a handsome profit. As long as they remain in their own country the independent Pure Oil Company swear they can never ship a barrel of oil in America if it goes on a single American railroad. The minute it gets into Germany, or a country where there is no discrimination, they make a handsome profit. They have been fighting that for 35 years, and the only reason, they say, is the railroad discrimination in favor of the Standard Oil Company. Do you believe it is better to go on, as we have gone on, wearing out several generations, than for the Government to step in?—A. I am not acquainted with the oil industry at all.

Q. What I was trying to reach was this: If you object to pooling under Government regulation because you would not want the Government to interfere, that would affect the validity of your testimony somewhat; you would be prejudiced against any interference of the Government, regardless of whether it would be of public benefit or not. We have a great many men in our country that are very fearful that the Government may take some steps to interfere with railroads, while every other country on the face of the earth except England has its own railroads.—A. It is reverting somewhat to the incident about the oil. I do not know why the experience with reference to oil—not doubting that it is as you say—should change the policy with regard to all the railway lines and with regard to everything else in this country.

Q. We had a witness from Cripple Creek who swore that he was interested in the Portland, one of the greatest mines in America, with some great wealthy syndicate. He is also interested with some miners in a poor mine right by the side of it; that for the Portland mine, that had ore rich enough to bear any kind of transportation charges, they got a rebate at the rate of \$60,000 a year, while this poor mine over here, run by poor men, had to pay an exorbitant rate to make up that \$60,000. He says it is a general thing in silver and gold mining, and we find it here and there, but the oil industry has been brought before us more generally than any other.—A. Of course I would not undertake to reconcile any or every individual case that this commission has had brought to its notice.

Q. (By Mr. KENNEDY.) Are you in favor of strengthening the Interstate Commerce Commission and giving them authority to make just rates on complaint that discriminations have been practiced?—A. I am in favor of strengthening the Interstate Commerce Commission so that upon representations and upon hearing they may say that a rate is unreasonable if it is so, and make the rate.

Q. And have their decision go into effect?—A. Have it effective.

Q. Pending an appeal to the Supreme Court?—A. Yes.

Q. (By Professor JOHNSON.) Do you know whether we have as many miles of road per square mile in this country as England and the countries of western Europe?—A. I don't think we have as many miles of road to the square mile.

Q. Does the question of discrimination, as it exists in this country, exist in

Great Britain and the countries of western Europe?—A. The complaints on discriminations are the same as here.

Q. Does the question exist there as it does here?—A. Well, I am not sure about that; I could not say.

Q. You at least have not heard that discriminations are a serious question in Great Britain and on the Continent of Europe, have you?—A. No, sir; I have not had that matter brought to my notice.

Q. Then if we don't have so many miles of road per square mile as these European countries, and these countries have practically eliminated the great railroad problems with that of discrimination, is it strictly correct to say that railroad development here is far ahead of that of any other country?—A. I don't know that it touches conclusively the proposition of our railroads in this country. Our time of railway travel and the regularity of the service is better. So far as the continental travel is concerned, I am satisfied that the time of travel here is very much quicker than on the Continent and that the facilities for passenger traffic are superior here to those there.

Q. Does your information convince you that there are more trains running over 40 miles an hour in the United States than there are in all of western Europe—that is, comparing the number of roads there with the number of roads here?—A. Comparing the number of roads there with the number of roads here, I should say that travel is quicker here than it is there. I think a commission came over here from the Continent—of course, I have not the data at my hand, but I think it was a commission from the Continent that came over here to investigate that matter—not many years ago, and I remember reading the result of the report of that commission; and it was to the effect that the time of railroad travel here was much faster. Then there are no big trunk lines abroad such as we have here.

Q. Every comparison I have seen has been a comparison between the whole United States and one country of Europe, and further than that the comparison has been only between express trains of this country as compared with one of the smaller European countries. I have not seen, but would like to ask you if you have seen, a comparison that attempted to compare our railroads as a whole with the railroad service as a whole in western Europe?—A. No; I have not seen that.

Q. Would you say that would be a fair way to make a comparison?—A. Yes; I think that would be the fairest way. I remember making quite exhaustive copies from that report, and I could easily refer to it if necessary; it shows on what lines the comparison is made and gives the prominent points in Europe, and also gives the prominent points in this country, and states the time between each one in each instance. But I have not seen a comparison upon the line that you speak of, generally.

Q. (By Mr. KENNEDY.) Coming back to America, I should like to have you state what you specifically favor in the way of amendments to the interstate-commerce law.—A. I would give them, among other things, the power to fix reasonable rates, after a hearing at which those interested in the industries to which the rates would apply could be represented. I would give them power to change existing rates if, upon hearing, the commission was convinced that they were unjust.

Q. Would you give them power to send experts to a railway office, here and there all over the country, the same as national-bank examiners are sent, to examine into the affairs of the railroad companies?—A. Yes; I think I would.

Q. (By Mr. CONGER.) Have you, in your paper, warned the commission against centralization of these big railroad properties? As I understand it, your theory is that a legal pool would hasten that centralization; am I correct in that?—A. Yes; when I spoke of centralization I used the word centralization as meaning pooling.

Q. Is not the present competition quite likely to bring about an actual consolidation of these large trunk lines, in which event the big corporation controlling all or one of the trunk lines between Chicago, for instance, and the seaboard of the East, would possess all the benefits of the pool without any legal inspection or restriction?—A. I don't think it would have that result. I don't think the avoidance of pooling would bring about that consolidation or concentration of power between different lines of road.

Q. You don't think that consolidation extends to the extreme?—A. I don't think it would follow to the extreme.

Q. (By Representative LORIMER.) Mr. Bell has suggested that in pooling a road secures its share on a basis of its traffic the previous year. Have you any opinion as to whether or not it is necessary to base their share in the same way, or can they fix it on any other basis?—A. Upon any basis, I imagine. I don't think they would be confined, in any sense, to such an arrangement.

Q. So that while probably in the past it has been based on the previous haul, they may agree upon any other scale?—A. Yes; I understand so, and think it would be possible.

Q. (By Mr. CONGER.) The point in my question that I was trying to bring out was this, that unless that basis is modified the pool would be no pool at all. The manager of some line would go right out just as he does now, or at least the opportunity would be open to him to go out, just as it is claimed they do now, and offer rebates, by which he would get more freight to carry and consequently a larger share of next year's business; in other words, there would be competing just as there is now?—A. Yes.

Q. So that I think it is a fact that while the percentage of the tonnage they do carry is used as a basis, it is modified by other interests or modified arbitrarily?—A. Yes.

Testimony closed.

CHICAGO, November 24, 1899.

TESTIMONY OF MR. AUGUSTINE GALLAGHER,

Representative of Merchants' Exchange, of St. Louis, Mo.

The subcommission being in session on the afternoon of November 24, 1899, Representative Lorimer presiding, Mr. Augustin Gallagher, being duly sworn, testified as follows:

Q. (By Representative LORIMER.) Please state your name in full.—A. Augustine Gallagher.

Q. And your business and post-office address.—A. I am in the publishing business in St. Louis, Mo., and represent the Merchants' Exchange of that city in this instance.

Q. (By Mr. C. J. HARRIS.) Are you prepared to go on and make a general statement, or should you prefer questioning?—A. I think I should prefer the questions, if you please.

Q. What have you to say in regard to unjust freight-rate discriminations against American flour?—A. I should like to bring the attention of the commission to the fact that we are very rapidly losing our export flour trade. The loss has been severe in recent months—from last February down to the present time. The trunk-line railways of the country published a tariff in which they established different rates for wheat and for flour, for grain and grain products. Previous to that (while, of course, cutting the grain rate whenever they felt like it) they had published the same tariff rate for wheat and flour, and it was generally understood abroad that the American miller had an equal rate on wheat and on his flour. The publication was a national transportation scandal and invited the foreign millers to bring influence to bear on the railroads to increase the export tariff on flour. The ocean carriage was largely in foreign ships and under foreign flags, and an opportunity was presented for them to lower the ocean rate on grain and increase it on flour, and this has progressed to such an extent that I fear that unless this is stopped our export flour trade will be destroyed. I am informed by well-informed men in the trade that they share this fear with me.

Q. Do you know what the difference in the tariff is in ocean trade between grain and grain products?—A. It fluctuates greatly. It will be probably 2 cents to 5 cents; and again, if there is no grain available and they get flour, they will take flour low. As a general thing the difference would range, I think, from 1 to 3 cents.

Q. And the discrimination between the two between St. Louis and the seaboard has been what?—A. It is now 7 cents per 100 pounds for flour more than for wheat. I will give you the exact figures which were in effect on November 1. It was a sort of a nice way of all the railroads to respond to the ruling of the Interstate Commerce Commission. The rate on flour from St. Louis to New York in the tariff dated November 1 is 27 cents, to Philadelphia 25 cents, and to Baltimore 24 cents; on wheat the rate to New York is 20 cents, to Philadelphia 19 cents, and to Baltimore 18½ cents.

Q. You are getting the same grain rate from St. Louis that they get from Chicago?—A. No; we are not. If we were we should be in what is known as the 100 per cent territory, whereas we are in the 116 per cent territory.

Q. (By Mr. CONGER.) Can you tell us what the rates were before November 1?—A. There has not been a large difference made by this new tariff; a very

slight difference. I did not charge my memory with the exact difference, but if I remember correctly the discrimination amounted at one time to 8 cents, and previous to that it was 5 cents and before that 3; there has been a gradual increase for months.

Q. You said, I believe, that the fixing of these rates by the railroads was in order to comply in a nice way with a rule or order of the Interstate Commerce Commission; can you tell us in short what that order was?—A. The commission held a 3-months' investigation of the matter. After they got into it they found it was an enormous question. They held hearings in New York City, in Chicago, in St. Louis, and in Washington. They issued an order which ran something after this fashion. I will give you the substance of it. "We believe it is good railway policy and good business policy that wheat and flour should go at the same rate, and in case differentials are made at the seaboard in no case shall they be over 2 cents per 100 pounds." And the roads contend that they have complied with the order. The published tariff—I don't know whether it is effective or not—that is, I don't know whether they live up to it or not—but the tariff out for the 100 per cent territory is in compliance with the order, without any special recognition of the order at all. They claim that the commission has no right or authority to make such orders at will. The tariff from Chicago to-day is 2 cents higher on flour than on wheat, which would be in that way a compliance with the order. The discriminations in other parts of the country, as from St. Louis, are just as violent as before.

Q. In other words, the railroads coming into Chicago, so far as their tariff schedule is concerned, have complied with the order, whereas the roads coming into and going out of St. Louis have not complied with the order; that is your testimony?—A. Yes; that would be the effect.

Q. In this territory, in complying with this order of the Interstate Commerce Commission, that the differentials should not be more than 3 cents, did the railroads raise the then or previously existing rate on wheat for export, or did they lower the rate on flour?—A. The change was made November 1, at a time when rates generally were advanced; so that the rates on flour and wheat were advanced, if I remember aright, and on several other commodities.

Q. Your idea is that the roads raised the rate on export wheat?—A. Yes.

Q. (By Mr. C. J. HARRIS.) What have you to say of the carloads of wheat and flour; is there any difference in handling that would demand a higher rate for one than for the other?—A. It is contended by the railroads that there is, and that that is one of the reasons why they demand a higher rate. There is a domestic trade that will take flour in small carloads of 125 barrels rather than 200 barrels, particularly through the cotton States and where farmers have a few hundred hands working for them all through the South; and the same thing prevails in the Northwest. On account of this—on account of this trade taking these small carloads and the fact that the miller will often load a car with more wheat than the capacity will warrant—the railroads have an excuse to argue that it costs more to transport flour than wheat. In reality they also load more flour on a car than the capacity will warrant. That is the question we had a hearing on. It was on the question of export flour, and we introduced evidence to show that the millers had frequently loaded cars in excess of their capacity, and it was shown that they had permission from the railroad management to load the cars in excess of their capacity. It was a very simple proposition, or should have been, to anyone; because where a miller has an opportunity he would be a very foolish miller to load light cars, where he was paying for switching, when he could load heavy ones. The millers that were witnesses before the commission expressed a willingness to comply with any reasonable demand that the railroads deemed proper, if the railroads would furnish the proper equipment to do it; they complained, and very properly too, that in the matter of transportation of wheat the railroads furnished the very best of equipment, but when it came to the transportation of flour in barrels, for instance, they gave them any old car that happened to be lying around doing nothing.

Q. Gave larger cars for wheat?—A. Yes, larger cars; it was stated also that the modern equipment, the new equipment, on all the railroads is much larger than the old equipment; and, as a matter of course, the larger the cars the fewer the cars and the lower the actual cost of transportation.

Q. Is the domestic and export rate on flour the same?—A. No.

Q. There is a difference?—A. Yes; there is a difference.

Q. What is the domestic rate to New York on flour?—A. I don't know.

Q. Do you think the exportation of wheat at the rates complained of benefits the producers of grain?—A. No; I do not. That has been presented as an argument of the transportation lines. They undertook to set out that they had

been making these low rates at times on that theory; that is, that they did it to take the grain out of the country because the American farmer did not have a market for his grain. In other words, they argue that they find a market for the product of the country. As a matter of fact the farmer never participates in that profit at all. This grain is bought up by buyers for a future profit; it is bought up by railroad lines and it is bought up by the elevators, and it is run out of the country by the train load, taking advantage of a rate out of which the farmer gets nothing. If there is any money in it, he merely hears of the price which it brought through the newspapers some time after the grain is gone from him, and long before that he gets for his grain exactly what the market price was at the time of his sale. That is all he ever gets; it is all anyone gets for grain and it is all anyone pays for grain.

Q. (By Mr. CONGER.) You think the price of wheat is fixed by these men, or does the market of Liverpool have something to do with it?—A. There are days when the Liverpool market will have some influence on the world's market, because the demand for the product is larger, although I think as a rule the Chicago market is the controlling feature in the grain markets.

Q. You think the Chicago grain market controls the price of wheat the world over?—A. It does to a very large extent. It is the leading speculative market of the world. Of course, the foreign markets control here, as I say, just so far as they are buyers. If there is a good demand in Liverpool—in other words, a seeking market—the foreign market will very likely influence our markets for the time being.

Q. (By Mr. KENNEDY.) You said just now that the farmer is paid for his grain just what the market price is. Is there not a charge, or at least a belief, that in some sections of the country they are paid a little more than the market price because of freight discriminations which certain grain companies or interests enjoy?—A. That happens occasionally; yes. It is not by the philanthropy of the buyer, however; that is not the basis upon which he works. It is because in a certain district there may be a competing line of railroad and also competition in the buying of the grain on that account. Of course the fellow who gets in there first will try to run all competition out of that territory if he can, and a farmer in that way may get more money; anyway sometimes the farmer gets the benefit of the competition, but it is not by reason of any philanthropy.

Q. Do the Chicago buyers invade St. Louis territory and offer the farmer more for his grain than your men can afford to pay for it?—A. No; St. Louis is a great milling center, and we always buy more wheat than Chicago on account of the milling demand.

Q. (By Mr. C. J. HARRIS.) How large is the milling interest in St. Louis?—A. We had a committee of the millers and Board of Trade of St. Louis and suburban towns for the purpose of securing some statistics to present to Congress; and we found we had a capacity of over 27,000 barrels per day, and employed 1,100 men exclusively engaged in that business outside of truck drivers, men working in the elevators, etc.

Q. Have you anything to say about the under-billing of cars?—A. That is one of the very worst evils, I think, in transportation to-day; that is one of many; I will not say it is the worst.

Q. Please state what it is.—A. It is a matter that can more properly be obtained through the railroads or lines over which the practice is permitted. I have known members of the trade—I want to ask first if it is your object to have me point out now the facts with the names, etc. Of course in getting this information—

Q. You know the general facts?—A. I have got a great deal in confidence that it would possibly not be well to publish.

Q. Give us the general facts.—A. I have had millers tell me within a week that they had been solicited by the railroad companies to ship 200 barrels of flour and bill out 125.

Q. You could not give definite proof of that?—A. The gentleman who told me didn't want to go into the matter, because he was dealing with the railroad company; but he said that if the commission deemed it necessary he would, as a matter of fact, give it.

Q. Are there any other methods of discrimination?—A. Yes; there is a straw-man and a pawnbroker system of borrowing money; that is, a system, by which a railroad agent goes to a man and tells him to take a tariff and move his goods to seaboard, and they will borrow advance freight money on his shipment. In the meantime the man draws interest on his investment, and this pays a large part of the freight. That is a system that was described to me by a man who works it himself.

Q. (By Mr. CONGER.) What is the straw-man system?—A. I have a shipment

of a commodity to make and I want to put it over a line that is going to give me a rebate. Instead of billing that stuff to the man I have sold it to I bill it to a fictitious man, or straw man. On the bills he is the actual shipper. I do not see him at all, don't know anything about him, but he bills the stuff to the man that I want it to go to, my customer, and it will go through all right, and by and by the straw man sends me a check for a rebate. You can not find him; at least I have not been able to do it. That was also described to me by a man who practices it.

Q. (By Mr. C. J. HARRIS.) Do you think speculation in railroad stocks is another practice of the roads?—A. Yes; my opinion on that question would simply be the reflection of what I have been told by traffic men. The securities of these roads are very slow at times, and it is very rarely that there is chance of getting any of their stock, unless it can be sold for more than it is worth. Take any of these granger roads; they are controlled by the present owners and the syndicates, and they have no intention of delivering the shares of stock, although the stocks are speculated in here and in St. Louis and everywhere all over the country. Of course the present owners have no intention of allowing the stock to pass out of their control. The present price of railroad stocks is generally considered by traffic men, so far as I know, to be out of reason—out of any correspondence to the dividends or the revenues derived from them. I don't know the history of this business, but the gentlemen who told me about it are well acquainted with it. I will mention one of them because he was before your commission; he is a very well-informed man and his name is Mr. Vanlandingham. I am told that the history of the railroads is that when the railroads get ready to dispose of their securities they encourage a rate war and in that way unload on the public, and that much money is made in hard times by speculation in these securities.

Q. (By Representative LORIMER.) To unload on the public they have to start a rate war?—A. Yes, when stocks are away up; when the stocks are high they sell out to the public on the idea that they are going up, and by and by they go down because the handling of the road is such as to depress them.

Q. After they are out?—A. Oh, certainly; after the inside speculators are out.

Q. (By Mr. CONGER.) You mentioned the billing, and then told us of other kinds of rebates and discriminations. Do you know of others than the ones you mentioned? If so, I should like to hear about them.—A. I have one case with me; I brought it along as a curiosity. I have in my safe the complete documents of the case all ready to publish; I picked them up about three years ago; I have the check the rebate was paid with, the expense bills, and everything. It was done by sending the favored shipment to shipper's order. The way I got it was this: Some clients of mine, confederates as it were, concluded with me that we would find out if there was anything of the kind going on upon a certain line. I was confident that rebates were being paid, and that a lower rate was being made to Texas by a certain railroad, and a grain buyer and a miller in — went into this scheme. The grain buyer it seems could not very satisfactorily get any wheat along this line, but he could go to the favored shipper and buy wheat, and he found that this favored shipper would put the wheat by the carload down at a certain point he desired in Texas at a rate much lower than he could get on wheat himself and put it down there; it was shipped to that point in Texas subject to shipper's order.

Q. Addressed to themselves?—A. The shipper gives the order when it gets there, and he may forward it by the same mail. Say I bought a carload of wheat from this shipper and sent it to Texas; the man who received it, being in on the scheme, of course went and paid the freight on it. The grain man in Kansas had bought this grain from the favored shipper, who had sold it to be delivered in Texas, subject to his order. The grain man who bought it of the favored shipper sent a notice to the miller in Texas to charge the full tariff rate above the agreed price of the grain. The miller, being in the scheme, went to the freight office and paid the freight and got a receipt and found the freight was very much less than this man had stated in his notice of the tariff, and sent him a check for the difference and wrote him a letter telling him he had agreed to do. That is the method that used to be practiced a good deal. I don't know whether it is now or not; it is very hard to keep track of these cases. In fact, it is impossible, under the present system that prevails; we have no system of supervision.

Q. One witness yesterday testified that in his opinion it was the custom among some railroads to give lower rates on special articles of freight within the borders of the State in consideration of their having consigned to them a large amount of business that would be interstate commerce. Do you know anything about any such practices?—A. I could not give you any positive information; I have heard of

these things, but the things I am telling you now I have investigated, so as to have positive information for you. I have no positive information along the line you mention, though I don't believe they have got a classification marked; I just happened to think that that is a way that they used to do to cut rates—to change the classification; and they have also done that in recent years.

Q. (By Representative BRILL.) How is it about weights?—A. For instance, I will give you a case: Where I live we ship peaches, 4 boxes to the 100 pounds, to Salt Lake City; 350 miles farther they allow us to ship 6 boxes for 100 pounds. That is in billing, and they ship them to the railroad agent.

Q. What is the reason for that?—A. Why, they want to favor that man and lower his rates 50 per cent, or whatever per cent it is. It is understood, of course, that the railroad could punish that man if it desired to.

Q. They ship direct to the depot agent?—A. Yes; I have an intimate friend who tells me he ships 6 boxes to the 100 pounds and has to ship to the agent, while we ship 4 boxes to the 100 pounds.

Q. (By Mr. C. J. HARRIS.) What is the practice of railroads when extra tonnage is needed in grain shipments?—A. They usually go for grain; they can load it very easily and store it in large amounts; they can load up a train with it out of a house with large capacity in very short order and move it quickly.

Q. What effect does that have?—A. It tends to cutting of rates. The railroad takes advantage of the different markets where it sees they are available to millers and manufacturers; it picks them out and goes abroad, as a rule, to furnish competition there through building up the milling business in foreign countries.

Q. Do you have any complaint about the freight on millers' supplies, machinery, etc.?—A. No; we have had no complaint about that. I think it might be well to call the attention of the commission to the great volume of that business. When we have sought relief from this tearing down of the export trade, that threatens the life of the entire milling industry of the country, our argument with the railroad officials has been that we should be recognized here because the milling business furnishes the railroads with such an enormous tonnage not only on domestic, but on export business, and that this tonnage comes gradually, month after month, and is continual, and we are willing to pay good tariffs. In preparing our argument with the companies before the Interstate Commerce Commission I concluded to show the tonnage the millers were responsible for in addition to the wheat and flour. I concluded to show what the industry demands in the way of supplies used by the millers, such as coal, oil, cooperage, bags, lubricants, and the many other things that they use. Machinery was a very heavy item, paying high rates. I went to the books of about 20 mills and asked permission of the millers to secure these figures; and in some instances I wrote to the management, telling them what I wanted and asking them to have the bookkeepers give me the exact amount of the stuff that they purchased in the course of a year and the capacity of the mills. The capacity of these mills would range from 100 barrels per day to 2,000 barrels per day. One hundred barrels per day is one of the smallest mills that could engage in the business, and it is understood by millers that when you have a mill of 2,000 barrels capacity daily you have reached about the limit of industrial economy. A larger mill would not produce flour any cheaper per barrel. So I secured figures from mills of 100 barrels to 2,000 barrels capacity. I took the actual number of bushels of coal these people bought, the actual amount of machinery, bags, lumber, cooperage, oil, and all such stuff, and it amounted to 88,000 tons more than the annual grain exports of the country on a 5-year average, even including last year, with exports of 148,000,000 bushels. Now, this tonnage takes the highest local rates on every character of stuff, and the railroads make money on it. For instance, machinery and all finished products that are painted and varnished, and all that sort of thing. Take coal; I have one illustration of the cost of that from one mill in Dallas, Tex., where coal paid nine times its value in freight; and I found one in western Kansas where the coal cost ten times its value in freight.

Q. (By Mr. CONGER.) Ten times its value at the mine?—A. Yes. We are continuing to stand out against the railroads and the enforcement of these discriminations, which, besides being unjust, threaten a live industry.

Q. Do you think the railroads are justified in handling wheat for export at a lower rate than wheat for domestic use?—A. I think the roads are justified in making a lower rate for export than for domestic use.

Q. On wheat?—A. Yes.

Q. On flour. Do you think the rate should be lower on that?—A. Yes.

Q. Do you think that overproduction has any influence on the price of wheat; does a very large crop or overproduction affect prices?—A. Whenever the world has an overproduction it affects the price disastrously for wheat for the time being,

although overproduction will not operate to the extent of having a depressing influence for any great length of time.

Q. When we have a surplus where is the effect felt first?—A. Most of it in Liverpool; Liverpool is the big buyer; it is the great distributing point; the Continent takes a great deal of our wheat.

Q. What I am trying to get at is this: As Liverpool is the largest buyer of our wheat and a great distributing point, whether lower transportation rates between Chicago and St. Louis and Liverpool would not give to the farmer more for his grain than he would get if these transportation rates were twice or three times what they are now.—A. If the farmer gets any benefit out of these transportation rates I don't know what it is. Of course it may be, I think it is, a question of supply and demand, and that should fix it. We have no assurance when this wheat goes abroad where it will go. It may be bought up by the Liverpool merchant, but we have no assurance that the wheat is not going to France. It will go into France under a duty of so many francs per hundred kilos, and then if the flour is exported from France that duty, which is paid by the miller, is refunded to him. He can take our wheat at a cut-rate price, take it into France and mill it without paying any duty; then export it to Great Britain, the duty being refunded to him, and take our market away from us; and when it comes to putting our flour into France it is barred.

Q. You have stated that the farmer or producer of wheat in this country receives no benefit from these lower rates on wheat or flour for export, and what I was trying to reach was your mode of reasoning by which you reached this conclusion. To that end I wanted to ask you whether, in your opinion, if it cost five times as much as it now does to transport a bushel of wheat from Chicago or St. Louis to Liverpool, the farmer could export grain or wheat. In other words, would it not cut him off?—A. Five times would be an unreasonable rate and out of proportion to the value of the stuff and out of proportion to the rates paid the world over.

Q. Does it not follow as a natural conclusion that if these rates were five times as high our exportation of grain would be practically cut off, and the result would be an oversupply here and a consequent lowering of the price of wheat all over the country?—A. I am quite willing to strike a line of principle with you, but I do not like to agree to a violent comparison of that sort.

Q. That would be, in general, the result; that would be the principle?—A. There seems to be a principle of that sort governing all business transactions.

Q. Would not the converse be true, that if the transportation rates on wheat for export were greatly reduced competition between buyers of grain would be such that the farmer would get at least a portion of the benefit?—A. In answering that question we have to take this into consideration: These men who get this low rate have the product here in their warehouses and can draw on it almost any time. Now, they may depress the market and they may not; they have it in their own hands whether to do it or not. The theory that you advance appears to be reasonable, but the facts that I advance are facts; that is the situation we complain of; it is the fact.

Q. It strikes me conjecture enters into it to some extent. I know some people contend the other way—that the farmer is actually receiving more for his grain.—A. I have heard that.

Q. (By Mr. C. J. HARRIS.) If these rates were stable and to be counted on this low rate would benefit the farmer, would it not?—A. Oh, yes; if everybody had the rate there is no question but the lower the rate the better it would be for the farmer; but then the farmer does not get the rate, and only a few people do get it.

Q. These export rates are open to all?—A. Those are not the rates we are complaining of—the 2 cents differential—although flour should be carried at the same rate.

Q. I understand what you are complaining of are these sudden, specially made rates, made at times when tonnage is particularly wanted, that the farmer does not get the benefit of?—A. That is it, exactly. I will give you an example. I am not contending against grain at all; I think it should bear its own burden, but I do not think our railroads should build up a foreign industry to hurt ourselves. I have in mind a mill; I can give the number of the tariff and the road it went over to substantiate this. These very gentlemen went to the owner; he was a big miller and could put out lots of tonnage if he took a notion. If I remember correctly, it was 17,000 bags of flour he contracted for; and you know 17,000 bags, at 400 to the car, will make quite a string of freight. He got a cut rate of 5 cents on that amount. They slapped in one of these midnight tariffs; published the tariff, and gave notice of withdrawal just as quick as he filed the contract. Now, that is a great deal to the country miller with 250 barrels a day capacity. I

think the miller that gets that sort of privilege ought to be regulated just the same as the grain man who does it.

Q. I will ask you if you find any tendency on the part of your people to Government ownership?—A. I think there is a very dangerous tendency throughout the Western country. I travel a good deal over the country seeing how the crop is, and I generally travel over the territory two or three times a season. I never observed the growth of the feeling or the theory, or whatever you may call it, to be so marked as in recent months.

Q. (By Mr. CONGER.) Are the people dissatisfied?—A. The people feel that the public is not getting a square deal.

Q. Your idea is that these people are dissatisfied and advocate Government ownership because of dissatisfaction from rebates?—A. Just because they are not getting what is due them and they know that other fellows are; they are not satisfied with the way things are conducted. They have come to the conclusion that they can buy a postage stamp as cheap as anybody can, and they can go through the custom-house as cheap as anybody can, and are getting around to the idea that they could go to the station agent's office and buy a railroad ticket as cheap as anybody if Uncle Sam had control of it.

Q. Your idea is that their dissatisfaction comes not from high rates, but because the rates are unequal, and because somebody else, they think, is getting the advantage of them?—A. Yes; that is no longer theory, but facts. I want to go on record that that is no theory. Everything I have stated to you to-day is based on one or more transactions of the character described.

Q. Are you familiar with the situation in the East? Do you think the custom of giving these rebates and discriminations is as prevalent there as in the West?—A. I could not say. I am inclined to think the Trunk Line Association is a better managed body and the rates are better maintained; at least, they keep their information to themselves better than the roads in the other parts of the country.

Q. If they do discriminate the public does not know as much about it?—A. We do not hear about it as much.

Q. The point I was bringing out was this: I think it is generally believed to be a fact that the sentiment in favor of Government ownership is more general in the West than in the East, and I was wondering whether we should be justified in connecting that fact with the fact that there is more discrimination in the West than in the East?—A. Of my own knowledge I do not know. I have been informed, however, that your assumption is in line with fact; that the rate cutting is not as violent or as general. Of course, the Gulf lines inaugurate a slashing every once in a while, with their lines running down the Mississippi Valley to New Orleans and Mobile; and when grain ought to be 18 or 19 cents they go to the trade and in order to load a few ships or fill up some houses down there they put in a 10-cent cut and it upsets everything.

Q. (By Mr. C. J. HARRIS.) Have you any objection to the operation of elevators by railroads?—A. Yes; I believe the carrier that is chartered for the business of operating a railroad has no business whatever to engage in the grain business. I think his charter rights are impaired, if it was brought to an issue, in doing so.

Q. Will it not have a better effect on the prices that the producer receives, if the railroad company furnish an elevator, than if he has to go into the hands of these private elevator men?—A. I do not believe the history of trade, as conducted, will bear that out. I believe, in other words, it is the history of this business that wherever the road controls the business along its line it has a monopoly, and wherever that is the case, through the grain territory, you will find little elevators that have been abandoned for 5 or 6 years, all run down. You can tell from that what is happening. It is a sure indicator that the fellow has gone into some other business. If that man was competing at this station, it is a matter of reason to say that the farmer would get more for his stuff than when he has to deal with a monopoly.

Q. Is it your experience that competing elevators in different grain-buying points are—or did I understand you to say there are not competing elevators or grain buyers at these different points?—A. Where, for instance, a road has been shipping freight to some big grain concern that controls a big elevator system for several years, they will drive the little fellows out. Of course, when you drive the independent buyers out of the country, whether a miller or a grain dealer, you reduce the opportunity of the farmer to get a higher price for his grain.

Q. Are the natural advantages of the miller in this country as good as in any other?—A. No; the miller has some natural disadvantages that would entitle him to consideration, I think, of law-making bodies. For instance, grain going for export—I am speaking of export entirely, for I think domestic trade can be regu-

lated by competition, as we have no imports to compete with—export grain would usually go direct from the field, and is accumulated along toward the sea. But frequently the miller, in order to get supplies, has to go out 200 or 300 miles and buy grain. There is no grain delivered in a city like St. Louis by wagon—a few thousand bushels a year, perhaps. He may even have to come to Chicago and haul the grain in and haul it back again.

Q. (By Representative LORIMER.) How about the Minneapolis miller?—A. As a general thing, they get their wheat back north of them and move it down. It is in the line of transit. Occasionally they have to buy wheat outside. They used to come to Kansas, a few years ago, but it was plain to be seen that when they had to haul wheat to Minneapolis from Kansas to keep their mills going, it was done at great cost.

Q. It pays to locate a mill in that position?—A. Indeed, it does.

Q. Is it not customary for millers to get from roads what are known as milling-in-transit rates?—A. They do in some localities. They pay a cent a hundred for it, though. I think that is a usual practice, paying a cent for the privilege.

Q. Does not that practically overcome this advantage you speak of?—A. No; it does overcome it in a sense where they do get it, and it does not where they do not get it. It is not general, only in Territories.

Q. Not general?—A. No. We have no transit privileges in St. Louis. We have to pay 1½ cents arbitrary on that bridge.

Q. Do you mean to testify that the millers in St. Louis who do an export business pay a local rate to their mill on the wheat they use, and then pay the rate from St. Louis to the seaboard?—A. They do in a certain territory. Kansas has milling-in-transit privileges. You can buy in western Kansas and bill to the East, and stop anywhere you choose and mill it and send the flour on by paying 1 cent a hundred for the privilege.

Q. It would naturally follow, then, that the St. Louis millers get the wheat for export from this free district?—A. No; that might be the impression of one not conversant with the business. St. Louis mills, until recently, were what is known as soft-wheat mills, while in this Kansas district the majority of the product is hard wheat, which produces an entirely different kind of flour. The reputation of St. Louis mills was built upon soft-wheat flour, which they manufactured for 50 years or more for export. A mill seeking soft wheat has to go where it is to be had, and if their accustomed field has had poor crops they have had to go to Indiana, or even Ohio, or to Chicago, for wheat.

Q. And use that wheat for making flour for export?—A. Yes; use it for anything.

Q. Do you pay the local rate in?—A. They can not afford to do it. That is one of the disadvantages the miller has, and we are of the opinion that through the medium of the Interstate Commerce Commission we ought to get some relief from this discrimination, this inland or American discrimination. As it is now the St. Louis miller has to pay an export duty of 7 cents a hundred pounds, 14 cents a barrel, on his flour. He can not do it; his profit is not so great as that.

Q. It is worse from St. Louis than from Chicago?—A. Oh, yes; very much worse. Now, I want to make a suggestion or two: I think if we had a national statute that would permit an officer of the Government, such as the secret-service or the special-service agents of the Interstate Commerce Commission, to break car seals in cases of suspicion, you would get at the underbilling. What I mean is this: All he can do now is to spy around. For instance, I will furnish him a case where I am sure there is underbilling, because a man told me a mill was having stuff underbilled. That is a pretty fair sort of evidence, but it is not actual evidence and would not go in court, and you could not convict a man on it, because the other fellow would deny it. Now, if he could get the car number and the initial of the car that is going to this fellow in question, then get on a passenger train and go down to that place and wait until the car got there, and break that seal, and bring Mr. Merchant up for collusion, count the packages, and know the exact weight in the car, the merchant to avoid trouble will not confess himself guilty of fraud; he will give up his invoice and say he actually bought so much stuff in that car, and you can make a case of underbilling; but now it is very difficult to make a case—very difficult. I do not know anything about the law on that subject. I presume it is within the Constitution, policing the trade, to do such things as that. My experience in this underbilling business is that that would be the best remedy that I know of. I talked with Mr. Marchand, who has charge of that part of the work of the Interstate Commerce Commission, and he told me of the troubles he had in running these people down. For instance, he had what he considered a sure case in Louisville. The stuff went to Texas; he

got evidence and had the people down there indicted, but the court decided the crime was not committed in Texas. He took it back to Louisville, got his witnesses up there, but has not got them indicted yet in Louisville, and has been at the case two years. His witnesses are getting away from him, and probably he will lose out on the case entirely.

Q. Have you any further suggestions?—A. I think uniform classification, Government supervision, interstate-commerce supervision will do away with rate-cutting in many cases where it is being done now, classification being changed to produce a cut rate.

Q. (By Mr. CONGER.) You mean a universal classification of the whole country?—A. Yes.

Q. Do you think it is practicable?—A. Yes.

Q. Without injury to the roads?—A. Yes.

Q. Do you think a railroad in California can handle iron ore as cheaply as in other places?—A. They would take that into consideration. The idea of the commission, I should think—and I have had some talk with them about it—would not be to do any injury to the lines, and they would accept such suggestions as would be needful; but the commission having adopted the classification best suited to this district, would hold it there and not change it at the instance of some extensive shipper.

Q. Any other suggestions?—A. I think not. More than that, I should be very glad to see the Interstate Commerce Commission empowered to enforce their rulings on findings of fact, the rulings to stand until reversed by the courts.

Q. (By Professor JOHNSON.) Are you in favor of substituting fines for imprisonment?—Yes; I think we should get convictions quicker by releasing the shipper unless he can be shown to be party to the fraud.

Q. Do you favor inspection of railroad accounts?—A. Yes; I do. I favor a rigid inspection. You will get the truth that way, and you will drive lots of dishonest people out of business.

Q. Do you believe in modifying the long and short haul clause so as to eliminate that wording, "substantially similar circumstances and conditions?"—A. With reference to that, I would not do anything that I conscientiously thought would injure a railway. In answering that question I would be willing, before a Congressman should vote on that matter, to take the best advice of railway representatives on the matters to be considered. They know a good deal about that themselves, and I believe when it comes to the question of making it a law they will do the fair thing. It is a big question; a great deal of evidence could be adduced on that, and a man in ignorance of the whole state of affairs might go quite wrong in expressing an opinion. But, about the inspection of records, I should be in favor of putting a stamp tax on it and putting it in the Internal Revenue Service if necessary, letting the shipper pay the tax in order to get at them because what the railroad manager is worried with to-day more than anything else is the other railroad manager. The railroads of the country want protection against each other worse than any other business I have any knowledge of; they absolutely need protection against each other, and I think before the agitation which is now on concerning transportation matters is over there will be a better understanding between the shipper and the railroad manager who wants his line conducted on absolutely fair lines, and it will result in very wise laws on the subject.

Testimony closed.

CHICAGO, ILL., November 23, 1899.

TESTIMONY OF MR. C. W. DICKINSON.

Manufacturer of agricultural implements, La Crosse, Wis.

The subcommission on transportation being in session in Chicago, Representative Lorimer presiding, at 2.55 p. m., November 23, 1899. Mr. C. W. Dickinson was introduced as a witness, and being duly sworn, testified concerning transportation as follows:

Q. (By Representative LORIMER.) Will you please state your name?—A. C. W. Dickinson.

Q. Your business and post-office address?—A. I live at La Crosse, Wis. I am connected with an institution for the manufacture of agricultural implements at that place.

Q. We have information that you know of some irregularities with reference to transportation in your section; will you, in your own way, tell us what your people have to say about this matter?—A. The first topic I should like to discuss is that of uniformity of classification in all parts of the country. I do not know how many different classifications there are in use in the country, but I do know of several, and we have found more or less injustice to ourselves, in our business relations, growing out of this difference in the tariffs. When I speak of "we" in this connection I mean the concern with which I am immediately connected.

Q. (By Professor JOHNSON.) Will you specify what inconveniences you have suffered?—A. Yes; a specific illustration of such an injustice arises in the difference in classification in vehicles under the Official classification and the Western classification, which governs in the territory in which we are located. For instance, under the Western classification practically all vehicles, except those of large and bulky structure, are shipped at one and one-half times first class; under the Official classification, which governs in Michigan, certain sizes of packages of vehicles are shipped as first-class. Under an arrangement of the railroad companies the classification governing at the initial point of shipment governs clear through to destination. So, while under the Western classification we should have to stand a rate of one and one-half times first class, that package can go through to a similar destination at a first-class rate. It amounts to a discrimination against the carriage manufacturer or handler in our part of the territory which is decidedly felt.

Another illustration is found in the different requirements in regard to packages. Cutters, under the Official classification, may be shipped in crates set up with the bows projecting, but no wrapping of the projecting part is required; under the Western classification, the same crating may be employed, but the bows must be wrapped—if shipped unwrapped they will take a higher rating. I had an illustration of that kind a few days ago, where the manufacturers in Michigan shipped a carload of cutters to us. When reshipped by us the bows were not wrapped, and the customer had to pay the raised classification, simply because the manufacturer, under the Official classification, was not obliged to crate as under the Western.

There is another discrimination which affects our business there, and all engaged in a business of that kind, arising out of the difference between the Western and other classifications. For instance, under the Iowa classification buggies of all kinds, packed pretty nearly in all ways, are shipped at first class; under the Illinois classification, they follow pretty closely the Official classification. The railroad companies have made a special ruling on buggies, I think brought about largely by the competition or the advantages that were afforded by manufacturers in Illinois and Iowa, whereby they have made a rate that enables the Michigan manufacturer and the manufacturers along the lake shore up to Manitowoc, Milwaukee, Racine, and Chicago, all getting that rate, to ship vehicles to points in Iowa at a rate that is sometimes even less than the first-class rate from Manitowoc, Milwaukee, or Racine. I specify these three towns because they are in the territory governed by the Western classification. So far as I am able to learn, that special rate, made, as I suppose, for that purpose, applies on shipments originating at any of these towns and towns taking the same rates. It is claimed by the railroad companies that that rate is made for the benefit of the manufacturers in Michigan, or the East, although the tariffs in which I have found that rate make no provision of that kind. It would seem to apply to shipments originating at these three lake-shore points I have mentioned.

We have a carriage factory at our place, and also one or two concerns shipping vehicles to many points in Iowa; where they could get a first-class rate through, the rate at our place—one and one-half times first class—amounts to more than one and one-half times the rate from these lake-shore points I have mentioned; and we think it amounts to a gross injustice to us.

I give these facts as illustrations of the principle. It seems to me that wherever there is a difference in the classification there will be more or less injustice arising from it, and that would be obviated by the adoption of a uniform classification throughout the country. I am not prepared to say that there would not be some particular instances, perhaps, where a difference in the rate arising under the classification might not be just, but throughout the very broad extent of country where these different classifications apply, the uniform classification, it seems to me, would be the proper thing. Inasmuch as the railroads themselves have adopted varying classifications in large sections of the country, I do not see how that could be brought about unless it was done by some form of governmental authority. It is quite possible, I think very likely true, that even in our territory governed by the Western classification there may be advantages to our

people under that classification; but as nearly as I can reach a conclusion in the matter, it is not so. It is a very large subject of course, and one does not become posted on all the inequalities and niceties in a short time.

Q. I believe you suggested there was another subject you wanted to present?—A. Yes; it is on the subject of freight discriminations. I am not here for the purpose of making complaints against the railroad companies. I think their difficulties very largely arise out of conditions that are very difficult for them to handle; but what the business men of this country need more than anything else is not a comparative rate, but a stable rate. If we know that rates are so and so, our business enterprises can build on a rate of that kind, we know somewhere about where we stand, but so long as the railroads have the power to adjust the rates on whatever grounds they may think proper, very great hardships are sometimes produced.

I will give an illustration of what I mean in that respect. A short time ago, say about 3 years ago, our rate on agricultural implements, wagons, vehicles—carload rates—to the city of Madison, Wis., was 19 cents a hundred. La Crosse is situated to within a fraction of a mile at the same distance from Madison as Chicago is; and, of course, Racine and Milwaukee are somewhat closer; but we found we were unable to do business there. After a good deal of investigation, because our station agent did not seem to be posted on such matters, we found that from Chicago to Madison, Racine, and other towns taking these rates, the carload rate was 12½ cents. That was all we learned at that time. There was a good deal of correspondence and many interviews backward and forward among the railroads; and finally the rate from La Crosse to Madison was reduced to 12½ cents; but within a very few days after that, I discovered a tariff had been in existence for a long time, which made a rate from Madison to Chicago on the same class of goods of 8 or 8½ cents; and also a rate applying on less than carload lots on all kinds of agricultural machinery and wagons, in both directions, of 15 cents a hundred. At that time and now our first-class rate to Madison was 48 cents a hundred, and the other class rates also in proportion; but the third-class rate, if I have the figures correct, was 28 cents a hundred, while Chicago, Milwaukee, and these towns taking the same rates, had a flat rate on all kinds of agricultural machinery of 15 cents a hundred, applying in either direction.

Of course that placed us at a very great disadvantage in trying to reach that territory, which was practically, at least, as near to us as Chicago. That rate was apparently unknown to some of the higher railroad officials; at least they disclaimed knowledge of it; and after a time the rate was abolished and the regular tariff rates were instituted—that is, the carload rate was raised to 12½ cents, and the class rates on less than carload lots, as per tariff, were instituted. That ran a very few months in that way, when one of the roads made a break again and reduced the rates to these special ones I have just indicated, to 8 or 8½ cents on the carload and 15 cents on less than carloads. That prevailed again until within the past 2 months. It was abolished about 2 months ago.

I simply call attention to these facts as illustrative of the principle that when the railroad companies are left to make the rate themselves they will, to favor special shippers under special conditions, make rates that will impose a very great hardship on other people. It seems to me that with the natural inclination of the railroad companies to get business the best way they can, the rate-making power ought to be placed under control, so that such injustices could not arise.

Q. What recommendation do you make in regard to the matter of rates?—A. It seems to me that the only way that it could be properly controlled would be to vest it in the Interstate Commerce Commission. I do not feel like making the recommendation so broad as to say the railroad companies shall not have the power to make rates; but I would at least provide that the rates may be revised by the Interstate Commerce Commission, with authority to make their rates prevail.

Q. In other words, you believe in giving the Interstate Commerce Commission that power which they think they ought to have?—A. I do, very decidedly; and if necessary to carry out the power of the Interstate Commerce Commission, I think the recommendation for the appointment of Government examiners to examine the books of railroad companies would be of great value.

Q. Do any of the industries of La Crosse and Winona have to compete with the industries at St. Paul and Minneapolis, or markets south and east?—A. There are lumber industries there that do have to compete; there are at La Crosse also. I think there are some milling industries; but I am not thoroughly posted on the condition of the milling industry in connection with rates and tariffs.

Q. You manufacture vehicles?—A. We manufacture and place a line of agricultural machinery; but there is a wagon and vehicle factory there. There is a wagon factory also at Winona; I think none at St. Paul.

Q. Do you get as favorable rates to the West and South as St. Paul and Minneapolis do?—A. No; I think not, all things considered. St. Paul is favored with commodity rates; so are we with agricultural implements shipped into La Crosse, and we are dependent on commodity rates even for raw material. I think all manufacturers in the West are dependent on commodity rates to put them in position to compete at all with manufacturers farther east; but we find we are at something of a disadvantage because of the nature of the rates. For instance, La Crosse pays 2 cents less than St. Paul under the commodity tariffs, but we pay also to St. Paul about three-fifths of the rate of freight from Chicago to St. Paul. Our commodity rate on our raw material, mostly, of course, iron and steel, is about one-half of the rate from Chicago to St. Paul on the finished product; but it takes about two carloads of raw material in the rough to make one of the finished product, and it amounts to a discrimination against us.

Q. Some years ago there was quite a strong competition between La Crosse and Eau Claire for the lumber trade, was there not?—A. Yes; and, of course, there is more or less competition between them now. The lumber industry along the Mississippi River, as far as the manufactured product is concerned, is in a languishing condition, you know; the logs are disappearing, a good many of our mills are gone, and others of the mills will have to go somewhere else for the raw product. That is true all the way up and down the Mississippi River. I think the lumbermen have felt pretty well satisfied with the way they have been treated.

Q. (By Representative BELL.) Is it a prevalent suspicion among the public that different shippers are treated differently by the railroads, different industries are treated differently, and different communities?—A. I think that is so; yes.

Q. Is there a lack of confidence in the management of railroads to-day as common carriers?—A. Yes. Now, to verify your question in regard to the differences of treatment of different localities, I may say one of the general managers very politely informed me that the rates were made on a basis that was not calculated to favor the Western manufacturer for shipping East.

Q. Has it not been the practice of certain railroads to try to build up certain trade centers?—A. Yes.

Q. How does that affect public opinion in the intermediate points; does it create dissatisfaction or is it satisfactory?—A. That is a very difficult thing for me to answer. I have not heard that discussed so very much. There are some who feel very much dissatisfied with it, and others, I think, perhaps feel as well satisfied to have a center built up where they can have their materials on short notice without a great difference in freight.

Q. How would it be between points like St. Paul and Chicago, if the railroad should feel disposed to favor one or the other? You would not expect the people of St. Paul to be satisfied if they gave Chicago a preference, or the people of Chicago if they gave to St. Paul a preference?—A. I have seen that discussed in the newspapers, more particularly, perhaps, in reference to grain rates, and my impression was there was an extreme amount of dissatisfaction. I recollect also seeing discussions in the newspapers concerning discriminations against Chicago in favor of St. Paul and Minneapolis in grain rates. Chicago seemed to feel that other industries were very sadly left behind by the railroad companies.

To state the proposition in a very broad and general way, it is quite a question, in my mind, how far a railroad is justified in making rates that will build up any one locality at the expense of another. It seems to me that when you get right down to the very broad and general underlying principles business should be built up where there are natural advantages for the business. Any discrimination on the part of a railroad in favor of another locality diverts the development of the natural locality in favor of one which is unnatural.

Q. You understand a railroad can not be built except it be on the theory that it is a public institution, do you not? The only reason why a railroad can get a right of way through your ground against your consent is that the law regards it as a public institution for the benefit of the public.—A. A public institution, qualified, of course, by—

Q. (Interrupting.) What the law calls a quasi-public institution?—A. Yes; that is so.

Q. And every man who goes into the courts for the purpose of getting a right of way across your ground or mine must show it is being built essentially for the public, in order to get it?—A. I understand that to be the case.

Q. That being the case, is it your judgment that it has the right to discriminate against any individual, any community, or any industry?—A. That question has its difficulties; as a famous statesman once said, "It is a condition and not a theory that confronts us." That is true of the business of the West to-day, especially the manufacturing business; it is largely built up by what we might

call favors in the way of commodity rates for first-class freight, especially where the roads may be united upon some one town as against some other locality where the advantages are more natural. Whatever the original qualities of the proposition might be, they are very much modified by the actual condition of things to-day, in which large and prosperous communities have been built up by favors of the railroad companies. Whether it would be just to discontinue the special privileges of that kind, now that the discontinuance would result in damage to large classes and large communities, is a grave question. With this exception, I think your proposition is correct.

Q. It would be just discontinuing a wrong, and there is no reason why it should be done unless it would be a greater wrong to quit.—A. That is the question, whether it would not be a greater wrong to quit after having given a man to understand that there would be a continuation of the rates. Let me illustrate with this proposition of law; Say one goes on your ground without your knowledge and holds it, and after a while, say a period of 20 years, you try to regain possession and seize this ground.

Q. The law says they must have an undisputed possession, and claim and color of right; and has not every community been protesting all the time about this? Entered a continual protest?—A. No; I don't know that the other communities have been protesting against the conditions of the kind I am now speaking of.

Q. (By Mr. CONGER.) Could you give us an illustration of some manufacturing establishment that has been built up in the West by such favoritism as you have referred to?—A. Say the iron and steel that is manufactured in the East and is not the natural product of the West.

Q. Are there many iron and steel manufacturers in the West?—A. Yes; large numbers of them.

Q. I don't mean manufacturers of steel and iron, but manufacturers of the finished product from iron and steel.—A. Yes.

Q. (By Representative BELL.) More or less manufacturing of iron and steel products, is there not? We have a plant at Pueblo, Colo., that works, I suppose, 7,000 men.—A. Yes; that is true, but they never have cut any figure in any industry that I have been connected with.

Q. They cut a great big figure in the iron and steel industry, if you will notice the product of steel rails and everything of that kind.—A. But not in the line of business I am engaged in, that of manufacturing agricultural implements. So far as I know and am concerned, the largest iron center is near us at Superior.

Q. What do you know about the production of coal and discrimination in favor of the coal companies? Do you know of any coal mine in the country that has been able to mine coal for 20 years without being connected with a railroad company? A.—My knowledge of that is all hearsay; I have heard plenty of statements that the railroads control the anthracite coal industry.

Q. Did you ever know of a man who ran a private coal mine successfully, if he was not connected with a railroad?—A. I could not answer that question; my knowledge of the question would not justify that. I don't know that it is not so.

Q. Do you believe that under the conditions under which railroads were built it is right, if they are public institutions?—A. No, I don't. I don't believe it is right that a railroad company should favor any industry as against another one.

Q. Or individual?—A. Or individual.

Q. Do you believe it has any right to monopolize any industry because of the fact that it owns a railroad or may control transportation?—A. I do not; no.

Q. What is your experience; are people generally contented or not with the present condition of railroads and the way they are run, or is there a dissatisfaction generally?—A. That question will have to be answered, I guess, in two ways. There is something of a dissatisfaction on the part of people who are themselves shippers—business people, I mean—when they find that an injustice is done against them that results in favor of some one else. To state the proposition clearly for our own institution, I will say that it is not so much a question with us what the absolute rates are provided they are equitable as compared with those of other people with whom we come in contact. There is a large number of people who make a kick against the railroads and the conditions who really don't know whether they are justified in making a kick or not.

Q. Has it been the general opinion of the business public, and is it the general opinion now, that the railroads do assume to control the destiny of the business public, and that they may make one community and destroy another; give one man an overcheck and another man the regulation rate, etc.? Has that been the chief objection to the management of the railroads of the United States?—A. I have no personal knowledge of rebates; that is all hearsay; but no intelligent man can say that he does not hear a good deal in regard to them.

Q. Do you get as favorable rates to the West and South as St. Paul and Minneapolis do?—A. No; I think not, all things considered. St. Paul is favored with commodity rates; so are we with agricultural implements shipped into La Crosse, and we are dependent on commodity rates even for raw material. I think all manufacturers in the West are dependent on commodity rates to put them in position to compete at all with manufacturers farther east; but we find we are at something of a disadvantage because of the nature of the rates. For instance, La Crosse pays 2 cents less than St. Paul under the commodity tariffs, but we pay also to St. Paul about three-fifths of the rate of freight from Chicago to St. Paul. Our commodity rate on our raw material, mostly, of course, iron and steel, is about one-half of the rate from Chicago to St. Paul on the finished product; but it takes about two carloads of raw material in the rough to make one of the finished product, and it amounts to a discrimination against us.

Q. Some years ago there was quite a strong competition between La Crosse and Eau Claire for the lumber trade, was there not?—A. Yes; and, of course, there is more or less competition between them now. The lumber industry along the Mississippi River, as far as the manufactured product is concerned, is in a languishing condition, you know; the logs are disappearing, a good many of our mills are gone, and others of the mills will have to go somewhere else for the raw product. That is true all the way up and down the Mississippi River. I think the lumbermen have felt pretty well satisfied with the way they have been treated.

Q. (By Representative BELL.) Is it a prevalent suspicion among the public that different shippers are treated differently by the railroads, different industries are treated differently, and different communities?—A. I think that is so; yes.

Q. Is there a lack of confidence in the management of railroads to-day as common carriers?—A. Yes. Now, to verify your question in regard to the differences of treatment of different localities, I may say one of the general managers very politely informed me that the rates were made on a basis that was not calculated to favor the Western manufacturer for shipping East.

Q. Has it not been the practice of certain railroads to try to build up certain trade centers?—A. Yes.

Q. How does that affect public opinion in the intermediate points; does it create dissatisfaction or is it satisfactory?—A. That is a very difficult thing for me to answer. I have not heard that discussed so very much. There are some who feel very much dissatisfied with it, and others, I think, perhaps feel as well satisfied to have a center built up where they can have their materials on short notice without a great difference in freight.

Q. How would it be between points like St. Paul and Chicago, if the railroad should feel disposed to favor one or the other? You would not expect the people of St. Paul to be satisfied if they gave Chicago a preference, or the people of Chicago if they gave to St. Paul a preference?—A. I have seen that discussed in the newspapers, more particularly, perhaps, in reference to grain rates, and my impression was there was an extreme amount of dissatisfaction. I recollect also seeing discussions in the newspapers concerning discriminations against Chicago in favor of St. Paul and Minneapolis in grain rates. Chicago seemed to feel that other industries were very sadly left behind by the railroad companies.

To state the proposition in a very broad and general way, it is quite a question, in my mind, how far a railroad is justified in making rates that will build up any one locality at the expense of another. It seems to me that when you get right down to the very broad and general underlying principles business should be built up where there are natural advantages for the business. Any discrimination on the part of a railroad in favor of another locality diverts the development of the natural locality in favor of one which is unnatural.

Q. You understand a railroad can not be built except it be on the theory that it is a public institution, do you not? The only reason why a railroad can get a right of way through your ground against your consent is that the law regards it as a public institution for the benefit of the public.—A. A public institution, qualified, of course, by—

Q. (Interrupting.) What the law calls a quasi-public institution?—A. Yes; that is so.

Q. And every man who goes into the courts for the purpose of getting a right of way across your ground or mine must show it is being built essentially for the public, in order to get it?—A. I understand that to be the case.

Q. That being the case, is it your judgment that it has the right to discriminate against any individual, any community, or any industry?—A. That question has its difficulties; as a famous statesman once said, "It is a condition and not a theory that confronts us." That is true of the business of the West to-day, especially the manufacturing business; it is largely built up by what we might

the railroad is not really or wholly a public institution; men put large sums of money into the railroads in order to run them, and naturally they ought to have more or less voice in their management.

Q. They are built upon the theory that a railroad is built for the public, and that it is a public institution, and that the public is entitled to the same rights and privileges that any individuals are entitled to, I don't see where the roads obtain the right to give you a favor and withhold it from me. That is the question in railroading, between the people and the railroads.—A. I think that would be carrying the principle rather too far, to say that the railroads could not extend favors to its own employees. If the question was simply one between you and me, as outsiders, that would be different. It probably would be different if the employee were given such transportation facilities as would enable him to transact a profitable business and give him an advantage over you or me.

Q. Then you mean he shall only have transportation in connection with his employment?—A. No; I don't quite mean that, although, perhaps, that is it very closely. The railroad companies are in the habit of giving transportation to their employees on private trips, and giving it to their families; that is what I should call a courtesy to the employees, such as business houses are very largely in the habit of extending to their employees that they do not extend to the outsider.

Q. Is there any sentiment in your State in favor of the Government ownership of railroads?—A. Yes; I think there is. I don't mean to say, however, that it is the general sentiment, although I hear it talked of more or less.

Q. Do you know whether it is increasing or not; do you know whether there is more of such sentiment than there was a decade or two ago?—A. Yes; as compared with two decades ago, and possibly one.

Q. What do you think is causing that sentiment to grow; is it a desire to own railroads or is it because the people have been discouraged by reason of these discriminations and supposed injustice?—A. It arises, I think you might say, wholly from the fact that they think the public is not treated rightly by the railroads. I never heard a man express any opinion that the Government ought to own the railroads simply from a desire of ownership.

Q. So we must assume from that that they don't believe they can get justice in any other way?—A. I think it is fair to state that is the sentiment so far as I know. I don't mean to say it is the general sentiment, but there is a sentiment of that kind.

Q. If these shippers were to understand that the Interstate Commerce Commission would absolutely put down these discriminations between citizens, and also between localities and different industries, and that railroads would be compelled to treat everybody alike, do you think there would be any such sentiment?—A. It is very hard to tell what I believe in that respect. I think it would depend on the officials that were put in control of it for the Government. They might discriminate where the railroads discriminated; I think it is true sometimes that Government officials have wrongfully discriminated.

Q. But you would not expect that generally, would you?—A. No.

Q. You would not expect the Government officials would prohibit a man who had a private coal mine from shipping coal at a reasonable rate?—A. No, sir; as compared with rates to other people.

Q. Do you know, as a matter of history, that when men own private coal mines, even where they have given them a reasonable rate, they have refused to furnish their cars?—A. I don't know that of my own knowledge; I have seen it charged.

Q. Have you seen it in these investigations that have taken place?—A. Yes.

Q. Do you know that the charge is made everywhere, even where the States have made rates for coal and iron ore, that the railroads have always claimed to be short of cars—that they had no cars—and that that has made it practically impossible for a dealer to hold a customer?—A. I have seen that charged, but I don't know it of my own knowledge.

Q. Is it general history that these things have occurred; has it been generally rumored everywhere that the railroads had control of the coal industry of the United States?—A. That is putting it rather broader than my information would warrant; I don't know that that is the general history of the coal trade. I know it is charged very strongly that that is the history of the coal-mining industry of the East. There is a large mining district in Illinois, but I don't know that I ever heard it charged of the industry there. We have not been consumers of coal for factory purposes to any large extent; not for steam purposes anyway.

Q. (By Mr. CONGER.) Going back to the question of railroads giving passes to their employees, for a moment, I want to ask you this question: Do you know of any other institution in the country, wholesaling or retailing its goods or products, that gives special facilities to its employees for purchasing goods that are for sale;

do you know whether in dry-goods stores or clothing stores, when an employee wants dry goods or wants a suit of clothes, the firm makes a present to the employee of what he wants, the same as the railroads make presents to their employees of the transportation that is for sale?—A. It has been done in some places; I don't know that they make a general practice of it. It is quite a common thing for them to furnish their goods to their employees at less than the regular price to customers.

Q. Presenting them goods and furnishing them goods at cost would be a far different question?—A. No; not particularly; they have the right to do it—

Q. (By Representative LORIMER.) Have you known of large institutions that make presents outright to their employees?—A. Repeatedly.

Q. (By Mr. KENNEDY.) I should like to ask you if that was a well-considered reply when you said these passes were given to the employees of the railroads on the broad principle that employers show more favors to their employees than they do to others; has that been your experience? Then you used the word courtesy later on; I should like to ask you now if it is true that the employers show more favors and courtesies to their employees than to others who are not their employees?—A. I think that word was used advisedly on that subject. I did not attempt to discuss the relation of the employee of a railroad company to the railroad; but I think it is a fair statement that the railroad companies give their employees passes to make private trips, and it occurs to me that it is merely a courtesy to the employee.

Q. Don't you think that when they do this they know they are not losing any money by it? Is it not probably done by the employers, not so much in the way of a courtesy as because the service the men have rendered is such that they can well afford to give the passes?—A. I am under the impression that the higher up a man is in the service the easier it is for him to get transportation. As I say, I know very little about the pass business from personal experience.

Q. (By Representative LORIMER.) Do you know whether or not railroad employees when traveling over the road are given passes whenever they ask for them?—A. I may say yes to that, from the fact that I am acquainted with a good many railroad employees who have told me they received passes from the railroad company to go on business that I knew was personal, and not railroad business; but I never have been informed that they often receive these passes. I understand that at the present time such passes are limited to transportation over their own lines of road; although they used to be able to get transportation over almost any road in the country.

Q. Do you think it is generally understood that a railroad employee can get a pass over the road he is working for, to transact business of his own? That is, whether he is a man working for a dollar and a half a day, or whether he is the general manager of the road?—A. I don't recall any case in which a section hand got a pass in order to make a trip to transact business of his own; I do know of brakemen, conductors, and other employees of the railroads having them. Of course you understand that I am not on the inside, and if they receive them they don't come and tell me about it; so I must pass on that.

Q. Do you know of any railroad employee of any grade that was ever refused a pass after he had asked for it of the railroad for which he was working?—A. No, I have no knowledge of a refusal.

Q. So as a matter of fact, you don't know whether they give preference to the higher grade of employees or the lower grade? When I say grade of course I refer to the wages paid.—A. I feel a good deal like a man who tries to shoot something in the dark, but I will say this: Some of the higher railroad officials get annual passes, and I don't know of any of the minor employees that have received annual passes; they have trip passes. This talk is about something I don't know much about; but generally, I think, the people who have had the annual passes have been the people who have been able to benefit the railroads themselves.

Q. (By Representative BELL.) Do you know whether it is a general understanding that the wealthy man, who is the man most able to pay his fare, is the man who gets the passes, and the man who is most able to pay the schedule freight rate is the man who gets the rebate?—A. Yes, I have felt that that is true; that a great number of people seem to be able to get transportation, or generally seem to, so far as I know anything about it, who don't seem to be of any value to the railroad. For instance, it might be said to be a fair proposition that a concern, whether it is an individual or corporation, that should do any favor to a railroad or furnish it with a large amount of freight would be entitled, naturally, to travel free, if anyone can. But frequently I have seen passes in the hands of people who didn't furnish the railroad companies with 10 cents' worth of business, so far as I could see.

Q. (By Representative LORIMER.) Public men, for instance?—A. Yes; public men.

Q. (By Mr. C. J. HARRIS.) Is it customary to give the newspaper men passes in your part of the country, especially?—A. I don't know of their ever giving them any. It is generally supposed, I believe, that their transportation is rather in the way of mileage.

Q. (By Representative BELL.) How is it with the county commissioners? Do they get passes?—A. I could not go through the details regarding the county officials, or say how that is; I could not say that they do not get them and I could not say that they do get them.

Q. You have never obtained them for yourself and have never held any official position?—A. I remember some years ago I was in St. Joe and had occasion to go to Nebraska to a collection. The dealer I was doing business with there in St. Joe was a councilman, and I appreciated the fact very much that he was able to get transportation for me and the party who went with me, there and back.

Q. What was his business?—A. He was in my line of business. These favors are pretty scarce now, I should say; we don't hear anything of them in our place of business.

Q. (By Mr. C. J. HARRIS.) You come in contact, in your business, with the agricultural classes rather intimately, do you not?—A. To some extent, yes; by the agricultural class I suppose you mean the farmer.

Q. Well, yes. What is the condition of the farmer throughout the western part of the country at the present time? Is he getting fair prices for his products, and is he in a prosperous condition?—A. There are localities where his prices are not as great as he would like, but I think it is fair to say that the farmer in the West is prosperous to-day. I find on inquiry, where I have been during the last two years, that the farmers have the money that is in the banks. I don't do a great deal of traveling now, and of course I am not so familiar with these things. At the same time, I think it is safe for me to say that I have not seen or talked with a banker in the last two years but would say that in his locality the farmers have the money in the banks. From that I conclude they are doing well.

Q. (By Representative BELL.) How do the prices this year compare with those of last year?—A. I think, probably they are a trifle higher, but not very much.

Q. What do you mean? You don't mean that wheat or oats are higher, or potatoes are higher? You may take the lowest price?—A. I have not kept tab on the highest and lowest price; I base my assertions on what I have heard men say who have followed the markets more closely than I have done.

Q. I think you will find a great reduction in the price of wheat, oats, and potatoes; potatoes certainly so, and both oats and wheat show great reductions.—A. I have not kept tab on them, but I do remember hearing someone say—he was a newspaper man—and he said he paid, as a rule, a little more than usual; that prices were a little bit higher than usual.

Q. (By Mr. CONGER.) How about the prices of live stock, cattle, sheep, and hogs? Are they lower or higher?—A. I think they are higher.

Q. (By Representative BELL.) You don't mean that they are higher now? Are you comparing them with any time during the past year?—A. I have not got the figures; I have not kept a very close tab, as I say, on these things, but I think the farmers feel very well satisfied with the prices. Horses are higher; a great deal. Hogs are higher.

Q. Horses have come up, but cattle have gone down?—A. It is a general impression, but I should say they have not. As touching on the relative prices of beef, I would say that I went to the meat market the other day and the butcher told me that the best beef was getting so much higher than it was that the people would not buy; he didn't know but he should have to go out of the business on that account; he said beef was getting to be so high that the poorer classes would not buy it. I wish to say to the commission that our people down there favor a general mileage book for travelers going over the United States or over large sections of territory, and I desire to make that statement in their behalf.

Q. (By Mr. CONGER.) What class of people are directly interested in this mileage-book question?—A. Mostly commercial men.

Q. Commercial men and employees of commercial men. Is that the idea?—A. Yes.

Q. (By Mr. C. J. HARRIS.) Would it not be difficult to arrange that mileage book so as to give the roads in sparsely settled countries and over mountains the rates they are to receive; and these roads running through thickly settled communities and on level grades, the rates they ought to receive?—A. I don't know. It seems to me that the railroad companies might adjust these things if they wanted to. For instance, the tariff rate in South Dakota is 4 cents a mile. If

the traveler gets a mileage book on the roads here at the rate of 2 cents a mile—if he gets these rebates back here why should he not get them there? The theory of the 4-cent rate as against the 3-cent rate on other roads was that it is a sparsely settled country and, of course, there might be some difficulties of that kind. But the railroads always seem to be able to surmount a difficulty when they want to do so, in my experience.

Q. (By Mr. CONGER.) Do you think it would be feasible for a road to handle passengers, as an economical proposition, at as low a cost per mile per passenger in South Dakota as in New York?—A. No; I should not think that could be done.

Q. (By Representative BELL.) Why not?—A. Because they don't carry enough people at a time on a train.

Q. You mean the cost per mile would not be greater—the actual cost of running?—A. If I should figure that out, I should probably say that the cost of running the train in South Dakota would be every bit the same as the cost of running it in New York State, except, perhaps, the cost of the fuel; but I should say that the profit to be made would depend upon the number of passengers carried. If a train should only carry 100 passengers the first day's travel and the next day should carry 500, of course the railroad would make more the second day than the first.

Q. (By Mr. CONGER.) The question as asked was not as the Congressman put it. I asked if it would be possible to carry passengers at as low a cost per mile per passenger in South Dakota as in New York State.—A. I think it is very evident it can not be done in a sparsely settled and mountainous country as cheap as it can in the Eastern country, where there is many times as much travel and where the cost of fuel is less.

Q. To have a universal mileage book going over the entire country would work an injustice to some railroads?—A. The recommendation was not absolutely for a universal mileage book through those large and sparsely settled sections. They can carry passengers in Wisconsin or Minnesota, I think, about as cheap as they can in New York or Ohio; I don't see but there is quite as much travel in these sections of the country as there is farther east.

(Testimony closed.)

CHICAGO, ILL., November 23, 1899.

STATEMENT OF MR. AMOS S. MUSSELMAN,

Grand Rapids, Mich.

To the honorable subcommission on transportation of the Industrial Commission, sitting at Chicago, Ill.

GENTLEMEN: In response to your courteous invitation to appear before your body and testify relating to matters touching transportation in which Grand Rapids is interested or has just grounds for complaint, we beg leave to submit a communication on this subject and ask for it your patient indulgence and careful consideration.

1. We claim that the rate basis for Grand Rapids should be changed from 96 per cent of the Chicago rate to 90 per cent. We claim that we are justly entitled to this per cent on the actual mileage basis and that the change should be made operative on through business both to and from the East. Grand Rapids is the natural center or distributing point for western Michigan, accommodating a population of 1,500,000 people. These people and the large distributing agencies in our city have a right to demand that this inequality or unjust basis in the cost of freight be remedied.

Milwaukee, related to eastern Wisconsin as Grand Rapids is to western Michigan, has a 100 per cent basis of Chicago rate, which, by her actual mileage, she is not entitled to; and this discrimination is more apparent when the fact of cheap lake transit which is afforded to western Michigan from Chicago and Milwaukee is considered.

In 1891, when Grand Rapids was on a 100 per cent basis, our board of trade, with the good offices of the G. R. & I. R. R. Co. and the C. & W. M. R. R. officials, placed this matter before the Central Traffic Association, urging our just claims for a 90 per cent basis. This resulted in a partial remedy by our being granted a 96 per cent ratio.

While we may not have exhausted all the remedial powers within our reach to have this unjust basis righted, yet we have felt that to take this matter to the

Interstate Commerce Commission, with their lack of power to enforce compliance with their orders, would be a futile attempt and waste of energy. We therefore urge that you recommend to Congress that the powers of the Interstate Commerce Commission be enlarged and that it be given authority to make its orders mandatory and operative on any date it may name. We are of the firm opinion that with such authority vested in the commission many unjust discriminations would be speedily remedied and the people's interests better guarded and subserved.

2. As regards pooling, we think that it should be legalized under the supervision and direction of the Interstate Commerce Commission. The reasons are several: First, there could not be any inducement to cut rates, as each trunk line would be getting its agreed share of tonnage, as the tonnage would be equalized. If this were in effect we certainly should not see one of the main commodities have a 9 to 10 cent per hundredweight differential, which is the case on wheat and flour for export.

While many contend that pooling is wrong a greater portion of the shippers think otherwise, and it is the opinion of our board that pooling between the railroads would eliminate the rate cutting. Were it not for rate cutting the railroads could carry freight at a lower rate, simply because they would not be carrying a large amount of freight at less than cost to them, for which loss the rest of the freight has to make up. The Middle States, mainly Michigan, Ohio, and Indiana, are the ones most affected by these cut rates. The railroads claim they do no cutting. While they say they do not cut rates east of Chicago, they do from Chicago and from the Mississippi River points to the seaboard, and all the trunk lines carry this cut-rate freight across the Middle States and accept their proportion of this cut rate; and here is where the wrong comes in. They give low rates, as stated, from Chicago and the Mississippi River points, but not east of there, consequently the shippers of these Central States are unjustly discriminated against.

We believe the recommendations of your commission will have great weight with Congress, and as all agree that transportation matters in this country are not in an ideal condition, we respectfully submit the foregoing propositions for your consideration.

Respectfully, yours,

AMOS S. MUSSELMAN,
President Grand Rapids Board of Trade.

CHICAGO, ILL., November 24, 1899.

TESTIMONY OF MR. JOSEPH F. TUCKER,

Chairman of the Central Freight Association.

The subcommission on transportation met at 10.10 a. m., November 24, 1899, in Chicago, Representative Lorimer presiding. Mr. Joseph F. Tucker, chairman of the Central Freight Association, was introduced as a witness, and, being duly sworn, testified concerning transportation as follows:

Q. (By Representative LORIMER.) Please state your name.—A. Joseph F. Tucker.

Q. Your post-office address and official connection.—A. Chicago; chairman of the Central Freight Association.

Q. (By Mr. C. J. HARRIS.) We would like to have a little description of the organization that you represent.—A. Our organization is composed of about 60 roads—I think 61 or 62. The boundary of our association is from Chicago west, striking the Mississippi River at Burlington, then south, around to Pittsburg, by way of the Mississippi and the Ohio, up to Buffalo, and then, crossing the Canadian frontier, up to Mackinaw, down the east bank of Lake Michigan, and back to Chicago. Within that territory there are about 60 roads, members of our association. We have bimonthly meetings and such other meetings as necessity may require. The association's organization simply provides for information of what each road is doing. There is no agreement of any kind; each road is at liberty to do as it pleases.

Q. They make, you might say, whatever rates they please?—A. Whatever rates they please.

Q. And the other roads are informed of these rates; they know what they are doing?—A. As a rule, the roads interested in any particular traffic are informed. If a case came up of necessity for reduction of rates the interested roads would

individually state what they wanted, and that information would be sent out to the others.

Q. What is the condition of business in your territory at present?—A. It is very largely everything. For instance, our territory comprises the 10 large Eastern lines.

Q. What is the condition of their business at present?—A. As to rates or the condition of business?

Q. As to amount of business.—A. They have had more than they could do for the last three months.

Q. On that account there is little rate trouble?—A. I do not think there was ever a time when there was less rate trouble, and I think, as a rule, there has been more said about rate troubles than has been justified.

Q. Tell us something about these discriminations.—A. I do not know of any discriminations; I do not think any discrimination could long continue without being known to everybody.

Q. Does that apply to this charge that very large shippers get advantages over smaller ones?—A. I do not think there is any such case. Of course a man that is a large shipper and does a large wholesale business, like several packers or large grain men, naturally have more power than the smaller dealer. That is exemplified in almost every commercial transaction.

Q. What are your ideas on the legalizing of pooling?—A. I am inclined to think a legalized pool, under proper conditions, is the greatest incentive to stability and maintenance of reasonable rates. It removes any feeling, as a rule, I think, of shippers that they were not getting equal rates with their neighbors; they often think that when they really are.

Q. The great thing in railroad rates, I suppose, is that the public should have as low rates as it is possible to have and let the railroads exist and pay their expenses and interest properly. The next greatest thing to be desired is that all shippers shall be on an equality, to do away with discrimination. Would pooling do away with discrimination?—A. I think pooling will do away with it. I think it is the greatest incentive I can think of to the stability of rates. Of course the shipper feels hurt if the railroads do not equalize distances and markets. But the competition is pretty sharp among the railroads themselves. The Gulf competition opening up presents new phases, and this Montreal competition is getting to be a new factor. In fact, I think there has been a great deal of grain shipped from here during the last year for Montreal.

Q. Will that take a great deal of freight from the United States railroads?—A. It depends. It is, of course, only the surplus grain that is exported. I think it is unwise to cripple the roads so that they could not meet any competition; and then as to foreign countries' wheat, or as to any foreign competition in the way of transportation—but I am not well enough acquainted with that; the grain men ought to be able to tell you about that better than I. I think with the railroad facilities now between here and the seaboard they can successfully meet the ordinary competition. This year they have really been able to meet the competition of the lakes, but that is on account of the high rates. The rate between here and Buffalo has been as high as 3 and 4 cents a bushel; last year it was three-fourths of a cent. I think the reasonableness of rates should be left to the courts; let the railroads show that they are reasonable. I do not think it is fair to curtail a man's income, as you do when you want to dictate what the maximum rate shall be, and at the same time not help him out on his expenses.

Q. In that case what protection would the general public have against being held up by high and excessive rates?—A. I think the competition of the country would prevent any unreasonably high rates by any pool; and, secondly, I think the public should appeal to the Interstate Commerce Commission if they are unreasonable. But I think the final resort should be somewhere where the railroads could defend themselves.

Q. They would have the courts as a last resort, even if the Interstate Commerce Commission.—A. (Interrupting.) In that case it would be a last resort.

Q. (By Professor JOHNSON.) I understand the meetings of your association are twice a month?—A. No; once in 2 months.

Q. What is the object?—A. To consult and talk over matters; see what are the necessities of any reduction of rates or advance of rates.

Q. Who are present?—A. The general freight agents, as a rule, representing the different lines, or the freight traffic officials.

Q. (By Mr. KENNEDY.) This is the classification committee?—A. The Central Traffic Association. The classification committee is composed of 6 members of the Central Traffic Association and 5 others—there are 15 in all.

Q. (By Professor JOHNSON.) This is a successor of the Central Traffic Association?—A. Yes.

Q. You say rate questions are discussed at these meetings; these are competitive rates that are discussed?—A. Yes. Anything relating to rates is competitive; the word local is hardly to be used any more.

Q. The object of this discussion is to decide upon what rate you think you severally ought to put in force?—A. No; the individual roads settle that.

Q. Is it true, then, that individual general freight agents come there with a definite proposition as to rates?—A. No. For instance, a party asks for a rate from a certain point on brick, which is strongly competitive—a man does not care where it comes from—and the brick-interested roads come there and talk it over.

Q. He describes the situation and tells what rate that road would like to put into effect?—A. Yes.

Q. Your association takes action on that?—A. The interested lines do; yes.

Q. And make a recommendation to that line?—A. No; they state what they will do. The interested individual lines will, say, put in a rate from Hammond to Chicago of 3 cents a hundred, effective January 1.

Q. The agreement they come to is that they will charge the same rate?—A. There is no agreement; the interested lines say they will do it.

Q. Isn't there an understanding?—A. No; no understanding at all.

Q. Suppose there is an understanding that different roads are going to charge different rates on the same traffic?—A. There could not be; they will have to issue tariffs and the lowest will prevail.

Q. Suppose there is an understanding that different roads are going to charge a different tariff on the same line of competitive freight?—A. This could not be; it would be from the same point, and all the roads leading from that point will know it. These tariffs have to be filed at Washington, and we get information of all the files at Washington, and send out that information.

Q. You mean to say it is unavoidable that the competitive roads should establish the same rate?—A. It is inevitable that they would. They would have to if they did any business.

Q. That is tantamount to an agreement to charge the same rate.—A. No; I think not.

Q. In effect?—A. No; I think that if one road should make a 4-cent rate the others would have to make a 4-cent rate, or lower, to get any business.

Q. Then it is true that each individual road of these 60 reports to the association the rates it proposes to put into effect?—A. That is the usual course; yes.

Q. And if there is an objection, that is raised and discussed in your association?—A. Yes.

Q. As a natural result of that, is there not considerable pressure brought to bear on the individual members to charge a rate agreeable to all parties?—A. No; I do not think there is any pressure at all.

Q. (By Mr. KENNEDY.) Are these published rates maintained?—A. I believe rates are well maintained. I believe they are better maintained than they ever have been. Of course, it is very natural for the shipper to feel that he is not getting the lowest rate, but I think he is mistaken as a rule.

Q. You say you know of no discrimination; do you mean general or specific?—A. I mean general. I am only speaking of my own knowledge. I do not know of any cases of discrimination.

Q. Is the Chicago Great Western in your association?—A. No.

Q. (By Professor JOHNSON.) What action is taken by your association in case of a vigorous cut in the rate on the part of one member?—A. Just as other rates; meet it.

Q. (By Mr. CONGER.) By action of the association?—A. Not action of the association; individual action.

Q. (By Professor JOHNSON.) Is any effort put forth to get the individual to restore the rate?—A. If that is done, it is individual.

Q. Does the correspondence go through your association?—A. Not often.

Q. Not often; it sometimes does?—A. I do not remember any such case. The member that puts in a reduced rate does it on reflection, and usually has some good reason for it, and holds to it.

Q. You think the situation as regards rate making is radically different in your association from that before the decision of the Supreme Court in the trans-Missouri case?—A. We endeavor in our reorganization to avoid any violation of the law.

Q. (By Mr. KENNEDY.) Is it understood among the railroad men of Chicago that the Chicago Great Western enjoys a much larger volume of traffic than would naturally go to it because of the pirating of rates on the part of that company?—A. I could not speak understandingly of that; I do not know. They are in the Northwest. I was on the St. Paul some years, and the St. Paul used to bring into Minneapolis more wheat than all the other roads put together. They made what

they call milling-in-transit rates, and would have a carload of wheat from Dakota stop at Minneapolis to mill, and that same rate would apply on that wheat and on the flour, with 1½ cents for stopping at Minneapolis. I do not think, in the end, any pirating of any rates will result in any increased tonnage, because it will soon be met by the competitor.

Q. Do you know whether there is truth in the statement that the public rates are not maintained and that the railroads can not maintain them?—A. I do not know how it is in the Northwest, but I should say in our association the opposite was the case.

Q. (By Representative OTJEN.) In case the railroads were allowed legally to pool, do I understand you to favor the expansion of the authority of the Interstate Commerce Commission to regulate rates; that is, to revise them?—A. Not as a finality. It seems to me that the railroads should have a reasonable hearing as to what reasonable rates were. I think the railroads would not agree to it unless there was some provision as to reasonable rates. I think there should be just as strong a law against unreasonably low rates as against unreasonably high rates.

Q. The Interstate Commerce Commission would fix the rate; in some cases it might lower it, and in other cases it might think a rate was too low. That would not preclude the right of the railroad to appeal to the courts from their decision. Do I understand you that there is any objection to that?—A. I should not think there was any. I understand from you that is the same as it is to-day. For instance, the commission makes a ruling—

Q. (Interrupting.) With the exception that they now have no authority to enforce that ruling; is not that the case?—A. Would your idea be that the railroads would have to conform to the rates under that ruling until the courts ruled otherwise?

Q. That would seem to me—A. (Interrupting.) I should not favor that.

Q. (By Professor JOHNSON.) Why not?—A. Because I do not think it would be fair for the Interstate Commerce Commission, not having in view the tonnage, and expenses, and necessities of the rate, to change the rate.

Q. (By Mr. CONGER.) Why not, if the roads had the alternative before them of not entering the pool?—A. I am only favoring a pool for the purpose of stability of rates, that is all; it would be an incentive in that direction.

Q. (By Representative OTJEN.) Even with pooling, without any supervision, how could you be certain that there was no cutting of rates and no rebates given?—A. I can only answer that by saying I am certain of but very few things. I could not be certain unless I had definite knowledge, but I believe it would remove a great many of the incentives to it.

Q. Do you think that after the Interstate Commerce Commission has given a hearing upon a certain rate there would be any great danger that they would do an injustice to the railroads?—A. I can hardly answer that. It might be so and it might be otherwise. To illustrate, take the rates to-day on grain from west of the Mississippi. The board of trade report shows that they received last year 320,000,000 bushels of grain; in 1897 they received 297,000,000 bushels. That does not look as if they were discriminated against. We have to haul that grain from west of the Mississippi in competition with the Gulf; we have to calculate the ocean rate from Galveston and New Orleans, and the extra insurance, elevator charges, and all that enters into the cost of getting that grain through the gateways and meeting the competition.

Q. Is it not to be supposed that the Interstate Commerce Commission would consider all these things in passing upon these rates?—A. They could not; no. I have sometimes thought the long and short haul clause might be abrogated. It forces, for instance, the same rate from out in the neighborhood of Kansas City to Liverpool the same as via Galveston; it forces the same rates from intermediate points where there is not the same competition, not the same necessity.

Q. (By Representative BELL.) As I understand, you see no reasonable objection to a law that would keep the railroads that were evil disposed off the people, and then keep the people off the railroads; put them on absolutely fair terms as between the public and themselves?—A. Certainly not.

Q. Do you believe in relentless competition?—A. Unrestricted competition in the end is ruin.

Q. Is it not ruinous to grocery men, farmers, laborers—any other line of business?—A. Railroadng is simply a commercial transaction; it is selling transportation.

Q. I suppose in railroadng you necessarily have what is known as the unreliable railroad man, the same as we have the unreliable lawyer, merchant, or men in other lines; that is, men that will break in upon agreements and start a cut that not only affects the public, but affects railroads; not only affects the railroads, but the public. If a pooling arrangement could be enacted and put under a good

board, like the Interstate Commerce Commission, do you see any reason why it should not benefit the roads as well as the public?—A. I think a legalized pooling law would be a strong factor toward the maintenance of rates, and stop a good deal of the unsatisfactory feeling; yes.

Q. And I suppose there is no question but that railroad managers, traffic managers, confer and reason with one another against lowering a rate or raising a rate, just as grocery men do, or men in any other line of business, for the good of the whole?—A. They do reason together; but unlike the grocery man, perhaps, they can not go out of business, and they must meet the competition they encounter.

Q. Is it your judgment that these companies with the irreconcilable managers are a benefit to the business?—A. As I said a while ago, I think there is more said in regard to discrimination than is warranted. Between here and the East, with that immense tonnage, the lines were hauling yesterday. I think, something like 15,000 tons of grain; I think it is impossible for any shipper to have a reduced rate without everybody else knowing it very quickly.

Q. Is it possible for him to have a drawback system that you do not know?—A. Oh, yes; of course, that is possible.

Q. Mr. Huntington, I suppose you know quite well?—A. C. P. Huntington? I know him by reputation only.

Q. He stated a while ago before the Senate committee that the Santa Fe, when it went into the hands of a receiver, developed a state of facts showing it had paid over \$7,000,000 in drawbacks; now if that be true, did the other roads know it?—A. No. I should think they would know it if the Santa Fe got a greater tonnage than they would otherwise get; I think the other roads would have discovered that there was something wrong.

Q. Did they have any power to prevent it?—A. The only power would be to reduce rates.

Q. That meant ruin?—A. That meant ruin if they went far enough.

Q. Do you not believe it would be to the benefit of all reliable roads to have such a legal regulation as to absolutely prohibit that system of doing business?—A. Oh, there is no doubt of that.

Q. And it would not injure the railroad system of the country?—A. To prevent the rebates?

Q. To prevent rebates, discriminations, and special favors.—A. Oh, yes; no doubt of that, I think.

Q. Now, we have had before this commission some very glaring instances of these rebates, related by men that received the rebates. The tendency has all been to give rebates, as far as shown before us, to the men best able to pay the tariff rate. Do you believe that is morally right?—A. No.

Q. Do you approve of that?—A. No.

Q. You would also be willing to aid the people as well as the railroads in preventing such conditions?—A. Yes.

Q. (By Professor JOHNSON.) Believing these things, how can you make the statement that transportation is merely something to be sold?—A. As railroading is a commercial transaction, they sell transportation. Unlike other commercial enterprises, they are obliged to sell all at the same price. I do not think any different condition can long exist.

Q. Then, it is not something to be sold in the open market as commodities are sold; it is simply to be sold at a price equal to all?—A. Necessarily; like the open market of other goods, it would finally land in the same place.

Q. Do you think it ought to be the nation's business to say that this service is to be sold equally to all?—A. I think discriminations should stop.

Q. Do you think it is the nation's business to see that they do stop?—A. Oh, there is no doubt of that part of it.

Q. Mr. Stickney took the ground that transportation was simply something to be sold and bartered, the same as commodities.—A. I can not agree with him.

Q. (By Representative BELL.) You recognize that a railroad is a quasi-public institution?—A. Oh, yes.

Q. You are willing, and the roads with which you are associated are willing, that there be a reasonable Government regulation?—A. I could not speak for the roads. I can only give my own personal opinion.

Q. Is it your judgment that the reliable roads would approve of a just regulation on the lines you have designated?—A. Yes; that is my judgment.

Q. (By Mr. CONGER.) In fixing the rates from various cities or shipping centers in the West to the seaboard—to New York, we will say—Chicago is taken as a basis and called 100 per cent, and other cities are given a per cent, sometimes lower and sometimes higher, according to distance. Can you tell us how these rates or percentages are fixed?—A. That was reached through what was called years ago the joint rate committee. For instance, the Mississippi River was the

dividing line; the western roads hauled to the east bank of the Mississippi River, and do to-day, at the same rates, and there was an equalizer put in there. The rates to these points being the same, and from these points being the same, it made the same rate through all gateways. The 100 per cent arrangement, Chicago basis—Louisville having the same basis—was, as you see, largely comparative. Thus, the east bank of the Mississippi River being 116 per cent, the west bank is plus. Some of the western lines, as you know, have small volumes of tonnage, and therefore correspondingly heavier operating expenses; that adds to that percentage basis somewhat. The eastern roads pay the western roads, for instance, out of that 116 per cent 20 per cent, and they take the balance. That is the way that was arranged, and it runs through to Buffalo. For instance, Buffalo has got, I think, two-thirds of the Chicago rate.

Q. The St. Louis rate is 116 per cent?—A. One hundred and sixteen per cent plus; that is, the bridge toll. It is arbitrary, but has to be paid.

Q. Are these rates, 100 per cent and 116 per cent, proportionate to the distances from New York to Chicago and from New York to St. Louis?—A. Yes; the 100-per-cent territory—we have a map; I wish I had it here, and it would show you at a glance. It runs up into Michigan—95 per cent up around Detroit. It is on distance.

Q. Detroit is 95 per cent?—A. I do not know what Detroit is; it is, I should think, less than 95 per cent, possibly about 85 per cent.

Q. I think Detroit is 78 per cent, not wishing to give testimony myself, however.—A. The difference in rate is a little different from the proportionate distance, for this reason, that it is fairer on a long haul to charge less per ton per mile as you increase your distance. That is, the terminal expense is the same for a haul of 50 miles as it would be for a haul of 500; so that would change the percentage a little.

Q. Do you know what the Indianapolis rate is?—A. I think the Indianapolis rate is about 100, perhaps 96; somewhere along there, I think 96 or 98; the 100 runs down to Louisville, I know.

Q. We will suppose, for illustration, that the actual distance from New York to Detroit is 72 per cent of the distance from New York to Chicago, and that the actual rate in effect is 78 per cent. That additional 6 per cent, as I understand, serves for terminal charges?—A. It would be, as I say, a less rate per ton per mile as you increase the distance.

Q. As that distance was less, the point nearer New York, that 6 per cent arbitrary would be increased?—A. Yes, to a slight degree, always, as the distance lessens.

Q. Supposing a town was exactly 90 per cent of the distance to Chicago, ought that additional terminal charge to be as much as 6 per cent?—A. It might be changed to a slight degree. I am inclined to think that Indianapolis is on the direct mileage basis.

Q. But to reduce this arbitrary charge as the distance increases would be the fair principle?—A. Yes; I think distance must necessarily be a large factor in transportation, except, perhaps, where this strong competition, like the Gulf or some other competition, comes in. Then, you have to meet the rates your neighbors set.

Q. If the distance was 90 per cent, to charge 96 per cent would be too much?—A. I do not know that I should like to say yes or no to that until I had looked into the circumstances of such a case. There might be some reasons that would govern my conclusion. But I think the original joint rate percentages were considered very carefully some 15 years ago, and were taken up on the merits of each case. It is fair to presume that any road that felt its town was hurt by 96 per cent, when it should have 92 per cent, would have stated it and it would have been corrected. We have corrected that map to some extent; not a great deal; it has lasted well.

Q. Suppose the shippers of such a town thought the rate was too high; to whom should they go for a reduction?—A. They would simply deal with the general freight agent of the initial road. For instance, Indianapolis has four or five general freight agents there—the Peoria and Eastern, the Lake Erie and Western, and others—and they would say, We are not fairly treated.

Q. That initial road, unless it had a through line of its own, would have to deal with other roads, would it not?—A. As a rule, the eastern connections of our roads take it for granted that the men that originate the business know the most about the necessities of the situation, and as a rule carry out what they suggest.

Q. Is there anything binding through your association on these roads, the connecting lines?—A. No penalty, or anything of that kind.

Q. Was this arrangement originally made through your association, the percentage arrangement?—A. That was made 15 or 20 years ago; you will see the necessity in the way of equality of points for some such arrangement.

Q. Oh, yes; I see the necessity for it.—A. They have been well satisfied; there has been very little complaint about it. A rate from Chicago to New York of 20 cents carries at once that rate from Mississippi River points—116 per cent.

Q. We are to understand, then, that the burden of maintaining or reducing these rates rests principally with the road that initiates the freight?—A. Yes. To illustrate, here is Pittsburg, in the pig-iron district. Something comes up; pig iron is either advanced or reduced. The Pittsburg representatives hear the complaints of the shippers and look into the case, and, as a general rule, the shipper and the railroads meet and it is fairly considered all around.

Q. (By Representative BELL.) About that difference, I suppose you know it is the history of other lines of business. For instance, manufacturing plants get better prices nearer home, do they not, usually? For instance, a milling plant sells its surplus usually at a less price than it does the quantity necessary to supply its home customers.—A. I heard Mr. Counselman testify that he saw American flour sold in London cheaper than in New York.

Q. Is that not natural?—A. I can not understand it. Of course in other commercial transactions I presume they sell the same article. I know they do sell salt for different prices, according to the locality where it is going.

Q. Is it not your experience in all lines of business that the surplus goes for a less price than the general product?—A. Yes.

Q. For instance, here is a milling concern. They used to complain of a mill right where I lived. They said that 300 miles away they could buy the flour cheaper than they could at home. Still, I know as a matter of fact, because I was interested in it, that the flour we sold at the distant point we sold at actual cost, because we had to run, anyway, so much or shut down, and had to get rid of the surplus. Does not that cut some figure in railroading?—A. We are doing that to some extent to-day. For instance, the rate on export corn is 2 cents lower than the domestic. It is getting rid of the surplus and meeting foreign competition—meeting competition that the local interests do not meet.

Q. Is that not necessary for both railroad and consumer?—A. I think it is one of the wisest things for this country at large to move this surplus crop out.

Q. For instance, take a great iron plant, and if you may have its product for the foreign market at practically cost, that enables you to supply it with its domestic supplies, such as ores and other things that you do make a profit on?—A. I really do not know about that, but I had occasion once to contract for the surplus coal of a mine. I was with the Illinois Central then. They sold that surplus coal much cheaper than they did the general supply, and by our purchasing it—we agreed to take the surplus, whatever it was—they were enabled to keep that mine open and to keep the thing going.

Q. It developed the business at home?—A. It kept the mine open. If we had not taken that surplus the coal miner told me he could not have kept it going; and, of course, it was for our interest, as the mine was on the road, to keep it open.

Q. Do you not think that cut some figure in the shipping rate, moving the surplus?—A. Yes. Independent of that, the export traffic is very large in its volume; it loads the cars heavily, export grain and export flour also, and can be moved with fully as much profit to the railroad as other freight locally, in smaller volume.

Q. (By Mr. KENNEDY.) Would it not be good public policy on the part of railroads to place flour on the same footing with wheat, if there is an equal demand for it abroad, looking to the giving of employment to our mills and our workers in the mills?—A. I think the transportation rates should be based on the value, which carries with it the risk to the railroads; and I think also the volume has something to do with it. The law provides the carload as the unit. I think the manufactured article should always be charged more than the raw material, and, as a rule, it is of less weight.

Q. Suppose it is loaded to the capacity of the car; there will be as much in weight of the manufactured article placed in the car, and placed there at the expense of the manufacturers themselves. Ought not the railroads to haul it at the same rate as wheat?—A. Then there will come in the terminal expense and the risk. Export flour from Minneapolis loaded—I think the statistics show—about two-thirds what the wheat was loaded. To illustrate, 60,000 pounds can be loaded of corn and wheat.

Q. Millers say they can load 60,000 pounds of flour.—A. The loading being even, the only thing I can see is the value of the article moved.

Q. (By Mr. CONGER.) Might not the railroads be in part responsible for the average smaller carload, by furnishing to the millers smaller cars, and furnishing for the wheat shippers new and larger cars?—A. Those figures I saw did not take that in.

Q. What is the quality of this flour exported? Is it equal to the flour manufactured for home consumption?—A. I take it for granted you can not manufacture any article without its costing more than the raw material, taking the whole output. It must cost more than that by the cost of manufacture.

Q. That is a general rule.—A. It is a matter of evidence that that export flour bears about the same price as the wheat; but I think you would have to go into that pretty deeply to see whether they did not use the poor wheat for the export. I am inclined to think if you took the books of the miller and saw what he paid for the wheat and what he received for the flour, he must have had some profit.

Q. Might not a large proportion be in the offal?—A. That is the same thing, you know.

Q. At the same time, it would seem to me quite possible that the value of the flour is not greatly in excess of the value of the wheat, particularly as I think it is a fact, and I am inclined to think it has been testified to before the commission, that the quality of the flour exported does not equal that of the flour for home consumption.—A. I think that was the testimony, that it was of about the same price. We have a grain list; from the spirit of accommodation on the part of the railroads, perhaps because of their inability to say no, a great many articles have been added to that grain list; they run from corn products up. We are moving that at the same price as corn. But there is a risk which the railroads assume; frequently the railroads are insurers of the property. As a rule, there would be a very much lighter load. Cerealine can only load 26,000 pounds, while corn can load 60,000.

Q. (By Mr. KENNEDY.) Is there not a basis of truth in the theory of the millers that the cause of the discrimination against American flour is that the railroads are themselves merchandisers of wheat?—A. You mean owners of it? No, sir; I do not believe any such thing. I do not know anything about that, of course, but I do not credit that at all, and, as I said in speaking of competition, I do not think any such thing could long continue without those not in it knowing something about it.

Q. (By Representative BELL.) Is there not a custom also of charging a higher rate on a valuable article than on a less valuable, without considering the risk of the railroad at all, as a matter of public policy?—A. At times, on account, mainly of the necessities of the particular case. The classification is really based on the value, bulk, and risk. To illustrate, here are spring beds that are bulky; they would not be moved as cheaply as pig lead.

Q. Is not the idea of what the article will stand in transportation also considered?—A. In a particular way; yes.

Q. For instance, you take the Rocky Mountain region. There is no risk in moving the ores. They will say that ores which run so much to the ton will be moved to the smelter for \$10 a ton; here is another ore that will barely stand transportation, and they say, we will move that for \$6 a ton.—A. That is on account of the value; yes.

Q. That is on the theory of what the article is able to stand?—A. Yes; what the article in view of its value should pay, or is able to stand.

Q. You find that necessary in order to develop the industry of the country?—A. Oh, yes.

Q. Therefore you can not have a stated rate for bulk?—A. No; we are guided entirely by the official classification. There are three classifications, the Official, Southern, and Western; I think there is still another, the Transcontinental. These classes here are for these light, bulky, valuable articles; then, we run to six classes, and I think the Western has nine.

(Testimony closed.)

CHICAGO, November 24, 1899.

TESTIMONY OF MR. JOHN F. WOFFINDIN,

Chairman of Chicago East-bound Freight Committee.

The subcommission on transportation, being in session on the morning of November 24, 1899, Representative Lorimer presiding, Mr. John F. Woffindin was duly sworn and testified as follows:

Q. (By Representative LORIMER.) Please state your name in full.—A. John F. Woffindin.

Q. Your place of business, address, and official connection.—A. Monadnock Building, Chicago.

Q. Are you connected with the freight association?—A. I am chairman of the Chicago east-bound freight committee.

Q. What is the object of this organization, as to freight and freight rates?—A. Our object is that of a statistical bureau; we also keep a record of all the industries around Chicago, and what connection they have with the various roads. There are 1,200 of them, and we keep a record of their location and what it costs to make deliveries thereto. We frequently have to meet and discuss questions as they may come up in relation to our transportation on Eastern roads and the rates. We keep a record of the minimum rates so that we can at any time know what the minimum rate is from Chicago to any Eastern point.

Q. (By Professor JOHNSON.) How is this committee made up?—A. It is composed of ten Eastern trunk lines, the C. and E. I., and C., I. and L. are also members. The trunk lines are: The Baltimore and Ohio; Cleveland, Cincinnati, Chicago and St. Louis; Chicago and Erie; Grand Trunk; Lake Shore and Michigan Southern; Michigan Central; Pan Handle; Fort Wayne; New York Central, and St. Louis and Wabash.

Q. What officials of the railroads are represented?—A. The freight officials of the roads in Chicago; the assistant general freight agent, or the general freight agent, as he may have charge of the offices.

Q. (By Mr. C. J. HARRIS.) Of each road?—A. Yes.

Q. Do you have anything to do with the rate-making power?—A. No.

Q. You simply keep a record of it?—A. Yes. Of course, we have the record of the short line—the line that has the lowest rate of freight for the accommodation of business, and also a record of the other lines that have a similar rate.

Q. (By Professor JOHNSON.) In keeping this record have you watched the prices of railroads, and have you found out what the various railways are doing in the various rates; is it the object of your association to keep each member informed?—A. Yes. If a road reduces the rate we make a record of it and advise the others.

Q. Do any of the roads reduce the rate without letting you know?—A. No.

Q. Would you know anything about it if they did?—A. The probabilities are that we would know.

Q. (By Mr. KENNEDY.) You make discoveries in this direction?—A. Of course, we keep a full record of their tariffs and it would be a case of neglect on the part of my clerks if they did not report if any change was made.

Q. (By Mr. C. J. HARRIS.) What notice do they give of a change of tariff; I mean the number of days?—A. If there was no neglect in reporting I would find it out from the tariff they would send me, which would be the usual tariff they file with the Interstate Commission.

Q. (By Professor JOHNSON.) Don't you endeavor to find out in other ways than by inspection of their published tariff?—A. I don't see how we could find out in any other way. I guess we could find out from our billings in our statistical work. I think my attention would be called to it in some way if such were the fact, and rebates had been offered.

Q. (By Mr. C. J. HARRIS.) Have rates not been put down to such a minimum figure that discriminations or rebates would hardly be expected on the part of railroads for the last few years?—A. I think that is true. Last summer rates were at such a low rate that I don't think a road could possibly have discriminated without losing money.

Q. Is it your impression that there is discrimination among certain individuals by the railroads?—A. I don't know of any. I have merely learned from the reports in the papers; I don't know anything about it of my own knowledge.

Q. Do you think there is much freight discrimination?—A. I think quite probably there is, but I have no means of knowing that.

Q. Well, in your position, being entirely occupied with freight rates and transportation matters, you would be in a pretty good position to judge, would you not?—A. I don't see how I could.

Q. Have you any opinion to express on legalized pooling?—A. I don't think that I have. My views are pretty much the same as those expressed by Mr. Tucker. What I would say on that subject would be merely a repetition.

Q. Would you favor a governmental oversight of this pooling arrangement, if one should be made, through the Interstate Commerce Commission?—A. Yes, I would favor a legalized pooling, and I suppose that would have some supervision.

Q. Some governmental supervision?—A. Yes.

Q. For what term of years do you think a pool should be entered into?—A. I should say not less than five years. That is my opinion.

Q. Why do you object to a yearly change?—A. I think the difficulties attending the creating of a pool are such that the several phases and various conditions would have to be considered, and they are such that it would be impossible from year to year to change a pool and have it on the proper basis.

Q. (By Mr. KENNEDY.) Would there be anything in the way of a readjustment every year different from that of the preceding year?—A. It would depend altogether on the circumstances about changing. I think it would be better for the stability of the rates to be assured, and that the pool should have a certain tariff.

Q. (By Mr. C. J. HARRIS.) Would that, in your opinion, do away almost entirely with discrimination and the giving of rebates?—A. I think it could be so formed that it would.

Q. Illegal discriminations?—A. Yes.

Q. Would you make the penalties imprisonment or fines?—A. I don't know really that I care to express an opinion on that.

Q. Would not fines be more effective?—A. Yes; if they would enforce them and they were severe enough.

Q. (By Professor JOHNSON.) Do you think either fines or imprisonment could be imposed?—A. That would depend upon the legislature.

Q. Suppose the legislature passed a law making it an offense to cut the rate and imposed a fine for a violation of the law, do you think that it should be enforced?—A. As I said before, it depends entirely on their executive ability to carry out what they propose. I think there is no question, as a practical matter, but what it should be enforced. It would depend on the legal machinery that was employed in enforcing it.

Q. Would it require any special legal machinery to enforce it?—A. I don't know. It might be necessary. I don't see why it should be, in a penal way. I think it could be enforced.

Q. (By Mr. C. J. HARRIS.) A bill not providing for suits for damages for the breaking of the agreement, or without fines definitely set forth for each offense, would be of no effect, would it?—A. Very probably not. I think to make it operative it would have to be subject to penalties.

Q. (By Representative BELL.) You said that if there were discriminations within the last 2 years, in your judgment, the roads that did so carried the freight at a loss?—A. No; I didn't say that. I was asked the question as to whether the current published rates were so low that anything carried below that would be at a loss.

Q. I understood you to say that it would.—A. Yes; I say so now.

Q. Under the low discriminating rates?—A. I did not say that they were discriminating.

Q. If any roads should discriminate, it would usually be the weak roads, would it not? Is not that the general custom of the weaker roads?—A. That would depend on circumstances. In an ordinary way I suppose that would be true.

Q. You said they were running at a loss if they were carrying it at a lower rate than the published freight?—A. Yes.

Q. They are presumed to carry it for a reasonable rate?—A. Yes.

Q. Now a road that is running its machinery any way, and not carrying loaded cars, might lessen that loss by taking this freight at actual cost, might it not?—A. Yes, to a certain extent.

Q. Then would not a reasonable rate fixed by Congress really benefit all the strong roads and protect them against the weaker roads, who were undertaking to cut down expenses?—A. A reasonable rate might do that, certainly.

Q. You see no objection to that?—A. I see no objection provided the rate is made, not only in the interest of the public, but also with some consideration as to the rights of the roads.

Q. You don't doubt but that the action of Congress would be reasonable on both sides, do you?—A. I have no reason to suppose otherwise.

Q. Is it not your experience that the principal objection to rebates and discriminations is not so much to the rate itself as giving special favors applying to one merchant and thereby tearing down the trade of another; building up one community and tearing down another, or one industry at the expense of the destruction of another?—A. I think that is so, in a general way, yes.

Q. And that is what the real public clamor is about—that is, supposed favoritism?—A. Yes.

Q. Is it your judgment that the roads you represent would object to such a law as would put every shipper, every community, and every individual upon an equal standing as to the rates?—A. I would not like to answer for the roads, but so far as I am concerned I see no objection to it.

Q. Is that the judgment of the reputable roads?—A. They would be, I think, very glad to have anything that would insure them stable, and at the same time reasonable, rates.

Q. You have no apprehension that a board like the Interstate Commerce Commission, appointed by the President, would be unreasonable?—A. I have no

reason to suppose so, no. If the facts were properly stated before them, I would have every reason to believe their action would be reasonable.

Q. They have always been patient in hearing both sides, have they not?—A. That is my experience, yes.

Q. And it is your judgment that the roads would be willing to have the jurisdiction of the Interstate Commerce Commission so extended that they might control the business in the interest of both the people and the roads?—A. I don't think any of our roads would have any objection to any measure that would insure reasonable and permanent rates.

Q. (By Representative OTJEN.) Do you see any objection, in case of legalized pooling, to conferring authority upon the Interstate Commerce Commission to reduce rates; to lower them if they see fit, and to raise them if they see fit; to regulate the rates?—A. Of course it would be supposed that they would not take any action until after they had heard the arguments of the railroads. I could not tell without hearing the arguments of the roads. Of course, if the rates had to be reduced by some superior power, where there was a friction between what the roads might consider was the proper rate and what the public might consider was the proper rate, I don't see why the Interstate Commerce Commission should not be as able to decide on that as any other body. There would have to be some power to arbitrate these questions.

Q. (By Representative BELL.) Have you examined the Cullom bill that was introduced in the Senate?—A. No.

Q. You don't know the terms of it?—A. No.

Q. (By Professor JOHNSON.) Are you in sympathy with the movement that has been inaugurated to enlarge the powers of the Interstate Commerce Commission?—A. I have really given that matter no thought and I would not like to give an opinion upon it.

Q. As a general proposition are you opposed to it?—A. I did not expect to be asked any question of that kind; it is rather out of my line of duty, and I don't feel competent to answer.

Q. Are you in sympathy with the amendment, or opposed to it, and if so on what principle?—A. You mean in sympathy with the amendment in what way?

Q. Enlarging the power of the Interstate Commerce Commission so as to give them power to enforce their rulings?—A. I think certainly that their powers should be increased, at least so that they can be more operative than they are at the present time. That is my idea.

Q. Do you think railroad men situated as you are would be inclined to oppose such a movement?—A. I don't see why I should.

(Testimony closed.)

CHICAGO, ILL., November 24, 1899.

TESTIMONY OF MR. J. T. RIPLEY,

Chairman of the Western Classification Committee.

The subcommission on transportation being in session on the morning of November 24, 1899, at Chicago, Ill., Representative Lorimer presiding, Mr. J. T. Ripley was duly sworn, and testified as follows:

Q. (By Representative LORIMER.) Please state your full name.—A. J. T. Ripley.

Q. And your official connection.—A. Chairman of the Western Classification Committee.

Q. And your post-office address.—A. Chicago.

Q. Will you please state to the commission the purpose of the organization of the Western Classification Committee and its connection with railroad tariffs?—A. The purpose of the committee is to establish and maintain a freight classification for Western roads; and its relation to freight tariffs is that it forms the basis upon which rates are made. An article is presented for shipment, and it becomes necessary to examine the classification and see what class it is given in that document, and then the rate is established, the class rate being quoted on that article as the schedule of rates or tariffs on the article.

Q. (By Mr. CONGER.) How is your committee made up; is it made up of the representatives of Eastern roads? By its relation with Western railways, you mean those roads running west of Chicago?—A. Yes.

Q. Each road being equally represented?—A. Each road is represented as a road. It sends a delegate to the committee, and has presented to the committee questions which it wishes presented.

Q. What official of each road usually comes?—A. Usually the assistant freight agent, sometimes the general freight agent or the traffic manager, sometimes the commercial and general agent.

Q. Does your committee have frequent meetings?—A. Twice a year.

Q. Only twice a year?—A. As a rule we are forced to have an extra meeting; but the by-laws provide for two meetings each year.

Q. What are your duties as manager?—A. My duties as chairman are to preside at meetings, and decide questions on the construction of the classification in the interim between meetings, or rule upon new articles presented for classification which are not already provided for.

Q. And your rules are operative as soon as made and on all the roads?—A. Yes; as soon as they are published they are operative.

Q. Are there many changes in your classification from year to year, or does it remain quite permanent?—A. Constant changes are being made at these semi-annual meetings; still, the changes are not so very numerous.

Q. There are other classifications?—A. Yes; Official classifications, which go east of Chicago and the Mississippi River and north of the Ohio River; and the Southern classification, which is in effect south of the Ohio River and east of the Mississippi River, and the Western classification, which is in effect from Chicago west to the Pacific coast.

Q. Suppose freight starts in New York under the Eastern classification and comes over into your territory under a different classification; how is that rate arranged?—A. If it comes through Chicago it is rebilled under the Western classification; and that may give it a lower or higher rate.

Q. Is that much trouble to the shipper?—A. I don't think it is a source of great inconvenience to the shipper. I have not heard of any objection to it on that account.

Q. That does not cut much figure, then?—A. I think that if there is any inconvenience it would be to the carriers rather than to the shipper.

Q. (By Professor JOHNSON.) Can a shipper ship right through to the Atlantic or the Pacific coast?—A. In some instances, I understand, the property has laid over, and is not billed through; and they make other rates apply from the seaboard to the Pacific coast.

Q. (By Mr. C. J. HARRIS.) What is your idea of a universal classification that would apply to the whole of the United States?—A. I am in favor of it.

Q. Could that be done by a governmental commission?—A. I think the railroads should frame such a universal classification. The attempt was made at one time to frame such a classification; practically it was agreed upon; but there were some parties that dissented and it was not put into effect.

Q. The railroads having failed to make a uniform classification, it is hardly possible—unless it be done by the Interstate Commerce Commission, or by some other authority—that it could be made at all, is it?—A. Perhaps not, unless it was made mandatory upon the railroads to frame such a classification.

Q. (By Mr. CONGER.) In the changes that are frequently made in this Western classification, is the trend toward uniformity or in the other direction?—A. I think the trend is toward uniformity.

Q. At the time the effort was made, as you have stated, to adopt a uniform classification, did those who objected to its adoption come more from one section of the country than another?—A. Yes; I understand so.

Q. They were from what section?—A. I understand the objections were from the East, principally, although some of the Pacific coast lines thought it impracticable, I believe.

Q. (By Mr. KENNEDY.) Has a gentleman named Chapman, of Painesville, Ohio, who was before the committee last week with a scheme for uniform classification, called his scheme to your attention?—A. I never heard of it; no.

Q. (By Professor JOHNSON.) Do you know whether discriminations result from the existence of these different classifications?—A. I think we had discriminations as between markets.

Q. Please explain how such discriminations may be the result of having several classifications?—A. Well, if the Official classification makes a lower class on a given article in the northern or western division, it becomes more difficult to ship that article from Chicago to points where the Western classification governs than it otherwise would be. For instance, the Official classification goes to St. Paul—that is, on all business from all points east of Chicago and St. Paul—and the Western classification governs from Chicago to St. Paul on that article. The Western classification being higher than the Official and the Official only governing from points east of Chicago, the Chicago shipper is at a certain disadvantage in reaching that particular market. It is also lower on business going to the Missis-

Mississippi River points, where the Official classification reaches. That has resulted in discrimination in favor of the Eastern shipper as against the shippers into this territory that is open to both classifications. To illustrate: if a man is shipping from a Wisconsin point to a market in either direction, he has to ship under the Western classification, whereas, if an Eastern man is shipping to the same market, he ships under the Eastern classification, and, speaking generally of the classification of the Eastern division, it is somewhat lower than the Western; and in that instance the Wisconsin shippers would be at a disadvantage.

Q. Would that be true of the Illinois territory?—A. To some extent, that is modified in Illinois. In Illinois there is a classification of freight framed by the Illinois board of railway and warehouse commissioners that is intended to offset that disability to some extent. Of course, the interstate character of commerce and competition interferes with the Illinois commission.

Q. Does not the fact that the commerce in the Illinois markets is largely interstate—does not that prevent the Illinois commission's tariff from having much effect?—A. Yes. It would not apply outside of the State.

Q. (By Mr. C. J. HARRIS.) The greater bulk of the freight would be in carloads and get the special rate, would it not, without being classified, such as wheat, coal, pork, etc.?—A. That is shipped outside of the classification; is not amenable to the classification. I don't have anything to do with the control of the rates.

Q. That, I suppose, would comprise the greater bulk of the freight, if not in value, would it not?—A. Probably it would, although I have never seen any figures made.

Q. Your classification applies to carloads?—A. Yes; and to less than carloads.

Q. (By Representative BELL.) Does your line of duty enable you to know the contents brought by the consignees of these goods through this separate classification?—A. Yes; I am apt to hear of them.

Q. Does it not result in a great many suits of replevin?—A. My impression is that it does not. Companies don't oftentimes have suits. There are oftentimes questions in dispute, and they give rise to complaints, and very often it causes delay in delivering the freight.

Q. Sometimes it results in a replevin suit, does it not?—A. Not within my observation. I don't think that is oftentimes the case.

Q. Now, in making up these classifications, what do you take into consideration?—A. Bulk and value are the two controlling features.

Q. You always consider what an article will stand, do you not?—A. That is one element, yes; represented by the value of the goods; and the element of bulk represents the accommodation furnished by the carrier and the space occupied.

Q. And also you consider what the article will stand, and the manner in which it is to be moved and used?—A. I don't think that that would be hardly a valid consideration in fixing a classification.

Q. If you were going to classify a very low grade of iron ore, a remarkably low grade; would you be liable to classify that according to its grade?—A. The element of value would be considered.

Q. But you haven't that exact.—A. The element of value don't represent all of it. Of course, the other element of bulk would be considered, inasmuch as it would enter into the amount required to make a carload, and the accommodations to be furnished.

Q. (By Mr. CONGER.) Is iron ore given two different classifications?—A. We have iron ore classified, but it is modified under the classification—under the so-called commodity rates, which are usually lower than the classification or tariff rates.

Q. It seems to me that when the railroads make two different classifications on iron ore and then pass on the quality or value thereof it would———A. (Interrupting.) It would complicate matters.

Q. (By Representative BELL.) Do you know of such a rate existing in the Rocky Mountains?—A. I can not say that I do, although it is my impression rates have been made based on the value of the ore.

Q. Now, do you think a uniform classification would dispense with all this trouble and annoyance to the consignee?—A. I believe it would, very largely.

Q. And do you see any reason why, when the railroads want to classify, some other power, as an arbitrator, might not do it and take into consideration all the facts, and compel the obstreperous roads to come in?—A. The framing of a classification would be a very complicated piece of work to those who have not been familiar with it, and it is doubtful whether a classification framed by the commission would give general satisfaction; at least at first. I think they might find it worse to take one of the existing classifications for the purpose of framing a new one than they would to frame an entirely new classification.

Q. You would not expect a board like the Interstate Commerce Commission to classify without taking your classification or right rates, and if they found any defects to correct them, would you?—A. No.

Q. You have no doubt but that they would take the classification of the railroads generally?—A. I think that they would find it wise to do it.

Q. If they should have a full hearing, which they would undoubtedly, and all interests should be considered, would you anticipate any injury would result to the roads from such a classification?—A. No.

Q. (By Mr. KENNEDY.) Please state what the privileges of shippers are before your committee.—A. The shippers have been demanding competition with the change in classification. They are naturally for reduction in classification, and these complaints are heard and considered at our semiannual meetings. They have the privilege of appearing before us and stating their cases.

Q. In person or by attorney?—A. In person or by delegate or attorney. The petitions are considered and passed upon by the committee.

Q. Is there much complaint on the part of shippers that their privileges are not sufficient before your commission?—A. I think there is a general satisfaction among shippers so far as the Western classification is concerned, as to their privileges of stating their cases and appearing.

Q. (By Representative OTJEN.) Did not the railroads several years ago get up a general classification which was substantially agreed to by the railroads with the exception of one or two?—A. Yes; that is correct.

Q. Of course that classification could be taken into consideration by the commission if they saw fit to take it up?—A. Yes; it would be available.

Q. (By Mr. KENNEDY.) Can you state what roads defeated that classification and give us your belief as to why they did it?—A. I don't know what roads objected to it. I understood that roads in the East were the most numerous among the principal objectors; but what the reasons were that led to it, and their objections, I could not say.

Q. (By Representative OTJEN.) You think that general classification is practicable in the entire country, do you?—A. Yes; I believe it is.

Q. It is not necessary to have a classification according to the sections?—A. No.

CHICAGO, ILL., November 24, 1899.

TESTIMONY OF MR. JOSEPH BOOKWALTER,

Representative of Kansas City Board of Trade.

The subcommission on transportation being in session in Chicago, Representative Lorimer presiding, at 11.50 a. m., November 24, 1899, Mr. Joseph Bookwalter, representative of the Kansas City Board of Trade, was introduced as a witness, and, being duly sworn, testified concerning transportation as follows:

Q. (By Representative LORIMER.) What is your name?—A. Joseph Bookwalter.

Q. And address?—A. Kansas City.

Q. Whom do you especially represent here?—A. I am in the grain business at Kansas City and a member of the board of trade, chairman of their transportation committee; and I represent the Kansas City Board of Trade.

Q. Will you, in your own way, state to the commission the matters you have thought of with reference to transportation?—A. Well, I can only speak of the tariffs as they practically affect our business at Kansas City. We have centering in Kansas City something like 16 or 18 railways, penetrating the territory surrounding the city, and are there to receive grain on consignment or buy it in the country and sell it again, to store it, to manufacture it into flour and ship it out, both for local consumption and for export. We have a grievance or two, perhaps. Our grievance consists chiefly of this: That in all the tariffs of all the roads the rate from any local point into Kansas City and then the rate from Kansas City out to any other point is from 1 cent and up, higher than it would be from the originating point to the point to which it may be shipped—1 cent a hundred.

Q. (By Mr. CONGER.) Is that true of Kansas City only, or of many other cities of the country?—A. That is true, so far as I know, only of the Missouri River towns—Kansas City, Atchison, Leavenworth, St. Joseph.

Q. The rate on grain you are speaking of. Is not that or a similar situation true of Chicago?—A. I am not informed as to Chicago. I do not know how it may operate in Chicago, but it operates to ruin our business.

Q. (By Mr. C. J. HARRIS.) Why would it not be reasonable that 1 cent more should be charged where the freight is shipped in and unloaded and then shipped out again than if it went directly through? I understand you say that is unreasonable.—A. Yes; it is unreasonable in this: That it is sufficient to bar the business. It is particularly unreasonable with reference to us because it is not true with reference to any other local station along any of these lines in the same business. You can go west on any of these roads and buy a car of wheat and ship it to the mill or elevator at any station on that road; it is unloaded and manufactured into flour; loaded out again, and shipped to destination without any additional charge.

Q. (By Mr. CONGER.) Under a milling-in-transit rate?—A. I do not know what they call it; they permit it, and it is done.

Q. (By Representative OTJEN.) What reasons do the railroads give for the making of this additional charge for the towns you speak of?—A. They call it breaking bulk.

Q. Rehandling?—A. They may rehandle it and they may not; they may do nothing; but if it is billed to Kansas City and billed out there is an additional charge.

Q. Even if the grain never leaves the car?—A. Even if the grain never leaves the car. They are to no more terminal expense or breaking-bulk expense at Kansas City than at any other place. It may not go off their track, and may not even go out of their yard.

Q. Name some other place.—A. Take Topeka, for instance, west of Kansas City.

Q. Name some small station west of Topeka.—A. Ellsworth, perhaps.

Q. I asked you to name these towns that I might put this question, that we may have a clear understanding of the case. I understand you complain that it is possible for a buyer or handler of grain to buy a carload of wheat at Ellsworth, bill it to Topeka, there rebill it to New York at the through rate from Ellsworth; that there is no additional charge?—A. At the balance of the rate; yes.

Q. That there is no additional charge because of the rebilling or stopping at Topeka?—A. That is right.

Q. Yet if that car were bought at Ellsworth and billed to Kansas City and there rebilled to the same point they would charge you an additional rate for that rebilling?—A. Yes. Now, if there was any switching done at Kansas City there would be an additional charge for it, but for whatever switching may be done at Topeka or the intermediate point there is no additional charge. If it should leave the road over which it came and went to an elevator and went out over another road there would be a switching charge of \$2 to \$6 a car.

Q. What road or organization of roads is responsible for making this charge, this discrimination, against Kansas City, if you might call it such?—A. I do not know that any one road is more responsible than another; they are all in it. A portion of these roads do not go beyond Kansas City and can hardly be said to be grain roads; they do not take grain to Kansas City, hardly.

Q. Are there any roads running into Topeka that do not run into Kansas City?—A. No.

Q. Have these roads that run into Kansas City and also into Topeka any reason for favoring Topeka as against Kansas City that you know of?—A. Yes; I think they would make this claim: At Topeka they can feel pretty sure they will get it out on their own road to destination, while if it goes to Kansas City they might never get it again. They claim it to be their car so long as they can haul it, and therefore dictate where it shall be sold; and they make a rate that will govern that. I think, perhaps, the roads most responsible for that arrangement are the Santa Fe, the Missouri Pacific, the Rock Island, and the Burlington; but the rule applies the same to roads terminating at Kansas City from the West.

Q. (By Mr. KENNEDY.) How could they be sure of getting the grain in their own cars from Topeka eastward unless there was some understanding between the roads, since there is competition between Kansas City and Topeka? Is there not more than one road running between these two points?—A. Usually it goes into the elevator or mill on their own line. The operation of it is very effective as against us. The local mills throughout Kansas and Nebraska and Missouri sell supplies either side of us; cars will go right through Kansas City going to mill. It has been very effective, and operates in many instances to entirely destroy the business.

Q. (By Mr. CONGER.) The milling business?—A. And the grain business, both. Kansas City does not get good milling wheat. The local mills can afford to buy it and pay more than our millers can pay, because they can manufacture it for export on the same basis that our people do, and our people have the cent or more per hundred and their switching charges besides.

Q. (By Mr. KENNEDY.) One grain man in Iowa testified that because Kansas

City was a milling point they could get better prices in Kansas City at times than they could in Chicago. That would seem to indicate, if his statement is true, that they get the best class of grain there.—A. They can only do that for their local business. Kansas City is a higher market for grain than any other market for grain in the country, simply because we get so little. Take oats—hardly a car comes to Kansas City to be shipped out; 4, 5, or 6 cars of oats a day is as much as is received there, and that is consumed there, because the roads add the 1 or 2 cents to ship through Kansas City.

Q. (By Mr. C. J. HARRIS.) Do you know how much wheat Kansas City receives?—A. That is governed a good deal by the size of the crop. Last year we had about 30,000,000 out of a territory that raised 240,000,000.

Q. (By Professor JOHNSON.) Not all of that 240,000,000 was shipped out of that territory?—A. No; but we got a very small proportion of it. To give an illustration of how that will operate as affecting us, our mills, and necessarily our elevators, I wrote some letters to shippers in the country and asked them to say how many cars of wheat they had shipped from July, 1898, to July, 1899. I have not these letters with me. I did not think to bring them, and only speak from memory. From a little town like Inman, a local station on the Rock Island, a shipper shipped something like 400 cars; 54 of these came to Kansas City; 227 stopped at a mill on the way to Kansas City—large mills, grinding for export, in competition with our mills.

Q. (By Representative OTJEN.) You speak of 2 cents. Is it sometimes more than 2 cents?—A. Yes; very much more sometimes.

Q. Two cents and upward?—A. Yes; one cent and upward.

Q. How high does it go sometimes—the difference?—A. Seven or eight cents.

Q. In addition to that there is a switching charge?—A. In addition to that there is a switching charge.

Q. Which is not charged any place like Topeka and these other places you speak of?—A. Yes. Speaking of the grade of wheat that we receive, we had something over 500 cars as a result of 3 days' receipts, taking in 2 holidays and Sunday. It being a large receipt, I made inquiry of the inspection department to see what was the grade of wheat and found there was less than 2 per cent of these 500 cars that was graded wheat; it ran from "rejected" to "4" and "3."

Q. What is the reason they send inferior grades to Kansas City?—A. It is the nearest market, and it is very uncertain what they will receive for the inferior grades if they send to Galveston, New Orleans, or Chicago, and as a rule they are not in a condition for long shipment, and it is desirable to get them out of the car as soon as possible.

Q. (By Mr. CONGER.) What becomes of that wheat?—A. It goes into the elevator and is scoured and dried.

Q. Kansas City is the nearest market where that can be done?—A. Kansas City is the nearest market where that can be done and storage be obtained. I want to say that this discrimination—arbitrarily from 1 cent a hundred up, with the very narrow margin on which the grain business is now done, any difference in the charge between one and another—determines the movement of that grain; where it shall go. Not very long ago the city of New York appointed a committee to investigate as to why it was that they were not receiving as much grain for export as they previously had. Among others called before that commission was the representative of Armour & Co., who were the largest grain dealers in the country, perhaps. Mr. Armour's representative, among other things, said that their charges, lightening the grain, and lack of facilities for handling the grain from car to vessel, made additional cost enough to prevent them handling it, and incidentally said that one-sixteenth of a cent per bushel on grain will determine where it will go. I simply give that as illustrative of why any discrimination will ruin the business of any particular place.

Speaking of Nebraska, there are some peculiarities of the tariff that I jotted down as I came along on the train last night, which will illustrate what I am after. Now, this state of affairs is true of other stations on the Burlington system; I just give this one as not being different from the rest of them. There may be a difference in the mileage, but not in the tariff. This station, Wahoo, is located in a very excellent grain country, growing white oats and white corn, both of which are very valuable to us. Now, Wahoo is 229 miles from Kansas City, northwest. It is 523 miles from St. Louis. The rate from Wahoo to Kansas City is 14 cents, and to St. Louis is 14; if it goes via Kansas City to St. Louis it is 21 cents.

Q. Is it farther from Wahoo by way of Kansas City than by some other road?—A. It is 67 miles farther by the Burlington road via Kansas City than by their own through line, but they charge 7 cents extra for that 67 miles, or they do not charge anything for 294 miles. They would have earned their 14 cents by hauling 229 miles, but they haul it 294 miles farther without additional charge.

Q. Not the same road, however?—A. The same road. I took the station of Wahoo because it has a peculiar feature; it is also a station on the Union Pacific, which terminates at Kansas City. The Union Pacific rate is 14 cents to Kansas City and also to St. Louis. If it is billed through by the Union Pacific via Kansas City, they earn the 14 cents; if it is billed through by the same line which terminates at Kansas City, and must give it up to some other road, the Union Pacific gets 7 cents out of it, and they give up half what they have earned. They do not take that because they are desirous of giving up that portion, but they are forced to do it in order to make tariffs in competition with the other roads.

Q. Why does not the Union Pacific make a lower rate to Kansas City?—A. They do not want to be hammered on the back somewhere else.

Q. Your idea, then, is that the rate probably is a fair one to Kansas City, but an extremely low one to St. Louis, relatively speaking?—A. That is in part true. I think the Kansas City rate is too high and the St. Louis rate is too low. It is not so much the love of St. Louis that the 14-cent rate is made there, but Chicago is based upon the St. Louis rate, and it makes a lower rate to Chicago, and they get to haul to Chicago instead of St. Louis.

Q. (By Representative BELL.) Have these railroads any elevators in Kansas City?—A. The Burlington has no elevator.

Q. Has the Pacific?—A. The Union Pacific has; yes.

Q. (By Mr. KENNEDY.) Is it your understanding that the Burlington has elevators in Chicago?—A. We understand they have; yes.

Q. They own the elevators?—A. I can not give you positive information on that.

The people of the South are great eaters of oats and white corn meal. The central portion of Nebraska, embracing this part of the country, is where the white oats are chiefly produced. They are desirable for oatmeal because they are white. Black oats and red oats are strong, and white oats are necessary for oatmeal. We have an oatmeal mill at Kansas City, but it can not get oats to run hardly any of the time; why it does not is plain from the tariffs. As I said, the rate on oats from Wahoo to Kansas City is 14 cents, that is 229 miles; the rate on oats from Wahoo to Memphis is 19 cents, 713 miles; 14 cents for 229 miles and 5 for cents 484 miles, going directly through Kansas City. If it is billed into Kansas City and then billed to Memphis it is 24 cents, 5 cents penalty for stopping at Kansas City for handling or manufacturing. The result is it goes on through and our people do not do the business. It is right on the line of road passing through the town.

Texas is a very large consumer of corn meal, and our people originally enjoyed the privilege, on the basis of through billing, of manufacturing corn meal and shipping to Texas. From Wahoo to San Antonio on corn the rate is 39 cents; if the corn is stopped at Kansas City and manufactured into meal it makes it 44 cents. The result is, the corn is shipped to Texas and manufactured in Texas, instead of being manufactured in Kansas City; 5 cents per hundred advantage is given to the mill in Texas.

Q. (By Representative OTJEN.) Is it not more expensive to ship the manufactured product than it is the raw grain?—A. I can not see any reason why it should be. It did not use to be.

Q. How long since has this been in operation, the difference between the transportation of the manufactured article and the raw grain itself?—A. I can not give you exactly the date.

Q. About how long?—A. A couple of years.

There is a little town in Kansas called Doniphan. They ship corn from Doniphan to Chicago via St. Joseph for 15 cents, 522 miles; they ship it to Chicago via Kansas City, which is 43 miles farther, at 19 cents; they ship it via Kansas City to St. Louis at 14 cents. If it is shipped to Kansas City, 50 miles, the rate is 7 cents. It is 522 miles to Chicago and 50 miles to Kansas City. One is 15 cents and the other is 7 cents.

Q. (By Mr. C. J. HARRIS.) Are these exceptional instances, or would you mean to say to this commission that Kansas City is discriminated against in favor of towns and places to this extent and proportion? If so, I can not see how you could do the volume of business in grain shipments—wheat, corn, and other products—that you do?—A. These are the extremes, ranging from 1 cent up to 7 cents, which is the highest discrimination; but there are many other stations on the Burlington system like this, running all the way down—5, 4, 3, 2, 1 cent—but anything which causes any discrimination is sufficient to bar our business.

Q. Now, is not the discrimination on some particular roads larger than on others?—A. It is all alike in the same territory.

Q. I did not know but there might be certain railroads discriminating against you.—A. We can not see any reason why the Union Pacific should charge 14 cents on a car that comes and stops at Kansas City, and 7 cents on the same car if it does not stop at Kansas City, for the same length of haul.

Speaking with reference to business, I counted up I think it was 90 days, up to yesterday, and we have averaged 3 cars of corn a day at Kansas City off the Burlington system.

Q. (By Representative OTJEN.) How much ought you to average if rates were uniform?—A. I do not know; we ought to have 150 cars, I should think, anyhow. It is a pretty small station on their road that does not ship 3 cars.

Q. Did you say the wheat that came to Kansas City amounted to 30,000,000 bushels, and that this discriminating rate has existed only within the last year or two?—A. Yes.

Q. How much business did you do prior to that time in Kansas City, in wheat, for instance?—A. It varied according to the crop; I can not tell you exactly; I have not the figures.

Q. Did it exceed the 30,000,000 of bushels?—A. Oh, it ran up as high as 40,000,000.

Q. (By Mr. C. J. HARRIS.) You think your business in grain is falling off?—A. It is, most decidedly.

Here is the town of Humboldt, for instance. That is 120 miles from Kansas City, and 571 miles from Chicago; the rate to Kansas City is 8 cents, while the rate to Chicago is 17½ cents. Humboldt happens to be the next station from Table Rock; and according to these letters I was speaking to you about having received last year they shipped 272 cars of corn from Table Rock and 3 came to Kansas City. These were not shipped by dealers; they were shipped by farmers, who did not know any better.

Q. (By Mr. CONGER.) The 3 cars were?—A. The 3 cars; yes. The reason why I took Humboldt was because I had the figures on there day before yesterday. There was bid on track, 25½ cents for No. 3 corn, Chicago terms. I believe the rate to Chicago is 17½ cents, that is, 9.81 cents a bushel; that would make it worth 35.30 here. The highest priced corn was worth here that day 33.5 cents. On the basis of the tariff it was worth more in Kansas City than it was in Chicago.

Q. (By Professor JOHNSON.) These points are all west of the Missouri River?—A. Yes. Now, the same relative rate is on the Missouri Pacific road in the same territory. I do not happen to have their tariff with me. While it may be said the Burlington does not necessarily bring its stuff through Kansas City, the Missouri Pacific can not avoid going through Kansas City; it is their only line.

Q. (By Mr. C. J. HARRIS.) I understood you to state that all grains were being handled on a very close margin at the present time; that would enable the farmer to get more for his produce relatively than ever before, would it not?—A. Yes.

Q. What has been the decrease in the last 10 years of the margin from the farmer to the markets?—A. I was not in the grain business as long ago as that.

Q. From your experience to the present time?—A. We used to expect always to get a half-cent margin on corn or oats, and a cent a bushel on wheat; we expect now to handle it for a quarter of a cent on corn and a half-cent on wheat.

Q. Are railroad rates lower now than when you first commenced business?—A. I do not think the local rate into Kansas City is.

Q. Are through rates to the seaboard lower?—A. I think they are, as a rule; yes.

Q. You have elevator facilities in Kansas City?—A. Yes.

Q. Are they private or public?—A. Mostly private.

Q. (By Mr. CONGER.) Have you any public elevators?—A. I think there are two.

Q. What capacity, approximately?—A. From 400,000 to 1,000,000.

Q. Do you know the total elevator capacity in Kansas City?—A. I think it is about 6,000,000.

Q. (By Mr. KENNEDY.) Who owns the private elevators?—A. They are men in business there.

Q. Not any railroad people?—A. Well, I think the understanding is they are owned by the railroads. They are operated by private parties.

Q. (By Mr. C. J. HARRIS.) Do your grain men have any complaints to make of the large private elevators buying wheat to better advantage than you, having any inside rates or discriminations that favor them particularly?—A. Yes; we do, in this, that if it continues that way we will all have to go out of business except these few people; just as this one indicates here from Humboldt.

I think I read in the paper that testimony was given before your commission by one of the large concerns here; that in view of their higher bidding out in the country the farmer was getting more for his grain than he would if they did not bid high. I simply want to say two and two make four. These large concerns can not bid any higher on the tariff than the smaller concerns, and they can not reach the business of the country nearly so cheap as the smaller concerns. To illustrate, the most of our wheat moves inside of 3 months from the time it is harvested. The local dealer at the station, besides his grain business, is engaged

in the lumber and coal business, or in the grocery business, or in the dry goods business, or in the milling business—something of that kind; he is not dependent entirely on his grain operations; if he makes a half day's wages on his grain, that, along with the profit he is making at something else, makes him a business, but the man who is engaged in no other business except buying grain must make it out of the grain entirely, and there will be 5 or 6 months in the year that he has exceedingly little to do. That is not so material to the man that is in any other business, but to the man who is exclusively in the grain business it is material, and that is the case with the large concern that goes into the grain business.

Q. You claim the smaller dealer can do it as cheaply or cheaper than the larger one; what is the deduction we are to draw from that, that the large dealers get inside rates?—A. That is what we believe. The Peavey Elevator Company, of Minneapolis, operates on the Union Pacific road west of Kansas City, and is building a line of elevators. They try to buy out the local man first, if he will sell; if not, they build an elevator beside him. A few days ago they offered a quarter of a cent more for corn along the Union Pacific road than they could sell it for in Kansas City the same day.

Q. (By Mr. CONGER.) What does that indicate to your mind?—A. That indicates that there must be an advantage somewhere.

Q. (By Mr. C. J. HARRIS.) Can you say what that advantage is?—A. There could not be any freight rate in the world that would allow them to buy it out there at a quarter of a cent more than they sold it for. I mean on the basis of Kansas City; I do not mean they paid a quarter of a cent more in the country, but on the basis of the Kansas City market, freight rate considered, of course.

Q. (By Mr. CONGER.) Your idea, then, in a general way, is that the grain tributary to Kansas City, which ought naturally to go to that market, is diverted to other markets, Chicago and St. Louis?—A. Yes.

Q. In your opinion, is more diverted to Chicago, or to St. Louis, or to both?—A. I can not tell you as to that. I do not think St. Louis gets as much benefit as Chicago and the South.

Q. You have mentioned three roads, the Rock Island, Burlington, and Santa Fe, as I remember?—A. And the Missouri Pacific.

Q. I think these three that I mention are the ones that, even according to the published tariffs, distance considered, discriminate in favor of Chicago as against Kansas City?—A. Yes; they do.

Q. Had you or your people in Kansas City connected the elevator men in this city with the discrimination in any way?—A. Well, we have thought these people pay more than the market will justify; it leaves them no profit.

Q. It occurs to my mind that Mr. Counselman operates on the Rock Island, Mr. Armour on the Burlington, and Mr. Richardson on the Santa Fe, and according to your testimony they are able to get rates that haul grain 500 miles for a slight advance over the rates these roads charge to haul it to your town, 100 miles or more, even according to the published tariffs that you have mentioned?—A. Yes.

Q. Do any of these men have elevators in Kansas City?—A. Yes; Mr. Counselman operates an elevator there, and Mr. Richardson operates an elevator there.

Q. Do they do much business there?—A. It depends altogether; if it is better to send the stuff to Galveston there is very little handled in the Santa Fe elevator in Kansas City; if it is best to go to Chicago there is not a great deal handled by Mr. Counselman's elevator. There is some influence connected with the business there. Until his death, which occurred some time ago, Mr. Johnson, a son of the vice-president of the Rock Island, was Mr. Counselman's manager at Kansas City. Mr. Harris, I am told, is a brother of Mr. George B. Harris, of the Burlington, and is the chief operator on the Burlington system.

Q. You say chief operator; do you mean for Kansas City?—A. No; in the grain business. He does not do business at Kansas City. The Burlington has no elevator at this time in Kansas City. We are advised they are going to build one. The Iowa Development Company is operated and managed at Kansas City by the vice-president of the Chicago Great Western Railway.

Q. It might be well for Kansas City to interest some of these men a little more in that town, might it not?—A. If it was simply for their business, but I do not think it would do any good for the other people who are doing business there.

Referring to the Maple Leaf, there is a little peculiarity about that. I was trying to buy some oats at Shepard, Iowa, on the Maple Leaf. That is a local station, and I simply name it because I have tried it. It is 167 miles from Kansas City. The rate is 10 cents to Kansas City and the rate to St. Louis is 12 cents; it is 528 miles to St. Louis. If it is billed to Kansas City and then goes to St. Louis it is 17 cents; but they can bill it right through Kansas City for 12 cents.

Q. This distance to St. Louis means through Kansas City?—A. Yes; and it will

necessarily go that way because they want to get in the full amount of their mileage; it is the terminus of their road.

Q. (By Representative OTJEN.) Do you favor legalizing pooling by the railroads?—A. Well, I am unable to answer that. I do not know.

Q. Do you know what are generally the views of business men in your section of the country regarding that subject?—A. I do not think their views are very well defined on that. Sometimes they think it would be an advantage, and other times they think it would not.

Q. Do you think there should be conferred on the Interstate Commerce Commission authority sufficient to fix the rate of railroads?—A. Yes; if it will act quickly. That is the only objection that I know of relative to the Interstate Commerce Commission, that it takes too long to act.

Q. What remedy would you have if you did not correct this matter in some way, such as by this Interstate Commerce Commission?—A. I do not know of any. The remedies, however, are too tardy.

Q. That is, the Interstate Commerce Commission takes too long a time in deciding on cases?—A. Yes.

Q. But do you not think that is largely owing to the fact that the commission has very little authority at present?—A. Well, it would seem they might exercise what authority they have a little more promptly. I think we are rapidly approaching the same condition in the grain situation that we are in most other branches of business—a trust that will absolutely control the handling, and thereby the price of the grain.

Q. What remedy do you suggest for the correction of this evil?—A. Requiring the railroads, in the first place, to attend strictly to the railroad business, and go out of the grain business, or any other kind of business; that is one way.

Q. That would also include persons who run elevators leased from railroads and who, perhaps, get special rates?—A. Yes. In the testimony before the Interstate Commerce Commission a year or two ago, involving that question, it was stated by an elevator man that the railroad company paid him as high as 4 cents per hundred for running grain through the house, as an elevator charge; that, of course, would give him the absolute control of business on that road.

Q. Well, in order to compel railroads to live up to uniform rates, they must of necessity be supervised by some sort of commission like the Interstate Commerce Commission?—A. Yes; it would seem so.

Q. And such commission ought, of necessity, to be clothed with sufficient authority to enforce its rulings?—A. It ought to.

I think it was in 1895 that we had our shortage in our corn crop, and at that time we fed out in this country 100,000,000 bushels of wheat to stock; wheat was cheaper than corn. We wiped out the immense visible supply of wheat, the immense surplus on hand, and since that time Chicago instead of Liverpool has controlled the price of wheat. Liverpool to-day goes up and down, as Chicago goes up and down; up to that time it was the other way. Now, 8 railroad systems control the grain-producing territory, and every one of these systems is going into the grain business just as rapidly as it can; and when you have got it into the hands of 8 men or 8 roads, with sufficient storage capacity to take care of the crop, it will be controlled by these people and the local dealer will have to go out of the business entirely, unless there is some remedy for that.

Q. This dealing in grain—is that done directly by the railroad?—A. I can not answer that, but there are certain persons doing business on these roads that can handle it when nobody else can.

Q. (By Mr. KENNEDY.) You think all circumstances point to it?—A. All circumstances point to it.

Q. (By Representative BELL.) Is it not the same way with the coal business?—A. I am told so, but I have not the knowledge to testify on that.

Q. Now, you seem to have a little doubt about this legal pooling; have you any doubt about there being a pool now by all these roads going into Kansas City in this case?—A. Very little doubt about it. The Union Pacific keeps up the rate of the other roads, though it ends there and has its elevators.

Q. (By Mr. KENNEDY.) You do not mean there is a pool in the sense of dividing their earnings, do you?—A. No; not that I know of.

Q. (By Representative BELL.) But as to rate and method of doing business?—A. Yes; I think so.

Q. Then, why would you have any hesitancy about a legal pool?—A. Well, as I said a moment ago, I do not know; it is a large subject. I can not tell.

Q. Do you not regard all your difficulties in Kansas City as connected with the elevators on the individual roads?—A. I think the policy has been dictated by those roads which originate the grain to compel it to go as far as possible on

their lines. They have ceased to be common carriers for the public, but regard the grain as theirs, to handle for their own personal advantage, and determine where it shall be sold.

Q. You regard the 4 cents which this elevator man down there got for his grain going through the elevator as really his drawback on the freight?—A. Yes. Any elevator in Kansas City would be delighted to handle that grain for a half cent and make money out of it.

Q. (By Professor JOHNSON.) Would you apply the name of pooling to those methods of doing business?—A. It depends on what definition you give to the term.

Q. Do you define a pool in that sense?—A. I am not a railroad man. I think, perhaps, pooling is a little farther-reaching term, and reaches to the division of the profits or division of the business.

Q. (By Mr. KENNEDY.) You mean an agreement between the roads instead of pooling?—A. I think, perhaps, it would be better to term it an agreement between the roads.

Q. (By Representative LORIMER.) Do you ever pay any attention to the daily Liverpool cables on grain?—A. Yes; we get them.

Q. Within the last year or two, have they in any way affected the price of the market here?—A. Oh, they do to some extent, but their prices within the last year or two have been governed chiefly by the prices here.

Q. Have you ever known of a low cable coming here, and during that day hear it said that low cables from Liverpool put down the price of wheat in Chicago?—A. Yes.

Q. Have you ever heard of high cables coming, and hearing it said that the high cables had the effect of putting up the price of wheat in Chicago?—A. Yes; but I think those terms are used more to influence the speculative market than anything else.

Q. On these days when the cables come high, has wheat in Chicago, from your knowledge, ever risen above the previous day?—A. I can not say that I associated it in that way exactly. Very often our local market is higher than Liverpool would indicate, or lower than Liverpool would indicate, on that particular day. For instance, the foreign cable to-day will be based on what our market was yesterday. You see they are earlier in the day; they close very soon after we begin.

Q. But, as it is generally understood, have high or low cables any effect on the market here?—A. I think so; necessarily. It would have some effect on our market.

Q. Chicago, then, would not altogether control the price if it is influenced at all by the Liverpool cable?—A. The Liverpool cable is influenced by the Chicago price, and they immediately influence each other.

Q. Then it would not be entirely confined to Chicago, according to that statement?—A. Not any more than it would be confined altogether to Liverpool. Liverpool is governed by conditions in Chicago, and Chicago is governed to some extent by the conditions in Liverpool.

Q. I understood you to say that Chicago now controls the price of grain instead of Liverpool, and I want to know whether or not that is absolutely correct?—A. I believe just this, that it controls to a great deal greater extent than it ever did before. It may not absolutely control, for it is influenced by other local conditions, visible supply, etc., and their local demand will govern their market very considerably.

Q. And there are outside influences, in your opinion, which have something to do with the price of grain here?—A. Of course.

(Testimony closed.)

CHICAGO, ILL., November 24, 1899.

TESTIMONY OF MR. ZINA R. CARTER,

Commission and produce merchant, Chicago, Ill.

The subcommission on transportation being in session on the afternoon of November 24, 1899, Representative Lorimer presiding, Mr. Zina R. Carter was duly sworn, and testified as follows:

Q. (By Representative LORIMER.) Please state your full name.—A. Zina R. Carter.

Q. And your post-office address.—A. Chicago.

655A—37

Q. Your business.—A. Commission; produce.

Q. And any official connection you have in the city.—A. I am a member of the sanitary board.

Q. (By Professor JOHNSON.) Mr. Carter, having connection with the drainage-canal project, must have given a great deal of attention to transportation by water to and from Chicago, and information in regard to that business is what I think we have in mind.—A. Well, if I am permitted to state my views upon this—

Q. (By Representative LORIMER.) (Interrupting.) Just state them in your own way.—A. As to our water transportation I would say this, first of all, that the future growth of the industries of this country, I believe, and the opportunities for our people to compete successfully in a fair race for the commerce of the world, requires that they should have the best and cheapest methods of transportation throughout this country; and I think I can place before you a few facts which bear directly on this question, and which show conclusively that water transportation furnishes great advantages to the people of this country over the best that the railroads are able to furnish. I find in the records of the annual report of the secretary of the Board of Trade of the city of Chicago these figures: For the year 1897 the average rate of freight on corn from Chicago to New York City, via lake and canal, including the charges at Buffalo, was 4.53 cents per bushel. That was the average rate during the season of navigation; and the average of rail rate for the year, taken from the public schedules, was 11.43 cents per bushel from Chicago to New York. The average rate by lake and canal on wheat for that year 1897, including the charges at Buffalo, was 12.5 cents per bushel. In 1898 we were not able to obtain the charges at Buffalo. They were very irregular, running from three-quarters of a cent to nothing, so I have to exclude that in the calculation of the carrying charges. The charge by lake and canal for the year 1898 was 3.81 cents per bushel on corn and 4.45 cents per bushel on wheat all the way. The all-rail charge that I have for 1898 was 9.8 cents, and on wheat 12 cents. From these statistics it is very easy to deduct these facts, that on the grain that was exported by the producers of this country in the year 1898 the difference between the charges for carrying by rail and water would approximate \$25,000,000 in favor of water carriage.

Q. (By Mr. CONGER.) Is that sum based on the whole crop of the country?—A. Based on the actual experience for the year 1898. It was something over 420,000,000 bushels of grain. We are not discussing in this connection, up to this time, any other character of freight.

Q. I notice these figures showing the average freight rate of the railroads are for the year, whereas the figures on the lake and canal rate are for the season of navigation.—A. True.

Q. Can you inform us whether the rail rate was lower during the season of navigation than during other times of the year?—A. Now, as regards a large part of these years which I have quoted from, I should not like to be definite. Of course I know there have been years during the summer season when the rail rate has been cut very close to the water rate; other years it has not. The average rail rate for twenty years past, as I have learned during that length of time, has been much lower during the summer than during the winter.

Q. Do you know how much lower, approximately?—A. Well, that is a matter I have not given very careful attention. I have not given it such careful attention as would enable me to state definitely, but I think it could be safely said, taking the average for 20 years, that it would be 25 per cent higher during the season of the closing of navigation than it would be during the season of water transportation.

Q. (By Professor JOHNSON.) If there is such a difference between the rail and water charge, why is it that the all-water traffic is not increased?—A. It does increase very slowly. The all-water transportation is now accomplished at a very great disadvantage, owing to the fact that the Erie Canal is not improved up to date; it is not in the condition in which it ought to be, with the commerce upon it. If it had been improved and was in such a condition now as the character of the commerce of the country at the present time demands it should be, the transportation would be at the lowest rate all water. That is the reason why a larger per cent of the trade does not go by the canal—because it is not in a condition to handle it.

Q. Still the Erie Canal can handle twice what it does now, can it not, without any improvement whatever?—A. I don't think so.

Q. Is it not a fact that the present water route is not able to compete to any large extent with the all-rail route?—A. There are the facts. Now, it is not a supposition of the mind that the man who can avail himself of a rate that is less than one-half is going to fail to do so. This year will show a difference

because of the export low rates by rail, and therefore a large part of the tonnage has been drawn from the lake trade; but in 1898 the largest per cent of the grain left Chicago by water.

Q. And went as far as Buffalo or Erie points and thence by rail?—A. Yes.

Q. My point is simply this: Your figures don't prove to me conclusively that the barge traffic can compete with the rail traffic on a large scale, and I want to ask you if you can prove that.—A. Now, in connection with this, it is true that the lines of road upon which the comparisons are made are the best in the United States—the best managed roads and the best equipped roads—and they are able to make the lowest rates, and of course the canal and waterways parallel these roads. They make a relatively lower rate than a rate for the same distance into Chicago from the West.

Q. (By Mr. CONGER.) Does not the matter of time required to make a shipment have something to do with the tonnage?—A. It would, in a fluctuating market, have something to do with it sometimes; yes.

Q. Is there or is there not a very much larger amount of grain shipped from Chicago by water so far as Buffalo and other Erie points than goes to these points farther east by way of the canal?—A. Yes.

Q. Do you know how the part-water and part-rail rate compares with the all-rail rate?—A. The difference would not be as great as all-water rate. I have not the figures.

Q. Is there a difference?—A. Yes; there is a difference in favor of the water.

Q. (By Professor JOHNSON.) Have you studied the way in which the traffic over the Erie Canal is distributed?—A. Not carefully; no.

Q. I think if you were to do that that you would find the greater part of the Erie Canal traffic is distributed or rather carried on during the months when the railways are crowded with business, and are not competing with the canal for the grain trade. That would indicate to me that the canal under present conditions is not a very serious factor beyond Buffalo.—A. Well, it is very easily said that when any route of transportation runs down and fails to perform its functions with satisfaction to the people, that it loses its stand and loses its business. That is the condition to-day with the I. & N. Canal in Illinois. It no longer amounts to anything except as a distributor of freights. That is the effect that it has now because it has not been improved for years and men have simply left it.

Q. What kind of a waterway east from the Great Lakes to the seaboard would be a carrier of the large traffic?—A. Well, first of all, I think the improvement of the Erie Canal and the making of it into a deep-water channel.

Q. To what depth?—A. I believe it ought to be required to be at least 10 feet. I don't believe I have arrived at the conclusion that ship navigation of canals by the ships of the Great Lakes is likely to be brought out.

Q. The evidence is against that?—A. Yes; it is not likely to happen. One of the strong arguments against it is that the vessels are very expensive in their construction. Of course, in order to navigate the Great Lakes, and in order to make rapid progress, they are constructed with enormous power, and they can not as carriers enter the canal. Therefore a much cheaper constructed boat would answer just as well for the carrying of the heavy freight, and it would not tie up so much money. Thus it would lessen the expense of transportation. Very much of the freight at least could be more cheaply carried than by the keeping of these expensive ships in the slow method of canal navigation.

Q. That being true, the canal could be utilized as a barge canal?—A. Yes.

Q. How large would you say that barge would have to be? Would you not say it would have to be equal to a train load in order for the barge to be an economical mode of transportation?—A. The larger the barge, all other things considered—that is to say, the largest that would be practicable—would probably be the most economical—in fact there is no question about that—but then you have to fall back on the dimensions of your channel and decide upon the size of the barge accordingly. It seems to me you must presuppose a barge of a certain size in order to have a transportation generally that can compete with the train, because the train is the unit by rail, and the unit now is from 1,200 to 2,000 tons of actual burden. It seems to me that you must figure on a barge that can compete with this other agency. That must determine your waterway prism.

Q. That is to say, you don't believe it is necessary for a single barge to carry as large an amount as a train load of cars in order to compete?—A. I don't think that would naturally follow. There are many other questions of cost that would enter into it.

Q. The question of the cost does enter into it?—A. Yes. There are many other questions aside from the single question of the wages necessary to handle the barge.

Now, coming to the question of the sanitary canal. From this and numerous other facts of like character I am led to believe, in the interest of our whole country, that the channel which has now been constructed by the city of Chicago, having a depth of water of 22 feet and being 28 miles in length, and which, by reason of the large outlay of work, has been very expensive, in order to make connection with the Mississippi River, that it would be a wise policy—in fact, I believe it to be the duty of our Government—to take the work up and complete it, because it will enable the great products of the Mississippi Valley to be handled more cheaply than by any other means possible. The sanitary district has expended about \$29,000,000; that is to say, it has actually paid out that money for 33 miles and over, where it has cut this channel, and the water is turned in.

Q. (By Mr. CONGER.) This channel connects with the Illinois River?—A. Yes; same draft. That is, exchange has been made with the Champaign River with a view of improving the navigable features of the river, as well as to obtain additional cross sections. We are now putting in bridges at different points.

Q. (By Professor JOHNSON.) How deep a channel in the clear does this drainage canal make feasible?—A. The depth of the water in the drainage canal is 25 feet or less.

Q. I did not refer to that. I mean in the natural channel; about what depth is feasible to ship?—A. That is a very large question. What the practicable depth would be would depend upon the use. How to produce the best result with the money expended is a question for the engineers to decide. Major Marshall, who is the resident engineer in this city, does not believe that they will be justified in attempting what would be known as absolutely deep-water navigation, while many other men believe in that. A careful survey and estimate has been made on the cost of completing a 16-foot channel from the point where our work as a channel terminates, down through Joliet and over the Desplaines River to the Illinois River, and so on to the Mississippi River; and it falls much under \$125,000,000 to complete it with a 16-foot channel.

Q. (By Mr. C. J. HARRIS.) And connect it with the Mississippi River?—A. Yes.

Q. (By Professor JOHNSON.) Is there 16 feet of water in the Mississippi River up to the mouth of the Illinois River?—A. No.

Q. That is a matter for the Mississippi River Commission, I suppose?—A. Yes.

Q. (By Mr. CONGER.) Do you expect that all this volume of water that the channel is likely to put in the Mississippi River is likely to aid in giving it the required depth?—A. Yes; it will aid in giving it the required depth all the way down through the Illinois River. It will add very much to the availability of the Illinois River, and will lessen the cost necessary to give it any given depth very much. And it will assist and improve navigation in the Mississippi River. I have discussed this question with merchants of St. Louis, and men who have given the matter much thought. Last December, when in Washington attending the meeting of the National Board of Trade, I had the opportunity of discussing this question with several merchants of St. Louis, and among others the then president of the Chamber of Commerce in St. Louis, and they believe that the additional water which the sanitary canal will furnish will be of great advantage to them in time of low water.

Q. Speaking of St. Louis, has not the railroad competition practically driven the commerce from the Mississippi below St. Louis, or between St. Louis and New Orleans?—A. I think the commerce, perhaps, has grown less in the last few years. It is a question I have not been interested in and have not studied carefully.

Q. (By Mr. C. J. HARRIS.) What would you do with the surplus water in times of flood in the Mississippi? Will that materially add to their disasters there?—A. In time of great flood, in addition, perhaps, to the amount of water they have, the 300 cubic feet of water per minute from the canal at a time of high water would not be noticed in the Mississippi River. Of course, the volume in flood time is vast in the Mississippi.

Q. (By Mr. CONGER.) What river do you connect with?—A. The Desplaines River, and very shortly after that with the Illinois.

Q. (By Representative ORJEN.) What would be the object in making this canal, say, 16 feet, when in the Mississippi River there is not that depth of water?—A. I am not advocating the 16-foot channel south. But some men who have made a study of this question thoroughly believe in it, and a survey has been made along these lines, as I have stated to you.

Q. At the same time that would practically mean, it seems to me, that a ship could be taken up to some point along the Illinois River or Mississippi River, where there is a lower depth of water, and unloaded into another ship.—A. I have no doubt if you would discuss this matter with some of the men who are interested in the Mississippi River they would tell you they are in favor of deep water for the

Lower Mississippi, and that when it was completed they would have deep-water navigation the entire distance.

Q. (By Mr. C. J. HARRIS.) Would that waterway, when completed, be a dangerous rival of the Erie Canal for the shipment of grain and other supplies?—A. This waterway we are talking of now?

Q. Yes.—A. No; I don't look upon it in that way. Of course, in some respects it would add to the volume of business which is now going by the Eastern route, while at the same time under certain conditions it might work detrimentally the other way. I think the rule would be that it would add to the volume of business going by this route.

Q. (By Representative OTJEN.) This grain could be brought by water from the Mississippi River this way as well as taken the other way?—A. Yes.

Q. (By Mr. KENNEDY.) Is the Illinois River classed as a navigable river?—A. Yes.

Q. Then to deepen that the State of Illinois could not take the initiative; it would have to be done under national auspices?—A. Yes; the National Government is putting in large motors, one at Campsville and one at Lagrange, for the purpose of improving the navigable features of the Illinois River there. The United States Government has taken full charge.

Q. (By Representative LORIMER.) It has taken charge of the Chicago River?—A. Yes.

Q. Is the deepening of the water here now in charge of the United States Government?—A. Yes.

Q. (By Mr. C. J. HARRIS.) Has there been anything done in a governmental way with the Desplaines River, this connecting link between the Illinois River and your canal?—A. By the United States Government?

Q. Yes.—A. No further than making surveys. They are constructing the Hennepin Canal, but the money expended on the Hennepin Canal will be of very little service to the people of this country unless the route is improved by them in both ways, so that in coming to the river they can move freight either way. Although it was a step for a short line, it will be of very little benefit.

Q. (By Professor JOHNSON.) The Illinois and Michigan Canal is still in use?—A. Yes.

Q. It is operated by the State of Illinois, I believe?—A. Yes.

Q. (By Mr. C. J. HARRIS.) What is the prospect of the tonnage of the lakes being increased by another year so that your grain and other products will have more liberal movement by water? Is the shipbuilding being increased at all?—A. Yes; and the incentive to increase is very great at this time. The earnings this season have been very remunerative, and you can easily conclude what the result will be. I know quite a number of the largest carriers are being constructed, and I would conclude, even if I did not know that, that there would be only one result, with boats making contracts a few months since to carry ore for less than one-third of what it can be carried by rail—the result of that will be to largely increase the tonnage of the lake.

Q. What is the rate on freight by water route, or is there a combination among the owners of boats to regulate that? Is there a rate agreed upon for a season by water?—A. There never has been a successful combination on the lakes. There have been contracts, many of them, entered into which favored a certain amount of tonnage during whole seasons, but no combination including all the tonnage of the lakes. Nothing of that kind, it seems to me, at present, would be possible or feasible.

Q. Has it a charter like an ocean charter?—A. Yes.

Q. Varying in price from month to month?—A. Those who are free from contract make a special contract for every ship—every load.

Q. (By Representative OTJEN.) They follow the market?—A. Coal has been carried within the last two years from Buffalo to Chicago as low as 20 cents a ton. There was not very much carried at that rate, but there has been a great deal carried at 25, 30, and 35 cents per ton. Ore has been carried from Lake Superior points to Buffalo, and near Buffalo, and to that section of lake ports there, for 40 cents. That is, perhaps, the minimum; but great contracts have been made at 45 cents per ton.

Q. (By Mr. CONGER.) What figures have you as to the maximum?—A. For this year the maximum was \$2.

Q. For ore?—A. Yes.

Q. (By Professor JOHNSON.) Then I understand there is a large number of vessel owners on the lakes?—A. Yes.

Q. And that a shipper usually has an opportunity of making a contract with several people?—A. Yes.

Q. You ship on the lakes, do you?—A. Sometimes; not extensively.

Q. How do you get your shipments billed; that is, do you charter a boat or do you go to some agent, or what is the way?—A. In grain a boat is chartered generally and loaded by one shipper. The shipper might contract with the owner, but the usual system is to contract with what is known as the vessel agent, who perhaps may be instructed to charter his vessel when he is on the road from Buffalo here. He expects it to be here on or about such a day; and it will take him from one to three days to unload; it depends upon the character of his cargo, the material he is carrying, etc. The agent desires to have a load ready for the boat when it is unloaded, so a charter or contract is made out with the agent here while the boat may be on its way.

Q. Is there much package freight on the lakes?—A. Yes.

Q. And is that shipped through the agents?—A. Yes; that is carried very largely by the regular steamship lines. The package freight—say, for instance, flour and pork, and all that sort of stuff—is carried largely by the regular lines, and they employ agents to attend to that business at all times. That business is transacted, so far as that part of it is concerned, very much the same as a railroad agent would transact it in shipping freight over a railroad.

Q. Please tell us, if you know, what the Lake Carriers' Association is, and what it does?—A. I don't happen to remember all of the things they do; but some things they try to do, for instance, is to regulate wages, and it is an association that tries to look after the interests of the lake carriers generally. I could not state the ground they try to cover, specifically.

Q. Do they have anything to do with rates?—A. Of course they would endeavor to fix a rate so far as the practice on certain lines is concerned, if they could, but they have never succeeded in fixing any rates which have stood out for any length of time.

Q. Did not this association at one time seriously consider the proposition of entering into a pool with the general traffic associations or a combination, when that was in vogue, with the Eastern traffic lines?—A. This association may have had something of that character under consideration, though it is not controlling the tonnage of the lakes. For instance, we have members of the Lake Carriers' Association who don't have any tonnage on the lakes. I know one of the leading men of Chicago who has been one of the officers of the Lake Carriers' Association, and, so far as I am aware, has not owned anything except tugs for drawing ships in here to Chicago. I don't see that the tonnage of the lake is a matter in which such members are very deeply interested, except incidentally. Of course when it is prosperous his business is good.

Q. (By Mr. CONGER.) You are a commission merchant, dealing in grain?—A. Yes.

Q. Where do you buy your grain?—A. I buy the most of my grain in Chicago.

Q. Where do you sell it?—A. Sell it in Chicago and ship some away. Largely, my trade is confined to the State and always has been.

Q. Do you ship some to New York?—A. Yes.

Q. When you do that, which kind of transportation do you use, rail or water route?—A. If I desire to ship a single carload of grain—and there is a great deal of trade done in a retail way, a carload of grain being regarded as retail—as it is already on the move, my method would be to ship by rail in order to preserve its identity.

Q. What proportion of the grain that you ship East goes by rail and what by water?—A. Nearly all the grain that I ship East goes by rail, because, as I have said to you, I have not been a large shipper. Most of my grain is sold here.

Q. For a certain class of trade—that is, the class you specify—the railroad transportation is much more desirable?—A. It would be desirable in a retail way; yes.

Q. (By Representative LORIMER.) Were you until recently the president of the Board of Trade in Chicago?—A. Yes.

Q. And you are familiar with the grain and elevator business of Chicago, are you?—A. Yes.

Q. Will you please state to the commission what you know of the elevator system as it is operated in Chicago, and its effects on the grain trade in Chicago and points tributary to Chicago?—A. Well, my knowledge of the method of management of the elevators is continuous for the past 20 years. The changes in the methods have been great. I have believed that sound business principles, correct business principles, were being violated in the elevator system of Chicago. Down to within perhaps 8 years ago the elevators of Chicago were public custodians of property, and they were paid such rate as was fixed at the beginning of each year, as a rule, for the grain placed at the beginning of the year in the elevator. The men who handled and managed these elevators were only occasionally engaged in

the shipping or receiving of grain. More recently, while the elevators are still used for the purpose of storing the grain of the shipper, of the man who may ship grain from the country, or of holding the grain of the man who may purchase it here for eastern shipment, still the large part of the grain in the elevators of Chicago to-day belongs to the man who is managing the elevator and who at the same time holds a license from our court to be the custodian of public property.

Those who are thoroughly conversant with the variations in the grades of grain, and the value of different grades of the same grade of grain, will readily see that an opportunity for profit, obtained by improper methods, is within the grasp of the man who is managing the elevators and handling that part of the grain which he does not own, mixing it with his own grain. A hundred cars of grain can be inspected by the inspector, and he may be an efficient, capable man too, but you may go right out to the elevator and walk right along that line and select 8 or 10 cars of grain, especially in certain conditions of the market, that will vary from 1 to 5 or 6 cents in value from the others. Now, then, when that goes into the elevator and into one bin, the purchaser knows he will get the average of the grade as inspected, under the old system, and the result was that many dealers in grain purchased elevator receipts and took the grain from the elevator. To-day the careful man would not accept grain simply on the inspection and receipt, but he would want to see a sample of the grain itself, fearing he might be compelled to take the lowest quality known to that grade, and would be almost sure to do it every time. That is one of the preferences which is afforded the men who are handling large amounts of freight over the different lines of railroad, and it is one of the abuses which bears most heavily on men engaged in the grain business in this country, the preferences being shown by the railroad people, and that is one of them. The railroad people in this city have built large elevators, and formerly had them managed by people who were simply managers of the elevators and custodians of other people's property. To-day, the largest receiver over a road, generally one large concern, has the use of these elevators, without doubt, at merely a nominal rent, nothing more. Another shipper or receiver who desires to place grain in that elevator must pay three-fourths of a cent for the privilege of having it handled through the elevator, and having it held 10 days. It can not go through the elevator for less than three-quarters of a cent.

Q. (By Mr. CONGER.) Are any of the public elevators managed by men who are not in the grain business?—A. I do not think there is to-day. There has been up to very recently, but to-day I do not think any of the public elevators are managed by men who are not in any way engaged in the grain business.

Q. Is there any effort being made by dealers in grain here in Chicago to correct this matter by State law?—A. Yes; much effort has been made during the past 2 or 3 years, first in the board of trade, as a body, attempting to correct conditions which they believed were a violation of correct, sound business principles. Much bad feeling was engendered by the attempt to correct it. Efforts have also been made for additional legislation, surrounding with greater safeguards the handling of public property.

Q. What is the opinion, or can you tell what would be the opinion of a majority of the members of the board of trade here on this question? Do you think you express the views of the majority of the members?—A. Yes.

Q. Has the board taken any official action on the question; have they gone on record in any way?—A. They have held elections in which that question was involved, and when the issue was made squarely they never failed to elect the officers who stood for the handling of public property by disinterested parties, by men whose only interest was the compensation which they received for caring for the property.

Q. It has been testified to before this subcommission that the present system has developed out of the necessities of the situation; that is, out of the competition between Chicago and other markets for this grain trade, and that but for the fact that these large dealers in grain had come to own their own elevators, and by dealing in grain themselves in a direct manner have thereby, because of their large operations, effected great economies—that only in that way has the prestige and supremacy of Chicago as a wheat market been maintained.—A. Now, let us analyze that and see how that looks. Here is a man that owns elevators in the country himself. He has managed these elevators for years; he has all the money that is necessary to handle his business successfully; he is thoroughly conversant with the business; and still he is absolutely forced out of business. Is it a reasonable acceptance that a man can hire every particle of his help and give his business that close, careful supervision that the other man is giving it? The reasonable explanation is that preferences are given this individual in furnishing him terminal facilities, free of charge; and the preferences he gets in rates drives the

other man out of business. No man who studies that question carefully can come to any other conclusion.

Q. Is it your opinion that these large dealers in grain receive or enjoy a lower rate of freight on the grain they bring into this market than the ordinary buyer?—A. I have no doubt of it. I have investigated this question carefully, and one of the strong reasons why that is done is because if one concern can handle all the grain that is left—for the little fellows get a little here and there—but if one concern can handle all the grain, and they want to make rebates on it, they can be made to that one concern and kept from the public; if divided among a dozen, it would leak and not be kept. Now, see what the evidence of that fact is. We have men on 'Change to-day who are doing business over a certain line of road. They are purchasing grain from the men who own the country elevators. One of the men I have in mind has not been doing business with that line of road more than a year; he has not had an opportunity to become established on that line and have acquaintances and friends, which would be a great influence and factor; he has made his relations with that road in a year or such a matter, and yet that man is getting to-day perhaps nine-tenths of the grain coming in over that road. Well, if he is a skilled merchant only, why does he not get grain from the other roads? He does not; he gets it over that line of road. That is one instance, and there are others just like it. If it was caused by his great capital and great ability as a merchant, ability to send through to Europe, and all that sort of thing, he would reach out over the other lines of road; but he gets it over that one line of road and no other.

Q. We have had testimony tending to show that it is the custom for at least a number of these large buyers, some of them, to purchase grain on more than one line of road. Now, is it your opinion, that as a rule, a single operator usually confines himself to one road?—A. Yes.

Q. But, to put the reverse, is it your opinion that along a given line of road there is usually but one operator?—A. There is usually the man, the firm, or organization that controls the terminal facilities in this city. They immediately branch out, and they very soon control a large percentage of the grain that goes over that line of road, and they do not do business on the other lines. They may, occasionally, do a little, but they do not do any large business, and it is almost wholly confined to the one line.

Q. (By Professor JOHNSON.) Is it not true that man is very apt to be a heavy owner in the railroad?—A. Unfortunately, we have a good many of the officers of the railroads in the grain business, and partners, and all that sort of thing.

Q. This man you had in mind was a large owner of the stock of the railroad?—A. I do not think the particular individual I was talking of has any direct connection with the railroad. I do not think he is a large stockholder in the road.

Q. (By Mr. KENNEDY.) Have you the belief that he is merely the agent of the railroad in this business?—A. No; I do not think he could be classed as a mere agent, because he is a grain merchant and has been doing a grain merchant's business in years past of a general character, just as other men in the city of Chicago have done. He has demonstrated no great ability in these years, but all at once he forms a connection with this road, and is able to go right out and get a very large part of the grain.

Q. (By Mr. CONGER.) The idea I got was that this man, in all probability, had a lower freight rate.—A. That is the point exactly.

Q. (By Professor JOHNSON.) If he was an owner in the railroad, he would be very apt to get it.—A. You gentlemen can very easily see if that was the desirable point, and that was what it led up to, the connection could be made and a half dozen silent partners could be enjoying the profits.

Q. (By Mr. CONGER.) Can you suggest a remedy for this evil? It is the purpose of this commission to recommend legislation to Congress or the various States. We have heard a great deal about the existence of the evil, and we would like to ask you, as a man of considerable information on the grain business, how to go to work to correct it?—A. Well, it is a pretty large question and requires the careful thought of the best brains of this country, and I do not know now that I have in my own mind any better method than enlarging the powers of the Interstate Commerce Commission and enforcing the law.

Q. It has been contended that if the system or custom of giving rebates could be done away with, if all discriminations to one individual or community could be eliminated from the transportation question, the evils of the trust, for instance, would be in a great measure eliminated thereby. Do you think that would apply to the grain business? In other words, if the transportation discriminations were absolutely done away with, so that men would be on an equality as rates of freight, do you think, then, this situation would be corrected?—A. In answer to your question I would like to say this: I think if that situation existed, every

citizen would have all he is entitled to ask for, absolute equality before the law, and an absolute good opportunity with every man, in proportion to his energy and ability. I believe to-day that the two greatest questions affecting the interests of the American people are, first, the prevention of preferences shown by railroad companies in the matter of freight carrying; and, secondly, the prevention of overcapitalization. These are the two great questions that are before the American people to be solved. I do not think the trust, in and of itself, if founded on actual values, need frighten anybody. But when a concern can capitalize 4, 5, or 10 times the actual capital invested and float it on the community and get good money for their worthless paper, it is a pretty bad condition.

Q. Do you think the proposition to legalize pooling would have an influence to do away with these favors in transportation rates?—A. I am unalterably opposed to pooling.

Q. Under all circumstances?—A. I can not conceive of any reason why the men who invest their money in railroad construction are any more entitled to the right to be exempt from competition than any other line of business.

Q. (By Representative OTJEN.) Do you see any serious objection to legalizing pooling when it is coupled with adequate authority in the Interstate Commerce Commission to regulate freight rates, and perhaps, in addition to that, to consent to any pooling contract that the railroads may make?—A. It is certainly true that pooling, under careful supervision and restriction, would be very much less objectionable than pooling by the railroads without any restriction; there is no doubt about that, because if pools can be formed and any rate fixed which they can temporarily maintain, they can fix any price that is not absolutely prohibited.

Q. (By Mr. CONGER.) I think nearly all advocates of pooling to-day couple with it the provision that the Interstate Commerce Commission shall be given authority to fix the rate.—A. I believe that to be true; yes.

Q. Would you object to that?—A. I have never come to the conclusion that it was wise policy to permit pooling.

Q. (By Representative OTJEN.) Give us your idea why it is not?—A. First of all, of course, we have never reached the point in the supervision of railroad affairs where we could consider it from the standpoint you now suggest. That is the first and strongest reason. I am willing to admit that if the law governing the powers of the Interstate Commerce Commission were so enlarged that they could, in a measure, control the action of the companies and the rates they made, we would have arrived at a point where, perhaps, pooling would not be so objectionable; I can easily see that.

Q. (By Mr. KENNEDY.) Do you believe that, preferable to pooling, there should be supervision by the Interstate Commerce Commission in this way: A railroad company is compelled to publish its rates, and the Interstate Commerce Commission given revisionary power over those rates, to correct, upon complaint which is found to be well-grounded, inequalities, injustice in the rates, and then the finding of the commission to go into effect pending an appeal which the railroad companies may take to the Supreme Court of the United States?—A. I believe any finding which they should make should go into effect. That is the weakness of the present law. Then let the railroad company appeal from that finding, and pending the decision of the appeal, the rate fixed by the commission should stand.

Q. You would have, then, the powers which the commission was supposed to have in the first place made plain and enforceable?—A. Yes.

Q. (By Mr. C. J. HARRIS.) So far as the public are concerned, if penalties could be enforced for discriminations and rebates made on the published rate, do you think the public would be taken care of as it now stands, and no pooling law would be necessary?—A. First of all, it seems to me perfectly clear that a railroad company should be permitted to arrange its rates within reasonable restrictions. They should be fairly remunerative. Then their rates should be such that all the shippers over the line might have the advantage of the greatest business to-day. The one that goes home to the people is the preference shown. There is no doubt about it.

Q. Now, if the penalty for preferences was a heavy fine for each case, why could not these published rates be enforced by you people who are put to a disadvantage by them?—A. Well, as to the best method of bringing that character of criminals to justice that is a matter I would not care to express an opinion upon.

Q. Would not heavy fines and penalties be much more effective than this criminal prosecution and imprisonment?—A. I think very likely you would more easily obtain evidence for conviction if that were the rule.

Q. (By Mr. CONGER.) One railroad manager would be a little more willing to prosecute his competitor or the manager of another road if the punishment was one of fine rather than imprisonment?—A. Yes; no doubt about that.

Q. (By Representative BELL.) You spoke of the injury to the dealer in grain by

reason of these preferences. What effect does it have on the wheat grower?—A. I think it is a well-settled law of commerce that free competition, free and open and unrestricted competition, produces the best results for the producer.

Q. Then you think the grower of wheat gets no benefit from the rebates that the preferred dealer gets?—A. I think that if the railroad company can afford to make a lower rate they should make it public and for everyone.

Q. But under the present system does the farmer benefit by these big institutions building their elevators and finding the market?—A. No, they will not in the end. It is not according to sound business principles that they will. If in the windup there is only one concern to buy their grain along the road, which is a presumable condition of affairs, they will not get a better price for their grain.

Q. You think not?—A. No, I think not.

Q. In these privileges in terminal facilities might not that be given in the way of rebate?—A. They may give it to them in any way; but these conditions exist in Chicago; the terminal facilities of the railroad companies, in many cases, facilities provided years ago, are practically given to one concern, and they immediately become large receivers over that line of road.

Q. A gentleman from the West this morning stated that he understood that a railroad company paid a dealer 4 cents for running wheat through the elevator when it was worth about a half a cent. Now, would you not regard that as a mere system of rebates—that he is making it up through the elevator charges?—A. He charged 4 cents? This was at the country point?

Q. Yes.—A. Where he received the grain?

Q. Yes.—A. And he charged the producer 4 cents a bushel?

Q. (By Mr. CONGER.) I think this was a Kansas City point and the elevator, instead of being owned by the railroad, was owned by the man, and the theory was that the railroad paid the 4 cents as a rebate on freight.—A. Yes; that was a very unusual condition of affairs, that anyone should be paying any party 4 cents a bushel for simply running grain through the elevator; and there must have been something special about it.

Q. That is what he means to say. That was the advantage given to him on the freight rate. Or, we take the oil companies that have created such a commotion in this country about discriminations. Men of one company insist that after they had hunted down the different discriminations from time to time, they found the Standard Oil Company sold the railroads all their lubricating oils, and instead of their paying the market prices, they paid three or four times the market price and centered all their trade with that one firm. As a rebate, now how would you reach a system of that kind?—A. Well, it looks to me as though these special cases which you are now describing, are all minor matters.

Q. These men state that they produce about one-tenth of the oil—the independent companies of the United States, and that they have been unable to make a profit on a single barrel of oil put on an American railroad, while, if they run it to the seaboard and ship to a foreign country where there are no discriminations, they make a handsome profit.—A. My understanding of your statement was that the rebate in this case would be the amount of oil used by this company doing the business.

Q. Instead of giving an actual rebate, it buys supplies from the company, and instead of paying the market prices it pays four or five times the market price, and they make the rebates indirectly.—A. There is a greater principle underlying this whole question, and the best any of us can do is to work determinedly along these lines. Whether or not we will ever be able to find a cure for these evils and come to a point where we will be entirely satisfied, is another question. I believe great improvements can be made over present conditions.

(Testimony closed.)

CHICAGO, ILL., November 24, 1899.

TESTIMONY OF MR. CHARLES A. MALLORY,

Chairman railroad committee, Chicago Live Stock Exchange.

The subcommission on transportation being in session in Chicago, Representative Lorimer presiding, at 3.30 p. m. November 24, 1899, Mr. Charles A. Mallory, chairman of the railroad committee of the Chicago Live Stock Exchange, was introduced as a witness, and being duly sworn, testified concerning transportation as follows:

Q. (By Representative LORIMER.) What is your name?—A. Charles A. Mallory.

Q. What is your business and official connection?—A. Chairman of the rail-

road committee of the Chicago Live Stock Exchange and treasurer and manager of the Mallory Commission Company at the Union Stock Yards, Chicago.

Q. We understand your organization has grievances, and we would like to have you state to the commission what your grievances are.—A. I was not quite positive this morning whether I would be able to come down or not, as I received word to go West, and I dictated a few of the fundamental things, and if it is the pleasure of the commission I will read them. They will probably cover all the points you will care to touch on. (Reading.)

I start out with the proposition of equal rights to all interests. Any legislation that will promote and protect all on a fair and equitable basis is most desirable. In my judgment, we have altogether too many laws, both State and national, caused largely by the lack of necessity for many of them, prepared and enacted by politicians in order that their constituents may know they are doing something, and possibly have some excuse for reelecting them to office. It is not so much the quantity of laws that we are in need of, but we should have a better quality of legislation, and then have it properly enforced.

Naturally matters pertaining to transportation business in this country, especially where much evidence is required, is very complicated to the average citizen. The courts found it impossible to cope with these matters in a satisfactory manner, owing to a lack of comprehension on the part of the courts and juries. Congress, evidently recognizing these conditions, created the Interstate Commerce Commission, with its extraordinary powers for investigation, and conducted by a board whose business it is to make themselves familiar with transportation affairs.

The law which created the Interstate Commerce Commission has proven defective in some features, and in order that the transportation companies and the public may derive benefits from their efforts, they should have proper power to enforce their findings. I believe one way to correct many of these legislative abuses will be to change existing tenures of office, laws, and methods of elections, so that no one may be elected to succeed himself, thus taking away the temptation to treat public questions with any thought of reelection.

The live-stock interests, which I have the honor to represent before your honorable body, probably have some grievances against the railroads, some of which, like many others, are doubtless more or less imaginary or the result of the generally expressed or implied sentiment against corporations; but as a rule, I believe the railroads mean to treat the live-stock shippers fairly and to treat localities as equitably as circumstances and competition will permit. From an almost national, as well as a local standpoint, our principal grievance is in what is known as the terminal charge, levied by all Western roads on all live stock consigned to Chicago. This is a charge of \$2 per car, and was added to the regular tariff June 1, 1894, and is still collected by all of these roads. The only change in conditions governing the handling of live stock at Chicago on that day was the addition of a trackage charge of 80 cents per car on most of the roads, and \$1.50 per car on others who used the companies' tracks a longer distance. This arbitrary charge of \$2 per car, which was 50 cents per car on 3 roads and \$1.20 per car on the other roads, more than the additional cost to the roads, caused the shippers all over this country to rebel against such treatment; and the Chicago Live Stock Exchange, through its railroad committee, held several sessions with the general managers of the railroads in June, 1894, and tried to convince them from a business man's standpoint that their act was not right, but without success. The chairman of this General Managers' Association stated, however, that if the company owning the tracks would take off their trackage charge they would remove the terminal charge.

We took the matter up with the Illinois Board of Railroad Commissioners, and after a full trial obtained a decision that the terminal charge was unjust, unreasonable, and illegal. The matter was afterwards brought up in the United States court in Chicago, and after a full hearing this court made a similar decision, and ordered the railroad company to desist, which they did until the court of appeals reversed the decision on a technical point. We brought the matter to the attention of the Interstate Commerce Commission, which spent considerable time in its investigations, all the roads being represented by counsel, who spent days in argument, citing authorities, etc., but the commission found the charge to be unjust, unreasonable, and illegal, and ordered the railroad companies to cease collecting it. The railroads refused to obey the order. The commission appealed to the United States court to enforce the decision, when the railroads filed a demurrer which was argued at great length and overruled. The case came up for a hearing on the 6th of this month, and after 2 days' argument, etc., the court took the case under advisement on only one of the points.

I go into this matter in detail to illustrate the necessity of some action being taken which will admit of adjustment of these and other matters pertaining to

the transportation business of this country by some tribunal having the proper facilities and knowledge for making investigations, hearing complaints and enforcing decisions. During all these years of litigation, investigation, and experience in this matter, I find that it is almost impossible, under existing laws and practices, for individuals or small organizations to compete with the combined legal and financial facilities of the railroads.

Another feature that impressed me along this line was the statement made by the railroad officials at their meeting, and by one of them in his testimony before the Interstate Commerce Commission, to the effect that this terminal charge would never have been levied had no trackage charge been made, and if this trackage charge was taken off the roads would remove their terminal charge.

I think this statement of facts, which can be proven by the records of the various cases, should convince any reasonable man of the necessity of some law or other method which would not only secure prompt justice to the people but prevent any arbitrary or vindictive actions. I firmly believe that the transportation companies are entitled to proper consideration and protection at all times, the same as any other business or interest, and any legislation that will advance the various interests, secure justice based more upon right than on technicalities, and promote and lead to better harmony all around, will be acceptable to our people.

Q. (By Mr. C. J. HARRIS.) Who levy this trackage charge?—A. The Union Stock Yard and Transit Company, who owns the tracks in and about the stock yards. None of the railroads coming into Chicago own their tracks to the yards.

Q. You pay, of course, the stock yards company as well charges for putting stock in there?—A. The stock yard company have yardage and feed charges, which all stock shippers have to pay.

Q. Why do they not include their railroad trackage in that general charge? I understand if that was removed the railroads would take off this terminal charge of \$3 a car.—A. The trackage charge is considered as part of the railroad charge, while the charges for yardage and feed is a stock yard company charge for their services.

Q. They are really the same company?—A. The same company practically owns the tracks that owns the stock yard, but the terminal facilities, as decided by the various courts and commissions, must be furnished by the railroad companies and must be included in their rate, and consequently the charges as levied by the stock yards company, which the shippers have to pay, have nothing to do with the railroad matter.

Q. This terminal charge has been in use since 1894?—A. Yes.

Q. The extra trackage by this stock yards company was added on at that time?—A. At the same time.

Q. (By Representative OTJEN.) As I understand, you think the interstate-commerce law should be so amended that the Interstate Commerce Commission will have authority to regulate such matters and enforce their orders?—A. Yes.

Q. (By Mr. KENNEDY.) I would like you to say if this charge is a discrimination against Chicago, which sends stock to Kansas City or other points in considerable volume.—A. Yes; it has diverted a good deal of business. It is a discrimination against Chicago to the extent of the \$2; besides, the sentimental discrimination—that has been equal to 5 or 10 times that; and it is used largely by the competitors of Chicago in the same line of business. Naturally the shippers look at it in all sorts of ways that were not right, and after it had been talked over and the competitive markets had handled it in their way it became much larger than the \$2 item would appear, while it does amount to considerable in the aggregate.

Q. Kansas City and these other big towns are not interested or moving with you to have this charge removed?—A. No. The Cattle Growers' Association, the largest association of its kind in this country, composed largely of Texas, Montana, and the other range people, have joined the Chicago live-stock men in their fight for the removal of this charge.

Q. (By Mr. C. J. HARRIS.) Have you any other complaints in regard to the transportation of live stock?—A. No; I do not think I have any other complaints to offer.

Q. Have you any discriminations in rates as between individuals, one man shipping his cattle for less than another—any inside rates that you know of?—A. Not that I know of. So far as I am aware, the rates on live stock are exactly the same to all shippers.

Q. Are the rates reasonable?—A. Judging from rates in the past and from the improved methods of handling the business, I should say that they would be considered reasonable. Of course there are exceptions to all rules, but I am speaking in the broad sense, and I should say they were reasonable.

Q. How does the price of stock compare now with former years?—A. The price

of cattle during 1899 has been considerable higher than it has been for the past 3 or 4 years.

Q. Does that apply to hogs also?—A. The price of hogs is not so much higher. Perhaps it will average 25 to 50 cents a hundred higher, while cattle will average from \$1 to \$1.50 higher.

Q. To what do you attribute this rise in price—scarcity?—A. Not so much scarcity in the supply as increase in the demand. The increase in the supply has not kept pace with the increase in the demand, in my judgment, and the prospective shortage has had considerable to do with the advance also.

Q. Is there a larger consumption of meat in prosperous times over dull times, when people are not employed?—A. Oh, yes, indeed. The laboring man, in my judgment, will use a larger percentage of his earnings in prosperous times for the purchase of meat than he will at any other time; and when he is well employed at good wages he will naturally spend more for meat products than under other circumstances.

Q. (By Professor JOHNSON.) Do any of the cattle shippers own their own cars?—A. Yes; not what you might call cattle shippers, but people who ship cattle own their own cars; such people as Armour & Co., Swift & Co.; they are in the packing business, but cattle shippers also. There are no cattle shippers that are engaged exclusively in the cattle business, to my knowledge, that own cars.

Q. When they ship live cattle they ship in their own cars?—A. They do to a large extent. Of course they also ship cattle in the common or railroad cars.

Q. Does that produce a discrimination against you men who do not own your own cars?—A. I would say to the extent of whatever profit they make from the use of their own cars—tariff; so far as I know they pay tariff rates on their shipments.

Q. Have you ever thought whether they did derive very much advantage from the use of their own cars?—A. I understand the owners of private cars of all kinds derive a good revenue from the use of them.

Q. Do you ship cattle in considerable quantities?—A. We are in the live-stock commission business; we are receivers of cattle. In answer to what I think you are trying to get at, I think there are very few exclusively live-stock shippers that would handle enough business to warrant their keeping a line of cars for their own use.

Q. (By Representative OTJEN.) Do you think it is good policy to permit these private cars?—A. That is a matter that I am not familiar enough with to pass an opinion upon. As I stated, I naturally think people that do not own their own cars, and who are competing with people that do, would be at whatever disadvantage the difference in the profit might figure.

Q. Would it not seem to be more proper that a railroad company conducting a business should conduct that business by its own cars?—A. Yes.

Q. (By Representative BELL.) You were speaking of the high price of cattle in 1899. Are you aware of a shortage of cattle in the United States during the past 5 years?—A. Yes.

Q. Did that have something to do with the rise in prices?—A. Yes.

Q. Do you remember about what the shortage was?—A. I should think 10 per cent would cover it.

Q. Have you seen the figures of Mr. Mulhall, the great English statistician, as to our shortage in the past 5 years?—A. No.

Q. About how many cattle have we in the United States?—A. That is a pretty hard question to answer except from the Government report; that is the only official document we have giving the figures.

Q. The Government reports have been showing this shortage ever since the Cleveland Administration?—A. I do not know just when it dates from, but people in our line of business do not put much faith in the statistics furnished by the Government in regard to live stock.

Q. You think there has been a shortage?—A. Yes.

Q. You think that would raise the price?—A. Yes; with the tremendous increase in consumption.

Q. How have the prices been the last few weeks?—A. This last week we have had a very sharp decline in most grades of fat cattle.

Q. How has it been in stockers?—A. There has only been a small decline in stock cattle; they have been lower than usual.

Q. There has been a rupture in the market in the last few weeks?—A. The first two weeks of this month we had a fairly steady market. This week we have had an unusual decline in certain grades of cattle.

Q. It struck the Denver markets before it did you?—A. It generally strikes the markets all about the same time. The telegraph works very promptly. If Chi-

cago declines other markets decline, and if they decline it has a sympathetic effect upon Chicago.

Q. Hogs have declined in the last few weeks?—A. Very slightly. The decline in hogs came in October, as it generally does in the fall of the year.

Q. (By Mr. KENNEDY.) Has there been a marked increase in the consumption of meats in the last year?—A. Yes.

Q. Could you state the percentage of increase?—A. I should think 25 per cent or 40 per cent over 3 years ago.

Q. What is the cause of that?—A. I should attribute it to the prosperous condition of the country and the fact that the laboring men are generally employed at fair wages, and they generally spend a good portion of their wages for meat.

Q. (By Representative BELL.) How did the war affect the meat market—the meat they supplied on the ships?—A. One part of the war affected it satisfactorily to the selling interests by advancing the price and another part of the war had a bad effect on it for quite a long time.

Q. A great deal was spoiled, was there not?—A. I do not know anything about that except what I have read in the papers.

Q. You know they had to throw overboard a good deal of meat?—A. I say I know nothing about that except what I saw in the papers.

Q. I suppose you have read also in the papers during the last few days that a great quantity of it was thrown overboard from an English ship going to South Africa?—A. Yes.

Q. We are not the only people who have to throw it overboard?—A. No.

Q. (By Representative BELL.) It affects the market, no matter who throws it overboard?—A. On that particular beef.

Q. Does it not affect all beef markets?—A. If enough of it was thrown overboard or lost in some other such way, of course it would affect the market by advancing it.

Q. (By Representative OTJEN.) As a matter of fact, the entire amount that is supposed to have been thrown over would cut very little figure in affecting the price?—A. I should say absolutely none.

Q. (By Mr. C. J. HARRIS.) It would not run one of these packing houses more than a few hours?—A. Not more than a few minutes.

Q. (By Representative LORIMER.) Would a boat load affect the market?—A. No.

Q. (By Professor JOHNSON.) If this meat had got a bad reputation— —A. (Interrupting.) That would have a bad effect on the market, more than the actual loss of the cargo.

Q. (By Representative OTJEN.) The fear that you would lose foreign trade?—A. The sentiment that would follow the declaration that any part of the American meat was spoiled or unfit for use would naturally have a sentimental effect that would be depressing on the market. So far these times have only been temporary, because on investigation they have found that our meat products are absolutely all right.

Q. (By Representative LORIMER.) About how long do they have an effect?—A. Owing to the damage and the sentiment it causes? This one we are speaking of, regarding the investigation of army beef, lasted several months.

Q. If the throwing overboard of beef from a British ship is a fact, how much or how long will that affect the market?—A. I do not think it would affect the market at all; I do not think the trade would pay any attention to it.

We, as business men, connected with the live-stock trade, handling the product that is shipped from the range and from the feed lot to the market—we figure from the standpoint of supply and demand in the various markets. We do not go quite as far as the Agricultural Department, and figure on all the different cattle supposed to be in the United States. We have found from years of experience that this country is capable of producing anything so rapidly that by the time the years would roll around, when you might naturally expect a shortage to come, from their way of gathering statistics, other sections of the country have been industrious and increased their output to such an extent that we never come to that shortage in the market. So far as the trade and values are concerned, it is the supply and demand in the market that governs, and not what is in the country.

Q. (By Mr. KENNEDY.) The calf becomes a steer before you come to that point?—A. They are marketed a year or two earlier than they were.

Q. (By Professor JOHNSON.) As a matter of fact, are there any live-stock statistics in this country?—A. Not that we consider reliable.

Q. They are not actual counts; they are estimates?—A. I should judge so.

Q. The only counts are those made by the census?—A. Yes.

Q. (By Representative BELL.) The Agricultural Department—does it not make

inquiries annually?—A. They claim to; they publish every January a supposed report of all kinds of live stock in the country.

Q. (By Mr. KENNEDY.) Without facilities for gathering that information, must it not be a matter of inquiry largely with the Agricultural Department?—A. Yes; almost entirely.

Q. (By Representative BELL.) How is it as to their other statistics?—A. I am not familiar with that.

Q. Might not we include them all and say they are all guesswork?—A. I would not want to go on record as to anything I know nothing about. They may have some facilities for finding out how much grain there is, and other things. I do not know anything about that; but so far as live stock is concerned, their statistics are of no value whatever.

Q. (By Mr. C. J. HARRIS.) So long as cattle do not have to be shipped into this country to supply the demand, and we have enough cattle raised here and shipped to the markets to supply our home demand, there could not be a shortage of cattle in this country?—A. No.

Q. There might be more or less one year than another, but there would not be what you would call a shortage so as to raise prices. Now, if we had to import cattle from other countries, that would raise the price, perhaps, would it not?—A. Yes. In my judgment these things are largely regulated by the supply and price of other live stock. For instance, when beef reaches a certain point consumption will commence to drop, and if pork is relatively lower a good deal of that consumption will take up with pork, and if mutton is still lower it will increase the demand for mutton; so we are not entirely dependent in this country on any one class of meat.

Q. (By Representative BELL.) Suppose we had 8,000,000 more cattle placed on the markets of the United States, would it raise or lower the prices of cattle?—A. It would lower the price.

Q. Then the shortage must have some effect on the price?—A. Yes; it does.

Q. (By Representative LORIMER.) Suppose we had 8,000,000 more cattle in the country than we have now, and the same amount was shipped to the market as now, what effect would that have on the market?—A. If the 8,000,000 cattle were thrown on the market all at once?

Q. If they came up in the natural way, and we were here and there shipping just as you receive now, would it affect the market?—A. I think the market would be lower with 8,000,000 more cattle in the country than there are to-day.

Q. Would it be as low as if the 8,000,000 were thrown on the market?—A. No. The temporary effect of 8,000,000 cattle on the market would be very depressing.

Q. So there would be a difference between having 8,000,000 in the country, with the regular supply shipping to market, and 8,000,000 thrown on the market?—A. Oh, yes.

Q. (By Representative BELL.) Suppose we had 8,000,000 more cattle, would they not ship more to the market?—A. Oh, yes; more of them would mature.

Q. (By Professor JOHNSON.) We are large exporters of cattle and meat products?—A. Yes.

Q. And a home supply equal to the home market would represent a tremendous shortage, would it not?—A. I do not think that I just catch your meaning.

Q. An attempt was made a moment ago by a question to show that as long as we had cattle enough to supply our own needs we could not speak of a shortage. We are supplying not only our own needs, but the foreign supply. We are large exporters, and it seems to me we would have a tremendous shortage if we could supply only our own home markets.—A. It depends a great deal to what extent you were carrying the shortage. A shortage may be less than the previous year; it may reach a point like a famine, or it may be just a few less than the last year; but, speaking with the broader view, I should say that a shortage, so called, is nothing more nor less than the natural result of the depression that the cattle market went through 2 or 3 years ago. Low prices will follow what we call generally liquidation. A great many people became discouraged because cattle were not seeing such a good market and threw them on the market.

Q. (By Representative BELL.) Do you not think the driving of cattle out of the Neutral Strip, Indian Territory, and the fencing of the Western range, whereby the ranger had to spay out of business, had some effect on the raising of cattle?—A. Yes.

Q. You handle a good many spayed cattle, do you not?—A. Yes; not during recent years, but from 1894 on we did.

Q. Did not that come from the ranges being eaten out and fenced up?—A. Yes, some of the cattle were thrown on to the market on that account, but had the price not been so low a good many of these cattle would have found places where they had feed and would have been held.

Q. You do not think high prices would make grass grow?—A. No; but it makes people hustle around and find feed more than it would with prices low. The transportation facilities are such in this country now that they can ship cattle almost any place and find feed.

Q. But the ranges are fenced up in the great West.—A. The reduction in supply of cattle on the ranges has been going down for 3, 4 or 5 years.
(Testimony closed.)

CHICAGO, ILL., November 24, 1899.

TESTIMONY OF MR. CHARLES W. BAKER,

Secretary of the Live Stock Exchange, Chicago, Ill.

The subcommission on transportation being in session on the afternoon of November 24, 1899, at Chicago, Ill., Representative Lorimer presiding, Mr. Charles W. Baker was duly sworn, and testified as follows:

Q. (By Representative LORIMER.) Please state your name in full?—A. Charles W. Baker.

Q. And your business?—A. Secretary of the Live Stock Exchange at the stock yards in Chicago.

Q. We understand that the people in your line have some complaint to make about the transportation companies through which you do business; will you please state what the conditions are?—A. I can only reiterate what Mr. Mallory (see testimony of preceding witness) has testified to in this regard. Mr. Mallory has covered the ground very thoroughly and carefully, and anything I would say would be cumulative evidence along that line.

Q. (By Professor JOHNSON.) Have you given any thought—you have, I suppose—to the amendment of the interstate-commerce act?—A. Yes; considerable.

Q. Are you in accord with Mr. Mallory's views?—A. Quite so; yes.

Q. Do you or not find that gentlemen in your line of business have that view generally?—A. Yes; I might go still further and say it is perfectly universal, so far as it has come within my knowledge.

Q. Is the Live Stock Association; you are secretary of that?—A. Yes.

Q. National Live Stock Association?—A. Yes; it is allied generally with the National.

Q. Does that association join with the National Millers' Association and others in the effort to secure a strong law?—A. As their representative I participated in the meeting, and will take action with them in the effort to secure remedial legislation such as we agreed upon day before yesterday.

Q. The officers of your association are in accord with the views presented and the act that was discussed there?—A. Yes; in the main I believe it meets the approval of my people.

Q. Do you remember whether that bill calls for a public accounting of the railway accounts?—A. I believe it does; I believe there is such a provision in there.

Q. (By Mr. KENNEDY.) As secretary of your organization, perhaps you are able to tell us something about this enormous shortage in cattle that was spoken of.—A. The figures we have show that some 6 years ago there were 52,000,000 cattle in the country. There are about 10,000,000 less to-day. I think 1 year there was a slight increase. I think there was an increase of about 1,750,000 in one year. But if I remember the figures now, carrying them in my head, it is my impression that the supply is now about 10,000,000 less.

Q. (By Professor JOHNSON.) How long do you think it will take high prices to restore that deficiency?—A. About 2 years.

Q. The 10,000,000?—A. Yes; it will take longer than that, I am afraid. It would take say 3 or 4 years perhaps, with the continuance of high prices. While you can breed and put an animal on the market in 18 months or 2 years, when you come to increasing your supply, besides supplying the demand that exists all the time, it would take a little longer time to catch up. At the same time the consumption is heavier.

Q. With the high price?—A. Yes; it is constantly increasing; although I think perhaps the supply now keeps pace with the increase in population. We are spreading out all the time.

(Testimony closed.)

CHICAGO, ILL., November 24, 1899.

TESTIMONY OF MR. E. P. RIPLEY,*President of the Atchison, Topeka and Santa Fe Railway Company.*

The subcommission on transportation being in session in Chicago, Representative Lorimer presiding, at 4.45 p. m., November 24 1899, Mr. E. P. Ripley, president of the Santa Fe Railroad Company, was introduced as a witness, and being duly sworn, testified concerning transportation as follows:

Q. (By Representative LORIMER.) Please state your name.—A. E. P. Ripley.

Q. What is your official connection?—A. President of the Atchison, Topeka and Santa Fe Railroad.

Q. If you will, you might make your statement.—A. I speak somewhat hastily upon some evidence which I saw published in the papers last night, as given here. I gather from the newspapers that it was testified here that the general sentiment of the mercantile community is averse to the pooling of the freight earnings of railway companies. That statement is, of course, a matter of opinion on the part of those who state it. My impression is that the sentiment of nearly all of the mercantile community that has had the largest dealings with the railroad companies is the other way. The statement was made here yesterday that the Chicago merchants and Chicago business men had had more or less experience with the pooling of earnings by railroads, and that it had not been satisfactory. I wish to take issue with the statement. (Reading:)

I have read the reported remarks of a witness who appeared before your board yesterday in opposition to the "pooling" idea.

Passing by a good deal of flamboyant declamation about the danger to the public from railroad combinations, which danger never existed and which never could exist, we may come to what this witness evidently thinks is the strongest case he can think of as showing the iniquity of the pool—namely, the Southwestern Traffic Association, which he says was a "vampire, which for a decade sucked the life-blood of the commerce of the Missouri Valley." How does this witness reconcile this statement with the fact that during this decade (say from 1877 to 1887) the population of Kansas City increased from 58,000 to 156,000 and that of Omaha from 25,000 to 110,000, and that not only these cities but the whole Missouri Valley and the States of Kansas and Nebraska grew and waxed fat amazingly? What evidence has he, save his naked assertion, that this association restricted trade in the slightest degree? It is true that at periodical intervals quarrels arose among the parties to this pool, and that at such times there were periods when that natural competition of which this witness thinks so highly had full sway, with the result every time of unsettling values, disarranging the plans of merchants, and working general destruction, and the reason for these disturbances was simply and solely because the pool was not legalized, because some (not all) of the courts held them to be void and unenforceable by legal process, thus relegating them to the honor of the parties as their sole support, and in the absence of legal construction of these contracts what wonder that differences of opinion and of interest worked occasional disruption? Moreover, it is absolutely untrue that the rates were advanced under this pool. It may be true that advances were at times made on certain commodities, but far more rates were reduced, and the general average for the 10 years will show a steady reduction. It is not claimed that the agreement worked perfectly or that no discriminations existed; but it is a fact that they were far less common and far less demoralizing and disastrous, alike to shipper and railroad, than those that have existed since the passage of the interstate law.

This witness quotes the opinion of various parties in opposition to the pool, but for every such opinion there can be produced 10 in favor of it, not from the ranks of railroad officers, but from merchants and shippers, State and interstate commissioners, students of modern political economy, and in fact almost all those who have dispassionately studied the problems surrounding the transportation business of this country. It is well known that the chairman of the interstate commission favors pooling under proper restrictions, as a majority of the interstate commission does, and always has from its inception. So, also, I believe, does a majority of the State commissions and a majority of the shippers of the country. The statement that the majority of the latter hold contrary opinions is pure assumption.

The statement that rates in this country ever were or ever can be too high per se is absolutely without foundation. The service performed by American railroads is admittedly the cheapest in the world, as well as the best, and no pool, however restrictive, can change the general laws of competition. No greater economic

blunder can be committed than the fostering of free and unrestricted competition among carriers by rail. It tends to the aggrandizement of the few and the submerging of the many, and that portion of the interstate law which so unwisely prohibits pooling has done more to concentrate business in few hands and to drive out the small trader than could have been accomplished in a century of the old methods.

One of the ablest of the interstate commissioners has said that the prohibition of pooling defeats the whole purpose of the law; that the law prescribes uniform rates and forbids the only known plan by which rates can be kept uniform.

The fact is that the commercial world does not accept, never had, and probably never will accept the "equal rate" theory. It is just what the railroads want, but what the large shipper does not want. He will theorize that equal rates are best for all, but in his heart and in his practice he believes himself entitled to lower rates than his neighbor of less capital or less enterprise. Believing this, he is actively engaged in finding ways to evade the law, and it would be surprising indeed if he failed to succeed. The law can no more be enforced than the prohibitory laws which have so conspicuously failed. You may close the front door of the saloon, but those who are determined to get in will do so.

But the underlying fallacy of all this talk about trusts and monopolies as applied to railroad pooling is the failure to differentiate between the railroad industry of the country and other purely commercial enterprises. The demand of the railroads that they be permitted to charge reasonable rates (and nothing more has ever been asked) is treated as if it were on a parity with a demand for the legalization of a trust in any article of merchandise, and it is argued that to do this is to establish a dangerous precedent, apparently forgetful of the fact that this country has never assumed to dictate or to regulate the price of any commodity except railroad transportation, as to which it has assumed both by State and national laws to fix prices; and it certainly would appear to a reasonably fair-minded man that when the supreme authority undertakes to limit the revenues of a private corporation it owes that corporation something in the way of protection. As matters now stand, the railroads are limited in charges, forced to compete and forbidden to combine for protection, though all the world may combine against them. It is considered legitimate and praiseworthy for the employees of railroads to combine to force up wages and a crime for the railroads to combine to maintain the rates which the Government holds to be reasonable. Could injustice go further? No such restrictions are put upon any other business in this country, and no such restrictions are imposed upon railroads in any other country.

To ask for permission to pool earnings is a very modest request under the circumstances. The roads might well ask for more—as, for instance, laws prohibiting the building of unnecessary roads and confirming each existing line in the sole occupancy of its territory.

Such laws exist in other countries, and are wholly reasonable and proper if the railroad is to be considered as a public or "quasi-public" institution. In short, the whole attitude of the American people toward the railroad industry is inconsistent and dishonest. They are considered as public institutions to the extent that their users are to limit their rates, but their owners are to pay their bills. They are taxed more heavily than any other interest, and accorded nothing in return, except the so-called "right of eminent domain," which, being interpreted, means that they can force a man to sell his property at two or three times its value, and even this is nothing for which they have to thank the public, since it is a necessary concomitant to the building of railroads, which the public must have.

To conclude: The permission to pool is asked for—not as a favor, but as a right—as being not a cure-all, but as the best known remedy for discrimination as between individuals and localities, which is to-day and always has been the worst and practically the only evil with which the American railroad system can be charged, either as to present or past practice; an evil which can never be removed by laws, however drastic, but which can be largely done away with by removing all incentive to it.

Let the Government do one of three things, namely:

1. Remove all restrictions and turn the railroads loose.
2. Accord them that protection to which they are justly entitled.
3. Buy them.

The railroads are entitled, in all fairness and justice, to ask that one of these three courses be pursued. The present mixture of all the objectionable features of the three is unjust to the last degree.

My position is, if you will excuse me for advancing it—but I believe it is a part of your unfortunate positions that you are obliged to listen to everybody's opinions—a railroad is either a private corporation or it is a public corporation. If

CHICAGO, ILL., November 24, 1899.

TESTIMONY OF MR. E. P. RIPLEY,*President of the Atchison, Topeka and Santa Fe Railway Company.*

The subcommission on transportation being in session in Chicago, Representative Lorimer presiding, at 4.45 p. m., November 24 1899, Mr. E. P. Ripley, president of the Santa Fe Railroad Company, was introduced as a witness, and being duly sworn, testified concerning transportation as follows:

I gather from the newspapers that it was testified here that the general sentiment of the mercantile community is averse to the pooling of the freight earnings of railway companies. That statement is, of course, a matter of opinion on the part of those who state it. My impression is that the sentiment of nearly all of the mercantile community that has had the largest dealings with the railroad companies is the other way. The statement was made here yesterday that the Chicago merchants and Chicago business men had had more or less experience with the pooling of earnings by railroads, and that it had not been satisfactory. I wish to take issue with the statement. (Reading:)

I have read the reported remarks of a witness who appeared before your board yesterday in opposition to the "pooling" idea.

Passing by a good deal of flamboyant declamation about the danger to the public from railroad combinations, which danger never existed and which never could exist, we may come to what this witness evidently thinks is the strongest case he can think of as showing the iniquity of the pool—namely, the Southwestern Traffic Association, which he says was a "vampire, which for a decade sucked the life-blood of the commerce of the Missouri Valley." How does this witness reconcile this statement with the fact that during this decade (say from 1877 to 1887) the population of Kansas City increased from 58,000 to 156,000 and that of Omaha from 25,000 to 110,000, and that not only these cities but the whole Missouri Valley and the States of Kansas and Nebraska grew and waxed fat amazingly? What evidence has he, save his naked assertion, that this association restricted trade in the slightest degree? It is true that at periodical intervals quarrels arose among the parties to this pool, and that at such times there were periods when that natural competition of which this witness thinks so highly had full sway, with the result every time of unsettling values, disarranging the plans of merchants, and working general destruction, and the reason for these disturbances was simply and solely because the pool was not legalized, because some (not all) of the courts held them to be void and unenforceable by legal process, thus relegating them to the honor of the parties as their sole support, and in the absence of legal construction of these contracts what wonder that differences of opinion and of interest worked occasional disruption? Moreover, it is absolutely untrue that the rates were advanced under this pool. It may be true that advances were at times made on certain commodities, but far more rates were reduced, and the general average for the 10 years will show a steady reduction. It is not claimed that the agreement worked perfectly or that no discriminations existed; but it is a fact that they were far less common and far less demoralizing and disastrous, alike to shipper and railroad, than those that have existed since the passage of the interstate law.

This witness quotes the opinion of various parties in opposition to the pool, but for every such opinion there can be produced 10 in favor of it, not from the ranks of railroad officers, but from merchants and shippers, State and interstate commissioners, students of modern political economy, and in fact almost all those who have dispassionately studied the problems surrounding the transportation business of this country. It is well known that the chairman of the interstate commission favors pooling under proper restrictions, as a majority of the interstate commission does, and always has from its inception. So, also, I believe, does a majority of the State commissions and a majority of the shippers of the country. The statement that the majority of the latter hold contrary opinions is pure assumption.

The statement that rates in this country ever were or ever can be too high per se is absolutely without foundation. The service performed by American railroads is admittedly the cheapest in the world, as well as the best, and no pool, however restrictive, can change the general laws of competition. No greater economic

much more the practice, much more rife, since the attempt was made to prevent it by law than it ever was before, and naturally so.

Q. Do you not believe that if we had a law that would fix a reasonable rate—and I do not think anybody who has anything to do with the Government wants anything else than that—and see that it was enforced rigidly by the railroads—do you not think that would be better for the railroads as well as the people?—A. It certainly would be better for the railroads if all rates were enforced as published; that is what we want. It is not possible for any man, or any body of men, to fix absolutely certain rates which shall be charged under all circumstances and conditions. Conditions vary so rapidly, it is impossible, almost, to do that; and there must be a certain amount of elasticity in that; but the rates once established and once published should be changed only publicly. There is no question about that, and that portion of the law—so far as the established rates are concerned—that portion of the law is being lived up to absolutely now. The trouble, under the present conditions, is that the larger shippers, men controlling the large tonnage, believe, as they all do believe, regardless of the law or any general sentiment on the subject, that their large business entitles them to concessions. They believe that to a man; they do not admit it openly, perhaps, but that is their idea, and that is what they try to enforce; and there are comparatively few of the railroads strong enough to resist the pressure that these people bring to bear; and in my judgment it is impossible, or practically impossible, to prevent concessions being made in some way or other. There are so many ways in which it may be done—I do not like to say railroad men are expert as law breakers—but there are so many ways concessions may be made without violating the letter of the law that I regard it as impossible to arrive at a prohibition of discrimination by statute.

Q. If the spirit of the law is evaded, the law itself is transgressed?—A. Granted; but it is very difficult to apply any remedy unless the letter of the law is broken.

Q. I understand just the contrary. If the spirit of the law is evaded, there is a breach of the law. For instance, a drawback of freight indirectly to accomplish the same thing, would have as much turpitude in it as if it had been directly done?—A. But very difficult to prove, however; it would be very difficult to obtain conviction.

Q. You think the condition is practically remediless, then?—A. I think it will always be. Until it becomes to the interest of the carriers to maintain absolutely equal rates, which it is not now, concessions will continue to be made.

Q. These concessions are generally made to the men most able to pay the regular rate?—A. Yes. The tendency is, among the railroads, that the man that has the most transportation to buy is very likely to buy it the cheapest.

Q. (By Professor JOHNSON.) Do you think the railroads could withstand the pressure of the big shippers, if they were allowed to pool?—A. Under those conditions there would be no incentive for them to make any concessions to anybody.

Q. (By Representative BELL.) Do you understand, in pooling, each man should have a proportion of the business done?—A. Precisely. That is what a pool means.

Q. I thought you pooled generally on the basis of the business during the year before?—A. No; that would be a very foolish proceeding. That would be an incentive for everybody to do what he is doing now.

Q. That is the present practice?—A. There is no present practice, because there are no pools. It never was the practice when we had pools. Once in a while, some of the railroad people thought that they could, by illegitimate methods, increase their tonnage one year as a basis for demanding a larger proportion the next, but they were very seldom realized.

Q. (By Professor JOHNSON.) How would the proportion be arrived at?—A. By arbitration, as a rule; sometimes agreed to, but usually an agreement was made by which it was left to an arbitrator in case of failure to agree.

Q. (By Mr. C. J. HARRIS.) The directness of line and superior accommodations of a road—would not that lead to a larger percentage than the roundabout road?—A. Yes.

Q. No matter how much the roundabout road might get by illegitimate methods?—A. Nobody would be willing to recognize as the basis of percentage, the business done by illegitimate methods; never did.

Q. (By Representative BELL.) Under the arrangement between the Midland and the Denver and Rio Grande, have not all their traffic arrangements from Grand Junction east been made each year on the business done the year before?—A. I do not know. That is a local matter with which I am not conversant at all. I do not think, however, that is the case. In the first place, I do not think they have any pool there or any agreement.

Q. Well, they have had.—A. Perhaps, in years past.

Q. They have a joint agent?—A. They have a joint agent at Grand Junction,

of course, because they have the joint use of property between Grand Junction and Glenwood. They have a joint track, but I am sure there is no agreement for any division of business there.

Q. I have always heard the railroad men there, being local men, say that one reason the competition was so sharp was that the business they did this year was the basis on which they did business the succeeding year?—A. I do not think that is true. I am not speaking of my own knowledge on that subject; I have troubles of my own, and am not altogether conversant with the business of these people out there. They occupy a stretch of joint track between Grand Junction and Glenwood—90 miles of joint track—and the expenses of that track are paid in proportion to the use of it; the expense of maintenance is in proportion to the wheelage that each company sends over it; so that every wheel each sends over there adds to his proportion of the expense. I should say, at first blush, that is the plan, but of course I do not know.

Q. (By Mr. KENNEDY.) Does your idea of legal pooling contemplate the forcing of all lines in a competitive country to go into a pool?—A. Oh, no; I would not object to that, but I do not think that is necessary. I think there are some objections to it, although I would not personally object.

Q. Then if one road remains out and indulges in pirating methods to get traffic, does not that kill your pool?—A. No; I think not. That would simply mean the others would, instead of fighting it singly fight it jointly, and fight it with legal methods, which they would be prepared to do under these circumstances. The trouble is now, when you have one party who thinks he can flock by himself, the law forbids the rest of us from combining against him. Combined, we can regulate that gentleman pretty thoroughly—singly, we are helpless.

Q. (By Professor JOHNSON.) Would you object to an examination of your accounts by a public accountant?—A. Well, that depends on what use was to be made of it afterwards. There are certain portions of the accounts of railroads that belong to the stockholders and should not be public property.

Q. The same system that applies to banking interests.—A. I do not see any objection to that.

Q. (By Mr. C. J. HARRIS.) What would be your judgment as to the possibility of the Interstate Commerce Commission making the rates for railroads; would it be possible?—A. No; because it is too much of a job, and it would be impossible for them to come in close enough contact with the wants of the mercantile community. One of the witnesses said here a few days ago that every railroad company must have a bargain counter. I disagree with that witness in almost every particular, but there is a modicum of truth in that statement that every railroad company must have a bargain counter. I do not mean he must sell transportation for less than the published rates, but he must modify his rates from time to time, and sometimes on very short order. The business is a sensitive one, and the same reasons exist for quick action in the changing of rates that exist in the selling of merchandise. There is no reason why it should not be done honestly and fairly, and everybody be advised, but it is not possible to intrust that sort of thing to a body thousands of miles away.

Q. You would have no objection to that board passing on the rate after it is fixed?—A. They have that power now, practically.

Q. In theory, would you clothe them with the power to make that effective?—A. I should be willing to that rather than the conditions we have now. It is an enormous power to intrust to any body of men, the power to fix the tremendous revenue that is involved in that thing, and yet I hardly think they would make any worse mess of it than is being made under the present conditions. That would depend very much on the personnel of the commission. I can see that a power of that kind might be subject to very great abuse. It is a larger power than is wielded by the President of the United States, or anybody in the United States.

Q. You would still have the protection of the courts?—A. Yes.

Q. And their tendency is to be conservative in all matters of that kind. The great problem you have to meet now is that of adjusting rates properly between different localities, is it not?—A. That is one of the great problems, and one that is never settled satisfactorily; that is to say, somebody is always disgruntled over it. With the best of intentions on the part of railroads, it almost always ends in a compromise, not satisfactory to anybody, and very unsatisfactory to a great many. Each railroad is interested in a particular port or particular locality, and each railroad is fighting for the supremacy of that particular port or district, and the result must be ultimately a compromise. Everything we have to-day is a compromise between opposing ideas. The endeavor has been to do the fair thing. In fact, there have been so many opposing interests that it has been impossible to do anything very unfair, but it is not an exact science.

Q. It must be a matter of compromise?—A. Of compromise and judgment.

Q. That being the case, would not a body of intelligent men, sitting as the representatives of all interests—carriers and public alike—would not such a body of men be able to assist the carriers in this judgment between conflicting interests?—A. I think so. There have been many cases where I would like to place the entire responsibility on an outside body, and have them say what is to be done; where two or three communities were warring with each other about the adjustment of rates, and the railways were between the upper and nether millstones, and could not please everybody—there have been cases where I would like to have thrown that responsibility on an outside tribunal.

Q. Then you say if the law gave the carriers power to deal with personal discriminations, and clothed the public with power to adjust, so far as may be, the conflicts between localities, the transportation problem would be largely solved?—A. It would be simplified. I do not know that it can ever be solved.

Q. (By Representative BELL.) Is it not largely settled in the Eastern States?—A. No; we can hardly say that. It is settled in certain portions of the East by the processes of amalgamation that have been going on. The lines in the East are so largely consolidated into a few hands that it is to a considerable extent settled in that way, and that is particularly the case in New England. There are practically only 2 railroad corporations in New England to-day, and yet there is less complaint there than in any part of the United States.

Q. Is it not true that as the country settles, and as the railroad business becomes settled, that it kind of settles itself in time?—A. It is true that the older a community becomes the more settled things become. It is also true that the older a community becomes the more likely they are themselves to become interested in railroad properties. I think that accounts for most of the tranquillity we find in the Eastern States—the fact that the people along the lines are interested. If the people along our lines owned a large proportion of our stock, I am satisfied we would have much less trouble than we now have. I wish they did.

Q. Now, with reference to the Government buying the roads; that is the third way. Do you think it would be possible for the Government to run the railroads in this country?—A. It would be possible. As a railroad man, I should have no objection to the Government owning the railroads. As a citizen, I should feel very unhappy about it.

Q. What do you think would be the cost of running them as compared with now?—A. I think it would cost a great deal more; no one can make an estimate of how much. There would be a certain amount of waste done away with. There is a certain amount of waste incident to all competition that would stop the moment the Government took possession, because there would be no competition. That, in the aggregate, would result in quite a large saving. But governmental methods, as we know them, and as applied to governmental affairs now, would result in a very large deficit in the operation of railroads, unquestionably. The influence of politics and politicians on the railroad business would be, I think, exceedingly disastrous, and any elective officers who were in a position to influence the policy of the railroads, and who would also be desirous of pleasing their constituents, would find the two things irreconcilable. Everybody would want a branch railroad and everybody would want as many trains as possible on it, whether they paid or not, and the price of the election of a Congressman or Senator would be his ability to get things out of the Government in the way of transportation. I think the result would be disastrous.

(Testimony closed.)

WASHINGTON, D. C., December 6, 1899.

TESTIMONY OF PROF. EDWIN R. A. SELIGMAN,

Professor of Political Economy and Finance in Columbia University, New York City.

The commission met at 10.55 a. m., Vice-Chairman Phillips presiding. At that time Prof. Edwin R. A. Seligman, of New York City, professor of political economy and finance in Columbia University, was introduced as a witness, and being duly sworn, testified as follows, the topical plan of inquiry on transportation being followed:

Q. (By Professor JOHNSON.) Will you give your name and post-office address?—A. My name is Edwin R. A. Seligman; my post-office address is Columbia University, New York City.

of course, because they have the joint use of property between Grand Junction and Glenwood. They have a joint track, but I am sure there is no agreement for any division of business there.

Q. I have always heard the railroad men there, being local men, say that one reason the competition was so sharp was that the business they did this year was the basis on which they did business the succeeding year?—A. I do not think that is true. I am not speaking of my own knowledge on that subject; I have troubles of my own, and am not altogether conversant with the business of these people out there. They occupy a stretch of joint track between Grand Junction and Glenwood—90 miles of joint track—and the expenses of that track are paid in proportion to the use of it; the expense of maintenance is in proportion to the wheelage that each company sends over it; so that every wheel each sends over there adds to his proportion of the expense. I should say, at first blush, that is the plan, but of course I do not know.

Q. (By Mr. KENNEDY.) Does your idea of legal pooling contemplate the forcing of all lines in a competitive country to go into a pool?—A. Oh, no; I would not object to that, but I do not think that is necessary. I think there are some objections to it, although I would not personally object.

Q. Then if one road remains out and indulges in pirating methods to get traffic, does not that kill your pool?—A. No; I think not. That would simply mean the others would, instead of fighting it singly fight it jointly, and fight it with legal methods, which they would be prepared to do under these circumstances. The trouble is now, when you have one party who thinks he can flock by himself, the law forbids the rest of us from combining against him. Combined, we can regulate that gentleman pretty thoroughly—singly, we are helpless.

Q. (By Professor JOHNSON.) Would you object to an examination of your accounts by a public accountant?—A. Well, that depends on what use was to be made of it afterwards. There are certain portions of the accounts of railroads that belong to the stockholders and should not be public property.

Q. The same system that applies to banking interests.—A. I do not see any objection to that.

Q. (By Mr. C. J. HARRIS.) What would be your judgment as to the possibility of the Interstate Commerce Commission making the rates for railroads; would it be possible?—A. No; because it is too much of a job, and it would be impossible for them to come in close enough contact with the wants of the mercantile community. One of the witnesses said here a few days ago that every railroad company must have a bargain counter. I disagree with that witness in almost every particular, but there is a modicum of truth in that statement that every railroad company must have a bargain counter. I do not mean he must sell transportation for less than the published rates, but he must modify his rates from time to time, and sometimes on very short order. The business is a sensitive one, and the same reasons exist for quick action in the changing of rates that exist in the selling of merchandise. There is no reason why it should not be done honestly and fairly, and everybody be advised, but it is not possible to intrust that sort of thing to a body thousands of miles away.

Q. You would have no objection to that board passing on the rate after it is fixed?—A. They have that power now, practically.

Q. In theory, would you clothe them with the power to make that effective?—A. I should be willing to that rather than the conditions we have now. It is an enormous power to intrust to any body of men, the power to fix the tremendous revenue that is involved in that thing, and yet I hardly think they would make any worse mess of it than is being made under the present conditions. That would depend very much on the personnel of the commission. I can see that a power of that kind might be subject to very great abuse. It is a larger power than is wielded by the President of the United States, or anybody in the United States.

Q. You would still have the protection of the courts?—A. Yes.

Q. And their tendency is to be conservative in all matters of that kind. The great problem you have to meet now is that of adjusting rates properly between different localities, is it not?—A. That is one of the great problems, and one that is never settled satisfactorily; that is to say, somebody is always disgruntled over it. With the best of intentions on the part of railroads, it almost always ends in a compromise, not satisfactory to anybody, and very unsatisfactory to a great many. Each railroad is interested in a particular port or particular locality, and each railroad is fighting for the supremacy of that particular port or district, and the result must be ultimately a compromise. Everything we have to-day is a compromise between opposing ideas. The endeavor has been to do the fair thing. In fact, there have been so many opposing interests that it has been impossible to do anything very unfair, but it is not an exact science.

Into this general reform the Federal Government has brought a jarring and discordant element, because not only does it now levy a separate tax upon inheritances, which diminishes pro tanto the chances of the States to develop that system, but also, if the Federal Government were to tax interstate commerce through transportation companies for the purpose of independent revenue, it would most seriously and still further hamper the efforts of the separate Commonwealths to secure just taxation.

I therefore lay down, as a general principle, that there ought to be no Federal tax on transportation companies for purposes of pure revenue.

That, however, does not by any means settle the problem as to whether there ought or ought not to be a Federal tax on transportation companies, possibly for other reasons, and that brings me therefore now to the second part of the inquiry. What is the tendency in the several States with reference to the taxation of transportation and other corporations, and how can the evils which at present exist, and which seem almost insurmountable, be averted?

The chief difficulty in our Commonwealth taxation of corporations arises out of the problems of what is called double taxation. They arise, in other words, from the legal fact or fiction, whichever you may call it, that there is for all purposes and to all intents absolute State sovereignty in each Commonwealth. In the legal system, for purposes of taxation at all events, it is a fact, not a fiction, that each Commonwealth has sovereign powers. Now, what are the difficulties that arise from that legal fact, when confronted by the economic fact that economic interests are not confined to any one Commonwealth, but that the economic interests of the community are scattered throughout the country and are intertwined with all the Commonwealths, that, for instance, with the growth of industry we have corporations which may be situated legally in one State, which may have their actual property in another State, and which yet may be owned, so far as stockholders and bondholders are concerned, in a third State? Here for example, a North Dakota railway, or a railway which runs through North Dakota, whose chief officers and legal representatives may possibly be in Illinois, and whose bonds and stocks are owned in New York, which is not at all a preposterous supposition. In other words, we have, under the stress of economic development of the nineteenth century, an incongruity between economic conditions and legal facts; legally we still have the system of taxation which grew up when each community was isolated from its fellow community, and this legal situation is no longer in conformity with economic facts.

Now, what are the difficulties that arise from this curious situation? I may add, of course, that this condition of affairs is not in the least peculiar to the United States, but is found in all modern federal governments. It is found in Germany; it is found in Switzerland; it is found or will be found certainly in Australia under the new form of government; with the exception that nowhere perhaps is the legal idea of State sovereignty so strong as it is in this country. For instance, in Canada the problem does not exist at all in that way, because the provinces are not legally sovereign.

Now, the difficulty, so far as taxation is concerned, is that wherever the States attempt to tax transportation companies upon receipts—gross receipts, net receipts, or anything else in accordance with receipts—you at once run up against the rock of interstate commerce. It has been decided in a number of cases in our various States which attempt to get a State revenue from the gross receipts of corporations that, so far as domestic corporations are concerned, corporations chartered within the State, the State is at perfect liberty to levy a franchise or excise tax, however it may be called, upon the total receipts of the corporation; that is, provided the franchise is measured by the gross receipts, then it is valid. No State is at liberty to levy a tax upon gross receipts so far as those receipts are derived partly from interstate commerce. But through the fiction of the law, of course, where you call it a franchise tax or excise tax, and measure the franchise by the gross receipts, then the tax is upheld. This applies, however, only to domestic corporations. Under economic conditions to-day a large part of all corporations doing business in any State are foreign corporations; they are corporations chartered in some other State, perhaps in New Jersey or West Virginia. Now, under these conditions the courts have repeatedly held, and the Supreme Court of the United States has laid down as the law of the land, that you can not levy a franchise tax upon foreign corporations, because, of course, the State does not give a franchise except to its own corporations; a State does not give a franchise to foreign corporations; and therefore a tax of this kind levied upon foreign corporations is a tax not upon franchise but upon business, and being a tax upon business it can not be levied upon the business derived in whole or in part from interstate commerce. Therefore we have this situation in this country to-day, in all these States,

more especially the more advanced and developed industrial States, and the problem will soon be the same in all the other States of the Union. It is only a question of a few decades when the industrial system will spread throughout the whole country. We have therefore this situation—that although the revenue is sought to be obtained from corporations, the great mass of corporate business can not be reached by such a tax on receipts. Some States, therefore, in order to avoid that difficulty, attempt to solve the problem by taxing corporations not on receipts but upon the valuation, or upon the capital stock, and in some cases also the bonded indebtedness. A great many of our States tax the capital stock of corporations; some, like Pennsylvania, add to the tax on capital stock a tax on bonded indebtedness.

What are the results of this conflict between legal and economic conditions in this class of cases? So far as capital stock and bonded indebtedness is concerned, it is clear at once that a difficulty arises from the fact that the capital stock may be owned or the bonds may be owned by people who are not residents of the State. The capital stock of the Pennsylvania Railway may be owned entirely or in very large part in New York or in Chicago, or *vice versa*.

What is the legal situation as regards the taxation of corporations under this, the most general form of taxation of corporations? So far as the taxation of capital stock is concerned, the courts of this country have finally reached the conclusion that it makes no difference where the stockholders live, because the tax is assessed, not upon the stockholders, but upon the capital stock. The situation would seem to be free from difficulty there, but it is not, because as soon you levy a tax on capital stock the question arises. Upon what part of the capital stock are you going to levy the tax? Here is the Western Union Telegraph Company, which ramifies through, perhaps, every State of this Union. If you levied a tax upon the entire capital stock of the Western Union corporation the Western Union Telegraph Company would be taxed fifty times; instead of being taxed once it would be taxed by each one of the fifty States upon the whole of its capital stock, which, of course, would result in the company's going out of existence. Therefore, it is easily seen that where you have a tax on capital stock, in order to realize justice you must tax only a part of the capital stock. The question then arises: what is the economically defensible part of the capital stock that is taxable in each State?

I do not wish to answer that question now, but simply to raise it and point out the difficulty and to state the problem, showing that even though you tax the capital stock you have not got over the difficulties of double taxation and the question of the diversity between economic conditions and legal facts.

What, however, is the situation with reference to the bonded indebtedness of railways? The most advanced States, as all scientists, have come to the conclusion that to tax corporations simply upon capital stock is manifestly unfair. You may have two corporations, each with \$100,000 working capital; one corporation may have no bonded indebtedness at all, and the other corporation may have bonds outstanding of \$200,000, double the amount of the capital stock, and the second corporation may have raised its entire working capital, in the economic sense, by selling its bonds and giving away its stock as a bonus. If, therefore, you tax only the capital stock, you would be taxing the first corporation three times as much as the second corporation; because, in the second case, where you have a total amount of \$300,000—\$200,000 bonds and \$100,000 stock—you are taxing the corporation only upon one-third of its actual capital, while in the case of the first corporation you are taxing it upon 100 per cent. And therefore it is that all statesmen who have looked into the question, and a good many of our States that attempt to realize justice in taxation, now say that corporations must be taxed upon stocks and bonds or upon a valuation equivalent to stock plus bonds.

Now, what is the legal difficulty there? The court of the United States, in the Foreign-held Bond cases, has decided that a tax upon the bonds of a foreign corporation is a tax upon the bondholders; and consequently, since a State has sovereignty only within its own borders, no State can reach the bonds of a corporation which are held outside of that State. There at once you see the deathblow given by a legal decision which, in my humble opinion, is totally incorrect from the economic point of view, though entirely defensible from the constitutional point of view. You have a deathblow given to this whole system of taxation, because if you can tax railway bonds only so far as they are owned within the State, it will not be very long before you will have no bonds at all to tax within that State, and, as a matter of fact, you would have the same difficulties you had in the other case.

I might go on and describe other forms—although these that I have mentioned

are the most important—other forms of corporate taxation in this country, to show you that in each case we run up against these legal and constitutional conditions which are not in harmony with our economic conditions. It may be laid down, of course, as a general rule that in the long run law, crystallized justice, is nothing but the outcome of social conditions. The law is simply the legal statement of the economic and social conditions of a country; and the legal system always follows the economic conditions. The economic conditions come first, and the legal conditions are gradually changed so as to be in conformity with the economic conditions.

Now, all that I have tried to point out is that we have certain economic conditions which are out of joint with our legal conditions, and that before very long we are bound to change our law to conform to our economic conditions; because, of course, we can not change economic conditions to conform to law.

The question therefore arises, in view of the chaos in our State and local systems of taxation, to which are largely due these problems of double taxation: what is the remedy? There are only two general lines on which an advance can be made. The one is to attempt to secure a uniformity of State action, if possible, through Federal pressure. I consider that one of the chief functions of this commission, not alone with reference to the taxation problem, but also with almost every other one of the problems with which you have to deal. That is to say, I consider that a great many of our existing evils in this country arise from the diversity, complexity, and opposition between our State laws, and that as long as we have our present political system, which very wisely prevents the absolute centralization of all economic powers in the Federal Government, we must try to get at the problem through a gradual unification or uniformity of State laws by pressure from above. That, applied to the problem in hand, means an attempt to do with the taxation problem what we are beginning to do with the railway problem, what we are beginning to do with the labor problem, having annual conventions of our labor commissions, our railway commissions, etc. There ought to be annual conventions of State tax commissions, where these problems might be discussed, not from the narrow point of view of State sovereignty, but from the real economic point of view of the wider economic interests of the country; and those meetings ought to be held under Federal auspices, safeguarding, of course, the interests of the Commonwealths and preventing any friction or jealousy. In that way a great deal of good could be accomplished.

If, however, that is an ideal still too remote for any practical purposes, there is one other way in which a reform of taxation in this country can be accomplished through the intervention of Federal authority. I stated some time ago that I considered it highly inadvisable for a Federal Government to levy a Federal tax on transportation or other companies for purposes of revenue. It is a question, however, whether we ought not—whether we may or not constitutionally—whether we ought not to follow the same principle that some of our State governments follow when dealing with the complications between State revenue and local revenue. In order to get around the difficulties of double taxation between counties, municipalities, etc., they levy a State tax on corporations or other subjects, and then turn back the revenue under a well-considered general system to the localities, thus avoiding the difficulties and the friction of which I speak. The question therefore arises: can the Federal Government exercise its powers of taxation by levying the tax at all events upon corporations engaged in interstate commerce, and then turn the proceeds over, according to well-considered and carefully devised rules, to the various Commonwealths, in order to help along the various Commonwealths in their struggle to adjust and reform State taxation itself.

This is the system which is pursued by other national governments. England, for instance, pursues the system in various kinds of taxes. In inheritance taxes they collect that revenue under well-settled rules and then turn over a part of the revenue to localities. So other European Governments do the same thing; and we in our own country have the precedent, of course, of the Government collecting money and then turning it over to the States—a distribution of the surplus revenue, which, of course, was not very happy as a political measure, because it was not framed on any economic line at all, but it seems that the Government has the constitutional power of getting revenue and then distributing it as it chooses.

That, therefore, would be the line of thought on which I think a consideration of the reform of taxation ought to proceed in this country. To recapitulate what has been said, to sum it up so as to state it clearly, I will just say this, that our whole system of State and local taxation is a chaos, almost worse than a chaos, in the most advanced industrial States. It is not so, of course, in the agricultural States or in the Southern States, or even perhaps in part of the West, where

the old general property tax is still suitable, because the economic conditions are not the modern conditions, but the economic conditions which were true of the North and East years and years ago; but wherever we have modern industrial conditions the old general property tax is no longer defensible. We are trying to get rid of it and our advanced States are getting rid of it. There is even now a great commission sitting in New York City which—I may be permitted to say without divulging any secrets—will bring in a bill before long to reform the whole system of taxation in New York State, and it is proceeding along these general lines, although I am not at liberty to state exactly what the recommendations will be.

Now, what is true of New York will be true of all of the other States in the Union soon. Everyone agrees that in order to bring about this reform we must have a divorce of State and local revenue. Everybody agrees that if you are going to have a separate State revenue you must have it primarily from inheritances and corporations. Everybody agrees that if you have it from corporations you can not have a just system under the present conflict between legal facts and economic conditions. Ergo, I say, the conclusion is that we must so change the legal facts as to bring them into harmony with economic conditions. That can be done finally in only one of two ways, either by voluntary cooperation on the part of our State authorities, voluntary and possibly with pressure from above; or, secondly, through a certain separate or independent intervention by the Federal Government itself. Therefore, it seems to me that this problem, which at first blush seems to affect possibly only the Federal Government, is of very much wider importance because it not only affects the whole question of State and local taxation, and not only affects the question of just taxation of corporations themselves, but necessarily affects the whole question of taxation apart from that of corporations, because as soon as you solve the problem of taxation of corporations properly you are in a position where you can attack the other and perhaps more complicated problems of taxation of property.

Q. (By Professor JOHNSON.) In order to make your admirable presentation of the principles of the subject a little more concrete and to develop more details, I would like to ask you a few questions. First, I understand correctly, do I, that your objection to the taxation of inheritances is entirely from the standpoint of their taxation by the Federal Government?—A. Entirely.

Q. That is, you consider them a proper tax for the State authorities?—A. I do; and not alone proper, but a highly desirable taxation.

Q. In the taxation of gross receipts, how do the States of Illinois and Wisconsin arrive at the basis for their taxation?—A. Well, that differs, of course, with each State. In Wisconsin, if I am not mistaken, they divide the railways up according to the gross receipts per mile, and where the gross receipts are a certain number of thousand dollars per mile they tax them at a certain rate, and then it differs, high or low.

Q. Most of the railroads of Wisconsin are interstate in character. How do they determine what is subject to State taxation and what is not?—A. I am not quite sure in Wisconsin. It is some little time since I have had my attention called to that particular phase of it in Wisconsin, but my impression is that the taxes there are comparatively light, and that the interstate railways have acquiesced in the taxes imposed upon them without raising much objection. When I was speaking of that problem it was more especially cases like, for instance, Maine that I had in mind, and other States, where a large part of the revenue was sought to be obtained from this source, and where the corporations are fighting the law and have succeeded in overturning the law.

Q. If a State were to levy a tax of 4 per cent on the gross receipts of a corporation as a license tax, could that be done?—A. That brings out a point that I mentioned—that the courts of this country have tended toward a line of decisions distinguishing between domestic and foreign corporations. So far as domestic corporations are concerned, they are willing to accept a franchise tax, as it is called in some States, a license tax in other States, measured by receipts; but so far as foreign corporations are concerned, they are not willing to permit any infringement upon the law prohibiting the taxation of interstate commerce. And therefore where, as in most cases, the railways are largely foreign corporations, of course it would mean that there could be no adequate revenue from such taxes even under a license tax.

Q. In the valuation of stocks and bonds owned by a corporation, do not the States take such a proportion of the total value of the capitalization of a corporation as the mileage within the State is of the total mileage of the corporation, in some cases?—A. In some cases there has been a tendency in the last few years, notably, for instance, in taxing the express and telegraph companies in Ohio and

Illinois and a few other cases, to take only that proportion of the valuation which is employed within the State. In the case of transportation companies they measure it by mileage; but that would not apply, where the tax is imposed not upon a valuation equivalent to stocks and bonds, as in Indiana, but where the tax is imposed ipso facto upon the stock and bonds themselves, as, for instance, in New York State as well as in Pennsylvania—the tax there is imposed upon the capital stock. Now, it is true that so far as the capital stock is concerned, they levy only upon that part of it which is employed within the State; but so far as the bonds are concerned, it is complicated by this question of extra-State ownership of the bonds. That is the difficulty.

Q. If the States are to tax on valuation, that seems the only practicable way, does it not?—A. I think so.

Q. By taxing according to mileage proportionately?—A. Decidedly.

Q. (By Mr. FARQUHAR.) Is it possible to reach a uniformity in that class of taxation as between the States?—A. If you should tax simply railway companies within each State and then each State were to agree—which they do not by any means do at the present time—if each State were to agree to tax only that part, whether of the gross receipts or of the capital stock or anything else that you may tax, which is in proportion to the mileage within the State, then you would have to that extent uniformity between the States. But the trouble is that some States do tax that part and other States tax the whole of the capital stock.

Q. In case of States which impose an excise tax or franchise tax or the pro-rating by mileage, how many States tax the railroads, even back to the telegraph poles and the tools in the shops and so on? And in one or two of the States have they not taxation of township and county and State? How is it possible, even theoretically, to discover a practical way of spreading that taxation under the proposition you make?—A. I am glad you mentioned that fact, because when I was speaking of just taxation there I had reference only to the States as compared with each other. When now you come to taxation within the State I think that mileage is very far from being a just system, because, as has just been pointed out, in one city or one county you may have an immense terminal worth millions of dollars, and in another county you may have nothing but the track without any side tracks at all. Mind you, mileage does not mean trackage. Even if you were to have trackage that would be a different system from mileage, because in one county you might have four tracks, and after you have passed one station the next section might have only one, and after you have it measured up the four tracks would only amount to as much as one; and then you would have only the one line with the terminals and with the important bridges and a good many other things that might be mentioned. So that even from the point of view of State taxation, I do not think that mileage is a theoretically correct system at all.

Q. (By Professor JOHNSON.) Do you think, as an abstract proposition, that the taxation of receipts is a just tax?—A. From the abstract point of view, entirely irrespective of the practicability of the system, there is no doubt in my mind, that the taxation of receipts—meaning by that, however, net receipts and not gross receipts—is a more equitable system of taxation than any other, and we find that pretty much everywhere else in the world.

Q. Then if the Federal Government were to undertake taxation of interstate transportation companies, you would advise them to tax the net receipts?—A. I do not say that exactly, because the facts of the existing economic life may often invalidate an abstract principle. It may be wise abstractly to do so, and yet not wise in face of the existing relation between the individual and the government in this country, in face of the fact that our commonwealth differs from those abroad very largely in this respect, that we look upon our Government as our servant, and not as our master as they do in Germany. For instance, it is unfortunately true that one of the results following from that good principle, is that if we were to attempt to levy a tax purely upon net receipts, that probably would not result in having a just system, unless it had very careful safeguards. In other words, the great corporations could easily succeed in so scaling down the nominal net receipts that they would not have any receipts to tax. I think that if you have a tax on net receipts it must be very carefully defined; you must define net receipts as they never have been defined before, not even by the Interstate Commerce Commission, so as to obviate the possibility of diminishing the net receipts. It is largely for that reason that most of our States where they levy a tax on receipts, levy the tax on gross receipts rather than on net receipts; a system which is theoretically far less good, but which has many practical advantages.

Q. Would it be possible by careful statutory definition of net receipts, by prescription of uniformity of accounts, and by Government inspection of railway accounts, to arrive at a public knowledge of the net receipts of railway corporations?—A. I think so. I think that the main difficulty with the question of net-receipts taxation would arise not so much with transportation corporations, but with manufacturing corporations. Where you have the quasi-public corporations, the system as you outline it would very largely overcome the objections, which I have mentioned.

Q. In that connection would you advocate the prescription of uniformity of accounts on the part of the Federal Government and the public inspection of accounts of transportation corporations?—A. It seems to me that there really can be no question, not only of the advisability, but of the imperative necessity of such a system as that, because it would not only be useful for purposes of taxation, but it would be almost indispensable in a great many other questions of the relations between railways and the Government.

Q. How do you look upon taxation as one of the effective means for the regulation of transportation and industrial corporations?—A. I think that taxation has always been utilized, and will always be utilized for two purposes. Of course, I know that the extremists on both sides would take exception to that statement. My statement is that taxation is not only to be utilized for fiscal purposes, but may also be utilized for social purposes; such social purposes as are approved by the majority. In regard to that point there are really two different schools of thought throughout the world. The one is the extreme individualist, of whom we still have quite a number in this country, represented possibly most effectively by Hon. David A. Wells, who died a short time ago. He claims that taxation can be utilized only for fiscal purposes, and as soon as you utilize it for social purposes, it is not taxation, but confiscation—one of his deductions, of course, being that the protective tariff was confiscation. That was the point of view of Mr. Calhoun and others.

On the other hand, we have the socialists, the extreme socialists, who are represented in academic circles in this country and abroad by eminent men, who maintain that the difference between the nineteenth century and former centuries is that in former centuries taxes were used only for fiscal purposes; that to-day the great problem is the social problem, the economic problem, and that the taxes must be used for social purposes, and that a tax is not a tax unless it has a social object. You then have these two extremes. On the one hand you have a man who says that if a tax is used for anything but fiscal purposes the tax is not a tax, and on the other hand you have those who say if it is used for such fiscal purposes it is not a tax.

I think the great mass of scientists and statesmen will confess that the history of the world shows, and that the theory of the subject also shows, that taxation must be and may be utilized for both purposes; that, of course, the primary end of all taxation is to secure revenue, but that if, on the other hand, there is a certain desirable end to be attained, whatever the end may be, we must not shrink from utilizing taxation for that end, if the use of taxation as a means is workable. Therefore I would answer your question in that general way.

Q. You would say, then, that the regulation of trusts and interstate commerce might properly be facilitated by the agency of taxation?—A. Decidedly.

Q. (By Mr. KENNEDY.) I should like to hear an expression of your views relative to the new system of taxing corporation franchises in the city of New York, the one that was embodied in the Ford bill.—A. That is a rather special and peculiar measure, because the Ford franchise bill, or as it is now called, special franchise bill, does not affect the franchises of ordinary corporations, but only a particular aspect of some corporations. What I mean is this: There are three different rights given to corporations by Government, first, the right or the franchise to become a corporation. That is paid for in New York State, as well as most of our other States, by payments known as incorporation fees or bonus on charters, or various names of that kind. When a company incorporates, it must pay a certain fee or charge for the privilege of becoming a corporation. The second franchise which is paid for is the franchise, not to become, but to be, a corporation; not the liberty of coming into existence, but the liberty to act. That is paid for by the system of so-called franchise or license tax, as we have it in New York, Pennsylvania, and other States. That is a tax, whether upon capital stock or upon gross receipts or anything of that kind. The third kind of franchise is the one which this new New York law is attempting to reach; that is, the privilege of certain corporations in localities to make use of the streets and highways, by going either on, below or above them. It is that franchise and no other franchise which is sought to be taxed by the Ford bill, and it seems to me

just as defensible to put an additional tax upon such corporations for local purposes as it is to put a general franchise tax on general corporations. The object, therefore, of the Ford franchise tax is simply to make those quasi public corporations, sometimes called municipal monopolies—the street railways, gas companies, electric light, steam heat and power companies, etc.—pay more than they are paying, simply on their capital stock for local purposes, or on their real estate, because very few of them pay on their real estate, since they do not own the streets. There is no real estate there. All for instance, that gas companies would pay, would be on the value of the pipes beneath the street; all that the street-car companies would pay would be—if it paid at all—upon the value of the rails. Of course, they do not pay on the value of the street, because the street does not belong to them. Now, these municipal corporations pay for what is practically—what would be called in the case of a business—the good will, the good will of the business. That is to say, the value of their property as a whole is very much more than the value of their tangible assets, and the Ford franchise bill seeks to hit this difference between the value of the tangible assets, actual realty, and actual visible personalty, and the total value of the corporation.

Q. There is no attempt, then, to tax the good will that goes with the franchise the State gives a corporation to build a railroad through a State?—A. No; because that is thought to be reached by State taxes on franchises. The State has a tax on franchises, but it measures that in a peculiar way, and, moreover, the State has an additional tax on transportation companies over and above the franchise tax.

Q. You say it is measured in a peculiar way. Will you state that peculiarity?—A. In New York State they measure the general franchise tax on a corporation according to dividends. They levy the tax on capital stock in proportion to dividends, pursuing the same system that Pennsylvania formerly pursued, and finally abandoned.

Q. You understand that if the Government were to assume ownership of the railroads of the country the States would be deprived of the right to tax the property of the Government?—A. That would necessarily follow from our constitutional limitations. It does not follow abroad; they have a very curious system; but in this country, of course, no State can tax any agencies of the Federal Government. I think that would constitute, among other objections, one of the most serious objections to Government assumption of railways in this country.

Q. The States would be very jealous of that right, and would no doubt oppose the Government ownership on that ground?—A. Decidedly.

Q. (By Mr. A. L. HARRIS.) Just at this time the State of New Jersey is attracting a great deal of attention on account of her tax system. What have you to say in regard to other States adopting a similar plan?—A. The State of New Jersey has, on the whole, been very wise. I think, in fact, that the whole system of corporation law of New Jersey is, in some respects, in advance of many other States. They have taken very good advice, indeed, in framing their system in New Jersey. I know the only difficulty is that New Jersey is such a small State, and it has so few expenses in comparison with the vast interests within the State that the problem is not the same. New Jersey, you may say, fattens upon and lives upon New York City, practically; that is what it amounts to, and what properly ought to be taxed in New York, all these railways whose terminals are, economically speaking, within New York, have, legally, terminals in New Jersey, and New Jersey is therefore within its borders. The wealth and income is out of all proportion to what is really economically within it. If you were to take from New Jersey the suburbs of New York, you will find the situation would be a very different one in New Jersey; therefore, while the system is very good for New Jersey, and while they can get along with a very low rate of taxation, and while New Jersey does not levy any State tax at all upon property for general purposes, it is simply because of the fact that New Jersey happens to be an annex to New York City.

Q. And would it be possible to have a uniform law bearing equally upon all of the States?—A. The system of uniformity, as I said before, would have to be arranged according to carefully devised rules, and these rules ought to be framed from the point of view of the economic interests, so far as it is possible, and not in accordance with the temporary territorial and local position.

Q. Possessing the advantages she has now would New Jersey consent to uniform taxation laws?—A. Provided New Jersey would get sufficient revenue from her own State. It seems to me that the plan is feasible within certain limits. Of course, I do not wish to imply that any Federal commission or any other commission could take away from any State some of its own source of taxation. What I did mean to imply is that certain general rules can be laid down as to the divi-

sion of the tax between the States—not only according to the location of the railway, but also in accordance with the rights of the stock and bond holders; in accordance, in other words, with the economic interests. They have been able to do that in Switzerland to a certain extent. They have been able to do that in Germany to a certain extent, and it seems to me that when the question is properly presented the problem is not insurmountable in this country. Of course, it would mean that certain States which now permit the domiciliation of weak corporations which are afraid to take out a charter in other States would lose that proud preeminence, but that is a thing which I think is very much to be desired in the interests of all corporate development.

Q. I see in 1897 the State of New Jersey collected from the Pennsylvania Railroad Company alone \$411,000 of tax, while she had only 708 or 709 miles of road within the State of New Jersey. Is that altogether fair to the other States that have also helped to make the value of the Pennsylvania Railroad's property?—A. I think the fact that you have instanced is one example of the glaring discrepancy between our legal facts and economic conditions, and the problem is not so difficult of solution in New Jersey as might be thought, because New Jersey needs comparatively a small revenue. It is a small State, and the consequence is that its rate of tax is very much lower than, as you will see, in Pennsylvania or New York, and therefore a uniform system could very much more easily be effected there.

Q. I noticed a few days ago in the paper that the State of New Jersey had over a million dollars of the excess she had collected to turn into the school fund without taxing a single dollar of property for State purposes.—A. There are other States in this Union that do not levy any tax on property—Connecticut, for instance, and other States—and the plan under advisement, I may say, by New York is precisely to that effect, so there will be no more taxing of property.

Q. Do you think the old era of tax for State purposes, as well as other purposes, of property according to its true value in money, is not practical now?—A. I think the theory was true at a certain stage of economic development, and that was the reason why everywhere in the world at a certain stage of economic development you find the tax on general property. You find it in the Middle Ages and you find it in every country of the world at a certain stage; but when that economic stage is past that property tax is bound to go with it. In our advanced industrial communities in this country we have gotten past that stage, and it does not work. It resolves itself practically into a tax on real estate, plus a more or less wild guess at the personal property.

Q. One of the objections of the method of taxation was the difficulty of getting the true valuation of the property, was it not? A good deal of property escaped all taxation? What have you to say in regard to the present law of Illinois in regard to the reform in getting the valuation of property?—A. I say to that that Illinois is simply another example of a new broom sweeping clean. It will sweep all right for a while. All attempts to secure the desired result of equal taxation of property by making a listing system, by making the penalties more severe, work as long as everybody believes the law is going to be enforced; but it takes only a very short time for anybody to conclude that the law will not be enforced.

Q. The opinion appears to prevail among the agriculturalists of the country that they are bearing more than their share of taxation. What are your views upon that subject?—A. I think that in a great many of the States the contention is a correct one, simply for the reason that what amounts practically to a real estate tax in the rest of the State is a general property tax in the rural districts.

The large cities' personal property very largely escapes because it consists mainly of corporate securities, while in the small farming districts in some of our States the chickens and the cows and the agricultural implements are taxed to the farmer as personal property. Where that is done, of course, the farmer does pay more than his share, because he has to bear his own burden and that of the city besides.

Q. The amount that goes to the State revenues is comparatively small, is it not?—A. About 15 per cent—from 13 to 15 per cent in New York State—and I should imagine perhaps a little more in some of the other States. It is pretty difficult, of course, in dealing with any economic problem, to make any generalization in regard to any part of the United States, because we forget that the United States presents this curious spectacle for the first time in the history of the world; that we are dealing with different stages of economic development. We have the frontier life in some of our States yet. We have our purely agricultural communities in some of our Southern States, and we have the most fully developed industrial communities in a few of our Eastern and Northern States. You have these three different stages of economic life existing at the same time

in the country, and you can not make any generalization that covers the whole country, and that is why, therefore, I should hesitate to answer that question in regard to the whole country. That is one of the reasons why the solution of all economic problems is so much more delicate in the United States than in any of the compactly developed and complete communities of the Old World. It has taken them 1,000 or 2,000 years to get their development, which we are going through in a few decades. Some of our States have only just begun to become States—just beginning development. They are, practically, to all intents and purposes, as regards certain economic conditions, where Europe was away back in the Middle Ages.

Q. As a rule the local tax is a burden, is it not?—A. It is.

Q. And the locality that pays the tax substantially controls the amount of that tax?—A. Very largely; not entirely. There are certain obligations; but, as a general principle, I think it may be laid down.

Q. The tax problem is one of the most difficult to solve equitably that the legislator meets, is it not?—A. Yes. As long as our legislators will realize the fact, which many are beginning to realize in the most advanced States, I am glad to say, in this country—as long as they realize that you have got to attack the problem piecemeal, and you can not reform the thing all at once, the situation may be very much improved. When I say you have got to attack the problem piecemeal, I mean you have got to take one step forward at a time; and the first and most important step for the present time in this country I consider to be a divorce between State and local revenues, in order to prepare the way for reform of local revenues. You never can do that as long as you mix up State and local revenue, and it was to emphasize that point that I spoke this morning in reference to the possible interference of the Federal Government.

Q. (By Mr. RATCHFORD.) Have you noticed the recent decision of the Ohio supreme court with reference to the taxation of trusts within that State—a decision handed down some few days ago?—A. I do not think I noticed that, sir. What was the exact point?

Q. (By Mr. FARQUHAR.) You spoke of the fact that the uniformity of State action might be attained through pressure from the Federal power. How is it possible, unless the Federal power create one of these corporations, that it have any effect either on commonwealth taxation or taxation by the National Government itself?—A. I had reference more to the indirect pressure than the direct pressure. What I meant was the same sort of work being done, perhaps unconsciously, by the Interstate Commerce Commission, in influencing the State railway commissions, and thus ultimately affecting State railway legislation. There is no one at present in any of our States who looks at the problem in any but a purely local light. What I want is a body which may be induced to regard the problem in its general aspects.

Q. Do you know of any means whereby the Federal Government itself could regulate the railway corporations of this country through taxation, otherwise than by creating them?—A. If I understand the question correctly, the Federal Government has the right to tax any corporation, whether created by itself or not.

Q. Direct or indirect?—A. It would be called legally an indirect tax, although economically it would be a direct tax. This has been decided by the Supreme Court of the United States. The gross receipts' tax during the civil war, which was economically a direct tax, levied on the railways, was decided by the court to be an indirect tax and perfectly constitutional.

Q. That, however, was a state of war. I mean in a state of peace, in a normal condition of the country. How wide would you define, under the Constitution, the regulation of interstate commerce? Would you maintain that it ought not to contain within itself this taxing power?—A. Whether that is true or not, sir, the power of taxing the railways could rest upon some other clause of the Constitution. The Government now taxes inheritances; it is true that its constitutionality is being discussed at this very moment across the way (pointing to the Supreme Court), but the Government is levying taxes on other forms of business, which have been upheld. The stamp tax has been upheld only a few weeks ago as being a tax on business. There is no reason why the Government can not levy a tax on business, whether State or interstate, providing it is not levied so as to run up against the prohibition of direct taxation.

Q. What I want from you to-day would be propositions leading to some progressive gradual steps toward the regulation of this whole taxing power of corporations, and thereby leading to the regulation of trusts.—A. I thought I had covered that point in my testimony. I can repeat my own view in just a word or two. I say there are two ways in which the Government can bring its influence

to bear; the one is by enacting a law providing for the calling together of annual conventions of State commissioners by inviting them. Of course you can not compel the State to do so, but you can invite the State to do so, and by tactful arrangement I think a great deal can be accomplished in that voluntary way, and a great deal more good could be accomplished than by compulsion. The Federal Government in conjunction with the State commissioners could lay down principles which, if followed, might lead to an improvement in the system. What those principles are, I hinted at, although, of course, I did not develop them fully. That would be the only way—for the Federal Government to work hand in hand with the commissions of the States.

Q. Through the creation of a new commission, do you mean? By what agency?—A. Either a commission or an official body which would have this especial object in view. I am not prepared to say which would be more effective.

Q. (By Mr. PHILLIPS.) You would form this commission of the taxpayers of the various States?—A. Yes; but the gentleman asked what the Federal authority would be—whether one man or a number of men. That, perhaps, is a question. That would be one way.

The second way—although I should prefer that the second way be not followed until the futility of the first had been shown—the second way would be for the Government simply to enact a law, as some of our States have already enacted laws, providing for a tax on such corporations and providing for the redistribution of this tax among the various States, in part or wholly, according to certain defined rules.

Q. (By Mr. FARQUHAR.) Taxation includes this general proposition—that there is a privilege granted. Every one of our interstate railroads is incorporated by a State unless we except, of course, the transcontinental. The great systems are created by States—are granted their privileges by States. What the commission want to get at is this: What position the National Government ought to take. The propositions you make on the legal status of the matter and on the economic development are seemingly antagonistic as to State and Federal taxes.—A. Of course before such a bill of any kind would be passed it would be necessary to lay down carefully the economic lines on which the bill should be framed.

Q. Much safer than legal lines?—A. Unless you have legal lines your bill will be overturned by the courts, but you have got to have economic lines when you go to work. I did not go into these matters in detail because it is not a practical proposition; but when it becomes so I shall be very glad to come before the commission. In order to save time I would say that in an essay that I have written on double taxation I have mentioned some of the fundamental principles which would have to be observed in such a bill. I shall be very glad to send the commission a copy.

Q. (By Mr. RATCHFORD.) Is it your opinion that when the capital stock of a corporation is increased either by appreciation of the value of the property or by what is commonly known as watered stock such increased capitalization should be taxed?—A. If the increase is a real economic increase of capital I think it should be.

Q. What is an economic increase of capital?—A. The water in the stock would not be an economic increase, because it would not increase the earning capacity of a railway.

Q. Still it has a purpose, has it not? There is a purpose behind it?—A. Oh, decidedly.

Q. If it is an appreciation in value of property, then you believe it should be taxed?—A. I think the difficulty could be easily gotten around by stating that you are going to tax the market value and not the par value. Then the difficulty settles itself, because if it is watered stock it would not increase the market value of the stock.

Q. It is believed in some cases to-day that certain corporations are capitalized for an amount two or three times as large as the actual investment. That is said to be a great evil. It is commonly called watering of the stock. Now, if that be an evil would it not be a good way to check that evil to tax them for their excess capitalization?—A. That plan in itself might be a very good one; that end would certainly be a desirable one, but the difficulty is that you would hit the good with the evil. You may strike the honest in trying to reach the dishonest, and it seems to me that the difficulty of which you speak can possibly be better reached in some other way than by the use of the power of taxation.

Q. Well, if the line between the honest corporation and dishonest one is apparent by the extent to which they water their stock, the honest corporation, it seems to me, would not be subject to taxation under that system.—A. A corporation may

often desire to increase its capital very largely, and it might not at the first blush be apparent what the purpose is. It may seem to be water and yet not be water. We can not tell until probably some years have elapsed, when we could all see what the situation is. It often happens that a corporation needs more money to develop its fast-growing business, and an increase of capital there may be perfectly justifiable from an economic point of view. It seems to me that the Massachusetts method is the better way to deal with it.

Q. As we understand, the increase of capital in the case which we are now referring to is not an actual increase of capital. If more capital is required in the development of their business, then it is actual capital, and they would not object, it seems to me.—A. My point is that it is frequently difficult to draw the line between what is fictitious and what is actual capital, just as it is often difficult to draw the line between what is legitimate and illegitimate in speculation.

Q. Do you believe that fictitious capital creates a fictitious credit and value?—A. If you mean that an increase of capital stock, or the watering of capital stock, may sometimes be done for mere jobbing purposes, that, of course, is unfortunately true, and it may for the time being increase the credit of the stock and enable them to sell it at a higher price.

Q. Is it your opinion that franchises and State privileges, given sometimes by way of State legislation, should be taxed?—A. I think that all franchises of a quasi-public nature ought to be paid for over and above the general rate of taxation.

Q. (By Professor JOHNSON.) We shall be pleased to have you state what you wish to say in regard to the telegraph service and the public control of it.—A. I shall try to be very brief in regard to that point, gentlemen. I have only a few ideas which I want to present here touching upon the question of governmental ownership and management of the telegraph service of this country.

The general principles with which I will start out are that the problem as to governmental ownership of industry depends primarily upon the following three considerations: First, upon existence or non-existence of widespread social interests; second, the amount of capital invested, and, third, the complexity of the management. Now, what does this mean? There is no demand—ought to be no demand—in a community for the governmental assumption of any industry unless that industry is of such fundamental social importance to everyone in a community in his efforts to get a living as to justify interference by Government to that extent. No one except the socialist would, for instance, ask that the Government should take hold of a shoe factory, because after all it is a special interest. It may be true that everybody wears shoes in this country, but they do not all wear the same kind of shoes and the same quantity of shoes. So it is with every other industry. But when you come to such a thing as the postal service, for instance, everybody is agreed, with the exception of some extreme individualists in England, like Mr. Herbert Spencer and others, that it should be in public hands and not in private hands, because in a democracy everybody is supposed to read and write and everybody is also supposed to use the mails. Now, I would maintain that from simply this point of view what applies to the postal service ought to apply also to the telegraph service. Unfortunately in this country the telegraph service is not used by everyone. The charges are so high, apparently, and the conditions are such that the telegraph is used mainly for business purposes and to a very slight extent for social purposes. In other countries, where the telegraph is an adjunct to the postal system and where the rates are lower and facilities greater, people use it, as any of us know who have traveled abroad; people use the telegraph system to a far greater extent in proportion to the intelligence and the population than we do. Therefore, from the point of view of widespread social interests, the telegraph service ought to be put on a par with the postal service. Secondly, as regards the capital invested. One reason why there is no more discussion about the governmental management of the post is that there is no capital needed. There are not any complex questions. Of course we do spend \$100,000,000 a year, but we have not any large capital account. It is mostly current expense. That is wherein the postal service differs toto coelo from the railway service. Just as in the postal service you have practically no capital expended, so in the railway service, the most stupendous of all modern industries, you have the greatest possible amount of capital invested. Just as I should be most strongly opposed to governmental assumption of the railways in this country, among other reasons, for the fiscal reason that it would throw the whole budget out of gear; that the revenues and expenditures of railways would be two or three times as great as all the rest of our revenues together, and that the whole budget of the country would depend upon the suc-

cess and prosperity or failure of the railway system; so, for that reason, I should be in favor of the governmental telegraph, because the capital, although greater than in the case of the post, is yet very slight as compared with other interests. All you have got to do is to get enough capital to put up poles and string your wires, as in case of private companies, and perhaps also to get certain rights of way in case of Government that would not be of much importance. Of course if the Government were to buy out the telegraph lines there would be a capital outlay, naturally, but even then it would be insignificant when compared with the capital invested in ordinary enterprise or the means of transportation.

As to the complexity of management. This, again, would be an insuperable bar, in my estimation, to Government management of railways, because of all businesses the railway business calls for the most delicate and careful adjustment or administration and needs and pays for the highest possible business ability. The greatest salaries in this country to-day are given to the railway presidents—salaries from \$25,000 to \$100,000 a year—and deservedly so, because it calls for the highest possible ability to run a railway successfully. Therefore a government could naturally not hope to compete successfully in that line of business with private individuals. It would make, under existing American conditions, more or less of a mess of it. However, in the case of the telegraph service all those difficulties vanish. There, again, you have not a complex business, but a simple business. The great end of individual initiative in industry in general is that it must have ability turned toward the reduction of the cost of production, in inventions, etc. All progress in the world consists of lowering the cost of production of commodities by driving out old processes and introducing new processes, and that method of improvement results not alone in lower prices for the community, but, as our history has amply shown, gradually higher wages for the operative as well as prosperity for the employers. In the case of the telegraph system you have not, or you have to an infinitesimal extent, this element entering. Of course there may be a new invention in telegraph machines, but the experience of even such sleepy administrations as those of France and of England shows that the telegraph service does keep on a level with the new inventions and that the telegraph operators may be put on a slightly higher scale there, but of a very different category from the regular postal officials. Therefore it seems to me, if you look at the question from these three points of view, which are the important ones—the widespread social interests, the amount of capital involved, and the complexity of the management—that all three of these considerations argue in favor of the assumption by Government of the postal telegraph, as is the case in every other country in the world, including the most improved and most democratic communities like Switzerland, like Australia, and like all other modern democracies. Of course we all know also that the telegraph was practically in Government hands at the time of the first telegraph in 1844, and that the Government decided not to go on with the telegraph business for very much the same reason that led the postmaster-general in England violently to oppose the postal reforms of Mr. Rowland Hill. They thought the whole thing would not amount to anything and did not want to commit the Government to that hazardous experiment. Yet the originator of the telegraph system, who was wise enough to foresee its natural outcome, concealed his opinion that this was a natural adjunct to the postal system, and the history of every government of the world has shown, except our own, although it may have started in private hands, that it must be brought, as in England and other countries, under Government control. The only reason, I take it, why there is not a larger and greater entry in this country for Government assumption of the telegraph is that the abuses connected with the telegraph service are far less after all than those connected with other forms of transportation, as railways; but even then there are certain dangers, if not abuses, and the great point to be remembered is that in questions of this kind what we must seek after all is the highest social utility. It is said that if the Government ran the telegraph in this country it would not make as much money as the Western Union Telegraph. No doubt it is true; but, on the other hand, the object of the Government would be to make no profit at all, but to run the service just as the postal service is run. Any possible profits in it would reduce the rates. We all know the rates are far higher in this country. Even though we allow for the lower value of money in this country, the rates are higher in this country than abroad for short distances and for long distances, and the use of the telegraph lines and the telegraph service can not be compared in this country with the use that is made of it abroad; and, therefore, although there are not any serious abuses in the telegraph management of this country, yet at the same time it seems to me that every argument that could be made in favor of assumption of the postal service can be made in favor of assumption of the tele-

graph service. We do not argue about the post because the country was in possession of the post a long time before this controversy as to the desirability of Government interference on the question; but if it had not been in control of the post in the colonies or at the time of Hamilton we should have had this same question in this country as to Government posts *v.* private posts. That is simply a historical accident that we have a Government post in this country, and it is simply because the telegraph was not invented until 1844 instead of in the eighteenth or seventeenth century that we have not a postal telegraph.

Q. (By Mr. PHILLIPS.) What would be your judgment in regard to the ownership of the telephone?—A. Every argument that applies to the telegraph applies equally to the telephone, with the possible exception that in the case of the telephone it may not be desirable to have Federal control. But England passed a law only a few months ago which shows that there are a great many arguments to be advanced in favor of Federal management even of the telephone system, especially since the long-distance telephone is becoming so important a feature. England has passed a law whereby in a very few years the whole telephone system will be part of the English post-office. When I say every argument that applies to the telegraph applies to the telephone that must be taken with a modification. I think the arguments are not quite so strong for the telephone as for the telegraph, because the complexity of the management is a little greater in the telephone than in the telegraph. It requires a little more care to keep up to the level of modern science in the telephone than in the telegraph.

Q. Are there any governments now that have the telephone under their control?—A. Almost all European governments have them now.

Q. The German Government?—A. Germany, yes. In Germany, France, Norway, Switzerland, and Australia the telephone is run as a part of the postal system. In England, now, under the new law, the telephone is to be run as a part of the postal system. They still permit them another ten years continuance, but not the development of a private telephone company. The charter expires, I think, in 1911, and then the whole system will be in the hands of the English post-office.

Q. (By Mr. FARQUHAR.) In the management of the local telephone, then, would you place the postmaster, for instance, of the city in charge of the commercial and local phone?—A. Decidedly.

Q. How about the management of your long-distance telephone?—A. That could be arranged just as our postal service is arranged between the cities. The receiving station, of course, would always be under the management of the postmaster, and the accounts could be kept between the cities just as our postal accounts for railway transportation, etc., are arranged. Those are mere little matters of detail, which would not give any difficulty at all. But the point that I wanted to make was that the increased possible use of the long-distance telephone would argue for a national telephone rather than for a municipal telephone, and that it is that which has led England to take it up now and take the power away from the municipalities and put it into the hands of the General Government.

Q. Do you see any dangers at all in the number of Government servants and politics there?—A. Of course I assume that hand in hand with this whole system there would go a development of our civil service, a very progressive development of our civil service, a movement which the President has so wisely and so well emphasized in his message of yesterday. There have not been any great dangers politically in our postal service, it seems to me. If there have been, they have been more than counterbalanced by the political dangers that would have been if the postal service had been private. You have got to weigh and balance the good against the evil of this case. There are, of course, these possibilities of political danger in Government service.

Q. Are there not particularly political dangers where there are large amounts of money used in any governmental function?—A. That is the reason that I make so much of the second point, that the capital invested is so small, and in this business the capital invested is very small indeed; almost the entire expense is running expense. It would not be as great as that of our postal service to-day.

Q. Would your practical plan be for the Government to take over the whole of the Western Union system and the Bell telephone?—A. As soon as that could practically be done I should certainly be in favor of it.

Q. That is, you would eliminate any notion of competition there—not building a Government line in competition with any existing line?—A. I am always opposed to governmental competition with private enterprise, because, although the assumption is that the private enterprise will be brought up to the level of the governmental efficiency, the practical result is always that the governmental agent is pulled down to the level of the private. The experience of many coun-

tries has shown that. Competition between the Government and private individuals can result only disastrously to the public.

Q. Is that proposition that you are making now partly explained by the condition of railroads in France?—A. I think the best history of that instance is the history of the railways in Belgium rather than in France, because it was especially in Belgium that the competition of railways proved to be so ruinous.

Q. (By Mr. KENNEDY.) When you spoke of the running of railroads, you spoke of all these high-salaried presidents. Is it your idea that the Government would be deprived of the talent that these railroad companies now employ if they—
—A. (Interrupting.) Under our present political or democratic system I think that would inevitably follow, because our history, especially in our consular and diplomatic service, shows that you can not expect a democracy to pay as high salaries as monarchies and other countries, and with low salaries the temptation would not be great enough. They would go and finance our great trusts and they would finance our great industrial enterprises and not our railways.

Q. When you see the State of New York able to induce a great railroad president to serve in the capacity of a United States Senator for \$5,000 a year, and the Government able to induce a great lawyer of the State of New York to come and act as Secretary of War, does it not seem that the inducement to enter Government service would compensate for the loss of salary, and that the Government would get all the talent that would be necessary to conduct these transportation companies?—A. Of course, it is to be understood that with the progressive advance of political ideals in this country, what you state would come more and more to be the fact; but I think we are a long way off from that condition—from the condition of the Prussian administrative service. In Prussia, I think, that is true; I hope in that respect it will be true in this country some day; and possibly the assumption by the Government of more work may lead individuals to be willing to sacrifice themselves for the public good. But under the present materialistic, and necessarily materialistic, drift of the American people, having a whole continent to conquer and necessarily developing all its productive forces, it seems to me that the weight of the influences is thrown to the other side, and not so much in political as in private business.

Q. (By Professor JOHNSON.) Have we not numerous instances of men quitting the Government service because of small salaries?—A. I think that is beyond question, and we all know that the cases mentioned by the gentlemen are the cases of men who have some means to start with. We all know of men who would have liked to accept Government positions when offered to them, but it was simply stated that they could not possibly afford to do so. It is asking a great sacrifice of a man in these days of immense opportunities for ability, to give up comfort and everything of that kind for the mere ideal end of serving the public. Only the best and highest men will do that.

Q. (By Mr. KENNEDY.) You will not say that if the Government did control the railroads it would not be able to secure all the talent that would be necessary to conduct these enterprises?—A. I should think the chances would be rather in favor of a less efficient management than you find at present under private control. What might be the case ultimately I do not pretend to say.

Q. (By Professor JOHNSON.) Will this proposition be true, that the Government would get the same talent cheaper than the private corporation?—A. That is probably true.

Q. With the evolution of our political ideals we shall be able to secure adequate talent?—A. It is simply a question, as you say, of the state of political ideals. In Germany, for instance, in Prussia, the very best men there go into public business and into administration; and in France, to a certain extent.

Q. (By Mr. RATCHFORD.) What is the experience of some of those other democracies that you spoke of—some of the European countries; has their experience been, in making their change from private ownership to public ownership, that they were unable to obtain that high development?—A. So far as telegraphs are concerned?

Q. No; railroads.—A. There is only one country in Europe that has done so, and that is Prussia. And Prussia, as I have said, is a very peculiar and exceptional case, because the Prussian civil service has always stood very high. In Prussia they have a successful income tax, for instance; and yet no one who knows the difference between political conditions in Prussia and the United States would dare to state that an income tax in this country would be as successful as it is there.

Q. How about Australia and Belgium? Are they not adding new systems of railroads, and have they not done so?—A. In Australia and in Belgium they are greatly extending their systems, but even in Australia the conditions are a little

different from what they are in this country. We must remember that the drift toward governmental aid and interference in Australia has necessarily always been far greater than in this country, because of the economic conditions of Australia. Australia is a vast arid table-land, most of the country being fit only for grazing, where nature is not bountiful, and where the individual alone can scarcely cope with the difficulties of nature; and from the very beginning, in order to develop Australia, they have had to have the aid of the government in every respect. In this country we are in an entirely different situation; this country is the most fruitful country, and the Mississippi Valley the greatest valley, on the face of the globe, and the Americans have always thought that they could develop the country most by depending on themselves. That is the fundamental political or philosophic reason why the Australian democracy has so much of what we call socialism, and why we have so little; and as long as the conditions remain such in this country, it seems to me, the legal difficulties will remain the same.

Q. One of the chief reasons you advance in opposition to governmental ownership of railroads is the enormous capital invested?—A. Yes.

Q. Is it not a fact, that in Germany the capital invested per mile of railway is many times more than it is in the United States?—A. Yes; in Germany it amounts to two or three times as much.

Q. Per mile?—A. As it does in the United States.

Q. And yet they manage successfully under Government control?—A. Oh, it must be remembered that even under private control in Prussia, the conditions were very different from what they are here, the so-called private management of the Prussian railways. The private railways of Germany were always accustomed to far greater governmental interference than we have had, and when they were bought up and lifted into the system by the Government, it was an apparently slight change. The Government had always interfered a great deal with the private railways, and they were built up under officials who were accustomed to consider questions of rates and of tariffs also.

Q. (By Mr. FARQUHAR.) Was it the same in the English and Scotch and Irish railways?—A. In England it has been less than in Germany.

Q. But they had almost supreme control of the telephones and they had almost supreme control in building roads?—A. Oh, that is so.

Q. (By Mr. RATCHFORD.) In Germany the construction of the road is much more permanent in character, and the rates for travel of passengers are much cheaper?—A. Well; the rates of the passenger fares on the whole are somewhat less than they are in this country, although it is very difficult to make a comparison, because they have the class system, and it depends on whether you are going to compare the first, second, or third class with ours. Of course, the freight rates are very much higher, because of our long-distance traffic. The passenger rates are less. On the whole, when you compare Prussia with America, I can answer best by agreeing with Professor Van der Leyen, who has written a book. He was one of the great advocates of the assumption of railways by Prussia; and he said that if he was an American he would be the most outspoken opponent of governmental railway control in this country; which shows that he sees the difference between the Prussian conditions and the American.

Q. Is it your observation that the public generally patronize their railroads more than ours are patronized?—A. No; for an entirely different reason. We must remember that in many parts of the Continent of Europe the social conditions are almost medieval yet, and the peasants travel very little. Not so very long ago they were bound to the soil, and although they are free, yet everybody knows how slowly old conditions change; and it was mainly for this reason that the Austrian-Hungarian Government brought about such a great reduction in their system of railway charges, under the zone system, some time ago, in order to stimulate intercounty or intermunicipal travel within that State. So that I do not think we could draw any useful lesson at all from the comparison of this point in countries whose economic and social conditions are so entirely diverse as those of the United States and of Germany or Austria.

Q. (By Professor JOHNSON.) We have heard a good deal on the question of pooling pro and con, and we know very well that you have given a good deal of attention to the subject, and we should like to hear you on it.—A. Probably what I should have to say would add very little to the advice that has been presented to you by the practical men, experts on both sides. I can only state very little, which comes from a consideration and study and comparison of our system here with that of the railways in other parts of the world.

Here, of course, the general consideration with which we have to start out is that the fundamental problem is that of competition versus monopoly. It goes

without saying that both systems have their good and their bad sides; and it may be well to point out in just a word how far these advantages or disadvantages would apply to the matter in hand. Now, as I take it, the great advantage of the competitive system consists in what I stated a moment ago in another connection—that competition always forces the price down to the level of the best competitor. What I mean is, that if you look at the history of any industry, you find that it is only through the force of competition that the conditions arise under which new efforts are made, under which new machines are introduced, under which the cost of production is lowered; and that all progress, therefore, which directly depends upon the lowering of the cost of production, depends indirectly upon competition between producers. It is only through competition between the producers that you have the incentive to the lowering of the cost of production. That is the immense advantage of competition, and that is why, under the competitive system in the nineteenth century, the world has been making such immense advances. Now, this very excellence of the competitive system discloses its weakness when applied to a public or quasi-public institution. Prices can be brought down and lowered only through the efforts of separate producers to get the better of each other, and to offer to their purchasers all sorts of inducements in order to widen their market. Every merchant, every manufacturer, tries, so far as he can, to get control of the market, and he tries to get control of the market by reducing his own price to that point which is consistent with any profit to him; even in some cases, if he is a shrewd man, a wise man, he does as the Standard Oil Company, for instance, has done; and in certain cases, in order to crowd out competitors, he will reduce prices for the time being below the level of the others, in order, only, to raise them a little later on.

That is the normal and the necessary condition of affairs in private industry. If I go to a woolen house in Worth street, New York, I try to ascertain what my competitor is paying for those goods and then I try to get a little lower rate; and upon my getting that lower rate or not will depend, perhaps, the success or failure of that merchant. In other words, merchants can succeed only by playing off one man against another. That is what competition means, in getting the best rates available.

Now, while that is the normal and necessary condition in ordinary economic life, when you apply that to a quasi-public institution it becomes bad instead of good, because the fundamental condition of all such quasi-public institutions connected with transportation or otherwise, is that all consumers should be put on the same level. That is just the opposite principle, therefore, of what you have in ordinary business. Ordinary competitive enterprise means preferring the one over the other. The transportation business, which is primarily a quasi-public business, if it is to be conducted according to principles of social utility, means putting everybody on the same level. In other words, the competition in transportation can be a competition not as to rates, but only as to efficiency of service; whereas, in ordinary business life, competition includes not only competition as to efficiency but also competition as to rates. Therefore, the conclusion is that competition is not so applicable to the transportation business as it is to ordinary business. It is applicable, in a certain sense, that we must seek to preserve the good side of competition, which is competition as regards efficiency, giving the best service and getting and making use of the newest appliances; but we must not have competition as regards rates.

Now, it goes without saying that the evils of this competition in transportation service are responsible for practically all the abuses of our railway system. They result in the discriminations, both personal and local, of which we continually complain. Just as in the postal service the Government does not sell to the wholesale purchaser of postage stamps at a lower rate than to the little boy who buys a 2-cent stamp, so also the railway ought not to sell to the wholesale, large, or favored shipper, at a different rate from that which it sells to the individual and defenseless man; and yet we all know that ordinary business is conducted on that very principle. The getting of wholesale business means selling differently to different individuals, according to the quantity purchased, according to individual conditions. Therefore, the conclusion is that in the transportation business competition is only relatively good, and that the bad sides of competition come out very much more clearly than they do in ordinary industry.

If you do not have competition, or if you only have modified competition, what must you have? The opposite of competition is monopoly.

The good sides and evil sides of monopoly are just as glaring. The good side of monopoly is that it prevents or it may prevent the difference in the treatment of individuals which is due to competition. Of course you may have personal discriminations through the monopolist, which are due simply to his own personal

whim. So, also, we find that where railways are entire monopolies, as in some of the countries of the world, they may and often do have almost as bad a system of abuses as where the railway is entirely under the competitive system. We have only to turn to California in order to see that in a State where there is practically no competition at all, you may have just as serious evils under the monopoly system as you have under the competitive system: and we may also turn to France, where they have the division of the field of the railways, each division of the field having a monopoly of the railway system there, and we shall see a great many evils and dangers in noneffective management, lack of facilities, etc., which would not arise under the competitive system. That, however, simply means that because in a competitive industry you have the force of competition to compel improvement and to bring prices down, under a system of monopoly you must have some other power to take the place of competition in order to avoid the evils of monopoly; and that is, of course, the reason why in all real and strict monopolies governments interfere, whereas in ordinary competitive enterprises the ordinary forces of competition are supposed to be sufficient to safeguard the interests of the consumer. If you have evils under the monopoly system and evils under the competitive system the question arises, Is it not possible to devise some scheme whereby you may reduce the evils of both systems to a minimum and whereby you may increase the advantages of both systems, competition and monopoly?

Now, it is from that particular point of view that I should like to approach the question of railway pools and traffic associations. So far as I can learn from the study of the history of pools and traffic associations, both in this country and abroad, they form the best system thus far devised by human ingenuity to give us, under careful scrutiny and guidance, the advantages both of competition and of monopoly, or if you want to use instead of the word "monopoly" the word "combination," which possibly would be better, it gives the advantages both of competition and of combination. It gives the advantages of competition because even under the pooling contracts, as they exist in other parts of the world as well as in our own country, there is no cessation of competition, or ought not to be—very often is not—no cessation of competition as regards facilities.

Even under the most ironclad pooling arrangements in this country, let us say between the New York Central and the Pennsylvania, although the rates to Chicago may have been exactly the same, and although even the hours of running the trains may have been within a certain limit the same, yet each railway did what it could to increase the efficiency of its management and the pleasure of the journey so as to attract as many people as possible to it, and thus pave the way for a change in the pooling arrangement another year.

You have, therefore, under a well-devised pooling system, a retention of the advantages of competition, and you have under a well-devised pooling system an avoidance of the evils of competition so far as competition means cut rates, cut-throat competition, personal discrimination, and to a certain extent illegitimate and indefensible local discrimination. Of course, no system, whether of combination or of competition, is going to do away with local discrimination or can do away with local discrimination. Local discriminations are in the very essence of the system of railway rates, belong to the whole theory of values in economics, and they ought not to be abolished until that time comes—if it ever does come—when the railways will be run by the Government for nothing and when we shall have a uniform railway rate, just as we now have a uniform postal rate. I say that time will probably never come, because of the essential difference between the economic conditions of the railway service and those of the postal service.

Therefore, my conclusion would be that pools and traffic associations mark a natural and well-defined step forward in the progress of the railway industry. That, of course, in order to avoid the evils of combination or monopoly, you must not allow the railways to do what they choose with their traffic associations or pools; but you must regulate them and keep them within certain lines. That you must make them, whether they want to or not, minister to the general public good. That they must look upon the railways not as a private business, but as a trust for the public. And that, within those lines and under a general supervision, far from pooling and traffic associations being a menace to the community, they really, so far as I can ascertain, offer the only way out of the chief evils from which we at present suffer in railway transportation. And that this is not merely a personal opinion, a fad, an idea, can be seen from the history of pools and traffic associations of all other countries of the world; and we find that in one form or another, wherever we have any vestige of competition left at all, where you have not a complete and absolute monopoly, you have these pools and traffic associations; and that even where the Government runs the railways, it forms pools and traffic associations with the railways that enter a competing

State; all of which shows that there is and must be some underlying cause which makes these things inevitable and which will compel them to endure whatever be the attitude of legislation. You may have as many laws against them as you like; if the economic forces are in favor of this institution, you will have the institution, no matter what your law. The only effect of the law may be to render secret what ought to be in the light of day; and you will thus add to the difficulties of the problem by preventing publicity and by increasing secrecy, but not in any way by doing away with the institution itself. That is, therefore, the general attitude upon it.

Q. (By Professor JOHNSON.) Do you believe in the municipalization of the street railway service, or would you have the service left in the hands of private corporations?—A. I think that everybody is agreed at present in this country that the relations between the Government and the street railways have not been close enough—I mean in an honorable, straightforward way. But it seems to me that the problem can, for the present, be attacked far better in this country by municipal regulation of street railways in the direction of greater revenue from them than by immediate governmental assumption of management. And I would base that opinion mainly on this ground, that of the three points that I have mentioned, the widespread social interest, the capital invested, and the complexity of management, the second and third apply, to a large extent, to street railways. Of course, the complexity of management in a street railway is not by any means so great as in a steam railway; it is a far smaller business; but still there is a greater complexity of management than there would be in the case of the telegraph or of waterworks or anything of that kind.

On the other hand, the capital involved is tremendous, and for that reason it seems to me that the safer plan would be to safeguard the interests of the public through governmental regulation rather than through governmental management, in the face of the immense changes that are going on at present in the methods of street railway management. We all know that we are just living in a period in which the methods of street railway management have been revolutionized, and who can tell but in another 5 or 10 years they will be revolutionized again.

If now you put it in the hands of Government, you reduce to that extent the chance that the Government will avail itself of all the new advances of science, and until we have gotten down to a condition of affairs which may be considered permanent, I should think that the argument was rather in favor of governmental control than of governmental management of street railways. I think it differs altogether in that respect; for instance, from the water supply, because in the case of the water supply there is not any question of capital involved, or not so much, and far less question of complexity of management, because the methods of management are very simple indeed. It is simply a question of getting the water and then distributing it through pipes, which is a simple matter. In the case of a railway system it is a very different matter.

Q. (By Mr. FARQUHAR.) You believe, then, in taxing the railroads all that they will stand for the benefit of the public and the general community?—A. I should not put it in that way. I should put it that the street railways ought to bear a far greater part of the municipal burdens than they do at present; that they ought to contribute far more largely than they do at present to the municipal revenues.

Q. Would there be a great difficulty there in the way of these old charters, the chartered life of these corporations, the 99-year franchise and such like? How are the municipalities going to get new taxation under these long charters?—A. We have an example of that in the new franchise tax law of which I was speaking; this new law applies to the street railways as well as to the others.

Q. An attempt was made in Ohio a short time ago to get a 99-year law through for the life of all these street corporations.—A. (Interrupting.) With a fixed rate of taxation during all that time?

Q. Yes.—A. Well, of course, that would be an argument simply against the policy of giving long leases, long iron-clad leases.

Q. And where those municipalities also, Professor, or combinations had an auction made public through public advertisements and sold these rights of franchises for their streets, when it has amounted to a large sum, has it not always been to undertake the service until they make a new arrangement?—A. That has been very frequently the result.

Testimony closed.

Whereupon at 1.25 p. m. the commission adjourned the further taking of testimony until to-morrow morning at 10.30.

WASHINGTON, D. C., December 7, 1899.

TESTIMONY OF MR. GEORGE R. BLANCHARD,*Late commissioner of the former Joint Traffic Association.*

The commission met at 10.35 a. m., Senator Kyle presiding. Mr. George R. Blanchard, of New York City, N. Y., was introduced as a witness, and, being duly sworn, testified as follows:

Q. (By Senator KYLE.) Please state your name and address and business.

A. George R. Blanchard, late commissioner of the former Joint Traffic Association.

Senator KYLE. Mr. Blanchard, I believe has prepared carefully a statement which he is to present to the commission, and will present it in his own way from the beginning to the end, and if the commissioners discover any points they would like to have elaborated, they can make note of them, and ask questions, or defer to the close of the witness' testimony, as they see fit. You may proceed now, Mr. Blanchard.

WITNESS. (Reading:) In responding to your request for my testimony in various matters relating to land transportation charges, by rail, I premise by saying that as the general term "Science" includes many branches, so the word "Transportation" embraces multitudinous and intricate conditions of state, national and international thought, labor, development, change, discovery, disappointments, and triumphs in each of its great departmental avenues, and as each applied science has eminent specialists in its various avenues, so transportation has them in construction, operation, law, commercial relations, etc. You have, therefore, wisely divided this great general subject into topical forms, and have properly asked your witnesses to limit themselves to those subdivisions of the carrying problem as to which they are severally most experienced and informed.

As a railway traffic officer and member, chairman and commissioner of various associations, my knowledge has been greatest in the commercial channels of railway administration, and I will endeavor to limit myself thereto.

My testimony will represent my personal views, and not those of any railway company or organization.

FIRST.

JUSTIFICATION FOR DISSIMILAR FARES.

Your topical plan says, in part II, division A, paragraph 25: "Passenger rates; Differences in different parts of the United States; Causes and effects; Local and through rates."

The legitimate causes of differences in passenger fares, briefly epitomized, are—

(a) Because various original charters and amendments thereto, legislation and varying legal decisions in different States, originally warranted and still sanction differences in fares in various forms in adjacent as well as separated areas. For illustration, the New York Central Company is limited by law to 2 cents per passenger per mile, with some exceptions, while other roads in the same State and in other States are not.

(b) Dissimilar volumes of passenger traffic justify differences in fares—as, for example, those of the New Haven System contrasted with the fares of the Colorado Midland or Mobile and Ohio Companies. Five cents per mile with 10 passengers per car is not as profitable as 50 passengers per car at 2 cents per mile each. Moreover, on some lines some passenger trains may be run at a loss to aid the public convenience as well as other branches of the passenger or freight service.

(c) The dissimilar first costs of railway construction and, later, their varying expenses of maintenance, as when numerous high mountain elevations are to be surmounted on some lines as compared with the nearly level gradients of other routes, may justify due differences of fares. Compare, for example, the Denver and Rio Grande and the California and Oregon line in this respect with the Lake Shore and New York Central railways.

(d) The costs of terminal facilities and improvements, as shown by the large expense for costly lands in great cities compared with the lesser expense at smaller points, say New York contrasted with Norfolk.

The great outlay for elevated tracks in cities is also becoming a factor in this connection.

(e) Fares may differ in different sections as aids to freight development, as the special fares made for coal miners, lumbermen, large manufacturing concerns widely apart yet strongly competitive, etc.

(*f*) The speeds and equipments of passenger trains. The New York Central and Pennsylvania Limited trains, for example, are the most expensive in the world, having dining, buffet, apartment, and observation cars, all vestibuled, equipped with both gas and electric lighting apparatus and carrying an unusual number of employees per train—such as stenographer, barber, stewardess, special electrical engineer, etc.

By reason of the large space given to each passenger in those exceptional trains the number of passengers per car average less than one-half those per car of those carried in ordinary trains. The fewer cars per limited train are nevertheless necessary to uniform high through speed to overcome high grades and summits, differences of distance, etc., and all other trains give way to them when delays occur, thereby increasing their expense. It also costs more to maintain the costlier outfits of these swifter trains. All these elements mean lesser net earnings per car and per train mile and justify higher fares, even more than the same companies charge for travel in their regular trains at slower speed which carry many more passengers per car and per train.

For illustration, the fare by the World's Fair Special via the New York Central was fixed by arbitration at \$6 above the so-called standard fare from New York to Chicago as an amount representing its speed, facilities, luxuries, etc. The steamship lines charge on the same basis and their patrons do not demur.

(*g*) Differential lines of about equal length, which compete with such superior service may perhaps justly charge lower fares for their less expensive through trains and the slower time over their longer distances. Reasonable and due concessions from the so-called standard fares—by which is meant the fares by the best equipped lines—have therefore been recognized and used to equalize these diversities until the so-called differential lines approach closer parities of time and facility, or assent to equal fares for other reasons.

(*h*) Commutation travel, being larger in volume and value and more regular—say as to and from New York City and Philadelphia and about Chicago and Boston, than between St. Louis and East St. Louis or Cincinnati and Kentucky points, etc.—justify different charges to commuters on those different lines. Low commutation fares may justify and influence the duration of standard or regular fares. It may also be just that commutation fares to and from the grand central station in New York differ from those in and out of Jersey City. New York ferriage also constitutes an item of difference in some instances.

(*i*) Some differences in fares arise from the fact that some of them are State fares, others interstate.

(*k*) Growing factors in this connection are the trolley fares parallel to some standard-gauge lines in the same general districts, but not in others. For example, there may be trolley lines in three directions from Philadelphia, and none from Louisville or Omaha. The companies thereat may justifiably make different fares on those different trains from this cause.

(*l*) The proximity of water routes. The Hudson River may particularly regulate some fares between New York and Albany; the boat lines on Long Island Sound may influence rail fares to common points on its waters, and via such points to Providence and Boston; the Ohio River between Cincinnati and Louisville, etc. The lake fares from Chicago to Milwaukee may influence those by rail between the same points. No such causes affect fares about Denver or New Orleans, yet the differences in various fares thereabouts as compared with those east or west thereof may be justified on other grounds.

(*m*) Some of the foregoing causes may operate to create different fares for 1,000, 2,000, and 5,000 mile tickets in different sections, as well as in commutation, excursion, and round trip fares, and the time periods during which various tickets are made available may also be justifiably unlike.

(*n*) Specially reduced fares for large bodies traveling together also vary in different sections. Witness dissimilar reductions to the Grand Army, the Society of Christian Endeavor, commercial conventions, the National Educational Association, etc., west of Chicago and St. Louis and south of the Ohio River as compared with those east and north thereof. The fares in the same section also differ justly for summer excursions over long distances and alternate routes and possibly over the same railways between the same points.

(*o*) Different fares are, for these and minor reasons, equitable in the same general territories as well as in separated districts, and they appear generally acceptable to interstate travelers.

(*p*) These reasonably dissimilar fares practically classify travel somewhat as it is classified abroad and somewhat as freights are classified, but each and every fare is available here to all who desire or may be entitled to use one in preference to the others or to change from one to another, as the traveler's surroundings jus-

tify or require. It is as the same travelers classify the shops where they deal in the apparel they buy, the hotels or theaters they patronize, the stage or street car they prefer to a cab, etc.

The underlying differences in the governmental import and postage tariffs are founded upon the same principles of warrantable dissimilarities—as, for example, cloths and wines differing in value for like weight, or a letter compared with a postal card occupying the same space, etc.

Why should the reasoning for the Government—i. e., the people—not govern for that essential need of the people, i. e., the railways?

(q) Some differences of through fares may be caused by the policy and action of Canadian lines as compared with ours—notably the Canadian Pacific.

(r) It is not that fares are dissimilar in different districts which caused discriminations, but the dissimilar fares on the same classes of travel in the same district.

To generalize these principal conditions, it may be said that the railways of the country tend to resolve themselves into its own natural geographical divisions:

1. East of the Hudson River and Lake Champlain.
2. The territory west thereof lying between the Great Lakes on the north, the Potomac and Ohio rivers on the south, and east, substantially, of Chicago and St. Louis.
3. All south of the Ohio and Potomac to the Gulf and east of the Mississippi River to the Atlantic Ocean.
4. All west of that group to the Missouri River or Denver meridian, forming what may be called the Rocky Mountain division.
5. All west of that group to the Pacific Ocean, constituting the transcontinental division.
6. The Canadian group, having also affiliated lines in and across the United States.

7. Our Hawaiian, Philippine, and Alaskan interests, rival to the Dominion, Isthmus, and Suez lines, which will hereafter more require special consideration and perhaps exceptional consideration as to through fares.

For the reasons adduced it is impracticable, either in usage or law, to make the fares for like general service alike in all these areas, yet the more or less justifiable disparities cited are gradually being lessened under those natural, but in many cases slowly unfolded and unenacted laws, which enlarge travel and commerce and which have operated more potentially than statutes, especially since the Windom report. These great laws are unceasing in effect, modified readily by railway administrators from constant and long experience, are equitable and comprehensive in plan, scope, and effect, and adapt themselves in due differences of measure to the variety of conditions encountered in these traffic empires. As lines extend their consolidations across former territorial borders, more uniform and lower average fares will more prevail. Witness the unification and uniformity of fares when such mergers removed the Mississippi River as a barrier to continuous travel, tickets, and baggage checks. As populations, railway amalgamations, and comprehensive betterments increase they will further justify more or swifter trains, a better general service, further concessions in fares, and a nearer approximation to uniformity of fares for each class of travel affected. Legitimate competition will then compel extensions of these liberalized facts, acts, and policies over parallel routes, as the same causes have been similarly forceful upon them in freight rates and classifications, bringing, as in the past, mutual public and corporate benefits. No statute law is needful or helpful to such advancing advantages and uniformity, because these evolutions are as natural and forceful as the sequence of the seasons from winter to harvest.

SECOND.

THE MISUSE OF PASSES.

Your paragraphs 26, 27, and 28, under the same head, relate largely to various phases of the issues and use of passes, and I answer:

(a) Free passes are doubtless given to shippers in undue number, result in some unjustifiable discriminations in both freight and passenger traffic, and deplete due and reasonable earnings.

Nevertheless some passes issued to shippers may be regarded as justifiable. The successful merchant becomes the desirable railway director or president, and, as such, receives free travel over various lines, but railways cannot discriminate between his use of his pass for his railway and his business account. Another equally large merchant may not be so circumstanced and unintentional preferences may thus result.

(b) The passes issued to persons accompanying live stock are intended to secure experienced care for animals in transit.

(c) Some passes issued to manufacturers may be wholly or measurably compensated for in the various freight rates involved in their business, and while appearing to be free tickets are not always so. I think the two should be dissociated.

(d) Most passes issued for account of charitable considerations are unquestioned in purpose, but even they are liable to some abuses.

(e) Some press passes or reduced-fare tickets are issued in exchange for newspaper and other advertising. They constitute a convenience to the press in getting news and identifying the holders of such tickets and save the keeping of detailed accounts and the passage of moneys. It also seems desirable in these instances that each such transaction represent itself, as in the sales of other tickets.

(f) Exchange passes are issued for specified officers of connecting lines, car companies, etc., but I believe that if no passes were issued to anyone except officers or employees of a company and members of their own families over its own line, or for equally proper considerations, carefully limited, legislation would be measurably benefited, proper earnings saved, and discriminations in fares lessened as between persons and localities. The revenues of the freight and passenger departments would also then be more justly assigned to each as properly due. It would also tend to lessen discriminations in freight rates if the militant army of freight solicitors paid their fares on the lines of other companies which they invade in order to influence the routing, or the tariff rates, of the initial lines, who of right should specify the exact net through rates and the routes to be used. They should be paid as all their other proper expenses are paid by their employers.

(g) So far as the unwarrantable issue of passes to legislators and public officers is concerned, that subject can be most effectively handled by the bodies whose members accept such passes.

THIRD.

TICKET SCALPING OR BROKERAGE.

Your paragraphs 29, 30, and 31 invite consideration to ticket brokerage, commonly called "scalping," which I believe to be artificial, meretricious, and discriminating.

A mass of technical facts upon this subject and the conclusions drawn therefrom lie in the expert testimony pro and con before committees of both Houses of Congress, notably in January, 1898.

Therein it was shown that at that time 346 newspapers, substantially all the railway and steamship passenger lines of the United States, the laws of 10 States, the long example of Canada, the resolutions of numerous national, State, and mercantile associations, the resolutions of the railway commissioners of 19 States, the insistent and repeated views of the Interstate Commerce Commission, the lesson taught by every other railway country of the earth, the due protection of the large organizations to whom special fares are granted and to the railways granting them, the due observance of law, and the best moral sense of all the commercial world were all arrayed on the honest side of every phase of this question.

Per contra, ticket brokerage was defended by not over 3 railroads and 560 ticket brokers, the latter, as a class, being marshaled to perpetuate and even strengthen, by the sanction, defeat, or evasion of law, every pernicious feature and practice of the objectionable calling. Some legislators and others withheld their opposition to or gave the scalpers their indirect support mainly because they misunderstood the question or thought the railways held the cards and should apply them rather than because they sanctioned the practices of misrepresentation or wrongs abundantly proven against the guild as a whole.

The antiscalping argument stands primarily upon the unshaken ground that the proper places to buy proper railway tickets are the authorized ticket offices of the initial companies, and the only proper officers to sell them are the duly deputed agents of such starting lines or their authorized connections, and not in the private offices of self-constituted agents, having no authorized rights of representation or agency. Stock and merchandise brokers act by authority of principals, and only railway ticket brokers practice methods to reduce legal railway revenues without any due authority, because, to sell tickets cheaper than the published fares, scalpers must get them cheaper. They are therefore illegal, and such sellers must resort to every known device for personal gain.

Substantially, therefore, every dollar they realize belongs to some railway company or passenger who has been wronged to that extent.

Proceeding from these foundation principles, we oppose scalping:

(a) Because its cessation means the stoppage of many secret, fraudulent, and illegal practices, which create undue, unreasonable, and unauthorized discriminations in the passenger fares duly made, published, posted, and filed according to law.

(b) Because resold tickets cut the local fares from the points where they are sold, and thereby produce fares and differences in fares not intended or authorized by the railroads and forbidden by law. To that extent they create unjustifiable preferences between persons, localities, and also to trade bodies, conventions, and other associations moving in large numbers by extending the reduced fares granted to such bodies to persons not entitled to receive or use them.

(c) Because the closing of unauthorized brokers' offices would doubtless stop the inducements now existing to steal, alter, forge, counterfeit, or plug tickets, or issue tickets bearing fictitious indorsements as to extensions of time, and would also curb or prevent the sales of passes, advertising, editorial, and mileage tickets by sellers, buyers, and reissuers. It is also to be emphasized that it would substitute authorized and accurate information to the traveler, for the false representations now constantly made by brokers in order to sell their tickets, in respect of routes, time, change of cars, sleeping cars, checking of baggage, connections, etc. Recent tests show the great extent to which this misrepresentation still exists.

I would like to say in connection with this subject that the ticket offices of the scalpers in New York were visited recently, and in nearly all of those visited untrue or misleading representations were made in some regard as to connections, time, or some other fact in connection with the actual facilities of travel.

Q. (By Professor JOHNSON.) How could you get at that information?—A. By sending persons to the scalpers' offices to ask if such and such lines made certain connections, or did this or that, would such and such tickets be accepted on certain trains, etc., the time of trains, number of times transfers took place, and information of that general kind.

Q. And you know from sending for that information?—A. Yes. (Continued reading.)

(d) Because scalpers have induced some conductors not to cancel tickets taken up, in order that they may resell them in their scalping offices—and sometimes more than once—for their joint benefit.

(e) Because they have corrupted clerks and ticket distributors in some railway general offices by inducing them to purloin and dispose of irregularly issued tickets for a consideration.

(f) Because many scalpers operate in clear violation of law, notably in the 10 States wherein they nullify the statutes thereof.

(g) Because many scalping offices are in the nature of fences or pawn shops, both of which latter are subject to legal or police regulations and examinations, while scalpers' offices, being used for similar purposes in another commodity escape such safeguards against misuse and fraud.

(h) Because the railroad companies are held responsible for disturbing passenger conditions, which they disapprove, and which they ask the aid of law to effectually resist and prevent.

(i) Because scalpers incite railroad wars and reprisals as the best means by which they can procure the greatest number of tickets at the lowest cost and, by shifting their business from one road to another and by working in conjunction with other unauthorized or pliable agencies, they have frequently produced the serious contentions in fares which they desired.

(k) Because when a railway company decides to secretly reduce one or more classes of through fares, it dares not do it in its own offices in violation of the interstate act, of various State statutes and of the several tariffs which it has published, filed and posted pursuant thereto, but usually avails of ticket scalpers' offices to collusively violate the act, a course which involves better-intending lines in a demoralized scramble for business. I do not mean that this practice is now even considerably resorted to by the railroads. It has been gradually circumscribed, but if scalping offices were altogether abolished, or their authority required to be made legal, it would tend to the entire cessation of these joint resources and practices.

(l) Because scalpers afford no honest information or accommodations to travelers which the railroad companies do not desire to extend to all their patrons under just and uniform charges and rules, administered through their authorized bureaus of information and redemption, where they will return to the holders of unused portions of tickets all amounts exceeding the fares which duly accrue between the points which the passenger actually traverses, correct errors of their agents in selling tickets as to routes, the erroneous checking or losses of baggage, etc. Even the scalpers must send their patrons to such offices for those purposes,

or substitute a show of authority made up often of fraud, ignorance, collusion, dishonesty, and depleted and unequal fares. The railroad ticket agents at all points will transmit unused coupons to the redemption bureaus and give all desired information.

(m) Railway companies sometimes decline to issue reduced-fare tickets of such forms as are easily manipulated because of the certainty that scalping will ensue and thus unduly extend the privilege granted to unauthorized users of such tickets. The same fear actuates some companies to impose conditions upon the faces of their special tickets and limit their durations of sale and use, whereas, if scalpers' offices were abolished, they could safely dispense with such safeguards, because the bona fide passenger would not use the methods, misrepresentations, or abuses which scalpers practice.

(n) The cessation of scalping would in no wise lessen the public facilities, because each company could retain the services of any experienced scalper by conferring upon him a proper appointment as agent and regulate him thereafter by the rules which govern their other agents.

(o) There are two organized bodies of scalpers: The American Ticket Brokers' Association and the Guarantee Ticket Brokers' Association. They have their directors, officers, agents, rules and regulations, they discuss and decide some questions of cut fares, and they adopt resolutions and deal with the property of others in which they have no direct interest, while, at the same time, under the decision of the Supreme Court, the railroad companies cannot adopt counter agreements without violating its decisions.

Moreover, the rules and decisions of the Interstate Commerce Commission do not reach scalpers' fares or practices, because they hold the railways accountable. Furthermore, the fares of the railway companies proper can only be changed by 3 days' notice as to reductions and 10 days' notice as to advances, while the scalpers can change them either way daily or hourly. In this way a railway company, acting with a scalper, can also change the fares and evade the law. There is a manifest injustice in all this which could and should be corrected by appropriate national legislation.

(p) Another feature of ticket brokerage has not been sufficiently urged upon public attention. If a passenger purchasing a through ticket from New York to Chicago is required or desires to discontinue his journey at Buffalo, the unused coupon west of Buffalo will be redeemed by the issuing company or its unused connection. If he takes the same unused coupon to a scalper, he is offered by him less for the ticket from Buffalo to Chicago than the railway would redeem it for. His fare from New York to Buffalo would, therefore, be more than its due amount to the extent that he received less than his remaining coupon was worth. Against this the purchasing passenger west of Buffalo may get a ticket under the legal fare but he is not entitled by law to that preference. In this way we answer the loudly vaunted public advantages of brokers and venture the further assertion that if scalping was abolished the average fares paid by passengers would not exceed those which prevail under its continuance.

(q) The payment of commissions by railroad companies is an inciting cause to the continuance of scalping because such commissions are often divided between scalper and passenger. The payment of commissions is justly chargeable upon the railways. Therefore I think that with the discontinuance of the one should go the stoppage of the other, and the perpetuation of either or both of the evils may prevent, in some instances, open and uniform reductions of fare more nearly to the net basis received out of the fares from which commissions and scalping must be deducted before the real or true fares are ascertained.

(r) I believe you would promptly advocate our view if corresponding brokerage offices were opened throughout the country for scalping freight rates through advancing, reducing, manipulating, and secretly and fraudulently altering them for the benefit of some shippers by persons utterly unauthorized to deal with such values and bills of lading. Yet I know of no act or justification in the scalping of tickets and fares which would not with equal justice warrant similar scalping in freight rates and bills of lading.

(s) I leave to counsel the legal arguments growing out of various decisions pro and con, some of them recent, upon this subject. I am, however, qualified to discuss it by the statement that if that law is best which is expressive of the highest justice, then an act should be passed in this respect which will secure for the mutual, personal, and commercial relations of the citizen and carrier the observance of reciprocal justice, right, and the protection of property. I also leave in their more competent hands the questions of legislative process.

FOURTH—AS TO FREIGHT TOPICS.

GENERAL OBSERVATIONS.

You invite a very encyclopedia of information, reasoning, and conclusion as to "unjust discriminations and undue preferences," but only a hasty review is practicable now.

The first railway built in this country was in 1826, a tram, 4 miles long, to transport granite. There are now about 190,000 miles of main track, or 250,000 miles, including double, terminal, and lateral tracks.

In constructing this enormous mileage, being over one-half that of the world, within 73 years in over 3,000,000 square miles of area, covering 53 States and Territories, which were often commercially and legislatively antagonistic, depending also largely upon municipal, county, State, and national interests and assistance not always similar or concurrent, and controlled as to the most important of their earlier rates by parallel natural or artificial waters, and influenced or decided by the newness of the questions in many important aspects, many abuses crept into railway construction and subsequent administration for which legislative bodies were often equally responsible with railway organizers.

Railway promoters, therefore, operated sometimes upon questionable bases, judged both from their own or the people's interests, and competing cities, counties, States, and the General Government vied to attract intending lines, in order to secure capital, native settlers, and foreign emigrants, and thereby achieve a quickened local and national growth and international markets and interchanges. Witness the great franchises granted to the Illinois Central, Union Pacific, Texas Pacific, and other lines, the State aids to the Baltimore and Ohio and Pennsylvania railroads, etc.

Attractive charters, land grants, immunities, and exemptions from taxation, broad powers—as fixing rates and fares—public subscriptions of stocks and bonds, donations of lands and moneys, etc., were, therefore, generally sought and conceded. Then the interests of adjacent districts which failed to secure the first railways proceeded to organize and equally encourage other competing enterprises.

These artificial stimulations relapsed, as do all undue elations, into mutual sobriety and regrets. Discouragements in the costs of building and in the resultant quantities of traffic, geographical and railway rivalries and other causes, then led to transportation methods and legislation often indefensible. Public contentions, restrictions and forfeitures followed by ordinance, State law, and national agitation and decisions. The changes from a people's acclaim to their opposition was shown by the enthusiasm which fired the western world when the transcontinental line opened in 1869, as compared with the adverse granger legislation which ensued largely thereafter.

Most of the first railways were constructed to first connect important objective points between which there were inadequate local traffics. The pioneer trunk line, the Baltimore and Ohio, and the first transcontinental line are instances in point. Thereafter, what with felling forests, transferring stump grounds into arable lands, opening coal mines, urging manufacturing works, etc., the intermediate traffic was developed and often became the more important resource. However many or few the bonds or stocks issued to construct such lines, their holders were compelled to await returns thereon from the slow developments of the territories traversed. To accelerate these various results some rates were made excessive and some were reduced by favoritism, but before profits were reached many of the most important railway companies defaulted upon their interest, were sold out and reorganized, and much, if not all of the so-called water was thus pressed out of them again. But bear in mind that, however much the railway promoters lost or made, the people of the countries traversed invariably benefited the most from every local and national point of view.

Moreover, the rates and fares fixed upon the opening of all the important railway lines represented their highest charges and have since been continually reduced, as has been amply and often proven, until our patrons now enjoy the lowest rates and fares of the world, and the best and speediest average service, and American railway labor receives the highest wages in the world for less onerous duty, and for the fewer hours which constitute a day's work.

Notwithstanding these truths the public appreciation of the values of the railways as the greatest factors of home and foreign trade has constantly lessened, and municipal, State, and National legislation and taxation have increasingly restricted them or denied them the adequate consideration given, for example, to our manufacturing interests, but National and State legislatures constantly entertain, consider, or enact accumulating restrictions upon the railways, and the

or substitute a show of authority made up often of fraud, ignorance, collusion, dishonesty, and depleted and unequal fares. The railroad ticket agents at all points will transmit unused coupons to the redemption bureaus and give all desired information.

(m) Railway companies sometimes decline to issue reduced-fare tickets of such forms as are easily manipulated because of the certainty that scalping will ensue and thus unduly extend the privilege granted to unauthorized users of such tickets. The same fear actuates some companies to impose conditions upon the faces of their special tickets and limit their durations of sale and use, whereas, if scalpers' offices were abolished, they could safely dispense with such safeguards, because the bona fide passenger would not use the methods, misrepresentations, or abuses which scalpers practice.

(n) The cessation of scalping would in no wise lessen the public facilities, because each company could retain the services of any experienced scalper by conferring upon him a proper appointment as agent and regulate him thereafter by the rules which govern their other agents.

(o) There are two organized bodies of scalpers: The American Ticket Brokers' Association and the Guarantee Ticket Brokers' Association. They have their directors, officers, agents, rules and regulations, they discuss and decide some questions of cut fares, and they adopt resolutions and deal with the property of others in which they have no direct interest, while, at the same time, under the decision of the Supreme Court, the railroad companies cannot adopt counter agreements without violating its decisions.

Moreover, the rules and decisions of the Interstate Commerce Commission do not reach scalpers' fares or practices, because they hold the railways accountable. Furthermore, the fares of the railway companies proper can only be changed by 3 days' notice as to reductions and 10 days' notice as to advances, while the scalpers can change them either way daily or hourly. In this way a railway company, acting with a scalper, can also change the fares and evade the law. There is a manifest injustice in all this which could and should be corrected by appropriate national legislation.

(p) Another feature of ticket brokerage has not been sufficiently urged upon public attention. If a passenger purchasing a through ticket from New York to Chicago is required or desires to discontinue his journey at Buffalo, the unused coupon west of Buffalo will be redeemed by the issuing company or its unused connection. If he takes the same unused coupon to a scalper, he is offered by him less for the ticket from Buffalo to Chicago than the railway would redeem it for. His fare from New York to Buffalo would, therefore, be more than its due amount to the extent that he received less than his remaining coupon was worth. Against this the purchasing passenger west of Buffalo may get a ticket under the legal fare but he is not entitled by law to that preference. In this way we answer the loudly vaunted public advantages of brokers and venture the further assertion that if scalping was abolished the average fares paid by passengers would not exceed those which prevail under its continuance.

(q) The payment of commissions by railroad companies is an inciting cause to the continuance of scalping because such commissions are often divided between scalper and passenger. The payment of commissions is justly chargeable upon the railways. Therefore I think that with the discontinuance of the one should go the stoppage of the other, and the perpetuation of either or both of the evils may prevent, in some instances, open and uniform reductions of fare more nearly to the net basis received out of the fares from which commissions and scalping must be deducted before the real or true fares are ascertained.

(r) I believe you would promptly advocate our view if corresponding brokerage offices were opened throughout the country for scalping freight rates through advancing, reducing, manipulating, and secretly and fraudulently altering them for the benefit of some shippers by persons utterly unauthorized to deal with such values and bills of lading. Yet I know of no act or justification in the scalping of tickets and fares which would not with equal justice warrant similar scalping in freight rates and bills of lading.

(s) I leave to counsel the legal arguments growing out of various decisions pro and con, some of them recent, upon this subject. I am, however, qualified to discuss it by the statement that if that law is best which is expressive of the highest justice, then an act should be passed in this respect which will secure for the mutual, personal, and commercial relations of the citizen and carrier the observance of reciprocal justice, right, and the protection of property. I also leave in their more competent hands the questions of legislative process.

Suffice it to say that it is an evil which I think has grown steadily since about the close of the first year after the passage of the interstate act, and I believe it will continue to increase and prove more disastrous to railway revenues and to trade so long as adequate and due legislative measures for its actual and practical regulation or prevention are delayed. Mere prohibitions of the practice by providing for increased fines and penalties have not availed and never will. I discuss this subject more fully further on.

SEVENTH.

DISCRIMINATIONS AGAINST LOCALITIES.

Discriminations against places, districts, or localities usually arise out of the individual allowances just recited, because the underlying geographical bases or scales of rates have become uniform and substantially just in the territories they severally cover. For example, the scale from Chicago eastward is just; but if a large shipper of a leading commodity enjoys preferential rates therefrom, not only are other forwarders of the same commodity at the same point injured, but also both large and small forwarders—say at St. Louis on the one side and Milwaukee on the other—as well as elsewhere intermediately and in numerous directions and places. Such preferences also cause the beneficiaries to discriminate against the other railway lines from their own cities which do not concede to them like rebates.

The outside localities, shippers, and carriers thus harmed therefore often coalesce, and as they must do business under like conditions, these bad situations are extended over wider districts, involving more shippers, railways, and points and more geographical as well as individual discriminations until, in some instances, departures from the strict tariffs may have become the rule from some points, especially when business is sluggish.

Such methods also create further geographical preferences because rebates are granted mainly from the central points, which are large reservoirs of trade, and not from smaller common points or from strictly local stations. The smaller patrons from such places are therefore most discriminated against, and geographical preferences become inseparable parts of the same reprehensible system. The "long and short haul" clause is also largely nullified thereby when the duly published tariffs are depleted at the centers but maintained from shorter points en route.

More excusable or justifiable discriminations sometimes ensue from the close geographical relations of some systems to specific localities. Thus, the Canadian Pacific Company may fairly prefer and assist the cities of the Dominion, or the Norfolk and Western would develop Norfolk, yet the acts of those lines to those points affect the carriers thereto and cities between or competitive with them. The lines reaching from St. Paul, from the West, will preferentially aid that city and Minneapolis; the Gulf lines will develop New Orleans and Galveston; the New England lines will favor Boston, and so on.

EIGHTH.

DIFFERENCES OF CHARGE IN DIFFERENT SECTIONS.

Under this head your query relates to the complications attending the geographical adjustments of domestic rates and fares between competing localities, districts and lines and routes. The differences in fares have been presented. As to freight, and taking Chicago as a pivotal point, the determination of rates in both directions, applying upon 4,000 articles moving inward and outward over many roads of unequal length, facility, time in transit, etc., between sharply contesting points, as well as the vast number of passenger fares, can hardly be calculated. Then add the number of rates and fares involved everywhere else in the nation, and you have the problem in better form for the consideration of its magnitude.

Given, further, an export shipment at Kansas City intended for London and therefore competitive via Galveston, New Orleans, Pensacola, and all the sea-board transfer points north thereof to Montreal inclusive, at various rates which affect by law the rates to interior points under the "long and short haul" clause, as well as to and through all the ports, and how difficult becomes the task to differentiate all the rates first involved and to thereafter change them promptly to meet fairly all the mercantile and railway interests involved on land and sea? The same query is good as to competitive manufactured merchandise, say at

or substitute a show of authority made up often of fraud, ignorance, collusion, dishonesty, and depleted and unequal fares. The railroad ticket agents at all points will transmit unused coupons to the redemption bureaus and give all desired information.

(m) Railway companies sometimes decline to issue reduced-fare tickets of such forms as are easily manipulated because of the certainty that scalping will ensue and thus unduly extend the privilege granted to unauthorized users of such tickets. The same fear actuates some companies to impose conditions upon the faces of their special tickets and limit their durations of sale and use, whereas, if scalpers' offices were abolished, they could safely dispense with such safeguards, because the bona fide passenger would not use the methods, misrepresentations, or abuses which scalpers practice.

(n) The cessation of scalping would in no wise lessen the public facilities, because each company could retain the services of any experienced scalper by conferring upon him a proper appointment as agent and regulate him thereafter by the rules which govern their other agents.

(o) There are two organized bodies of scalpers: The American Ticket Brokers' Association and the Guarantee Ticket Brokers' Association. They have their directors, officers, agents, rules and regulations, they discuss and decide some questions of cut fares, and they adopt resolutions and deal with the property of others in which they have no direct interest, while, at the same time, under the decision of the Supreme Court, the railroad companies cannot adopt counter agreements without violating its decisions.

Moreover, the rules and decisions of the Interstate Commerce Commission do not reach scalpers' fares or practices, because they hold the railways accountable. Furthermore, the fares of the railway companies proper can only be changed by 3 days' notice as to reductions and 10 days' notice as to advances, while the scalpers can change them either way daily or hourly. In this way a railway company, acting with a scalper, can also change the fares and evade the law. There is a manifest injustice in all this which could and should be corrected by appropriate national legislation.

(p) Another feature of ticket brokerage has not been sufficiently urged upon public attention. If a passenger purchasing a through ticket from New York to Chicago is required or desires to discontinue his journey at Buffalo, the unused coupon west of Buffalo will be redeemed by the issuing company or its unused connection. If he takes the same unused coupon to a scalper, he is offered by him less for the ticket from Buffalo to Chicago than the railway would redeem it for. His fare from New York to Buffalo would, therefore, be more than its due amount to the extent that he received less than his remaining coupon was worth. Against this the purchasing passenger west of Buffalo may get a ticket under the legal fare but he is not entitled by law to that preference. In this way we answer the loudly vaunted public advantages of brokers and venture the further assertion that if scalping was abolished the average fares paid by passengers would not exceed those which prevail under its continuance.

(q) The payment of commissions by railroad companies is an inciting cause to the continuance of scalping because such commissions are often divided between scalper and passenger. The payment of commissions is justly chargeable upon the railways. Therefore I think that with the discontinuance of the one should go the stoppage of the other, and the perpetuation of either or both of the evils may prevent, in some instances, open and uniform reductions of fare more nearly to the net basis received out of the fares from which commissions and scalping must be deducted before the real or true fares are ascertained.

(r) I believe you would promptly advocate our view if corresponding brokerage offices were opened throughout the country for scalping freight rates through advancing, reducing, manipulating, and secretly and fraudulently altering them for the benefit of some shippers by persons utterly unauthorized to deal with such values and bills of lading. Yet I know of no act or justification in the scalping of tickets and fares which would not with equal justice warrant similar scalping in freight rates and bills of lading.

(s) I leave to counsel the legal arguments growing out of various decisions pro and con, some of them recent, upon this subject. I am, however, qualified to discuss it by the statement that if that law is best which is expressive of the highest justice, then an act should be passed in this respect which will secure for the mutual, personal, and commercial relations of the citizen and carrier the observance of reciprocal justice, right, and the protection of property. I also leave in their more competent hands the questions of legislative process.

TENTH.

THE "LONG AND SHORT HAUL" CLAUSE.

You cite the "long and short haul" clause and inquire its meaning. The answer and intent are that an interstate rate or fare between any two points on a line or route operated by one or more connecting railway carriers shall not be greater on the same article moved in the same direction, under similar circumstances and conditions, between any intermediate points on the same line or route when the lesser distance is wholly included in the greater.

Stated more tersely: An interstate rate or fare made between any two points shall not be exceeded by the rate on the same article moved over the same line, in the same direction, under similar circumstances and conditions.

I regard this provision just, as to the large majority of the tonnage and travel transported, and it has done much to correct the older evils and discriminations. There are, however, some justifiable exceptions, as in the cases of traffic between intermediate points on the transcontinental routes from ocean to ocean; traffic from New York to inland points on the all-rail routes to Galveston as compared with the rail rates to Galveston made against ocean and Gulf routes and rates; through traffic across Lake Michigan at lower than all-rail rates; Asiatic shipments traversing our country to England versus Canadian routes having no similar legal limitations, some instances of differential rail and water rates, and some other causes. In such instances higher rates for short hauls may be justified both on classified articles and on specific commodities and yet work a benefit and enlargement to trade, and not its detriment or limitation. The courts have so decided in various and recent instances.

ELEVENTH.

INTERNATIONAL AND IMPORT AND EXPORT THROUGH RATES.

We must start out with one unassailable proposition. Our own people must first have all their needs supplied. All we thereafter export is a surplus, whether it be grain, cotton, cattle, or machinery. We must therefore contest for old and open new markets. That is the universal, commercial, and national demand of all countries. How then shall we do it? If we can not do it at our regular rates we must make some special rates.

Grain and other rates from Western centers to the seaboard and Gulf cities are interstate and to Montreal international, but inasmuch as grain and other articles go abroad largely, the rates on them must be adjusted with due reference to foreign markets as well as to our domestic conditions, and the two may differ essentially. The due expansion of our commerce requires the foreign markets, and all nations are contending for them. Hence certain due differences in our internal or domestic rates compared with external or export rates from many points to many others properly ensue. For example, the grain rate from Topeka to Philadelphia proper may be decided solely by local—i. e., interstate—conditions, but the foreign markets may render either a general revision of all seaboard rates or local exceptions on exported traffic necessary and just. I know of no good reason why the rate for carrying grain from Buenos Ayres to Belfast should influence or decide a rate from Burlington, Iowa, to Providence or Boston, yet it may do so. This is essentially true also on flour, cattle, meat products, cotton, tobacco, dairy products, and much exported merchandise. The same principle also holds true as to imports. The rivalries our products encounter in foreign countries also differ. They may have one result in Bremen, and another in Havre or at Marseilles as compared with Glasgow, and require American railways to accept lower inland proportional rates to all trans-Atlantic points than the local rates to the Atlantic shore points of export.

A still further view relates to competing Canadian carriers. Much of their traffic with American lines and ours with theirs is interstate; as witness traffic from Chicago to Boston and Portland via the Grand Trunk and Canadian Pacific routes. Antagonisms are, for that reason, to be avoided, not invited. An important meeting has recently been held in Canada to devise public means by which a large share of American tonnage can be secured.

If, on the contrary, we desire and receive their reasonable cooperation, which I believe is the preference of all interests, we must give them ours. If, however, their export or import rivalry should prove unreasonable we should be prepared to meet it in through oceanic shipments and without thereby involving all our local traffic rates.

These factors add intricacies to the problem confronted, because we as much desire to attract, say, Toronto traffic to New York, Boston, etc., as do they seek to carry American products to and via Montreal.

Further, touching our reduced inland rates used as proportions of import and export through rates, it is to be said that while it may in instances be to the temporary advantage or disadvantage of certain seaports to stop it, it may be greatly to the national advantage to make such thorough rates, and what may be a disadvantage to one route to-day may become a benefit to it to-morrow by changes in ocean rates only. All the steamship companies plying between our own and foreign ports usually charge higher rates on spot freight—i. e., rates for consignments originating at our ports—than they charge upon the same articles sent upon the same ships at rates which are contracted inland for direct export upon through bills of lading. Legitimate national and international causes also frequently justify inland all-rail proportions between Chicago and New York of through rail and ocean rates—say Chicago to Bremen—less than the domestic rates from and to New York proper. As, for example, our competition in Liverpool with the wheat of the Argentine Republic and the Black Sea, or in London with other flour milled elsewhere on the Continent, clearly involve transportation as well as productive and manufacturing competitions, and may require through rail and ocean rates, say from Chicago, etc., less than the sum of the land local and ocean rates, because if such through rates are not thus made much international trade may be lost to our traders, bankers, and carriers because the carriers may properly decline to reduce all their domestic tariffs to the foreign bases made necessary by these international rivalries.

In this view there appears no good reason why the rate on flour shipped from a mill at Chicago to a local consumer at New York should be reduced to the proportional rates required from Chicago to New York en route to Antwerp. If such lower through rates prevail via any one prominent American port they also involve the through rates via all other ports to make the through rates the same. Other illustrations support this view. It is deemed a beneficial competition to maintain a route from Cincinnati to Philadelphia via Toledo and Buffalo. No link in that route receives its local rates, yet I am not aware that Toledo, Detroit, or Buffalo complain of injury to their local interests because freights pass through their gates of trade at proportions less than the rates from their own warehouses. So with Pittsburg, for example. These examples are strengthened by European shipments passing, say, through Newport News, where there is a large foreign trade and but very little local tonnage.

One fact is clear. If the New York buyer for an English grain house desires to purchase a million bushels of wheat delivered in Liverpool he will pay no more for American wheat than he would for Black Sea or Argentine wheat of like grade, and it must, therefore, be delivered there at an equivalent cost. If the sum of the Chicago wheat value, plus inland tariff rail rates and ocean rates, make the total Liverpool cost of our grain the highest, then our farmers, carriers, laborers, bankers, and others will clearly lose the trade unless the competing value is equalized. The tendency of low foreign rates through is to reduce the shore point rates so that the foreign trade reduces the prices of some articles consumed here. If, therefore, the joint rail and sea carriers reduce their respective local seaboard tariff rates to and from the seaboard to meet that international contingency, I do not believe it should be deemed cause or occasion for reducing all our grain rates to the seaboard and to inter-local points, under the long and "short haul" clause, upon like traffics not competitive with any foreign markets. To require that both the seaboard local rate and the proportional ocean rate be made the same might cause some companies to go out of the foreign trade and seek only the local tonnage to make good the loss.

I do not, therefore, concede that the effects of such inland rail differences are disastrous to American interests any more than are the differences in ocean rates hurtful to the interests of the British flag. Rather the contrary, because they create aggregate national benefits, and are taken into the account in averaging annual rates. I believe the present course helps all our country's producing interests, immigration, landowners, farmers, carriers, the boards of trade, the bankers, the laborers, the elevator interests, etc. Neither the British Government nor our own interpose objections or legislate to prevent this differential as a sea practice.

This subject has received exhaustive consideration from the Interstate Commerce Commission, and although they primarily decided that the seaboard rates on domestic consignments proper should be maintained on all foreign traffic through those points, they had subsequent occasion to review that opinion, and practically announced their inability to determine or regulate the question.

They have recently considered the subject and suggested a measure of difference, thereby conceding the principle; but a difference of fixed amount is not always just via all ports alike.

The Supreme Court said, March 30, 1896 (163 U. S. Reports, 1897), in the case of the Texas and Pacific Co. v. the Interstate Commerce Commission, involving this issue: "The tribunal may and should consider the legitimate interests of the carrying companies, as of the traders and shippers. * * * The mere fact that in this case the disparity between the through and local rates was considerable, did not warrant the circuit court of appeals in finding that such disparity constitutes an undue discrimination."

TWELFTH.

UNREASONABLY HIGH RATES.

Under the title of "Unreasonable and excessive rates," your paragraph 35 asks how they are determined, the occasions therefor, their effects on places, producers, middlemen, consumers, and the public, and by what means they can be prevented.

(a) It is a misapprehension that American railway rates are usually made arbitrarily and too often excessive, because our greatly reduced tariffs are due mainly to unalterable natural competitive forces, to the changes thereafter wrought in local rates and fares by the "long and short haul" clause of the Interstate Act, supplemented by conference, discussion, tests, changes and ultimate concurrence between our own and foreign producing and consuming interests until the interstate rates now published and filed substantially conform to equity and have the public approval. No appreciable percentage of our open rates or fares are complained of to the railways, and I believe 95 per cent or more of them are satisfactory. For examples: If a coal mine is to be opened, its owners first agree with the railway as to the rate before shipping. If a large Northern manufacturing concern or a cotton mill in the South is to be built, their projectors see all the competing railways, and they finally agree on the best rates and conditions offered. So on through the list.

Therefore, I know of no standards by which to duly gauge the varying reasonableness or unreasonableness of the all-rail rates in different parts of this country. Comparisons with the rates of Canadian and Mexican rail carriers on our northern and southern borders and the success of American rail transportation lines in competing with the free water, ocean, and river routes which surround and penetrate us, or with the canal charges which are affiliated with the lakes, rivers, and the ocean, clearly establishes their reasonableness. Many of these water lines have been aided by unsecured governmental appropriations, and the successful railway competition with them also proves the lowness of the rail rates. It is commendable to assist and improve our waterways, and perhaps to leave commerce over them free, but it is not just to attack the railways for their greater national services.

The only other good standards of comparison are our former rates and fares and the all-rail rates which now prevail for land transportation in foreign countries. Judged by any and all these bases, I unhesitatingly aver that they all prove that the vast majority of all the interstate rates in the United States are reasonable. They surely are the lowest in the world, and our merchants receive therefor the quickest service, the most abundant, exceptional, and cheap terminals and lateral service, a greater choice of routes, are granted more general recourses under our bills of lading, the most liberal settlement of claims, and have access, through reduced rates, to more foreign countries and greater varieties of legitimate and illegitimate competition than any other shippers of the earth secure.

(b) Touching the reasonableness of rates, Mr. Nimmo, the former Chief of the Bureau of Statistics, said:

"During the year ending December 31, 1893, only sixteen cases came to a formal consideration and hearing. In only one of the cases decided was the reasonableness of the rates called in question, and in that single instance the claim was decided to be not well founded." This was after the law had operated five years.

(c) I compute that there are at least three millions of freight rates and passenger fares in this country applicable to interstate traffic in both directions and including the State rates influenced thereby. When this enormous aggregate is considered, that hundreds, and often thousands, of transactions occur annually under each rate or fare, and that complaints to the Interstate and State commissions have probably not been one one-thousandth thereof, such striking facts should also challenge legislative attention in proof that our rates and fares are reasonable and just rather than unreasonable or excessive.

(d) Important general facts in this connection are these:

For two generations orators urged and applauded the opening of new railway lines because they would develop fallow and great arable areas, even at the high rates then current. Indeed, reductions of such former rates were sometimes publicly opposed. A State convention at Syracuse, in December, 1858, resolved:

"To recommend the passage of a law by the next legislature which shall confine the railroads of this State to the business for which they were originally created" (i. e., local traffic).

(e) The average rate of the New York Central Company in 1858 was 3.18 cents per ton per mile, equal to 7 cents per 100 pounds on grain from Buffalo to New York. The rate now is about six (6) cents per 100 pounds. In 1873 the all-rail grain rate from Chicago to New York was 55 cents per 100 pounds. It is now not more than one-third as much.

(f) In 1873 the freight rates upon 70,268 miles of railway then built averaged 2.21 cents per ton per mile for 168,000,000 tons then carried. In 1895 the rate averaged 0.839 cent for 763,800,000 tons carried upon 179,162 miles of railway, producing gross freight revenues of \$743,784,451, the average rate for 1873 being over 263 per cent of the rate in 1895. The rate is still lower now.

(g) At the average rate charged in 1873, the freight earnings in 1895 only would have been \$1,215,344,000 more than they were and over \$80,000,000 more than the entire indebtedness of the States and Territories in 1890. In 1895, 179,162 miles operated paid \$81,375,774 in dividends, or but \$454 per mile, being but 40 per cent of the dividends per mile paid in 1872. The gross mileage increased 310 per cent; the gross dividends only 26 per cent. These conditions have recently improved.

Of American railway earnings in 1895, 68 per cent was derived from freights, 24 per cent from passengers, and 8 per cent from miscellaneous sources. The gross receipts upon each ton of freight moved in that year averaged 97 cents and 48 cents upon each passenger carried. The addition of but 1 cent per ton on each ton carried in 1895 would have been \$7,638,000 and 1 cent on each passenger carried would have been \$5,439,742, or say \$13,000,000 for both. It can not be assumed as to this item that the consumer is entitled to constant reductions and that the railway shareholder is never entitled to an advance.

Apportioning the dividends paid upon stock in 1895 in the above proportions, the freight account would be chargeable with \$55,335,526 and the passenger account with \$19,530,187, equal to but 7.2 cents per ton and 3.6 cents per passenger carried, these figures including all distances.

(h) Poor's Manual for 1895 reported \$5,182,122,000 of railway stock capital outstanding. The dividends on stock in that year being \$81,375,774, the average rate of dividends was 1.57 per cent. The Government reports say that nothing was paid in that year on \$3,475,640,253 of this stock, being 68 per cent of the whole amount outstanding.

(i) Had the average charge for transporting 1 ton 1 mile which obtained in 1888—the first full year of the interstate act—been charged in 1895, the freight revenues for 1895 would have been \$122,223,523 more than they were. Railway taxation increased in the same period from \$25,435,229 to \$39,250,000, or 54 per cent, facts which seem to prove a sufficient evaporation of the "water" in stocks to satisfy the most optimistic hydraulicon.

THIRTEENTH.

COMPARISONS WITH FOREIGN RATES.

A comparison of a few of the rates charged on American and foreign railways may prove serviceable.

Edward Bates Dorsey, commenting in 1886 upon "American and British Railways Compared," said of the relative freight rates:

"The rate as given from Liverpool to Birmingham (97 miles) on grain and flour is \$3.01 per gross ton, and the rate as given from Chicago to New York (1,000 miles) is \$5.60 per gross ton." (It is now about \$4.)

J. S. Jeans, writing on "Railroad Problems" (London, 1886), said:

"English railways practically work on the same tariffs to-day they did in the infancy of the system," and "it is probable that the average ton mile rate on English railways will not be much, if any, under 1½d. (3 cents), which is just *three times* the amount charged on the principal American lines."

Our rates have been reduced since then very much more per mile than have those in England.

The average receipts of the European railways in 1890 were \$9,800 per mile; ours \$5,700, or but 59 per cent as much. We also had 26.5 miles of railway for every 10,000 inhabitants; Great Britain and Ireland, Germany, France, and Austria-Hungary averaged but 5.4 miles.

FOURTEENTH.

THROUGH FREIGHT RATES AND ROUTES.

Through freight routes and rates, referred to in your paragraph 37, need but little comment.

Through rates and fares were formerly made by adding those from point to point, charges for terminals and bridge service, etc. The responsibilities and rules of carriage of the several links in the through lines were dissimilar, uncertain, and clashing, diverse bills of lading and tickets were used, the settlements of claims were delayed and made on different bases, no road was accountable except for its own carriage under these varying rules and orders, transfers of tonnage and persons were many at numerous junctions, unequal rules of lading per car prevailed, the classifications were numerous, local, and unlike, the time in through transit was much longer, diverse rules of car service, storage, and delivery were usual, and added to these conditions the through charges were over four times those now prevailing. These facts were true of the line composed of the Hudson River Railroad to Albany, thence the New York Central and Lake Shore or Michigan Central roads to Toledo and Detroit, thence rail to Chicago, and so on beyond. They now offer more and better alternate routes to shippers than exist in any country on earth.

Such illustrations might be many times multiplied. The solutions and transformations, now almost entire, are so desirable to the railroads themselves as help: to economy in car supply and movement, return lading, relative peace with the public, swifter time, enlarged traffic, etc., that they can not again be abridged, and every change has been for the public benefit and will continue to be. So that no shippers would again favor the old semi-detached methods of carrying through freights from point to point under the warring conditions and difficulties above recited, because they now receive one through bill of lading, carrying one rate, one responsibility, and like rules, and, what is more, on much quicker time and at greatly lower rates.

These bettered facilities were the native evolutions of trade necessities, common ownerships of continuous routes, absorptions of branches, improvements at transfer stations, the betterments of terminal facilities, more uniformity in the equipments used, authentic representation by more joint agencies, the designation of specific cars for given traffics or routes, and other gradually improved smaller conditions, like the telegraph, telephone, electric light, elevators instead of staircases in warehouses, and others of the great and minor adjuncts and conveniences, developers, distributors, and pushers of improved intercourse and commerce; facts which will continue forceful and controlling hereafter, as in the past. I do not, therefore, believe that there is now any necessity for, nor any good to be accomplished by, any legislation as to continuous or additional routes. The self-interests of the carriers will provide and regulate them.

It is now the rule that lines entitled thereto receive such representation in the joint tariffs of connecting lines as may best and reasonably facilitate tonnage and travel interchanges, provided that the relations are harmonious and the compensation and divisions equal to those accruing via existing lines. To force upon the railroad companies owning the parent stems the formation of connections which may be comparatively antagonistic, weak in experience and equipment, and which will increase expenses, is not demanded by any public welfare. It should also be known that sometimes, under such a law, ulterior, unnecessary, and publicly hurtful motives might actuate the demands for such new lines. No captious proposal should, therefore, receive your indorsement that the railroad companies shall be required by law to increase their expenses in order to organize needless through lines not natural, cooperative, or complete in their affiliations, connections, or facilities, and which can not compete with others now more effectively and satisfactorily equipped. Moreover, unless new lines were equally well organized they would constitute trade hindrances rather than helps. Such a proposal also savors of requiring, by law, that the largest manufacturing concerns shall appoint as agents everybody who may apply for such an appointment.

FIFTEENTH.

FREIGHT CLASSIFICATIONS.

Touching dissimilar freight classifications and the causes therefor, as referred to in your paragraphs 41, 42, and 43, the subject may perhaps be made briefly clear in outline, but not in detail. I favor the consideration and adoption, if found

reasonably practicable, of a uniform classification for both railway and public reasons. It is, of course, understood that, there being six classes, for example, there will be six rates between all points, ranging, for general illustration, from \$1 to 60 cents per actual 100 pounds. What class an article shall be assigned to at first or transferred to thereafter, or what intermediate or commodity rate shall be made, are vital elements of rate making or fixing what the class rates shall be, and these constitute the whole question of freight tariffs. The changes therein should therefore be determined by the railroads, as they determine the original rates for each class and under the same rules, using the term "classification" as synonymous with all class-rate standards.

In the first part of my evidence I divided the United States into territorial areas in which different classes of passenger fares may justifiably prevail. Within the same areas the same or other causes may warrant differences of freight charge and classification; but other forceful general causes which influence tonnage rates should not be ignored.

For example: Where a large traffic of Western lines is in live animals their classification of live stock may reasonably differ from that applied to the smaller shipments of like animals in Alabama. So the classification of cotton in Georgia and Texas may properly differ from that used in California. The large amount of precious minerals mined in Colorado, Utah, and California, with their attendant risks and conditions, may reasonably justify classifications different from those applying to the infrequent shipments of such or other ores under a different liability over New England lines. The copper classification, or that of iron ore, may properly differ in different ore districts, depending upon quantity, regularity of movement, etc. Where there is a large and regular traffic in bituminous coal the classification may justly differ from that used upon remote lines which carry but little coal; and the classification, i. e., the rates, on anthracite and bituminous coals may differ over the same lines, depending in part on values, terminal facilities supplied, etc. The fruit classification in Florida may justly differ from that in Maine and be justifiably greater although moved in much larger quantities, because it is a principal resource in Florida and an incidental article in Maine. A class rate on lumber cut on mountains and carried down grade may justly differ from lumber rates applying all the way up grade on the same line.

The large lumber product of Michigan and Wisconsin may also justify the railroads in those States in classifying lumber differently from the classifications prevailing upon the Western plains, where but little lumber is cut.

The large concentrated manufacture of a great number of special wares in New England, largely by water power, and forming the bulk of their total outgoing interstate traffic, may justify different classifications thereon from those used in regions where manufactures are a minor resource; for example, the manufactures of New England, New York, and Pennsylvania, in comparison with those of Arizona or Florida. Similar instances could be cited as to various articles of production, such as grain, steel rails, flour, structural iron, etc., in different volumes in different sections of the country.

Some items of the classification, notably inexpensive wares like crockery, soda ash, resin, etc., are also affected by canal, ocean, and river competition more than others are; hence different classifications, as the proximity of water routes affects them.

The classification from Montreal westward to Canadian points may differ from that used from Albany, and thus affect American rates.

The transcontinental classification differs radically and with reason, because of Isthmian and Cape Horn competitions, from that used all-rail from the Atlantic seaboard to Kansas City and Memphis, or from the latter cities to Seattle.

These are some of the many salient warrants for differences in classification. Others relate to the friendly trade antagonisms of States, districts, and more extended territories; to the adjustments of the myriad differences of conditions by the considerable and necessary use of commodity tariffs and rules, which have the effect to equalize rates both as to firms and localities on important special articles, and also to provide rates intermediate between those resulting from class rates proper. For example, if the difference of 15 cents per 100 pounds, New York to Chicago, between second and third class was found too great, an intermediate, i. e., a commodity rate, may be desirable and in instances needful as an aid to equalize the railway and trade conditions otherwise created or encountered.

Many of these disparities have already been adjusted by differences of classification or by commodity rates. Any uniform classification must continue to recognize and provide for these inequalities and dissimilarities by differences

of special rates or by the fixed differences of classification rates, for the cogent reason that some justifiable differences of rates will continue on certain articles which must be adjusted by some public and reasonable method. To abolish all intermediate rates would advance some and reduce other rates unnecessarily, and, in some cases, aggravate the evil sought to be corrected. Absolute uniformity is, therefore, unattainable and disturbing.

There is but little difference between the formulation of the English classification and the trunk-line classification which prevails in the United States upon about 70 to 75 per cent of its freight tonnage and earnings. In England and all other countries different causes (such as we encounter) produce like policies and assignments of classification. For example, the classification (i. e., the rate) on fruit from some Mediterranean points via rail across France and England to London necessarily differs from the locally classified rates in both France and England, because strong competition is encountered for it through carriage from Mediterranean ports by water all the way through the Straits of Gibraltar. So with wines, etc.

The continental classifications (i. e., rates) are, for the same reasons, affected by the Elbe, Rhine, Seine, and Danube rivers. The classifications also justifiably differ in some instances in those countries from points upon those streams compared with those which prevail inland thereto or therefrom.

Further, if it be published that a given article is charged from New York 65 cents, second class, to Chicago, while the classification west of Chicago would fix the west-bound rate upon the same article at \$1 first class for the same distance and in the same direction, that fact would not necessarily produce a discrimination, the circumstances and conditions being dissimilar, because all like traffic would be charged a uniform rate New York to Chicago, and another uniform rate from Chicago west; yet that would not be discrimination.

If in any readjustment of the classification so as to make it uniform, the rates from Chicago to a point 1,000 miles west thereof continued unchanged, the alteration of the classification might yet operate so as to raise some and lower other rates and thus create an unreasonable rate or an unjust discrimination and require their revision or adjustment by more commodity rates. Nor would a uniform classification reconcile or dispense with legitimate differences in rates for like hauls in different districts. Notwithstanding all these reasonable issues, much good could, in my judgment, be achieved by the elimination and limitation of many commodity rates and the substitution of both local and general classifications thereof containing more classes, if some reasonable advances in rates were made in some instances in exchange for others reduced. This would produce some additional uniformity of rates and lessen some forms of inadvertent preferences.

One other view of the advocacy for a consolidated classification merits your thought and mention. I know of no pleaders for this uniformity who urge it on that ground alone. It goes, in their minds, with the desire or belief or both that a uniform classification means a reduction in rates incidental to greater mercantile convenience, but none seem to believe uniformity so essential or are so strenuous for the amalgamation as to propose or assent to any advances in rates to secure the national classification, although some interests would be required to make some concessions, if one were adopted.

As a matter of fact, interstate through rates are substantially all alike now via all like routes, and the national schedule would not make them more so because it would encounter the same sea, river, canal, and other rivalry as now, and the rates would have to be met and modified as now. For a considerable time it would require many changes in abrogating old or issuing new commodity rates. Furthermore, it would necessitate many changes in State as well as interstate procedure.

The principal causes of discrimination cited are therefore as likely to continue under a uniform classification as under various independent classifications. Diverse classifications do not cause them and a consolidated classification will not stop them.

Finally. Each of the present classifications have special adaptations to the circumstances and conditions of the business in the territories which they respectively cover, and this consideration must continue in any event we can now forecast. There are those who hold sincerely that it will increase the problem and lead to more unsteadiness in rates rather than to their solidity.

SIXTEENTH.

Very much that is said by and before you and elsewhere relates to misunderstood competition. I therefore submit a

CONTRAST BETWEEN RAILWAY AND TRADE COMPETITIONS.

When the term "competition" is applied to purchasing and selling transportation as it is to buying and vending goods, it is a misnomer, because, historically and instinctively, it conveys to most minds impressions of bargaining and concession. Buyers seek better terms than sellers first ask, and sellers whose capital, manufacturing facilities, control of specialties, patterns, patents, rentals, etc., differ, may, in order to secure such purchasers, sell at dissimilar prices adapted to market conditions or forecasts, the proportions of cash, notes, or credit offered in payment, their experiences with buyers' ratings, and the profits upon entire bills sold—i. e., losing on one article to make more on others. All this is commercially sanctioned, but it would be illegal and not proper in any sense to so bargain for different railway rates or exchange corn for bills of lading at false bases for the values of both, or for rival railways to grant preferences varied to accord presumably with a competing agent's estimate of a shipper's credit, the quantities forwarded, etc., or with the different capitalizations, dividends, distances, or facilities of the competitive railway lines.

Competing vendors openly misrepresent and laud their own and decry their rival's wares from market stalls or wagons, but variable freight rates and fares must not be so peddled publicly from railway wagons or privately in railway offices.

Yachtsmen "compete" for prizes with presumable rectitude, but when a yacht is purposely fouled or its spars weakened, it is not "competition" more than it would be if one railway procured the derailment of its rival's trains. It is conspiracy. This principle also holds true in athletic games, horse races, etc., because if the judges in such competitive exhibitions or of machinery, arts, etc., sell their awards, it is not "competition," but fraud.

Whatever may be the policy of the State as to prison laborers they do not fairly compete with honest toilers, nor could railways justifiably reduce the compensations of their employees to convict wages. It would not be fair competition, but a crime against honest labor.

Further, if a yacht owner, trade or art exhibitor violates the rules of his guild in its public contests, he is denounced and debarred from further competition, but if the reasonable rates, fares, and rules governing the important public functions of transportation are violated by a railway which aided to formulate them, that railway is applauded and rewarded for doing wrong by increased patronage on the trade exchanges which would dismiss their own members for lesser infractions, and the law encourages a continuance of the wrong.

This also is not competition, but a reward for illegal methods substituted for deserved punishment or penalty.

It is not, for these reasons, true competition when one or more railways unequally and secretly alter their published, uniform, and reasonable rates, fares, or rules, and which judiciously and judicially managed railways seek to legally observe in furtherance of law and the public interest as well as their own. Nor is it true competition—although it may be in a sense justifiable—when strong and well-meaning carriers, whose business has been taken by a rival at cut rates, take some legal chances to regain and keep it, because if they waited the law's inefficient aid, or any other method now usable, their shares of competitive business would be lost, perhaps permanently.

Further, if one railway company observes a reasonable tariff rate which a competing carrier reduces secretly and from which yet other rival carriers offer further rebates, it is clear that if the first rate was reasonable the last one would be unjustly low, and that such devices constitute waste, bankruptcy and discrimination. In such cases the first fair rates should clearly be restored and by united effort, if need be; nor is such unity of effort "monopoly," "conspiracy," "absolute power," or a "trust."

Assume further, one railway sturdy for uniform legal rates, the other pliant with concessions therefrom, and two shippers, one desiring to observe the law and the other to evade it. Concede then that the yielding railway grants the insistent large shipper concealed rebates. In such strife both railways will be injured—one because it loses its business, the other because it loses its profit—and one merchant will probably be ruined. Above all these, the large receiver of rebates will, phoenix-like, survive and rise, and will ultimately control his kind

of business from the points whence his rebates apply and will also injure other shippers at other points affected.

If *all* railways gave but one shipper, say of grain, 1 cent per 100 pounds advantage, he might ultimately control the cereal markets of the nation. So would he if but *one* railway at each large shipping point granted him that preference, assuming that all other railways thereat stood firm for right and like rates and rules for all. Then one railway would dominate the others and constitute the monopoly.

These vicious results would differ only in degree if advantages were given by one or many railways to say five shippers at the same or different points, because the five forwarders might then attack and ruin each other and yet others, until the surviving shippers were fewer and the smaller unfavored patrons were ruined.

Further, the merchant who reduces his sale prices or pays producers more on his commodities because of his reduced rates, affects only his rivals in the same trade and locality, while railways which reduce through rates, say from St. Louis to Boston, involve the rates from St. Louis to every seaboard city. This, in turn, as required by the act, makes such through rates the maxima between numberless intermediate and many noncompetitive places. This also is not competition, but the effect of law, because the first offending line may not reach any through and local points on the other lines. In such an instance an honest adherence to the geographical scale basis of rates would also deprive competing points of their trade. All these offensive conditions come through the needless and injudicious action or willful injury of the first offending route. None of these results would ensue from true competition, but would be the effects of pernicious action and favoritisms.

When a merchant thus discriminated against fails, he retires from sight or influence, but if a railway should fail it would be required to continue in business as a chartered and obligated public agency. Indeed, it is usually said that it is then best prepared to make the lowest rates, to which other carriers must, in turn, conform or lose their traffic. Thus ensues the tortuous and anomalous logic that railway administration is the only trade in which a bankrupt line makes rates—i. e., values—for entirely solvent rivals and the only business which may be increased upon insolvent capital.

The protection of right always requires the restraint of wrong, but in transportation neither the public nor corporate right can prevail so long as both protection and restraint must come from railway cooperation. Even that is legally interdicted and the present inefficient law has so far notably failed.

For further illustration, that act requires that the actual rates shall not be "*more or less*" than the tariffs filed, thereby requiring that railway competition *shall* differ from trade competition by not making less than the announced rates, but it provides no practical aids to that legal and essential consummation.

The minority opinion in the trans-Missouri case presented this condition succinctly as follows:

"That the interstate-commerce rates, all of which are controlled by the provisions as to reasonableness, were not intended to fluctuate hourly and daily as competition might ebb and flow, results from the fact that the published rates could not be increased or reduced, except after a specified time. It follows, then, that agreements as to reasonable rates and against their secret reduction conform exactly to the terms of the act."

For these uncontroverted reasons, as well as for the convenience, restfulness, and certainty of trade, merchants who desire that rebates should cease would doubtless approve a published grain rate of 20 cents per 100 pounds from Chicago to New York, and such just regulative legislation as would sustain that rate undeviatingly until as publicly altered, rather than indorse mercantile or railway practices which connive at a concealed rate of 15 cents for large shippers. They know that such vicious discriminations render legitimate commercial competition uncertain and impossible, because vast capital, controlling traffic, may tender it in train loads to pliable railways or those which lack business, or they may shift their large tonnages from line to line or unite with other large shippers to more easily compel preferential rates. It is to be regretted that they obtain them often enough to create great discriminations and wrongs. Some shippers thus become dealers in rebated railway earnings, as much as in their own merchandise, and make large profits from their rebates, thereby growing the stronger to exact further railway allowances, to stipulate purchase prices to producers as well as sale prices to consumers, and perhaps use their combined capital and rebates to further control merchandise values on trade and financial exchanges. In such cases such shippers, and not the carriers, constitute the real transportation trusts.

It can not, therefore, be too often or too strongly shown that however much all well-intending competitive railways from each point may observe uniform and

legal rates, the strongest and best disposed carriers must succumb to the objectionable conditions forced upon them by the weakest or less upright competitor.

The true purpose of the antitrust law is reversed by such methods. Not being, as the railways contend, first meant to apply to them, it is thus far adjudged that it does; yet being clearly applicable to trusts, the latter escape its effect and grow stronger from their large transactions with those carriers which grant them special advantages.

Permit a further illustration: The postal charges would be impaired if railways, express companies, and house-to-house letter carriers cut the postal rates 20 per cent, yet if real competition is the legislative desire and intent, why should individuals be restrained by law from such carriage and the public be made to pay more than they could get the same service performed for by others?

Commissioner Schoonmaker well said:

"A rate made by one line on a particular traffic must be the rate of all other lines to share in the business."

He also said:

"And this pernicious power is the creation of law, and is protected by the law upon the antiquated and once respectable theory, but now fully demonstrated fallacy, that unrestricted competition among railroads is a public benefit."

All such vicious rate-cutting methods simply sell transportation to the lowest and not, as in other trades, to the highest bidders, and are not therefore proper competition more than are auction sales of pawned, bankrupt, or damaged goods. It is the impairment or destruction of all true carrying competition and its legitimate rules, functions, agencies, and standards.

Based on these uncontroverted premises, which might be much amplified, competition properly means that when various contestants strive for a coveted consummation in any branch of endeavor they shall be governed by those rules in each which apply openly and impartially to all honorable contestants therefor, and which experiences have proven fair and essential to enable the best man, horse, yacht, machine, picture, shipper, or railroad to win under equal conditions.

When, therefore, in transportation, proper competitive forces have been fairly expressed in reasonable and uniform rates, classifications, fares, and rules, every violation of them, however small, constitutes a pernicious discrimination and should not longer receive even negative trade or national sanction.

Comprehensively and justly considered and applied yet more explicitly to railways, competition means due adjustments and readjustments of rates to conform equitably to those causes which from time to time properly control or affect them, such as rivalries with oceans, rivers, lakes, and canals, competing markets which distribute, consume, or reship, the relations of domestic and foreign localities, etc. Economies in management, longer and more numerous trains, lower grades, improved terminal facilities, better station houses, more and safer tracks and appliances, celerity of service, etc., are also true elements of legitimate emulation justly calculated to increase the business of one line against another, and also to produce lower open rates on all lines, and this true competition will never cease until human effort does.

Various interstate commissioners have strongly affirmed these views.

Judge Cooley said:

" * * * It is utterly impossible to judge of railroad competition and its effects, its usefulness, and its mischiefs by comparing it with competition as we encounter it in other lines of business."

Hon. Martin A. Knapp said:

"Deprived of special and exclusive rates, an advantage far more odious and powerful than exemptions from taxation, those trusts are shorn of their strength and divested of their supremacy."

Judge Patterson, who introduced the pooling bill of 1895, said:

"This preferential system throughout the country is gradually destroying the small and enriching the large shippers."

The great English commission of 1882 said:

"Reliance upon competition between railways to regulate rates and maintain them upon a fair basis and to prevent unjust discriminations will have to be abandoned as a failure."

Hons. A. G. Thurman, E. B. Washburn, and T. M. Cooley said in their joint report of 1882:

"The mere statement of these results is sufficient to show that this is not what in other business is known and designated as competition."

A distinguished United States Senator said in 1887:

"Competition of railroad transportation differs from every other kind of competition in the world. * * * It is not competition in trade. The railroad buys

nothing of the producer; it sells nothing to the customer; it simply carries; it distributes."

The Cullom committee said:

"Competition does not prevent personal discrimination, for the evil is most conspicuous when and where competition is most active."

Judge (afterwards Senator) Howe said:

"Competition (meaning improper competition) has done more to monopolize trade or secure exclusive advantages in it than has been done by contract."

The Interstate Commerce Commission said, in its first annual report:

"Excessive and unreasonable competition is a public injury."

The convention of railway commissioners, held in Denver in August last, said, after ten years' experience with the interstate act, upon this point:

"* * * Our policy of leaving competition in transportation wholly unrestrained, just as competition in private business is unrestrained, has been steadily working out its own destruction."

This form of indiscriminate rivalry so often becomes degenerate public strife that it the more requires due control and regulation in the interest of every public and private factor involved.

Our argument is therefore bolted to the solid foundation that Congress was well advised in 1886 to sanction associations, or so-called pooling, and that the prohibition of the latter in the interstate act was a public as well as corporate error and misfortune.

This brings me to compare:

SEVENTEENTH.

GOVERNMENTAL AND RAILWAY TARIFFS.

The United States bonded debt November 1, 1896, was \$847,364,460, whereas railway bonds were then about \$5,641,000,000, or seven times greater.

The annual interest on the national debt was then, say \$29,000,000 and about \$252,000,000 on the railway bonds.

President McKinley told Congress, March 15, 1897, that the Government's gross receipts for its fiscal years 1894-95-96 were \$1,072,651,000, and that they were \$138,000,000 less than its expenses. He therefore specially convened a fiscal or traffic association of the States, called Congress, to say that increased import tariffs were needful to sustain the public credit and extend our trade, and the House concurred by 84 majority.

The railway receipts in the same period were \$3,408,200,000, over three times as much, and the Interstate Commerce Commission's report for 1895 stated that \$890,000,000 of railway bonds were then in default of interest, being \$43,000,000 more than all the outstanding national bonds. These defaults increased in 1896. If the interest unpaid thereon averaged 5 per cent, and was three years in default, such defaults would aggregate \$133,500,000, being about the same amount as the Government's deficit in the same period. During the same three years railway dividends decreased \$22,000,000 more.

The prevention or correction of the railway conditions which produce discriminations then laid as fully within the power and public duty of Congress as to restore general business confidence by increased import charges.

Almost simultaneously with these national and corporate conditions the Supreme Court declared, by *one* majority, but as a minority of all the judges who had heard the cause, that an association of railways which had simultaneously decreased transportation tariffs to extend our trade should not longer agree even to that desirable public end, or to secure the uniformity, reasonableness, impartiality, publicity, and stability of charges which the Government maintains in its import, postage, internal-tax, land and consular tariffs, and which is also required in the collection of all national, State, and municipal taxes—this, too, notwithstanding the fact that the courts based their findings on the principle that we are exercising quasi and delegated governmental functions. As such, we are surely entitled to its protection in some measure—if for no other reason, than that governmental incomes are smaller and touch fewer people.

I cite some supporting illustrations:

(a) The Government pays uniform railway compensation in large amounts for the like carriage of its mails and stipulated prices for the transportation of its troops and supplies, yet it does not plead that "competition" is lessened, "trade restrained," or that its expenses are unduly increased because associations exist, nor does it claim and receive concealed rebates under guises falsely called "competition."

(b) As the Government is the largest patron of the railways, it is both due and consistent that all its clients should in other respects receive its legal aid to place and keep all citizens upon the same honorable plane in their transportation transactions on which it conducts its own business for the same people with the same carriers.

(c) If Government owned or rented the railways, as it does the custom-houses and post-offices, it would fix and enforce against all its patrons the uniform transportation charges which it found reasonable and made public, even by the enforcement of summary means. Such charges would not be secretly reduced, nor would that just course be then deemed "a trust," "a restraint of trade," or "a stoppage of competition." Conferences among parallel governmental lines would continue essential in order to decide and announce the intricate interstate rates and the frequent changes in them which might be required by law, by new national and international trade conditions, and by those great, legitimate, controlling, and ceaseless competitive forces which would continue as potent against governmental as corporate railways.

Railway competition, as now understood, would then clearly cease between parallel governmental carriers as it has between governmental custom-houses and post-offices, and, after the railway receipts had gone into one national purse, they would be assigned to the proper departmental incomes and expenses and their results be adjudged thereby.

A loss on one line or traffic would not be wholly justified by a gain upon another. Nevertheless, new railway lines, consolidations and combinations, carriers' antagonisms, man's faults, the rivalries of States, cities, and districts, the competition of water routes, rival foreign countries and markets, the wrongful depletions of reasonable rates by weak carriers plus strong shippers, and the struggles and reprisals which ensue and now compel corporate policies would still exist, create recurring disturbances of national rates, and invoke national cures.

(d) If, for example, the Government had purchased and operated the Union Pacific Railway under its recent foreclosure proceedings, it could only announce its competitive rates upon the large rival traffic of that great system after the conferences with other companies which it necessarily now avails of. With all its power, the Government could not maintain independent rates on that one line and secure rival traffic for it, unless its private competitors issued and maintained the same rates with equal honor and inflexibility, and clearly that railway can not do so now under a lesser sustaining power and weakening legislation. It might reduce rates and fares, but it could not even then maintain them except by cooperation with private lines. This has been found true of the competition of Government railways with private lines in Europe; therefore, the latter are alike wisely protected and to the manifest betterment, stability and security of fares, rates, and traders, as well as the carriers.

(e) The purchase and operation of the Union Pacific line would have been desirable as a stop to Congressional theorizing upon competition by bringing Senators, Representatives, and governmental officers to consider the reports of their own officers as to rates, as it did to its finance. Facts, and not theories, would then have prevailed, and the alternatives which all competitive railways must now contemplate throughout the country under any management, viz., to observe the interstate-commerce act up to the surrender of their competitive traffic to more plastic rivals, or to keep their shares of business by some of the methods employed by the latter would have been faced, not evaded. They would, perhaps, have then heeded the advice, now doubted and ignored, to legalize enforceable fair contract relations between parallel lines.

(f) When the Government publishes import tariffs it assures to all peoples, everywhere, their impartial and unabated collection. If the railways simultaneously establish reasonable, nonpreferential, and stable tariffs equally or more calculated to give effect to the same wise national policy upon what justifiable grounds can Congress deny its support to its transportation agents or representatives to enter into legally regulated joint contracts, in order that they may collect and retain such due and reasonable carrying charges, especially as it is the only plan which has everywhere proved an effective stop to undue and discriminating depletions of reasonable rates.

For further illustration import tariffs may be justly increased on some articles, but if the railways should fractionally advance their rates on the same imports it would be widely characterized as unjustifiable, monopolistic, extortionate, etc., although both increases might be alike proper or the railway increase the more so.

That one is a governmental and the other a corporate act is not a just reply, so long as it be claimed that we exercise our interstate transportation functions as

nothing of the producer; it sells nothing to the customer; it simply carries; it distributes."

The Cullom committee said:

"Competition does not prevent personal discrimination, for the evil is most conspicuous when and where competition is most active."

Judge (afterwards Senator) Howe said:

"Competition (meaning improper competition) has done more to monopolize trade or secure exclusive advantages in it than has been done by contract."

The Interstate Commerce Commission said, in its first annual report:

"Excessive and unreasonable competition is a public injury."

The convention of railway commissioners, held in Denver in August last, said, after ten years' experience with the interstate act, upon this point:

"* * * Our policy of leaving competition in transportation wholly unrestrained, just as competition in private business is unrestrained, has been steadily working out its own destruction."

This form of indiscriminate rivalry so often becomes degenerate public strife that it the more requires due control and regulation in the interest of every public and private factor involved.

Our argument is therefore bolted to the solid foundation that Congress was well advised in 1886 to sanction associations, or so-called pooling, and that the prohibition of the latter in the interstate act was a public as well as corporate error and misfortune.

This brings me to compare:

SEVENTEENTH.

GOVERNMENTAL AND RAILWAY TARIFFS.

The United States bonded debt November 1, 1896, was \$847,364,460, whereas railway bonds were then about \$5,641,000,000, or seven times greater.

The annual interest on the national debt was then, say \$29,000,000 and about \$252,000,000 on the railway bonds.

President McKinley told Congress, March 15, 1897, that the Government's gross receipts for its fiscal years 1894-95-96 were \$1,072,651,000, and that they were \$138,000,000 less than its expenses. He therefore specially convened a fiscal or traffic association of the States, called Congress, to say that increased import tariffs were needful to sustain the public credit and extend our trade, and the House concurred by 84 majority.

The railway receipts in the same period were \$3,408,200,000, over three times as much, and the Interstate Commerce Commission's report for 1895 stated that \$890,000,000 of railway bonds were then in default of interest, being \$43,000,000 more than all the outstanding national bonds. These defaults increased in 1896. If the interest unpaid thereon averaged 5 per cent, and was three years in default, such defaults would aggregate \$133,500,000, being about the same amount as the Government's deficit in the same period. During the same three years railway dividends decreased \$22,000,000 more.

The prevention or correction of the railway conditions which produce discriminations then laid as fully within the power and public duty of Congress as to restore general business confidence by increased import charges.

Almost simultaneously with these national and corporate conditions the Supreme Court declared, by *one* majority, but as a minority of all the judges who had heard the cause, that an association of railways which had simultaneously decreased transportation tariffs to extend our trade should not longer agree even to that desirable public end, or to secure the uniformity, reasonableness, impartiality, publicity, and stability of charges which the Government maintains in its import, postage, internal-tax, land and consular tariffs, and which is also required in the collection of all national, State, and municipal taxes—this, too, notwithstanding the fact that the courts based their findings on the principle that we are exercising quasi and delegated governmental functions. As such, we are surely entitled to its protection in some measure—if for no other reason, than that governmental incomes are smaller and touch fewer people.

I cite some supporting illustrations:

(a) The Government pays uniform railway compensation in large amounts for the like carriage of its mails and stipulated prices for the transportation of its troops and supplies, yet it does not plead that "competition" is lessened, "trade restrained," or that its expenses are unduly increased because associations exist, nor does it claim and receive concealed rebates under guises falsely called "competition."

(b) It first seems just to mutually acknowledge the needs for uniformity and stability in transportation charges, that they can only be secured by those who, under law, own and administer their properties, and that such results must be secured subject to the mandates and aids of intelligent and fair law. In progressing toward these vital conclusions certain phases of association work merit and require your thought. Their effects, although always measurably good, were insufficient because they lacked affirmative legalized powers and incurred constant legal action.

Each and every contract of railway association had for its primary objects, but with more practical procedures, those of the interstate act, namely, the uniformity and stability of just and reasonable rates, the cessation of every form of concession therefrom which could operate to produce undue discriminations and the provision of workable methods to those ends.

(c) I claim to have already established the urgent need for cooperative legislative and railway procedure to cure the recited public and private evils, because neither one of those agencies ever has or ever can do it alone.

ALL GREAT INTERESTS MUST UNITE AND COOPERATE.

Cooperative railway unity is indispensable, judged by the logic of analogy. We already have various State governments, independent within limits, but the argument would be preposterous which said that national control, regulating while protecting all, is centralization and usurpation, and that there should not be a common Congress, departments, executive and judiciary. States must respect the nation, the nation the States. The civil war decided those civil issues precisely as rate wars led railways to adopt the analogy of the General Government in carrying on their local and interstate public and private functions.

The nation must have its Congress and the President his Cabinet. A government with each department pursuing its own and a different policy would be justly derided, and the responsible political party would be displaced. States have their various county governments, counties their municipalities, and municipalities their police, and every profession, business, charity, and government must concentrate the influences and authority needful to unify, equalize, and shield its different interests. Organized stock exchanges and clearing houses are indispensable to fiscal regulation and values, produce exchanges and boards of trade to mercantile prices and probity, clearing houses to banks, maritime exchanges to marine enterprises, chambers of commerce to unite varied trade interests, etc., and they are all legalized trade helps and equalizers.

Some authority must therefore exist in every calling that is central, respected, definite, and disciplinary, and that is recognized by the common or statute law, not merely as permissive, but needful public safeguards and instrumentalities, and in no other way can any work be respected or respectable, potent for good against wrong, or make its results salutary and forcible.

When, however, railways desire and endeavor to conform to these universal principles and methods, railway legislation and commissions do not hesitate enough at unsound, hostile, and deprecating laws and orders which deny the rights given every other calling.

The rates of transportation *must* be predetermined in order to be announced in accordance with law. This can only be done by conference, which is association. The forwarders of New York and Chicago can not send their wares to 8 or more railways over which different rates may prevail without knowledge as to which route offered the highest or lowest or any intermediate rates to a multitude of points. Foreknowledge is therefore more necessary to the forwarder than to the railway.

Senator Cullom's committee anticipated this vital commercial and rate condition and said in their report, as demonstrating the value of association:

"A basis of fixed rates would seem to depend upon a general predetermination of the rates to be established by the carriers interested. It seems necessary, therefore, to leave a way open by which such agreements can be made in order to avoid the constant friction that would otherwise be occasioned."

I can not state the value of railway association better than did Justice White in pronouncing the opinion of the minority of the Supreme Court in the case of the Trans-Missouri Freight Association.

He said:

"* * * Agreements as to reasonable rates and against their secret reduction conform exactly to the terms of the act."

He said also:

To secure "a uniform classification and preventing of undercutting of rates, underbidding, etc.," * * * "that agreements among carriers" * * *

"were deemed not to be forbidden by law, but, on the contrary, were considered as instruments tending to secure its successful evolution."

Also:

"Even though such agreements be made with competing as well as joint lines in accord with the plain text of the interstate-commerce act."

Finally, on the question of associations, I quote the Interstate Commerce Commission.

Its first annual report said:

"To make railroads of the greatest possible service to the country *contract* relations will be essential."

The problem is greater as the traffic of the country increases, and the wise chairman of the Interstate Commission therefore said at Denver last August:

"Nor can these beneficent ends be reached, in my judgment, without conferring upon railroad corporations privileges of association and rights of contract with each other which are denied by existing laws."

This brings us to—

NINETEENTH.

CONSIDERATIONS DUE TO THE CARRYING INTERESTS OTHER THAN THEIR GREAT REDUCTIONS IN RATES AND FARES.

(a) The first relates to the investors interested, which are too often ignored. The Eastern trunk lines reported in 1896 that their shareholders numbered 99,826. To this was to be added the bond and shareholders on the same and other American railroads. One Eastern line reported that 50 per cent and the Pennsylvania Railroad Company said that 40 per cent of its shareholders were women.

At the above ratio of shareholders to mileage, the total number in the union would be over 950,000. Calling the total 1,250,000 of bond and shareholders, they, with nearly 1,000,000 employees, make over 2,000,000 persons then dependent upon or interested in our railways, and the number has greatly increased since this time. Assuming each reported adult to represent 5 persons, the total number more or less affected by railway administrative, legislative, or corporate results is 10,000,000 of persons, exclusive of those interested in the manufacture or production of locomotives, cars, rails, other iron products, wheels, lumber, cross-ties, stone, paints, plushes, oils, paper, etc., or the material used by manufacturers and by the railways.

(b) The total number of employees of the United States Government, June 30, 1896, was only 220,594, *excluding* judicial and legislative appointees, but *including* the Army and Navy and the Marine Corps. The number of railway employees proper in 1895 was 785,034, being 88,568, or 11 per cent less than 1893, although the railway mileage had increased 4,380 miles. The number has increased through 45,000 additional miles since constructed and because of increased traffic on the old lines. The number of persons employed per mile operated in 1893 was 5.04 and but 4.38 in 1895, a reduction of over 13 per cent with even greater mileage. This has also increased since then.

(c) Contrasting the wages of American and foreign railway labor, the following statement of the last data I possess will suffice, as the same ratio extended substantially through other branches of railway service and continue still about the same:

| Country. | Per day. | | Per month. |
|---------------------|----------------|----------------|-------------|
| | Engineers. | Firemen. | Conductors. |
| United States | \$3.65 | \$2.05 | \$62.46 |
| England | \$1.25 to 1.87 | \$0.75 to 1.12 | 30.40 |
| France | 1.00 to 1.16 | .75 to .83 | |
| Germany | .81 to 1.25 | .62 to .81 | 28.30 |
| Belgium | .81 to .89 | .60 to .60 | |
| Holland | .83 to 1.04 | .64 to .72 | |
| Hungary | | | 32.46 |

This comparison is yet more favorable to American railway labor when the longer hours and more onerous conditions which constitute a day's work abroad are considered.

When not only rates and fares are greatly lower, but wages and taxation are higher, American labor will justly share the net losses or the gains which may

accrue in railway earnings, if the average benefit is the ruling factor, and as the tendency of legislatures and courts to reduce rates and fares continues, or is modified.

(d) There were over 30 measures pending in the Fifty-third Congress affecting railways, but one of which (the pooling amendment) being for their and the public's joint relief. That was unhappily defeated. If the public good required the recent additional import measures to protect steel and tin and other makers and workers, farmers, lumbermen, importers of silk, etc., why should not railway owners and employees be also reasonably protected in some due and well-regulated manner for like reasons, in order at least that they may collect and retain all of their just and reasonable charges and earnings? Surely it was the carriers who made effective the cheap and quick distributions of American products which are gradually giving us new international markets.

TWENTIETH.

These premises confront the question relating to legislatively sanctioned railway cooperation, called—

POOLING.

I wish it understood that I am not at this time arguing that pools be now legalized. I am striving to answer your questions. Senator Platt (of Connecticut) said truly, in 1887, "What is a pool? It is simply an agreement between competing railways to apportion the competitive business; that, and nothing more."

A distinguished Senator also pointed the Senate in 1887 to the "utter and lamentable ignorance of what pooling contracts were."

This misapprehension of the term "pooling" has caused much public distrust, because pools usually mean the sales of shares in ventures, which may be decided by chance or fraud—a horse race, for example.

Railway pools, however, or "traffic unity," or "traffic federation," or "joint purses," as they are often called abroad, really mean certainties, because the public has full and published foreknowledge of the rates and charges thereunder, and only railways incur the hazards.

Let me correct a widespread public misconception. I have never known a railway-pool agreement which specified rates, because such agreements cover fixed terms, during which many changes in rates may be required by law, by altered trade conditions, by rates to or from other points, countries, etc., while the pool itself continues in unaltered terms. Rate and tariff making are therefore wholly distinct from pooling agreements. A pooling agreement may be unchanged in any respect for twenty years, yet may involve five or one hundred rates on the same articles between the same points.

In the same manner a classification may fix the distributive rates on 4,000 articles, but it is not a pool.

Two unassailable transportation principles favor these legalized agreements—i. e., pools.

The *first* is that *some* standards of rates and fares *must* be reasonable. Being so and legally preannounced to forwarders, filed with the Interstate Commerce Commission, and uniformly collected and paid without protest by all patrons, the railways challenge proof of any possible public wrong from the divisions of their legal proceeds as the participating railways may agree, because clearly as *only the rates affect the public interest*, their apportionment during carriage or thereafter are not just public concerns any more than are the proportions in which the same railways share the costs of constructing and operating their joint double tracks, union depots, belt lines, etc.

The *second* averment follows these premises. *It is only when pools are used as the means to sustain excessive rates that they are objectionable, and then, as always, the remedy lies in the correction of the rates, and not the prohibition of pooling itself.*

SUCH AGREEMENTS BENEFICIAL TO THE PUBLIC.

Pools being indisputably for the public welfare—to the extent that they would stop the payment of preferential rebates from reasonable and just rates, charges, and fares—they have other merits.

They transfer only unconsigned or assenting tonnage or its money values from the railways in excess to those in deficit. It may be that one company has an overplus in one month and a deficit in the next month, as various causes, pendulum like, operate or recur. The associated railways are therefore the only par-

ties who can be injured, unless it be by the stoppage of rebates to those receiving them.

The associated railways also account to each other for all the pooled traffic at the tariff rates or fares, and if rebates or commissions are nevertheless paid which produce excess tonnage or travel balances under the terms of a pool, the company—treacherously or otherwise—in excess must not only pay such rebates alone, but must also transfer its excess tonnage or pay the money balances therefor found due to its associates in deficit.

This clearly restricts rebates, because each railway and party to a pool shares the proceeds derived from the legal rates whether it carries the freight or not, and enjoys the resultant peace of management which good faith, if reinforced by law, would bring both to associated rival lines and to the public.

Pools, moreover, continue to divide the competitive traffic coming within their parview substantially in the proportions of their previous carryings of the same traffic as the public theretofore chose or preferred their routes. Under pools shippers continue to choose their routes as before, so that the traffic of dissenting forwarders is not used for tonnage equalization.

If smaller shippers assent that their freights may be used to so equalize the total joint tonnage because they thereby secure the desired parities of rates with large forwarders, that alone is a potential and conclusive argument. The largest shippers now get much the best terms, while it is the smaller ones who most need them.

Legalized pooling would also combine the facilities of the associated carriers, as if they were one company, organized to carry impartially the tonnage of a community, or as if all shippers constituted one great firm. Railways now charge all the members of one firm like rates and fares, and it would also be the best corporate and national policy for all companies to charge like rates on similar articles and tickets between the same points to all firms and persons.

Judge Cooley, as the first chairman of the commission, comprehensively, yet wisely, said in his first report:

"The more completely the whole railroad systems of the country can be treated as a unit, as if it were under one management, the greater will be its service to the public and the less the liability to unfair exactions."

The present chairman, Judge Knapp, says to the same effect:

"* * * the railroads of the country should be regarded in their entirety and treated, so far as possible, as a single system for all the purposes of regulation."

POOLING AIDS THE STABILITY OF RATES.

Pooling will, more than any other method, secure stable rates at traffic centers. They will, therefore, assist those local points dependable upon the larger ones, whereas small shippers at both central and tributary points now incur two disadvantages: They can neither compete with the preferred shippers at large adjacent cities nor can they ship as profitably against them from the small, noncompetitive points where the published rates and fares are usually held firmly.

Pooling, therefore, simply seeks to conduct competitive business upon the impartial rates and rules presumably observed at noncompetitive local points where cut rates are not allowed.

Pooling will also have the effect to increase applications for public reductions of rates which are usually considered and decided upon the merits of the causes presented rather than upon the results of concealed rebates.

Pooling affords the public the united facilities of the associated lines at times of calamity or emergency, stress of car supply, etc.

Pooling stimulates proper emulations under assured equal rates and fares, because improved facilities, speed, promptness in business methods, and courtesy are then more relied upon to secure business than the devices now too much and preferentially used instead.

Pooling will secure more uniform and rigid inspections of shipments, in order to detect false weights, misdescription of goods, etc., by which honorable merchants may be defrauded by untrustworthy shippers, and thus further tend to put all patrons upon equal shipping conditions and classifications. This form of inspection has its counterpart in the duties of the Treasury appraisers and inspectors.

Our system is equally requisite to the public security and equality.

One hundred and thirty-five thousand cases of misdescription made by west-bound forwarders of the actual wares shipped were detected by the trunk-line railways at three seaboard cities in one recent year on through freights only. Add to this number those at other cities and also on local and through freights in both directions, and the total of the cases detected and known is appalling.

Pooling would diminish these practices as well as rebates and substantially stop them if legalized longer term railway agreements were authorized under which these reforms could be more thorough and permanent, rather than spasmodic and insufficient.

It is often charged that railway honesty did not prevail under pooling. To admit this is no argument against it, for pooling did not *cause* bad faith. It clearly contracted and surely aided to check it. No laws, treaties, or conventions have stopped wars, conquests, reprisals, or crimes among nations, States, corporations, or persons, but this fact renders union, laws, and better procedures of correction only the more necessary. It would be as fair an argument to allege that because under the customs laws some undervaluations, defalcations, and smuggling continue we should drop the most practical means to stop them and interdict them only by proclamation.

Importers who undervalue goods to evade the import tariffs will also misdescribe their goods to thwart uniform transportation charges. An association of merchants could not stop the practice, therefore the Government uses its power to prevent such frauds upon its revenues.

The railways can not stop its wrongs by their action alone, and are as much entitled to national aid as any other calling which invokes law for like but lesser excellent purposes.

INTERESTING POOLING DATA.

Under former pools some tonnage was transferred from road to road, but not to the extent usually conjectured. In the last year (1886) of the eastward pools from Chicago, St. Louis, Peoria, Cincinnati, Louisville, and Indianapolis all the tonnage changed from one route to another thereunder at all those points was but 2.2 per cent of the total included, and this without protests from shippers, who knew that pools were good means to secure equal rates. The cash paid by all companies therefrom to each other in money settlements did not then average 9 cents per ton, whereas cuts in through rates may average 40 cents per ton or more. Of about \$12,000,000 of the freight earnings pooled at those points in that period less than \$300,000, or $2\frac{1}{2}$ per cent, changed hands. Over one-half that amount was thereafter returned to those companies who paid the first excess balances, because, to get their money back, they reduced their tonnage to their due apportionments thereof and not their tariff rates. No shipper or consignee was harmed by any of these results, and many were benefited.

No American railway pool can be cited which had the effect to advance rates unless to restore the unjustifiable rate-war reductions. When the Trunk Line Association was organized, in 1877, the average of the eastward and westward tariff class rates between Chicago and New York was seventy-one (71) cents per 100 pounds. When they discontinued pooling, in 1886, it was under fifty (50) cents.

None contend that pooling has fostered or that its legalization now will increase discriminations, because the agreements, declarations, purposes, and effects of pools are invariably to abolish or minimize preferences, being in this respect one with the interstate act.

TONNAGE IS NOT RESTRICTED BY POOLS.

Pooling has increased tonnage, not restricted it, because of the better general geographical adjustments of rates and their greater stability and uniformity. The westward through tonnage from New York City proper, under the pool above named, was 716,000 tons in 1877. It was 1,415,000 tons in 1893, although New York was most of that time pooled, while Boston, Philadelphia, and Baltimore were not.

Pooling has not restricted, nor can it curb, any just competition created by the laws of trade, the rivalries of seas, lakes, and rivers, or the enormous betterments of transportation conditions. Under pooling each company seeks to preserve or increase its individual strength by fair means, which is the true railway competition, and not to divert the traffic of its rivals by pernicious payments in the nature of bribes, which is false diversion and not real competition.

TRUSTS COMPARED WITH POOLS.

It is repeatedly averred that pooling will enable and encourage railroads to combine as trusts, and the Supreme Court has decided that they fall within the lines of the antitrust law, whereas all forms of pooling have been the opposites of trusts in all the respects following, viz:

Trusts are publicly antagonized because it is said that of most of them that their methods are secret and extortionate; because they combine to increase

capital in order to fix and control undue prices for their products; because they strive to prevent, limit, or annihilate competition, and because they sell to the unwary watered shares, based upon the increased revenues derived from these underlying wrong principles and deeds.

Admitting these grounds of opposition, which are often untenable, these discredited features do not transpire in railway pooling.

Railway rates and fares must be publicly preannounced and published. Not so with trusts. They must not be the subjects of private preferential contracts. Trust agreements may be. Railway rates must be published before they take effect, and be filed with and receive the actual or tacit approval of a governmental commission appointed by the President, confirmed by the Senate, and which is intended to geographically and politically represent all sections and the leading parties. Not so with trusts, which may legally avoid or may evade preannouncement, publicity, and governmental review. The Interstate Commission stipulates the form in which it shall receive the detailed annual reports of railway interstate carriers and publish them to the country, and many States so require with the same companies. Not so with trusts. The railroad companies do not *control* their own through rates, but determine, announce, and change them publicly after constant reference and concessions to the controlling and ceaseless elements of natural competition: *i. e.* water routes, foreign markets, etc., or because wavering railways compel undesirable action. Trusts make their own selling prices and conditions, and may grant various sales terms, credits, and other preferences based on quantities, responsibilities, etc. Railway prices for freight and passenger carriage must be public, reasonable, just, and uniform, and their reasonableness may be reviewed and established by the courts. Not so with the prices of trust products. Railway rates and fares are known to all competing railways. Trusts withhold prices from their rivals when practicable, and competition with them may be modified, merged, battled for, or extinguished. Trusts may so act as to restrict trade. Railways seek without exception, in their own and the public interest, to enlarge trade, and must carry all the traffic tendered for forwarding.

There is no prevention, restriction, or crushing out of competition between railways, because each competing carrier is legalized from the first charter to its last tariff, and is an ever-living agency of commerce, as much as are oceans, lakes, and rivers. The more crushed and the poorer a rival railroad becomes, the more active usually is its competition. The reverse is clearly the fact as to those who oppose trusts. Its rivals abandon business at the sinking point of lost capital. Railroads are reassessed and go on in business.

Trusts have no natural competition like that of free or publicly assisted waterways with railways. Some trusts are made and thereafter protected by the import duties of the country and find the railways their largest patrons, as in the steel industry. Railways are in no case so protected.

Trusts dictate shipping terms to railways, not the railways to the trusts, because the trusts may each day transfer their traffic from road to road in order to compel reduced rates or favoritisms. Trusts may build competing railway lines at their pleasure, under general laws, in order to achieve their purposes. Railways can not engage in the extraneous business conducted by trusts, such as the manufacture of sugar or oil. Trusts may perhaps cause furnaces, oil wells, coal and iron mines, iron mills, coke ovens, foundries, quarries, etc., to lie idle; but there are no idle railways, even under the closest pooling contract when two railways might readily carry all the tonnage offered to five. The more the tonnage offering, the more the competing carriers strive to provide the best power and cars to move it, even at reduced rates. The less the tonnage offered the more they strive for it and too often at broken rates.

Trusts advance commodity prices. It is in evidence as to every pooling contract of this country that under them rates averaged constant annual reductions.

Further, no railway would be required or could be coerced to join any pool, and if three railways of five pooled, the two which do not do so are as fully and publicly advised of the methods of the other three as if they were parties to the agreement. Not so with trusts.

POOLS DO NOT AFFECT TRUE COMPETITION.

As to voiding competition by a resort to pools. Prior to 1887 the railways could and did contract to divide money or tonnage, or both, and to maintain rates, yet not one of the disastrous results of pooling now held up to public fear ever transpired. Why, then, when they possessed this pooling power, did they not then stop parallel construction; then establish monopolies; then increase rates; then stop competition; then conduct themselves as trusts do, or, at least, then resist and

stop the great annual tendency of rates downward? The enormous increase of railway mileage of the United States and the constant and voluntary rate reductions are the incontrovertible answers. The railways did not attempt these things because the unceasing forces of true competition which I have cited produced these annual reductions in rates and fares and will as surely continue to keep them the lowest of the world.

There were no water routes from Pittsburg or interior local points to Baltimore, yet they were given the benefits of the rail rates from Buffalo to New York which competed with canal rates. In other words, due competition and enlightened self-interest selfishly yet comprehensively prevailed.

As forceful then as to-day was the fact that railways sought to build up large permanent local and through tonnages at low average rates rather than to carry a smaller traffic at higher rates, and, in enlarging local freight traffic, local travel also increased to the advantage of the companies which gave it growth. This wise policy employed more labor and developed individual local traffics into a mighty volume of permanent national and international tonnage.

Pools did not even preserve former dividends on railway stocks. I challenge contradiction of the statement that every railway company in the Union which has increased its stock has reduced its average rates per ton carried. If the New York Central Company should double its bonds and shares this year, it could not, with all its own powers, plus those of its strong proprietors and allies, increase its average rates in any appreciable degree because the lines competing with it would not increase their capitalizations or rates, and the Erie Canal, the Hudson, St. Lawrence, and Mississippi rivers, and the competition of Galveston, Baltimore, Montreal, and London would prevent it. At the same time all these lines are entitled to some share of the increase in national prosperity when they pay more for all the materials they so largely consume.

FREIGHT POOLS COMPARED WITH TELEGRAPH USAGE.

The analogy of existing uniform telegraph charges to railway pooling and the results thereunder seem convincing. Simultaneously with the early construction of railways, parallel telegraphs were built; the one to transport persons and property, the other information. The telegraph companies entered into what was then, as now, falsely called "competition," in which they had rate contests, lost money, struggled for capital, and became involved with legislation. They increased their stocks and entangled interested railways. Finally the wires were substantially consolidated, both continuous and parallel lines.

When Mr. Gould made the telegraph combinations it was widely alleged by many, who also called railway pooling monstrous, that he might use the information derived from inspected messages to create syndicates and fortunes which would threaten the Republic. On the contrary, although its stock was increased, the Western Union Company proceeded to desirable economies, increased its business, reduced its charges, extended its lines, increased its facilities, achieved greater celerity in the transmission and delivery of messages, and made them more inviolate. Aside from special telegraphic charges to Government and the press, and for night messages, the rates territorially are now substantially uniform, and the users of the wires not only no longer complain of discriminations, but applaud its reduced, well-known, and unrebated charges, because they are reasonable, uniform, and stable, yet they have not as many officers as have the railways. No man believes his rival pays less than he does for a like service. Its business has become practically and promptly postal without the law which was invoked to make it so. Substantially, railways seek only corresponding rights from the same offices in order that they also may maintain the same sound principles of uniformity and nondepleted charge therefrom, to be guarded, however, in the railway instance, by due national regulation, which is not extended over the telegraphs where the Postal and Western Union companies work in accord. The telegraphic results clearly represent better commercial and public conditions without law than the disturbing railway conditions under the Interstate Commerce and Antitrust acts and decisions.

LEGALIZATION OF COOPERATION IN OTHER TRADES AND INTEREST.

As these premises and facts have not been controverted, the railways desire only the grants of duly guarded legislative authority which will remove business and legal doubts, and which are as practicable, efficient, and necessary in railway administration as to organize and conduct impartially chambers of commerce, stock, maritime, and produce exchanges, and board of trade, and to the same hon-

orable public as well as private ends. No exercise of due private or corporate rights will create public wrongs. The same principle justifies the union and concert of countries in the State, and of the States in Congress, and of nations in international conferences, at The Hague, in world's fairs, and in political conventions, etc., to consider constitutional amendments and announce and record the will and good will of competing nations.

The New York Clearing House, with annual clearances 50 times the gross yearly receipts of the railways of the Union, has proven a national bulwark of finance, and assists all right fiscal standards, purposes, and doers.

That one of all these trade and national bodies sometimes does wrong is a reenforced argument for their necessity and benefits, because they go on organizing and acting until their principles prevail, because good agreements and deeds increase the averages of rectitude, sustain the well meaning, check the insincere or pernicious, and make and maintain right rules of human intercourse in all their channels.

TWENTY-FIRST.

AMERICAN INDORSEMENTS OF POOLING.

The extent to which pooling has been considered and favored by trade bodies, State railway commissions, and publicists and the changes in the opinions of important persons and commercial associations constitute important testimony in the railway behalf.

The Cullom committee of 1886 especially and carefully considered pooling, and of 149 persons whom it questioned 42 favored pooling generally, 26 favored legalized pools, 41 pools with legal and other restrictions, and no witness before it offered any acceptable substitute therefore.

That committee reported in 1886 as follows:

"It would seem wiser to permit such agreements rather than by prohibiting them to render the enforcement and maintenance of agreed rates impracticable."

Further:

"The committee does not deem it prudent to recommend the prohibition of pooling;" and "the ostensible object of pooling is in harmony with the spirit of regulative legislation."

Still further:

"The majority of the committee are not disposed to endanger the success of the methods of regulation proposed for the prevention of unjust discriminations by recommending the prohibition of pooling."

The law which that committee first submitted therefore provided:

"Said interstate commission shall especially inquire into that method of railway management or combination known as pooling and report to Congress what, if any, legislation is advisable and expedient upon the subject."

Judge Reagan, of Texas, then chairman of the House Committee on Commerce, mainly defeated these witnesses and these recommendations of the Cullom committee. He went thence to the United States Senate, and having thereafter become a railway commissioner of Texas he frankly said:

"Further study has caused me to believe that the [fifth] section may be amended so as to benefit both the railroads and the people by allowing the railroads to enter into traffic arrangements with one another."

This recommendation was coupled with certain governmental supervision.

Among other prominent men who formerly opposed pooling but who have as frankly changed their views are Hon. Charles S. Smith, late president of the New York Chamber of Commerce; Hon. Simon Sterne, the counsel for the New York board of transportation; F. B. Thurber, of New York; Professor Atwater, of Princeton; A. B. Hepburn, chairman of the great New York State railway committee of inquiry in 1879, and many others.

The first annual report of the first Interstate Commerce Commission said:

"The scheme of pooling rates, or the earnings from traffic, was devised and put in force * * * as a means whereby steadiness in rates might be maintained."

From the same report:

"The scheme was one which was made use of in other countries, and had been found of service to the roads."

Judge Cooley, its chairman, said:

"It may therefore be taken as agreed that, so far as pooling arrangements have the correction of this subject (discriminations) in view, the purpose is commendable."

Also that:

"Without the aid of the law to enforce pooling arrangements it is not yet apparent that any scheme can be devised whereby the cutting of rates can be effectually prevented."

He also said, May 20, 1890, to a convention of State railway commissioners, in Washington:

"It may seem altogether proper that the Government should make, or permit to be made, some provisions whereby the comparatively feeble road may be supported, not entirely by the resources of the district which it serves, but to some extent also by a tax upon the business or resources of other roads. A provision to this end is not uncommon."

The Minneapolis Board of Trade said in 1892:

"The railroad pool honestly administered is the natural balance wheel of interstate commerce."

In 1893 the United States Senate requested the Interstate Commerce Commission to reconsider the subject, whereupon the latter asked commercial bodies and others as to the advisability of amending the interstate act so as to legalize "pooling contracts which would tend to diminish unlawful discriminations."

Eighty-nine answers favored that proposition, or the entire repeal of the interstate act.

In June, 1894, a conference of commercial interests in Washington, representing 23 States and 87 trade bodies, unanimously recommended the passage of the Paterson pooling bill, which was afterwards modified to more favor the public in the Foraker bill.

After seven years' experience under the interstate act pooling was also indorsed in Washington, December, 1894, by all the State railway commissions there represented, except Minnesota, at which time it was resolved:

"That competing carriers may safely be permitted to make lawful contracts with each other for the apportionment of their traffic or the earnings therefrom, provided conditions and restrictions are imposed which protect the public from excessive and unreasonable charges."

At the national convention of railroad commissioners, held in Washington in May, 1896, Hon. J. H. Reagan, of Texas, who had once defeated pooling, reported as follows:

"I have believed and do believe that the pooling of freights and division of earnings could be authorized by law and so regulated as to prevent, to a large extent, if not entirely, railroad wars and unjust discriminations in freight rates, with advantage both to the railroads and to shippers."

The committee on government ownership, control, and regulation of railways reported to the same convention without dissent:

"Congress must legalize pooling in order to make it an effectual remedy for rate wars."

The National Board of Trade has three times recommended such legislation.

All these judgments received the approval of the Fifty-third Congress, the House of Representatives, by a majority of 56, and the Senate Committee on Commerce reported the bill favorably at the same session, but it did not pass the latter body.

TWENTY-SECOND.

POOLING IN FOREIGN COUNTRIES.

Your topical plan invites mention of English precedents.

Mr. Acworth, England, said in the *New York Independent* (October, 1892):

"To pools properly so called there does not seem to be any popular objection. Indeed, within the last year the two great Scotch companies, the North British and the Caledonian, have agreed to a 25 years' pool of their traffic, and though there was a good deal of opposition in Glasgow when it was first announced, within the last few weeks the Glasgow traders have confessed that they were mistaken and that none of the ills which they anticipated have arisen. * * *

"As traders they see the canvassers of the different companies coming to them, hat in hand, and begging for traffic, promising a later departure, more careful handling, and more prompt delivery—it may be more generous settlements of claims. As passengers they see the companies vying with one another in improvements, in accommodations, in frequency of service or increased speed, as well as in a score of details which make up the comforts of passenger travel. Accordingly, when the theorist comes along with his assurance that competition is extinct and that pools have done mischief, they are apt to shrug their shoulders and take not much notice."

While many of the difficulties which embarrass this issue here could be corrected by the better faith which characterizes the management of English and foreign railways generally, the closer parity of their shorter distances, their denser traffic, and their higher rates and fares all make it easier to maintain their rates on faith; nevertheless they too have had their periods of distrust and wrong, when they found pooling between governmental lines, between governmental and private lines, and by private lines only, the best panacea therefor, unless it was governmental control or geographical apportionments of territory, both being yet more stringent forms of pooling. The dissimilarities in our conditions, the greater area of our country, our longer railway distances and systems, the great differences in the facilities and strength of our own railways and their stronger rivalries of interior and exterior water carriers, etc., the more require that good faith here be supplemented by the legislative sanction and safeguards afforded abroad.

English public railway policy was best stated by the Royal Commission of 1887, appointed to inquire into the charges, rates, and tolls of British railways. It said:

"We are of the opinion that a sound principle to act on, in the matter of working and traffic agreements between railway companies, is to allow any companies to enter into them without reference to any tribunal, upon the *sole condition* that the particulars should be made public *in the locality* and that they should be terminable by either party at the expiration of limited periods. If any such agreement contained anything contrary to the rights of the public, the court of common pleas should have a power of setting it aside at the instance of the board of trade."

Railway Rates, English and Foreign, by J. Grierson, manager of the Great Western Railway (London, 1886), said:

"Agreements for the division of traffic, or for 'pooling,' as they are termed in the United States and Canada, are not unknown in this country. Some have been sanctioned by Parliament, others have been made between the companies without any express Parliamentary authority, and have been carried out. Mr. Gladstone made, in 1851, an award apportioning, for 5 years, the receipts for traffic carried between London, York, Leeds, Sheffield, etc., between the Great Northern, London and Northwestern, and Midland railways. In 1857 he made a further award determining, for 14 years, the proportions in which the proceeds from passenger and goods traffic between the same and other places were to be divided between those companies and the Manchester company."

"The Working and Management of an English Railway," by George Findlay, manager of the London and Northwestern company (1891), said:

"There is another plan which railways sometime adopt, which is known as 'Percentage Division of Traffic,' and which is carried out in the following manner:

Supposing that there is a certain traffic to be conveyed between two towns or districts, and that there are two or more railway companies, each having a route of its own, by which it is enabled to compete for the traffic. An agreement is made that the receipts derived from the whole of the traffic carried by all routes shall be thrown into a common fund, and that each company shall be entitled to a certain percentage of the whole.

The percentages are usually adjusted on the basis of past actual carryings.

"The Railways and Traders," by W. M. Acworth, (London, 1891), said:

"Companies have combined, and do combine every day, but for all that they have competed, do compete, and as far as we can see at present are likely to continue to compete to the end of the chapter. Will any Lancashire trader go into the witness box and declare that the Lancashire and Yorkshire and the Northwestern never make any attempt to get hold of each other's traffic? And yet all the world knows that, from a time whereof the memory of man runneth not to the contrary, these two companies have agreed to divide the traffic at competitive points."

He further said:

"The much discussed continental agreement between the Southeastern and the Chatham and Dover, which settles the proportions in which the two companies are to share the receipts for all traffic to the Continent passing over their lines, is solemnly scheduled to an act of Parliament and has been judicially considered by every court in the country up to and including the House of Lords. Yet is it not matter of common knowledge that the Southeastern and the Chatham each fight their hardest to divert the stream of traffic from the rival line?"

The prominent case of *Hare v. L. and N. W. Ry. Co.* grew out of the fact that—"Independent continuous routes agreed to divide the profits of the whole traffic in certain fixed proportions calculated on the experience of past course of traffic. It was held that such an agreement, being *bona fide*, was not *ultra vires*."

Wood, on Railroads (London, 1894), said of this case:

"A shareholder applied, though after several years of acquiescence, for an injunction to restrain the companies from carrying out the agreement. The application was refused. The vice-chancellor considered not only that on principle such an agreement was legal, there being nothing prejudicial to either the shareholders or the public, but also that he was concluded by the judgment of Lord Cottenham, of the Court of the Queen's Bench, in the Shrewsbury Case."

The same authority said generally:

"In England it is held that 'pooling' contracts, or arrangements between competing roads by which they agree to divide their joint earnings upon certain classes of business, or even their entire earnings, are legal and valid, where it does not appear that the interests of the shareholders or the public are prejudiced thereby."

"The Mogul Steamship Company, Limited, v. McGregor, Gow & Co. et al.," grew out of a contract limiting the number of ships to be run in a certain service. Lord Bramwell said of this, in 1892:

"It does seem strange that to enforce freedom of trade, of action, the law should punish those who make a perfectly honest agreement with a belief that it is fairly required for their protection."

Professor Hadley, now president of Yale College, testified in 1885, before the Senate Select Committee on Interstate Commerce, as follows:

"It is a noticeable fact that at the time when the first series of attempts was made to check discrimination in England the first pools were arranged."

He then testified more comprehensively:

"It may be stated as a fact of history that no nation has succeeded in prohibiting discrimination and pooling at the same time. I should be willing to go further and say that, as far as I know, no law has been permanently effective in prohibiting or discouraging either discrimination or pooling, except in so far as it at the same time indirectly or directly encouraged the other."

"On the continent of Europe the worst forms of discrimination, the worst abuses from which we suffer, are, in general, efficiently prohibited, but it is generally by an organized system of pools of whose completeness we have no conception in this country, pools that are not merely recognized by law, but enforced by law. The State itself enters into such pooling contracts on account of its own lines with private lines."

"Senator PLATT of Connecticut. To what countries do your remarks apply?"

"Mr. HADLEY. Chiefly to France, Belgium, and Austria; also, to a less extent to Switzerland and Italy. In France they have never recognized railroad competition as a principle, and scarcely have had it in practice at any time; but in Belgium and Germany they have tried railroad competition, and, what is all the more striking, have given it up as producing discriminations only to be avoided by pools. About the year 1860 the railroad system of Belgium was partly in Government hands and partly in the hands of special private companies. The private companies had longer lines, but the Government had unity of management and had had the chance of first laying out its railroads and choosing the best routes. The result was an extremely even system of competition."

"Competition produced the same effects it has produced in America—good and bad. It tended to the rapid development of the country."

"It caused railroad rates to become lower in Belgium than they were or had been in any other part of Europe, or any other country except the United States. On the other hand, it caused all sorts of oppressive preferences, special rates, special contracts with private individuals; the Government itself, in spite of all the central authority could do, being a worse sinner than any of the private lines in the matter of giving special rates to individuals."

"The people would not stand that the Government road should not make money, while a private road, apparently not quite so well situated, should make money. They tried to prohibit the competition of private lines by law. It was partly ended by the absorption of the competing lines and partly by pooling arrangements."

"There is one large private company, the Belgian Grand Central, that has a most inflexible pooling contract with the Government."

"In Germany also, about the year 1870, there was a tolerable equality, in Prussia particularly, between the State railroads and the competing private lines, and there was also a system of discriminations. Just in so far as the State either consolidated with private railroads, or entered into pooling contracts with them, the discriminations were abolished, but not until then. They never had discrimination so badly in Germany as we have in America, or as badly as they had in Belgium even, but they had some, and it was only abolished by consolidation and pooling."

"At present the Prussian Government owns practically all its railroads, but there was a time when it had large pooling arrangements with private lines.

"The Austrian Government and the private railroad men have come to the conclusion that the only way they can possibly abolish discrimination is by systems of pooling. The two main cities, Vienna and Budapest, the capitals of Austria and Hungary, are connected by two railroads and the river Danube, one of these railroads having been built by the State. As soon as the second railroad was made there was this division made, which included the State road and second road and the water route, each carrying its percentage, although the water route was a natural water course, * * * and so anybody who said he would not go into a pool would be considered to be a very strange man, and a man who was making trouble.

"A still stronger instance, perhaps, is the Arlberg Tunnel.

"Before they had opened that road they made a percentage division between that and the existing roads by dividing the traffic at each end of the tunnel. The parties to this division were the Austrian State railroads, Austrian private railroads, Bavarian railroads, two or three Swiss private companies, railroads in other South German States, and several French companies that formed remote connections. They state themselves in all that is written on the subject that the only way of avoiding discrimination between competing points is by such percentage divisions, with the authority of the Government."

Professor Hadley said later, in his work on "Railroad Transportation" (1886):

"With all the police power which the German Government controls, a power a hundred-fold greater than anything we have in this country, and with all its dread of irresponsible combinations, it seems that pools are not a thing which can be prevented, and that the only way to control them is to recognize them as legal and then hold them responsible for any evils which may arise under their management."

Speaking of the governmental railway policy of central Europe, he said:

"To secure obedience to this (prohibitory) system they must take away the temptation to violate it. This can only be done by a system of pooling contracts. These are accordingly legalized and enforced. They are carried on to an extent undreamed of in America. They have both traffic pools and money pools. There are pools between state roads and private roads, between railroads and water routes."

REMEDIAL LEGISLATION IMPERATIVE.

This long study and experience, the logical conclusions and usages abroad and the mutually beneficial results which followed the practical adoption of these policies in those great countries, can not be intelligently ignored in our own larger and more troublous areas by mere denunciations that the purpose is akin to monopolies, trusts, etc., although our rates average so much less than those which prevail in those nations having quasi-sanction or enforceable contracts. Here our presumably harmonious States defeat our just purposes, whereas jealous adjacent nationalities abroad assist the best solution of the problem.

OBJECTIONS TO POOLING.

The most recent authoritative criticism of pooling was made by Hon. Charles A. Prouty, of the Interstate Commerce Commission, in *The Forum* for December, 1897. That article was largely in answer to myself, and I have anticipated most of his grounds in other parts of this paper, but I will reply a little further.

He first conceded that "most people who have examined this question conclude that the right to make pooling contracts would, to a large extent, do away with the demoralization of rates and the consequent disastrous results to both railways and public, and that permission to make such contract should be given."

He then asks, as you do of me: "If, then, great advantage may be reasonably expected from pooling legislation, why is it that many people well informed on the subject oppose the passage of such a law?"

I now quote from his own comments, italicizing them in part, and answer them briefly:

(a) That the "enormous decrease" of railway earnings "altogether in the case of interstate traffic" is due * * * "to the action of competitive forces."

(b) That * * * "there is between those (rail) carriers a continual *struggle of the fiercest kind* for competitive business" * * * "and to which * * * the above reduction is *mainly due*." * * *

"A reduction in the rates between Chicago and New York would *force down* the corresponding rates at other points." * * * "The purpose of a pooling law is to *eliminate entirely* from railway operations, with regard to the traffic which it affects, the factor of *railway competition*."

* * * "Let us take two points like Chicago and Kansas City. * * * They are connected by six lines of railway, with no water *connection* to complicate the situation. * * * Each of these six railroads is seeking to obtain the business which moves between the two cities. * * * When other inducements fail, it reduces the rate."

"Assume that a pooling law is passed and that a pooling contract is made between these carriers." * * * "What is the objection to legalizing that contract? The common law declares it illegal as against public policy, and while there is current, both in and out of Congress, a good deal of nonsense upon the subject of trusts and monopolies" * * * "the monopoly of a necessity should be guarded against."

(c) * * * "A transportation trust is the most dangerous of all trusts, because it *absolutely dominates* the situation." * * *

"Whatever traffic passes between Chicago and Kansas City *must*, assuming them to be the only lines, pass over one of the six lines of railroad which are parties to that contract." * * * "It *cannot be denied*, therefore, that this combination of railroads controls the traffic between Kansas City and Chi-

This fairly concedes *all* "competitive forces;" not merely "struggles" and "strifes" and "rate wars," but shows that the railways must submit to water rates also, which are the greatest "competitive forces."

A "struggle of the fiercest kind" is not competition in any due railway, national, or legislative meaning, nor have the reductions been mainly due to that cause.

To "*force down*" corresponding rates at other points than those where the fierce struggles ensued is not competition, nor is it shown that other points are entitled to such rates by any competition, except those of markets, because many of the "other points" were local and would have but one railway.

No railway pool here or abroad has ever indicated an intent, or operated in practice, to "entirely eliminate" competition. It continues, and in no case abolishes it, but it regulates it. Mr. Prouty's illustration lacks the essential logic of fact. Boats run from Kansas City to St. Louis, and *do* "complicate the situation," because they limit many important rates between Kansas City and Chicago.

Rail lines Kansas City to Memphis, thence water to and via New Orleans, also govern many rates via Chicago to New York. So do rail lines Kansas City to Galveston, thence via Gulf water lines.

If, as averred, "it," i. e., *one company*, reduces not only the through rates for itself, but via all lines and all intermediate rates by the operation of law, it should not have that power. It is in no sense true competition, and if such strife ceased by pooling, and all the carriers concerned endeavored to restore and observe jointly the former agreed legal tariffs assumed to be reasonable, it would not be a monopoly more than in the first instance without a pool. The real monopoly consists in encouraging and giving one road such great power and landing it as the victor of competition.

No pool ever dominated any traffic situation.

A transportation trust never has been, and cannot be formed by pooling, because the individual companies continue their rival efforts by bettered facilities, rather than by rebated rates, because of the water rivalry so often set forth and because of commercial contests involving rates. The trust view may be and is more incited and quickly secured by consolidation, which the re-

cago more absolutely than any other trust could control a thing of common necessity, with the exception of the supply of gas, or electric light, or water."

(d) * * * "Now at the end of six months *some one of the six lines* looks over the income sheet and ascertains that, upon a particular basis, it is not earning what it is "entitled" to.

The matter is taken up with the other members of the pool; it is agreed that the rates are too low, that they ought to be advanced somewhat; and, accordingly, an advance is made. Would or would not this be the result? If not, why?

(e) "Almost every reduction (i. e., of rates) has been a *rate-war reduction*; and who is to say whether it was justifiable or unjustifiable? * * * but let it ever be remembered that the shearing is for the wool, not for the comfort of the animal."

fusal to permit mutual contracts is now greatly stimulating. Even that form of concentration can not dominate transportation, for causes recited and reiterated, and unanswered by facts. If Mr. Vanderbilt bought every railroad leading from Chicago and St. Louis to every American port from Newport News to Boston, he would not then "dominate the issue," for New Orleans, Galveston, Pensacola, Mobile, and Savannah would still be open-door ports, and the Great Lakes and the St. Lawrence River, the Erie Canal, our laws, and Canadian rail rivalry would continue as potent and forceful as now. This seems too clear for more argument.

So if one man bought the six lines between Kansas City and Chicago and thereby made his power more absolute than any pool could, he would then be compelled to buy all the lines from Omaha, Sioux City, and St. Paul to Chicago, and from Kansas City to St. Louis, Memphis, New Orleans, and Galveston, to have anything even approaching a trust or monopoly. Even then the Missouri and Mississippi River carriers would smash his "trust."

As he asks why, I will answer: Even if some *one* company "looks over the income sheet" etc., it can only see its own net results. To aver that all "the other members of the pool" would nevertheless, as he predicts, regard the rates as "too low" and *all* thereupon agree to advance them for the benefit of that one company, shows how some of our public men use inexpert conjecture as the equivalent of fact and experience. No case can be adduced from any source in proof of the pure surmise advanced, and there never was such an instance in any country.

As to why the rates could not be thereupon unduly advanced, I have shown in the comment next preceding.

Elsewhere in the same article, Mr. Prouty said: "Water competition has been a potential factor in the reduction."

If "almost every reduction" of rates "has been a *rate-war reduction*," it clearly entitled the contestants to a restoration of the reasonable ante-bellum conditions.

The various railway companies, after the usual consultations between themselves and with shippers, are the more proper ones to decide if the rate was just in the first instance.

The statement is most inaccurate from national railway commissioners. It is not true that the vast reductions in rates throughout the nation on all lines in 20 years have been caused by rate wars. Those wars have been minor factors compared with the great causes I have set out; and in many instances they

(f) That it is argued " * * * that a pooling bill should be enacted because the present law is not obeyed."

(g) "But if the formation of this contract were legalized, would there be *nothing* to restrain these lines from an arbitrary advance in rates?"

Certainly. "Precisely the same influences which operate in other business relations would operate here." * * * "Any considerable advance in rates consequent upon the passage of a pooling bill would raise a storm of indignation which would speedily *repeal* the law itself."

(h) "In the last ten years the changes have been mostly downward. In the ten years following the enactment of a pooling law, they would be mostly upward."

(i) "It may not be that the Boston and Maine would pool with a Los Angeles line, but it is *reasonably certain* that a line having its terminus at Galveston would pool with another line having its terminus in Boston."

were greatest when there were no wars at all. As for example in the coal, iron, lumber, limestone, ore, and other leading rates of the Pennsylvania, New York Central, Illinois Central, and other systems.

The present law is not only not obeyed, but so the commission says, it is impracticable of efficient administration in its essence: i. e., the stoppage of discriminations. If to justly reenact the law with pooling legalized, *solely* because the present law is not obeyed would best stop that great abuse, that ground would alone warrant such action. That, however, is an incidental, and not at all the main argument.

Those shippers and railways who profit by non-obeyance of the law are the ones who constantly and most strenuously oppose the legalized contract proposal. They are negatively aided by law, the views set forth by Mr. Prouty and the amendments proposed. This seems inconsistent with the prior assertion that legalized contract would "eliminate competition," be more absolute "than any other trust," and would "dominate the situation."

If precisely the "same influences" would operate upon railways as upon trade, why should not trade and railways both be legislated for, and why are advances and greater profits in the prices of general merchandise and larger special industries hailed as proofs of national prosperity while slight advances in freight charges, largely paid by foreign consignees and senders, and caused by higher prices for material, are denounced as a cause for "storms of indignation?"

Further, if such indignation could speedily repeal the law, wherein lies the danger of a trial of such amendments to it?

Keeping in mind the distinction between due tariff rates and undue rebated rates, this purely conjectural assertion recalls the foolish prophetic averment of the Windom Committee, appointed in 1874, entirely disproved by the later history of transportation, that national railway ownership and control were "the only means of securing and maintaining reliable and effective competition between the railways." Mr. Prouty says that government ownership keeps up rates abroad.

I quote this to show another of the pure conjectures upon which a governmental railway commissioner bases an unwarranted opinion, unfounded in any fact. It is not "reasonably certain," as averred, but certainly improbable, impracticable, and without precedent either in intent or result.

(k) "Competition gives a low rate; but it produces a succession of evils which are deplorable. Pooling * * * puts into the hands of the carriers *absolute power over the rate*. * * *

(l) "As water competition does not stop with the shore, so the influence of pooling contracts would not cease with the traffic to which they refer." * * *

"Once give railway companies the right to make contracts by which competitive business is controlled, and you have strengthened them immensely in respect to all their business."

(m) " * * * that in nearly every country on the Continent where pooling is permitted the Government owns and operates either all the railways or one or more important railway lines; in the latter case, exercising a much stricter supervision over the others than we have ever deemed possible."

This induces the inquiries: What is a low rate, and who shall decide that question? *How* does pooling give "the carriers *absolute power over rates*" when he, himself, says elsewhere in the same article:

"Water competition has been a *potential factor* in the reduction."

"There can be no question that the rates on grain between Chicago and New York * * * is for some months a controlling element."

Also, that: "A reduction in the rates between Chicago and New York would 'force down' the corresponding rate at other points."

Still further, the railways have never asked for an unlimited or unregulated right to pool.

If the published rates are reasonable and are maintained by means of legalized pools at the traffic centers, they should be equally observed at local points at the same or properly graduated charges, as provided by the "long and short haul" clause of the act.

It is not, therefore, the addition "of immense strength," but *immense justice*, and is required by law to avoid preferences for localities. Moreover, in the present complaint that rates locally *are* maintained, while at central points they are cut. Why, again, should *not* our railways be justly strengthened, instead of continually weakened?

This clearly begs my question. No railway in Great Britain, pooled or otherwise, is owned, controlled, or operated by its Government, and the English system is constantly held up to our admiration. They are all free to "pool," and many of them do so. I have shown the British and Continental practices, and repeat the unanswered query, viz: Why does a policy, endorsed by the Governments of Europe as to the railways under governmental, or private, or blended control, wise as a means to commercial stability, uniformity, and reasonableness of national and international rates, become "unwise," "restrictive," "dominating," "absolute," "monopolistic," and creative of trusts, in America, at one-half the foreign rates?

He says that some foreign Governments "own and operate either all the railways or one or more important railway lines."

Conceded, but I do not concede that a Parliament of the governments of Peel, or Palmerston, or Gladstone, or of Cavour, or Bismarck, or Thiers were commercially more ignorant than the Congresses of Hayes, or Cleveland, or Harrison.

Again, the statement seems to sustain rather than refute my claim that, if our

(n) Mr. Prouty asked if the Joint Traffic Association would submit to the English measure of regulation.

Government owned its railways, as the Windom committee advised we should, it would resort to the same, or an equivalent, European system to preserve equal, stable, and just rates.

Mr. Prouty made no answer whatever to the striking parallels of railway with governmental or telegraph charges.

I would unhesitatingly so advise, if the same rates and methods are allowed and legalized. I discuss fully elsewhere the English system.

Mr. Prouty concluded his adverse argument by stating:

"The writer does not oppose the enactment of a pooling bill." * * * "For the reasons stated by Mr. Blanchard, and for many reasons which he does not state, most people who have examined this question conclude that the right to make pooling contracts would, to a large extent, do away with the demoralization of rates, and the consequent disastrous results to both railroads and public; and that permission to make such contracts ought to be given."

He proceeds to discuss the limitations under which such authority should be granted. I present and argue them next.

TWENTY-THIRD.

THE INTERSTATE ACT—ITS POWERS AND DEFECTS.

Your topical paragraphs 54, 55, and 56 cite the Interstate Commerce Act and the commission, their present scope and powers, their defects and the proposed remedies therefor, and invite comparisons with the authority possessed by the English Railway Commission.

The conditions which led to the act of 1886 were dealt with fully in the Windom report of 1878 and the Reagan bill of 1879, and were reported upon again more comprehensively by the Cullom committee January 18, 1886.

The last held the American railway system to eighteen (18) counts, eleven (11) of which related to discriminations, the other seven to undue rates and capitalizations, managements, classifications, and engaging in extraneous business. Time and improved procedures have substantially non-suited six of the other complaints.

The stripped fact is that the act did not protect the public and railways impartially, and was, therefore, unjust. To stimulate so-called "competition," it was not made applicable to parallel water carriers. It regarded the railways as alone responsible for all the conditions condemned, and, although it applied theoretical penalties to shippers who procured preferences it devolved the practical corrections of all transportation errors upon the railways alone.

Its provisions were all antagonistic and none remedial, nor did it create or foster that mutual interest between Government and carriers essential to its success. It held to the exploded perversion that railway warfare is synonymous with business competition. It fostered the fallacy that while rates must be alike via one railway it was desirable and legal that they be different upon rival railways to insure so-called competition, or else that, however different in facilities and conditions, all rival railways could obtain equal rates and fares. It did not recognize the palpable fact that ten different rates on ten railways were as disturbing and discriminating as ten rates on one railway, and that therefore the poorest and most reckless railway can make the competing rates for all the others.

Finally it encountered legal reverses which induced railway laxity in its observance, and it has not corrected the evils which argued for its passage. Here, more than in foreign countries, because of our greater area and more complex conditions, mere mandates against discriminations and excesses have failed and will ever fail until they give the parties affected a common interest to obey the law and because the act, *as it now stands*, does not protect upright carriers or shippers against the encroachments of others less so.

THE DEFECTS OF THE INTERSTATE ACT.

As to the defects of the act, the evidence is not only general, but official and recent.

Interstate Commissioner Clement said at Denver, August 11, 1899:

"* * * the law has not been found to mean and accomplish what its authors intended." * * *

Mr. Clement does not explain how he has knowledge of the intent of its authors, and the Supreme Court has interpreted a different intent.

"Now, after the operation and test of this act, as slightly amended, for more than 12 years, the same causes of complaint and grievance in a large measure still exist."

Chairman Knapp, of the commission, said on the same occasion:

"The rules of conduct prescribed by the State in respect of public carriage are in many respects so indefinite as to be little more than guides, and so imperfect as to be extremely difficult of application." * * *

"* * * the railroads of the country should be regarded in their entirety and treated, so far as possible, as a single system for all the purposes of legal regulation." * * *

I remark in passing that this is the strongest form of pool.

"No just theory of legislation will proceed on the assumption that the public alone are in need of protection and that the railroads can take care of themselves. Such a view is unfair and illogical."

"The sufficient scheme of legislation, therefore, will recognize the possibility of wrongdoing on one side as well as the other, * * * and while equipping the shipper with ample protection will also furnish the carrier with all needful defenses."

"Nor can these beneficent ends be reached, in my judgment, without conferring upon the railroad corporations privileges of association and rights of contract with each other which are denied by existing laws."

Legislation framed on these wise lines can be made mutually effective, otherwise it can not.

The act has, nevertheless, secured more publicity of rates, lessened open rate-wars, has more justly scaled and equalized long and short-haul rates, both at intermediate common points and at local stations, has exercised beneficial warning or police powers, has silenced much unjust clamor against railways, has softened the railway attitude toward the public, has been mutually educational, and has been in the main well administered, but secret discriminations have not only continued, but have greatly increased. I am not, therefore, of those who believe that the commission's value is not much greater than its cost.

The insufficiencies of the act and its relapses have proceeded mainly from the legislative refusal to confirm the only practical plan commended by the Cullom report, viz. to give all well-intending shippers and carriers a joint interest and governmental authority to resist demoralizations in rates and fares by mutual contract. The adopted act followed foreign precedents, our own former usage, and the Cullom report only to this point. There it stopped. This was as if consulting physicians adhered to the discredited cures used by earlier science but disregarded the latest and best discovery for the disease treated and then blamed the patient for his relapses. It was as if Congress had refused to enact the recommendations of its own and the world's army and navy fiscal and diplomatic experts for the public welfare and security.

Railway officers and patrons can not be legislated into mutual rectitude when otherwise disposed, for even the Divine laws have not done that. They must be afforded some positive aids to betterment.

The reasons for mutual conciliation and cooperation are apparent:

Favored shippers oppose all methods to defeat rebates; weak lines will not be without business, and therefore pay drawbacks to get it; and strong lines will not permanently permit its diversion but will make the rates equal, a course which is commercially desirable, indeed essential, although it may be reluctantly and illegally done by drawbacks. Devices and concealed rates, therefore, ensue largely, which are illogically urged by some as desirable "competition" and "public benefits," whereas they are discriminations, pure and simple.

Proceeding to the failures of the act, and the best cures therefor, an amended law should, in my judgment, proceed upon very brief leading principles:

(a) That *some* standards of railway rates and fares and *some* carrying rules and conditions *must* be reasonable.

(b) That, being found reasonable in effect and being possessed with a public interest, the Government should, after such rates are filed with the commission and not by it objected to, and by direct affirmative action, aid the railway companies in their observance and enforcement as it observes and enforces its own tariffs, its arbitrations, its treaty obligations, its international postal unions, the written and unwritten laws of war, and all other expressed or implied obligations incurred on behalf of its people.

(c) That this is the essential and only means to the stoppage of the discriminations justly complained of, and the failures of the act in that respect.

These premises being unassailable, upon what defensible grounds can the nation continue to disregard the undisputed precedents, facts, and obligations involved and rely, as to the greatest agency of advancement the country possesses, upon the present inadequate and unenforced act or any amendments thereof which fail to recognize and enact these basic principles?

TWENTY-FOURTH.

DEPARTURES FROM THE FIRST INTENT OF THE CONSTITUTION, FROM THE ACT, AND FROM THE DECISIONS UNDER IT.

I leave to others the legal argument under this important head, but there are two or three salient points which deserve to be always remembered.

The Annapolis Constitutional Convention of 1787 declared one of its objects to be "to devise means for the uniform regulation of trade."

Its primal purpose was to prevent a State—not a carrier—from making trade discriminations against the products of other States. No railway then existed in the world, and the interstate act, especially as proposed to be amended, is not the "uniform regulation of trade," but only of one and often the smallest element of the trade. Nor is it regulation—it is control, legislation, and administration.

"The first important act of Congress respecting interstate commerce was passed June 15, 1886. It authorized railroads chartered by the several States to combine with roads of other States." "Its object was to prevent the States from impeding commerce," the commerce which the railways most desired should be interchanged.

The Cullom report of January, 1886, said: " * * * it would be inexpedient and impracticable to attempt to adjust existing inequalities by any system of rates established by legislation."

It also said: " * * * But it is questionable whether a commission, or any similar body of men, could successfully perform a work of such magnitude, involving as it would infinite labor and investigation, exact knowledge as to thousands of details, and the adjustment of a vast variety of conflicting interests."

A few months after the first commission organized it declined—in the case of *Thatcher v. The Delaware and Hudson Canal Company*—to fix certain rates, saying:

"It is therefore impossible to fix them in this case even if the commission had the power to fix rates generally—which it has not. Its power in respect to rates is to determine whether those which the roads impose are, for any reason, in conflict with the statutes."

The syllabus in the *Texas and Pacific* case *v. The Interstate Commission*, decided March 30, 1897, said:

"If the commission has the power of its own motion to promulgate general decrees or orders, which thereby become rules of action to common carriers, such exertion of power must be confined to the obvious purposes and directions of the statute, since Congress has not granted it legislative powers."

That the commission has not since then acquired those rate-making powers is also shown by the *Denver* report of August, 1899, and by the commission's urgent advocacy of the amendments now proposed. Therefore every proposal it has officially made since its organization tends and more lately intends to restrict competent railway administration to enlarge inexperienced and prejudiced control upon the dangerous margin of 1 vote, and to secure the powers not given it by the act it administers and thus far denied to it by the courts.

TWENTY-FIFTH.

COMPARISON WITH THE ENGLISH SYSTEM.

To intrench our position, and responsive to your topical inquiry No. 56, as well as Commissioner Prouty's inquiries of me in his *Forum* article, I desire to compare the existing English system with our system of supervision as the act now reads.

The Parliamentary regulation of the railways of England, Scotland, and Ireland—which, of course, does not extend over Canada or Australia—is comprised within the railway and canal traffic act of 1888, and amendments, and the previous unrepealed acts relating to the same general subject.

That act constituted a Railway and Canal Commission of two commissioners appointed upon the recommendation of the Board of Trade, to hold office during

good behavior, and three ex-officio commissioners. One of the appointed commissioners *must* have railway experience and knowledge.

These constitute a court of record. The ex-officio commissioners must be judges of the superior courts—one for Scotland, one for England, and one for Ireland—each appointed by its Lord Chancellor for not less than 5 years.

Certain designated local authorities and associations may complain to this commission or appear in opposition.

I owe what follows, mainly, to the incisive arguments of Attorney Hines, of the Louisville and Nashville Railway Company, and substantially quote the language of his able paper.

The English commission " * * * is to hear and determine complaints of contraventions of the railway regulation acts. It may exercise certain powers of arbitration, and its approval is required to certain agreements between railways or railways and canals. It may also order through rates under careful restrictions provided by law, and it may, when a railway owns a canal, order changes in canal rates when necessary to prevent the diversion of traffic from the canal to the railway. It is also required to report to Parliament when, in its opinion, the working of steamboats by a railway prejudicially affects the public interest.

Though in some respects the powers of this commission exceed the powers of courts generally, yet no duties are imposed upon it which would tend to impair its fairness and judicial character. The commission does not originate complaints; it does not proceed upon its own motion; it is not charged with inquiring into the management of railways; it has no administrative supervision of any of the details of railway operation; it is not charged with detecting violations of the law or of bringing about prosecutions therefor; its duty is to hear the complaints duly brought before it by proper complainants and to determine what, if any, relief is proper under the law.

Thus, in vital respects, the Railway and Canal Commission procedure differs radically from that of the Interstate Commerce Commission. Its two appointed commissioners are appointed for life, and one of them must be of experience in railway matters. The Interstate Commerce Commissioners are appointed simply for 6 years, there is no requirement that any of them shall have railway experience, and, as a matter of fact, experience in railway matters acts as a hindrance to their appointments.

The three ex-officio British commissioners are judges of the superior courts and continue to act as judges in the other superior courts when their services are not needed on the commission. All this is an additional guaranty that the proceedings of the commission will be characterized by a judicial temper, which is all important. There is no corresponding guaranty in the case of the Interstate Commission.

Perhaps an even greater guaranty of fairness and justice in the work of the English commission arises from the fact that it performs no function which would be calculated to disqualify a judge for the impartial exercise of his high office. On the other hand, the Interstate Commission is given supervision of various details of railway management; it is given and asks for more inquisitorial powers for the purpose of detecting railway violations of the law; it may institute complaints in its own name; it may cause prosecutions to be instituted to punish violations of the law. By section 12 of the interstate-commerce act, the Interstate Commission is authorized to inquire into the management of the business of carriers, and is required to keep itself informed as to the manner and method in which the same is conducted, and is given the right to obtain from the carriers full and complete information necessary to enable the commission to perform the duties and carry out the objects for which it was created. The Interstate Commission is authorized and required to execute and enforce the provisions of the act, and upon the request of the commission, it shall be the duty of any district attorney of the United States to whom the commission may apply to institute and prosecute in the proper court all necessary proceedings for the enforcement of the provisions of the act and for the punishment of all violations of it, and it may subpoena the attendance and testimony of witnesses and the production of all books, papers, etc., relating to any matter under investigation. The Interstate Commission is also given authority to institute any inquiry on its own motion in the same manner, and to the same effect, as though complaint had been made. This incites litigation rather than its avoidance, inasmuch as if the commission did not move themselves, some complaints might not be made.

Such duties and the character of detectives imposed upon the Interstate Commission and its authority to inaugurate criminal prosecutions, as well as to prosecute civil complaints on its own motion, have a strong tendency to deprive the commission of a judicial temperament, and are not conducive to the fairness and

impartiality essential in judges. In all these respects, the functions of the English commission are infinitely superior. For the interstate commission, with its present varied functions, to be permitted to render judgment against a railroad would be almost like allowing a man to be convicted of murder by the grand jury which had indicted him. To give our commission the power to inaugurate complaints on its own motion, and then to hear and finally determine those complaints, would be allowing a party to be the judge in his own cause, which is contrary to one of the elementary principles of law and justice, and such anomalies would not be remedied by allowing appeals.

These comparisons show the unfitness of the Interstate Commission with its present constitution and functions, and less so when enlarged as they ask, for acting as a court, and they show that Congress never intended to give the commission general independent powers or duties, except those of an administrative body designed in some respects to assist litigants and the courts in the enforcement of the interstate act. This is made clear by a study of the debates of Congress on the subject. Indeed, the courts themselves could not have exercised them if the interstate commerce act had left its enforcement to the courts alone instead of adding the commission as an adjunct to the courts, and now that the courts have very properly refused to sanction the unwarranted assumptions, the commission demands that, while it still retains the right to act as administrative supervisor of various details of railway operations, and also the rights to act as detective, prosecutor, and complainant, it be given the powers of a court, and that its orders be enforced as the judgments of a court. The commission will appeal in vain to the railway-regulation law of England for any sanction of an arrangement so repugnant to justice.

The British railway and canal commission is empowered to award damages and, for the enforcement of its orders, has all such powers, rights, and privileges as are vested in a superior court. Since the way the English commission is constituted and the functions conferred on it all give it the dignity of a court and substantial guaranties of judicial fairness and just decisions, and since it is expressly declared to be a court, it is proper that it be given the authority of a court to carry out its orders, which are, for these reasons, entitled to as much respect as if made by any other court in the land. Notwithstanding all this, an appeal lies from its decision on all questions of law.

The Interstate Commerce Commission aspires to much greater powers for the enforcement of its orders, greatly exceeding those enjoyed by the railway and canal commission, but it wants its orders to go into effect and to remain in effect until declared unlawful by the courts, saving a power in the courts to suspend the operation of the order pending review only when on the face of the record it plainly appears that the order is erroneous in point of law or unjust or unreasonable on the facts. Since the court could seldom say that such error or injustice plainly appears simply on the face of the record, the practical result would be that the commission's orders would be in effect throughout the proceedings for review.

Instead of the railway and canal commission of England serving as a precedent for giving such powers, that commission affords a strong contrary argument. To give the Interstate Commission such powers would be about as anomalous as for one man to be detective, prosecuting attorney, and judge in the same case. Certainly, until all other functions are eliminated from the commission and transferred to some other administrative body, and until the commission is restricted solely to the hearing and determination of complaints of violations of the laws which are brought before it by proper complainants, there should be no thought of giving it the powers of a court to put its orders into effect by execution or by any means whatever, except by suit in court for their enforcement.

Even then, to be as favorably constituted for dispensing justice as is the English commission, the members should be appointed for life; some of them should be men of experience in railway matters, and some of them should be judges, in order to insure that judicial temperament which is absolutely necessary for the proper discharge of such important functions. If the commission be made a court, the Constitution of the United States will make it imperative that its members hold office during good behavior.

Not only does the Interstate Commission insist that it should be given the powers of a court to enforce its orders, but that it should be given power to make all interstate rates, rules, regulations, and classifications throughout the vast area of the United States, and hold up as an example of the practicability and propriety of such a course the railway-regulation laws of England.

We have shown how far the English railway and canal commission falls short of an argument for giving the Interstate Commerce Commission the powers of a

court, and how, instead, it is an instructive argument against any such idea. Likewise, we find that the example of England, in the matter of fixing rates, is opposed to any such scheme. No provisions were made in England for fixing the rates of railways except in the charters of the various railway companies until the adoption of the traffic act of 1888, by which careful procedure was provided for revising the rates of carriers through the board of trade.

The board is a permanent committee of the privy council, established by an order in council in 1786. As now constituted, all the principal officers of the States are ex officio members, but the duties are really discharged by the president and the secretary of the board. The president is usually a member of the cabinet, being practically a cabinet minister of trade and commerce. One of its departments is the railway department, which is charged with the administrative supervision of railways in various respects, and makes inquiries into accidents, collects and publishes railway statistics, etc.

The carriers were, by the act of 1888, required to transmit to the board of trade classifications and schedules of maximum rates. The railroads were also to advertise in the newspapers and post notices at their passenger stations of their having so transmitted their schedules and classifications to that board. Thereupon the board was to hear all parties whom they considered entitled to be heard, and then, if the board agrees with the railways upon the proposed schedules, those schedules, or in the event of inability to agree, schedules prepared by the board of trade, were to be embraced in a provisional order to be transmitted to Parliament, and the board of trade was to agree on a bill confirming such provisional order. Our commission proposes to call its orders "administrative," for reasons before shown. If any objections were made to such bill, it had to be referred either to a select committee of the house in which the bill had been introduced or to a joint committee of the two houses for a hearing, and it was only when an act had been passed in pursuance of this procedure that the rates so designated should become binding upon the railways.

This system clearly recognizes that the fixing of such rates is strictly a legislative function, and as such it is exercised only by Parliament itself. Yet the Interstate Commerce Commission has used the system of railway regulation in England as an argument for conferring upon it the power to fix all interstate rates, fares and rules. Thus, according to its ambitious designs, not only is it to be a sort of superintendent of all interstate railways, and as such superior to the boards of directors and presidents, but a detective of violations of the law, a prosecutor of the railways for such violation, a party complainant against the railways, and also a court in all matters arising under the interstate commerce act, having all the powers of a court to enforce its orders, but it is also to be a legislature for the purpose of fixing the rates, fares, and rules of the carriers. Any such mingling of widely different functions is grossly inconsistent with the whole spirit of government in the United States; it would not be tolerated for a moment with respect to any other and lesser interests in the country, and is not a power given to the Treasury, Postal, Interior, State, or other branch of the Government having a Cabinet minister. Witness the recent clamor against Secretaries Gage and Hay, on the exercise of their right judgments in matters requiring legislative confirmation.

The Interstate Commission endeavors to conceal the fact that the power it seeks with reference to rates is in reality a legislative power by insisting that it would not, under the power desired, fix rates in the first instance or generally, but that it would only fix them upon complaint and after finding the existing rates unreasonable. Congress itself could not now, of course, fix rates in the first instance on any railway already in operation, because the rates have already been fixed "in the first instance." As to thereafter fixing and altering fares, rules, and rates generally, the commission's course is inconsistent with its present assertions. Although the commission now has no power to make rates at all, it in one case assumed to make the rates on all the classes of commodities, embracing over 2,000 articles, from Chicago and Cincinnati to eight points in four Southern States, which virtually affected the rates to all points in the South, not only from Chicago and Cincinnati and other points in the northwestern and central territory, but from all points in the East as well, by the intimate inter-relation of most rates between States.

If the commission saw proper to go into such a general rate-making order as this when it had no power to make rates and so misconceive the law, it certainly will not be less modest if more and enlarged powers were actually given to it, or less liable to error.

The commission insists that adequate protection is given by the power of review by the courts; but the fact is that any such power would be wholly insufficient.

The question of the reasonableness of a rate is peculiarly one of fact, and after the commission finds the facts that the rate is unreasonable, and that the maximum and minimum rates designated by it will be reasonable, and orders those rates to be observed, this finding will make out a *prima facie* case. In view of the reluctance of the courts to overturn findings of fact made in pursuance of legal principles by bodies constituted for the purpose, almost the only protection the companies will have will be the right to have the orders of the commission set aside when they would result in the railroad operating at a loss, or, in other words, would result in depriving the railroad of its property without due process of law, and the railroad company would have this same protection if the rates were prescribed by Congress itself.

These considerations necessarily lead to the conclusion that the colossal and summary powers which the commission now so strenuously demands will generally be, in practical effect, just as expensive and as binding upon the railroads as the action of Congress itself in the premises. The commission may act on its own motion. It will make rates and fares generally, and fix rates in the first instance just as Congress itself might fix them in the first instance, and the power will be in effect a legislative power and a power which in England is exercised by Parliament.

Therefore to cite the example of England as an argument for conferring such powers upon the Interstate Commerce Commission is misleading and absurd. To confer upon the commission the tremendous powers which it desires, will not only make it in effect the most powerful institution in this country, with practically unlimited control, over its trade and commerce in every part, but it will obliterate those well-defined distinctions which have so long existed here between the various departments of the Government.

While the railway-regulation laws of England are relied on by the advocates of this entirely unnecessary and radical departure from the principles of our Constitution, those laws, if followed, would defeat the unwise and needless provision ambitiously longed for by the commission. Those laws afford admirable examples of careful observance of the lines of demarcation between the legislative, executive, and judicial departments, always a fundamental principle in English-speaking countries, which would be most grossly and unjustly disregarded by conferring on the Interstate Commerce Commission the tremendous and widely differing powers which it so insistently demands. Giving it such powers would, instead of leaving the commission as it intended, and an adjunct to the interstate-commerce act and the courts, make the law and the courts adjunct to the commission; and nothing would be more unlike such a remarkable condition of affairs than the consistent and well-guarded system of railway regulation in force in England.

Finally, it is important to keep other distinctions between the policy of the English Government and our own in plain view. The *first* is that the rates in Great Britain average double those in our country. The largeness of the rates reasonably influences the system and measure of regulation. Their higher rates receive the most considerate restrictive regulations. Here the lowest rates are proposed to be made subject to more stringent and inconsiderate legislation than any country of the earth exercises. The *second* is that in many details their companies receive ampler care and protection, such as policing the stations, grade crossings, invasions upon the rights of way, the contributory neglect of persons injured, penalties for securing rates by wrongdoing, the measures of damages to persons, the legality of limitations or releases, etc. The *third* is that English legislative railway policy requires that when it is proposed to construct a new and competitive railway or extend former lines to a point or district previously reached by one or more other companies, it shall be first demonstrated that such new line is a reasonable public requirement before parliamentary powers will be granted for its construction and operation. With us persons contemplating the like construction of parallel or competing lines are encouraged to do so under lax and the simplest of formulas, declarations, and guaranties, and when built almost universally become disturbers of the preexisting rates, fares, and regulations, in order to detach business from other companies because the mere construction of new lines adds but slowly to the antecedent traffic.

If where three lines exist a fourth is authorized and built, the original ones are entitled to have their reduced traffic reasonably cared for as being just to the business of four instead of three companies.

When a new British line is built, it also becomes a conservator of rates under the prevailing system of regulations; here it is encouraged by theory and law to become a disturber because such a course is deemed competition.

Enough surely has been shown under this general head to demonstrate that the broad, intelligent, mutual, and careful legislative policy of England is in striking

contrast in every respect with the irrational, unfair, and prejudiced scheme of railway-rate control put forth by our Interstate Commerce Commission in every respect to which they both appeal commercially.

Reference is often made here to the English clearing house. As its name indicates, it clears only joint receipts and does not make or alter rates.

That body is, however, also chartered and not opposed by Parliament under substantially the general declaration that its business is to be conducted as if all the railways were one railway.

Its offices are headquarters for various rate conferences, which constitute a series of small associations possessing great value, but are not a part of its organization.

Finally, on this vital point, it is also to be recited and borne in mind that no such powers as those arrogated and asked for by our commission are conferred upon any other railway commission, board, council, or committee of any other country.

TWENTY-SIXTH.

SUGGESTED CHANGES IN THE ACT.

You naturally ask, in view of my criticisms of the present interstate-commerce act, and in response to your topical inquiry, what amendments I would propose for the interstate commerce act, which shall be mutual in purpose and effect, improve the administration of the law, and stop the evils of discriminations and excessive rates.

I premise by saying that I believe that the railway companies have given more cooperation and good will to the Interstate Commerce Commission than that commission has shown toward the railways. It is essential primarily that this condition be changed.

To that end I would personally favor:—

(a) More frequent conferences between the railroads and the commission, in some of which—upon the initiative of the commission—perhaps interested shippers might participate.

(b) As the commission is asking us for unnecessary measures of publicity and expense, I think we should receive from them at least a monthly bulletin which would show the objections to interstate railway tariffs in use, and not leave this to exaggerated conjecture. For this purpose I would have the statement impersonal, reciting as a suggested heading, "Complaints against interstate rates, received by the Interstate Commerce Commission during the month of ____." I would show therein the rate complained of, the article to which the objectionable rate applied, and the points of shipment and receipt, without naming the railway companies complained of or the persons complaining.

I believe the tendency of this bulletin would be to cause such rates to be more closely scanned and compared before issue, as the railroads would desire to avoid being entered upon this list; competing lines would compare their rates with those complained of; shippers might the more hesitate to complain unnecessarily, and we would at last know officially the exact amount of public disaffection with rates, which I think is now greatly magnified.

(c) In my judgment the commission should be enlarged to seven members. I do not believe it possible, with the rapid expansion of the business of the country, and in view of the fact that the railroads of Puerto Rico, the Philippine Islands, and Alaska, may ultimately come within one system of regulation, that five men can by any possibility of industry and knowledge encompass the consideration of all these great and intricate questions fairly and comprehensively.

(d) I strenuously urge the right of contract. I am not now advocating the immediate grant of pooling authority, but many other contracts than pools are equally essential to uniformity of rates, rules, and regulations—such as lighterage, switching, storage, stock-yard charges, union-depot arrangements, joint tracks, joint divisions between connecting lines, etc.—every one of which are as clearly in the public interest as they are in that of the railroads. In the important matter of inspecting through cars at agreed points, that measure is, for example—and without doubt—in the clear interests of the protection of both human life and of property being transported.

(e) In other and general respects I favor substantially the general features of the Foraker bill, so called (Senate bill No. 1479, March 30, 1897).

I am aware that the people demand a supervising power, superior in some respects to the railroads themselves, and, with mutual equity kept in view, I think it a proper requirement. I think the commission should show the people what is mutually proper, not partisan. I think the relations between the public

and the railroads are justly made up of mutual rights, but surely all the rights do not belong to the people, who do not own and who are not responsible for railway finance or management. The railroads must possess some vested rights.

I do not advocate that the railroad companies should be the exclusive and arbitrary managers of their property in all public respects, nor can I admit that five governmental officers should replace them as managers of this vast property in preference to unwise, unintelligent, and perhaps hostile constituencies. I think that conferences between the various interests should evolve a bill which every governmental and corporate fair mind should be alike willing to accept and adopt.

I favor this also because it is time that a stop was put in some measure to the confusion of authority; to the cross decisions in the lower courts; to the excessive demands of the commission on the one hand, and possibly to the excessive resistance of some railway companies on the other.

I believe the whole subject should be approached in a candid national spirit. We too much limp and jump to this end. It is not deliberately and mutually considered before action.

I wish to impress the board with my personal belief that this question is and always will be linked with a public interest; that the public has a reasonable and vital concern in transportation, as to safety appliances, the safe character of roadbeds, adequate protection at public crossings, security of their persons and property, the proper accounting as to bonds, shares, etc., and in reasonable rates, rules, and fares, and the stoppage of all discriminating practices, and ought therefore to have all its rights in such particulars, but it ought to enact wise and mutual laws about them, especially as the railways are the largest factors in the prosperity of the nation.

Most of the rulings of the Interstate Commission have been accepted by the railway companies. In four years 23 of its 40 rate rulings were complied with. Nevertheless, the railway companies have felt it to be their duty to contest some of such rulings and have been justified in this conclusion by important decisions of the lower courts and of the Supreme Court in their favor.

The Interstate Commerce Commission has not shown that its proposed stringent amendments are called for by the public. They seem the notion and motion of the commission itself in most respects. The annual reports of the commission only partially show the number or nature of the complaints which come before it as to excessive rates, which, next to discriminations, constitute the only additional reason for the existence of the commission and their number is therefore magnified in the general statements.

Numerous individuals representing trade bodies urge the amendments upon the ground that the Interstate Commission will stand impartially between the railroads and the public; that it is composed of "men indisposed to favor one party any more than another," and will constitute a "board of arbitration," and that is what the "commission will be under this bill if it is passed," etc.

I demur to some of these views, because an arbitration is usually had by agreement of both parties as to the issue to be submitted and decided, and both parties have a voice in the selection of the arbitrators; also because the repeated utterances of the commission show that they have already prejudged the case in nearly every phase under which it can arise.

They will, therefore, with their proposed widely extended powers, if granted, constitute a board of prosecution rather than a board of arbitration.

It is alleged in various arguments that no amendments are proposed which give to the commission the power to make rates. This is an evasion. The power to change a rate is clearly the power to make a new rate, and from time to time thereafter to fix other new rates, i. e., changes—leaving to the carrier, therefore, only the determination of such others as may happen to please the commission. It is the power which the commission objects to on the part of the railroad, yet desires to assume and increase for itself.

Great stress is laid in various arguments upon the necessity for a tribunal standing between the shipper on the one hand and the railroad companies on the other, which shall have the power to determine the issues between the two.

THE WITNESS. There is one feature of pooling contracts to which I am asked to call more specific attention than I have to-day. I have been instrumental in drawing some pooling contracts, and have been a party to many more, yet I have never seen one that held, from its first to its last word, any specific rate or fare. They refer to rates and fares then in existence or which may be from time to time made or altered. Pooling contracts, as some were made here and in England, may have been for 1 or 5 years, or more, during which time no line of the pooling agreement was changed; yet rates might have been properly and necessarily changed twenty-five times during those years. The first object, as you will readily

see, was to provide a procedure adapted from past experience, whether for 1 or 30 years, to govern the division of the same business, leaving the parties thereto the opportunity under one agreement and regardless of its duration to make such changes in the contracts or rates as the succeeding conditions of policy, management, or trade might justify or require. As I have said before, there is a great misconception in the public mind that pooling contracts specify rates, and are used to maintain them. Remember also that all the forces of due competition have as much play under a pooling contract as if pools did not exist, they being simply provisos that when various rates shall have been made they shall then—whether higher or lower—come within the provisions of the joint purse memorandum as to the division between the parties of the tonnage represented by the traffic or of the earnings derived from it. I think that ought to be made initially clear to you. Of course their purpose is to maintain the various rates so adopted.

(After a recess from 12.35 to 2 p. m., the hearing of Mr. Blanchard was continued, as follows:)

Q. (By Mr. KENNEDY.) Do you believe that it is good policy to push before the national legislature a bill abolishing ticket scalping, to the exclusion of all other legislation that the people of the country and the Interstate Commerce Commission and shippers are asking for, as was done in the last session of Congress?—A. My judgment is that it is wiser that all the reforms be inaugurated and go hand in hand with each other, and that they should not be dealt with piecemeal, but comprehensively. Nevertheless the contest has been made up so fully as to scalping that, if there is liable to be any considerable delay as to the other features because of considering that one again, I am of opinion that an act passed now to discontinue scalping would be more satisfactory to us—the people and the Interstate Commerce Commission—in producing quick results; some hold that to pass it now would strengthen the hands of those who favor further legislation on other points and would be more likely to lead possibly to giving us the authority which we desire in other respects, than for us to undertake to adjust all interstate issues at once. The reverse of this view holds with others, viz, that if we fail to abolish scalping now we incur the failure of that with our further proposals hereafter. Between these views it is my conclusion that if we can we should get simultaneous action on all points. If we can not it is better to get action which would correct the one great evil of passenger traffic, which practically gets a disturbing issue away from the commission and out of the way of Congress, and will mostly work to the public good.

Q. Do you believe that the railroads themselves are responsible for the system of ticket brokerage which they seek to have abolished by the National and State legislatures?—A. Only in a small measure at present. My answer did not go this morning into all the forms or evils of ticket brokerage. We will assume, for example, that from New York there are a thousand forms of tickets which pass through what are called the western termini of the trunk lines from Toronto, on the north, to the Chesapeake & Ohio trunk line junctions, on the south. Between these junctions are a multiplicity of connections; so many that Mr. Daniels of the New York Central Railroad stated in his testimony in 1898 that there were 50,000 or more ticketed routes, as for example between the seaboard cities and Portland, Oreg.

When it comes to issuing the various class tickets by all those various roads and routes, they afford more or less opportunities for scalping. For example, a ticket from Philadelphia reading through Buffalo, from Buffalo to Cleveland, from Cleveland to Toledo, and from Toledo to Cincinnati, goes on three sides of the square, or say two-thirds the circumference of a circle. Those routes are represented by various coupons, and the longer the distance the more the opportunities for scalping. The railroad companies, starting with the public convenience and their own revenues, are therefore obliged to confront this issue; should they decline to sell those various tickets at their advertised fares or run the risks of scalping them? We will suppose a ticket sold from New York by way of Albany, Montreal and Detroit, to Cincinnati; that ticket might be scalped at Saratoga or Troy or Detroit, and again at Toledo; and while the original transaction was a legitimate one over the traveled and current routes, it nevertheless increased the liability to speculation in those tickets by selling these various cut portions at these numerous points. In that way the railroad companies have done much, by multiplying routes, to assist the scalper in his object, but always, as I aver, the public convenience entered into their issue.

Another fact that existed for years does not prevail now to the prior extent, viz, that railroad companies and scalpers assisted each other. I am familiar

with the old Atlantic and Great Western Railroad, where a block of tickets, a thousand in number, for illustration, were put out from Cincinnati to New York. We will suppose the fare well maintained on the other lines on a basis of, say, \$17. Cincinnati to New York, but they placed those tickets with scalpers for \$14. In that way the railroad companies had direct dealings with the scalpers. In Buffalo at one time when some new lines opened through to New York perhaps over 10,000 tickets were disposed of to speculators direct, via numerous routes. Subsequently when the disturbances which such sales created were removed by a better understanding between the railway companies, the companies offered to redeem those tickets, perhaps not at the amounts which they received for them, but at a higher price than paid, that redemption fund being contributed and divided over all the lines with a view to the restoration of the rates and the public equalities of fares. The brokers, we will say, had disposed of 2,000 of those tickets; and the railways offered the brokers \$2 more than they paid for the 8,000 on hand, representing a profit of say \$16,000, which the public paid to the brokers, but scalpers refused to return those tickets notwithstanding that profit, believing that it was but the precursor step to stop speculation in scalping tickets; that they, notwithstanding the large gain from that transaction, would become the losers by the aggregate general policy, and that they could sell them to travelers for an equal or greater gain.

In other cases railroad agents have undoubtedly referred passengers to scalping offices as places where, to secure business, they could buy tickets over their lines cheaper. Suppose that the fare from New York to Chicago by the Grand Trunk line in connection with the Lehigh Valley from New York is \$18, while the standard fare via the New York Central routes is \$20. At that difference a passenger might say, "I do not prefer the lower cost line; the difference in connections and time and in sleeping car conveniences and meals do not attract me."

The ticket agent may then have said to the intending traveler, and possibly with the authority of his superior officer, "If you will go to A B, who has a scalping office, he has tickets over our road which originally started at Portland, Me., or somewhere else, through Boston to New York, and the party having used part of that ticket via New York, or elsewhere, the broker has on sale the balance of the ticket for \$15." Therefore the broker gets that \$3 below the fixed differential of \$2. The passenger saves so much of that scalp as the broker may allow him. To that extent the railroad companies have at times referred passengers to the advantages of a scalper's office and have then shared its benefits in the way cited.

In such cases the railroad companies may formerly have been responsible directly for some of the evils, but they have now been curtailed from the fact that agents have been appointed whose special duty it is to go into these scalping offices and "test the market," as it is called; and while I dislike to bring before a body like this the use of such instrumentalities, we have availed of the most experienced experts to do this work, and out of all the mass of information they derive such facts are confirmed. Nevertheless, however much the railroad companies have formerly connived at these methods, they have been gradually eliminated, and more and more the disturbing railroad officer and scalper have been thrown on more limited resources.

A railroad president told me that his chief ticket clerk being ill and his mail, marked personal, having accumulated and caused suspicion, he caused that mail to be opened and there were found letters from three different brokers saying, in effect, "I have received from you the tickets which are to be sold in my office. The standard fare being so much, the tickets are to be sold for so much." We will suppose that the standard fare being \$10 the tickets were to be sold at \$7; the broker then agreed to divide the profit between the ticket clerk and the ticket scalper. In this way the chief ticket clerk was found to receive three times his salary and cut the rates of his own company. So long as scalpers can buy tickets bearing the office stamps of an authorized ticket agent they prefer it; so they use every due and undue means to get them. When they found that the railroads gradually discontinued that practice they resorted to other questionable, discriminating, and corrupt practices.

Q. If the railroads were to agree, and all abide by the agreement, to have no dealings with ticket brokers, is it probable that the ticket brokerage business would be very much curtailed, if not almost eliminated?—A. The Eastern railroads had such an understanding prior to the decision of the Supreme Court, and it worked toward such good results I think that if to-day an agreement was nationally legalized by which all railroads might absolutely stop all connections with brokers that brokers' offices would continue, but in greatly curtailed extent, by reason of the ability to purchase portions of cut tickets and use the return coupons, convention and special party tickets, as they are called, and sell them to

parties who are not entitled to them. This would not, however, justify the continuance of their business, especially if they had no right of agency. As, for example, if the fare from Chicago to New York is \$20, the two-way rate is \$40. If, instead, the companies would sell one round-trip ticket at a fare one and one-third times one standard fare that would be \$26.60. To the extent the broker can induce a purchaser to use that ticket coming east for \$18 and sell the return part to some party not authorized to use it for \$16 they would receive \$34 for that for which they paid \$26, and, if a traveler presents the return portion of that ticket, the railroad companies can not, under some conditions, stop it. They can not stop to determine always whether the holder is a member of the Royal Arcanum, etc. They do undertake to get the secretary of that order, for example, to certify that the party holding such ticket was entitled to its privileges and return under the rates and rules made. But let us assume the holder sells that ticket to a broker who uses it. If the fare on mileage tickets is one and one-half cents a mile and the local fare is two cents or more per mile, the brokers would combine to buy, say a thousand of them under various names and subterfuges. By the terms of the ticket itself it is usually provided that such a ticket shall only be good when presented, say by John Richards for his passage, but he goes into one of the offices on Broadway, in New York, or on Clark street, in Chicago, and procures such a ticket, uses it part way and then sends it back to the scalper and gets a reduced fare for that part he used, or he may sell a portion of all the remainder of a ticket at first used legitimately. Again, the selling broker induces another broker to take up the ticket uncanceled and return it to him, and thereupon he divides with passenger and conductor the amount made. In some districts, as in New England, mileage tickets are good for any holders thereof. The result is that some persons buy them and sell parts of them at advanced fares, yet under the advertised tariffs. The railroads, meantime, may have done everything they could to prevent such results. In some cases they have gone so far as to have a photograph of the holder accompany the ticket. Of course, that is an annoyance and an inconvenience to passengers, who generally care more for saving than for reform. Then, those photographs were often scratched or faded so that one could not recognize the passenger from it. Every conceivable form, as I stated this morning, of fraud and misrepresentation is therefore resorted to to evade the companies' rules and its own and the passenger's legal obligations. The one thing to do, therefore, clearly for the public interest, is that a seller of tickets shall put over his counter a certificate or authorized proof of agency from the companies for whom he purports to sell such tickets; otherwise, make it illegal for him to sell them. If a man in lower New York, say in the sugar district, said he represented the American Sugar Refining Company and offered to sell its sugars, the first thing purchasers would require would be the authority to so sell. The American Sugar Refining Company could get an injunction and arrest that man for dealing falsely in their goods and representing the wares and sales falsely. We can not arrest anybody, yet the crime against railway and traveler is as much opposed to public morals and more so.

The fact is that the law frowns at every joint measure that we have taken to protect our railroad rates and fares, and out of 36 measures pending, at one time, in Congress, as I have said before, only the pooling, scalping, and commission questions were in favor of the railroads. We are treated, although in the service of the public interest, much as if we were its enemies. Senator Chandler has repeated the following statement, substantially:

"It is the railway intention if they pool to organize a monopoly power which shall be constituted of twelve thousands of millions of capital."

A more absurd statement of intent or practicability could not be made. How can we pool a road that carries salmon and local traffic in northwestern Oregon with a road that mainly carries oranges in Florida? How could we pool a lumber railroad in Maine with a road that carries principally cotton and cattle in southwestern Texas? Yet that is the character of the misrepresentations or misinformation that constantly go abroad. I have challenged Senators and others to an open discussion of this great question and never had an acceptance or even known anything worthy to be called an argument in the case.

Q. (By Mr. KENNEDY.) You stated an instance this morning in which you said that a man who bought a ticket to a certain point and sold it beyond would not get as much from the scalpers as he would get from the railroads in redeeming that ticket. Is there not a large body of travelers in this country who buy tickets, say, at Chicago for New York—use that as an illustration—and intend to go no farther than Washington, knowing that they can sell the unused portion of that ticket at Washington to a scalper for enough to save them \$1.50 or \$2 on their fare—is that not a practice that prevails very largely?—A. Yes; largely.

Q. Do you believe that the custom or practice of giving passes to legislators, members of the judiciary, favored shippers, and personal friends of railroad officials, is against public morality?—A. I do; decidedly.

Q. Do you believe, then, that as long as that part of the public who are the people's servants are favored in that way that others who know how to take advantage of this system and save themselves fares should be summarily cut off and these others left to enjoy favors from the railroad companies?—A. I do not think the two questions connect with each other. The ticket which is issued to a member of Congress, or a member of the legislature, or a judge or other public officer, is supposed to go to one who represents a position of public value or public utility. It is not generally illegal to bestow such a pass. It is complimentary and does not savor of dishonest intent, nor for purposes of influencing legislation. In the other case the traveler resorts to the practice to which you refer as a deliberate evasion of the fares and rules of the railroads, and is unlawful as to the intent and depletion of uniform rates under the act. He buys a ticket at New York to go to Chicago and he deliberately sells it en route, and intends to do so when he purchases it. In the case that you cite as to members of the legislature, they do not resell or loan their tickets. Many of those tickets are also returned to the railroads on the principle that the receivers can not accept those favors from the railroads. I do not think it any justification for the continuance of widespread ticket scalping in 560 brokers' offices, dealing with hundreds of thousands of travelers of all grades and stations, if a member or two of each legislature prostitutes his great public office. I do not think the one justifies the continuance of the other even if both are evils. It is an old truism that two wrongs never made a right.

Q. I do not refer to the idea that these persons who receive passes sell them; I made no allusion to the sale of passes by legislators.—A. Well, I am referring to that.

Q. (By Mr. FARQUHAR.) A person buying a ticket in New York for Chicago from a regular office—when he purchases that ticket has a certain assurance of safe carrying by the means provided for by that railroad, and also an insurance against accident attached to that ticket or whatever may befall him in being carried by common carriers between New York and Chicago. Is not that contained in every ticket that you make?—A. The assumption of that responsibility?

Q. Yes.—A. To the extent fixed by law and by usage, yes. All the tickets carry that responsibility against railroads.

Q. A buys a ticket in New York and he goes as far as Buffalo; he sells the ticket to B, a scalper—coupon ticket, say—and B sells it to a second party, C, who proceeds from Buffalo to Chicago. A railroad accident happens at Toledo or Elkhart on the line. Can that party, who is not a party to the original contract of buying the ticket, recover damages?—A. I do not know of any case of that kind that has ever been tried; but for one I should advise, if his death was caused by the neglect, fault, or error of the railroad company, that no discrimination should be made in the payment of damages merely because he was not the original buyer of the ticket. All parties who use that regular ticket do so because it is made possible by the railroad, and the holder has done nothing as yet unlawful in buying and using it. He is injured by the railroad company itself, and he ought to have the same recourse against the railroad that anybody should have, and the railroad company ought to have the same responsibility unless and until the law denies that right. Whether or not, if the case was pushed to an issue, they could successfully resist it is doubtful. There are certain cases, as in the issue of annual passes, where the pass being issued for a year specifically in favor of the person named, if that free pass is found in the hands of anybody that is not thus entitled to use it his heirs evidently should not recover if he died from railway neglect in the period of use, and I do not think he could recover any damages for injuries. On the contrary, he might be liable to arrest for misusing the ticket.

There are also some term or time tickets sold, say for half fare, for mutual considerations, in which the name of the buyer is inserted, which would, I think, come under the rule I have last suggested.

There are many cases where the railroad companies have sought to limit the use of these tickets. That is one reason for the issue of limited and unlimited tickets. A ticket good, stamped on the 13th, for a train to arrive in Chicago on the 14th offers no practicable opportunity for scalping, we will say, at Buffalo or Pittsburg. For that reason the railroad companies, in order to defeat this scalping, have reduced the fare on those limited tickets as compared with the unlimited ticket, thereby giving the holder of that ticket, for a consideration, the right to go from place to place more leisurely. And, incidental to that right, he may perhaps transfer the ticket to another purchaser, who might hold all the rights as to

parties who are not entitled to them. This would not, however, justify the continuance of their business, especially if they had no right of agency. As, for example, if the fare from Chicago to New York is \$20, the two-way rate is \$40. If, instead, the companies would sell one round-trip ticket at a fare one and one-third times one standard fare that would be \$26.60. To the extent the broker can induce a purchaser to use that ticket coming east for \$18 and sell the return part to some party not authorized to use it for \$16 they would receive \$34 for that for which they paid \$26, and, if a traveler presents the return portion of that ticket, the railroad companies can not, under some conditions, stop it. They can not stop to determine always whether the holder is a member of the Royal Arcanum, etc. They do undertake to get the secretary of that order, for example, to certify that the party holding such ticket was entitled to its privileges and return under the rates and rules made. But let us assume the holder sells that ticket to a broker who uses it. If the fare on mileage tickets is one and one-half cents a mile and the local fare is two cents or more per mile, the brokers would combine to buy, say a thousand of them under various names and subterfuges. By the terms of the ticket itself it is usually provided that such a ticket shall only be good when presented, say by John Richards for his passage, but he goes into one of the offices on Broadway, in New York, or on Clark street, in Chicago, and procures such a ticket, uses it part way and then sends it back to the scalper and gets a reduced fare for that part he used, or he may sell a portion of all the remainder of a ticket at first used legitimately. Again, the selling broker induces another broker to take up the ticket uncanceled and return it to him, and thereupon he divides with passenger and conductor the amount made. In some districts, as in New England, mileage tickets are good for any holders thereof. The result is that some persons buy them and sell parts of them at advanced fares, yet under the advertised tariffs. The railroads, meantime, may have done everything they could to prevent such results. In some cases they have gone so far as to have a photograph of the holder accompany the ticket. Of course, that is an annoyance and an inconvenience to passengers, who generally care more for saving than for reform. Then, those photographs were often scratched or faded so that one could not recognize the passenger from it. Every conceivable form, as I stated this morning, of fraud and misrepresentation is therefore resorted to to evade the companies' rules and its own and the passenger's legal obligations. The one thing to do, therefore, clearly for the public interest, is that a seller of tickets shall put over his counter a certificate or authorized proof of agency from the companies for whom he purports to sell such tickets; otherwise, make it illegal for him to sell them. If a man in lower New York, say in the sugar district, said he represented the American Sugar Refining Company and offered to sell its sugars, the first thing purchasers would require would be the authority to so sell. The American Sugar Refining Company could get an injunction and arrest that man for dealing falsely in their goods and representing the wares and sales falsely. We can not arrest anybody, yet the crime against railway and traveler is as much opposed to public morals and more so.

The fact is that the law frowns at every joint measure that we have taken to protect our railroad rates and fares, and out of 36 measures pending, at one time, in Congress, as I have said before, only the pooling, scalping, and commission questions were in favor of the railroads. We are treated, although in the service of the public interest, much as if we were its enemies. Senator Chandler has repeated the following statement, substantially:

"It is the railway intention if they pool to organize a monopoly power which shall be constituted of twelve thousands of millions of capital."

A more absurd statement of intent or practicability could not be made. How can we pool a road that carries salmon and local traffic in northwestern Oregon with a road that mainly carries oranges in Florida? How could we pool a lumber railroad in Maine with a road that carries principally cotton and cattle in southwestern Texas? Yet that is the character of the misrepresentations or misinformation that constantly go abroad. I have challenged Senators and others to an open discussion of this great question and never had an acceptance or even known anything worthy to be called an argument in the case.

Q. (By Mr. KENNEDY.) You stated an instance this morning in which you said that a man who bought a ticket to a certain point and sold it beyond would not get as much from the scalpers as he would get from the railroads in redeeming that ticket. Is there not a large body of travelers in this country who buy tickets, say, at Chicago for New York—use that as an illustration—and intend to go no farther than Washington, knowing that they can sell the unused portion of that ticket at Washington to a scalper for enough to save them \$1.50 or \$2 on their fare—is that not a practice that prevails very largely?—A. Yes; largely.

returned to its general offices and have been for years. If it were not the property of the carriers the railway would not have the right to take it up and send it back to be checked against the sales, etc. The contract to transport is accomplished and ended and the contract is surrendered because the railway alone issued the evidence of contract and seems entitled to its return as proof of fulfillment.

I therefore think that the conclusion was wrong both in itself and as an incentive and support to a further wrong. I have always regarded a ticket as simply indicative of the right of the purchaser to travel on the terms indicated thereon; that it is tendered by the railroad company to the intending passenger, not as a necessary adjunct of a journey because the railway could take it up as soon as the traveler's train started, or at a gate, before it left, as on the elevated railways, nor as a requisite receipt for money paid because the amount paid is not shown. It is given into the passenger's hands simply to show connecting conductors and agents beyond and baggage checkers that the first purchaser paid the railroad company its stipulated legal fares for the privilege of traveling upon that road between stated points and upon certain trains. It seems to me it would be as well to say that when we issue bills of lading that the parties are not required to surrender them on the due performance of the contract. We do not surrender the custody of property until the goods are delivered and due receipts taken therefor, which receipts constitute the fulfillment of the obligations of the bills of lading. In some States we have a right to demand the production and surrender of the original bill of lading in order to show that the goods represented thereby were received by and delivered to the consignee of authority in good order. It seems to me the same condition arises in a ticket, for the law would not authorize the scalping of freight bills of lading and rates, and that John Jones might enjoy from Buffalo to New York the substitution of 1,000 other barrels of flour started by John Smith at Chicago. If in the sale of the evidence of the right to travel the railroad should place upon the face of any ticket onerous, unjust, unreasonable, and illegal conditions, or those disturbing to public trade, the courts would not sustain the railroads, and ought not to, but if the present practice is the result of long usage in all countries and never shown to be wrong or publicly harmful, that these conditions were before adjudged reasonable and proper for the protection of the shareholder of the railroads as well as the passengers, those considerations should have weight and not hold the railroad company to the performance of its obligation to one person as also good against the transfer of it to two, three, or four passengers.

Q. So far as the State of New York is concerned, under that decision of the court of appeals, and in the State of Illinois under a similar decision, the tickets are private property.—A. I know, but when that comes to final adjudication I do not see how it can be reasonably and justly so held. However, that is merely a layman's opinion.

Q. In carrying wheat and flour from the West to the seaboard for export they went at the same rates up to last February. Last February new schedules were made up and wheat was carried at a cheaper rate than flour. I understand that practice did not prevail until last February. Do you know why it was done at that time?—A. No; and I do not for this reason: That promptly following the decision of the Supreme Court the presidents of our companies disbanded the association. Since that time we have simply been winding up its affairs, and my active connection with the organization ceased the 1st of October, a year ago. The fact you cite in this case is entirely new to me at this moment, and, if I understand you, I do not understand any new justification.

Q. The question was involved in the case decided by the Interstate Commerce Commission some months ago, to which you referred this morning.—A. Yes; that was that the wheat which had formerly been carried to the seaboard at uniform rates, whether for export or domestic consumption, was carried for less than wheat for domestic consumption and less than the rate on flour for export. The testimony then adduced was full and clear, pro and con. I do not know any new reasons actuating that policy; it has always been so in some measure. I stated this morning that I believe that there have been circumstances and conditions which justified lower rates to the seaboard for property intended for foreign consumption than to the seaboard proper for consumption within this country, and the same reasoning holds as to the manufacture of flour, whether at Minneapolis or the seaboard. I do not comprehend why all our flour rates should be brought to the seaboard level created by competition with the British miller in Manchester. Neither he nor the American miller sell to all at the lowest price they get for any flour. Take a consumer, we will say, living in Brooklyn, the circumstances and conditions entirely dissimilar from the conditions

of a consumer in Glasgow. If it came within that view, there might be defensible reasons for it, but as to the question of intentional discrimination of some American wheat against other American wheat to the same points in our own States, it would be unjustifiable from my point of view.

Q. Against American flour?—A. Yes; and American flour under the same reasoning.

Q. Would it not be in the nature of a discrimination against American labor and the American milling industry?—A. Yes, measurably, the facts being as you state; but if I knew all the facts I should be happy to explain them, and if it is the desire of the commission, I can ascertain the reasons for any recent action and communicate the facts to you. All our great manufacturers, if I understand the question, sell some products for use abroad less than for the prices obtained at home. They must do so to get the foreign markets. Perhaps the railways do so as well.

Q. (By Professor JOHNSON.) It was explained by interested parties that the trunk lines are more interested in the transportation of wheat than they are in the transportation of flour, and for that reason they are willing to make this discrimination in favor of the wheat. Have you any information on that?—A. No; nothing beyond former practices and the reasons I have partly cited. On the contrary, I have heard it represented to the railroads that they are carrying a barrel of flour which weighs 216 pounds at a price at which they were carrying 200 pounds of wheat, or 8 per cent less weight, and that the shippers made more on the flour than on the wheat, and shippers of wheat have often asked for a reduction of 16 pounds in some way to make the rates equivalent. That was regarded not as a discrimination in the true sense of the word, but the result of long usage, and it is the intention of the carrying companies, as expressed in former resolutions, to put the two articles upon the same footing wherever practicable. The transportation of wheat, for example, by the large and independent steam and sail lake carriers is recalled, where they put grain in elevators and spout or run the grain into the boats in bulk and run the grain out of the boat at Buffalo in bulk and ship it in bulk in the cars. It is not a new question. The individual lake carriers—plus the individual canal carriers—have done all this for years and would do more of it if the railroads ceased doing it, yet the Northwestern millers have waxed fat with thrift and drawbacks. Bulk grain is the more economic proposition and gives a much larger cargo per vessel and more money per cargo than to take flour where each barrel is handled individually into and out of the boat and transferred from car to car or boat to car, and the loss of earning space caused by the circular form of the barrel, and the greater value and number of claims. All this holds good, of course, of rail transportation as well, where even a much larger percentage of wheat weight over flour weight is carried per car. I have heard these reasons advanced and urged by bulk-grain shippers, and there is truth in them. The same conditions transpire in New York Harbor, etc. There the railroads make bulk-grain deliveries under a contract with the New York Produce Exchange, by which grain was to be floated in bulk in canal boats and delivered in bulk under specific rules of grading and transfers to ocean vessels or grain warehouses. Storage is also covered by that agreement. That contract does not include flour, as all members of the New York Produce Exchange know the above differences in the transportation detail and value of the two articles, although they bear close relations to each other. The same thing might be urged to be true as to the very large and increasing list of food products made from oats and corn. They also put flour in barrels, in cloth bags and paper bags of various sizes for transportation, altering thereby the former more fixed relations of barrels, packages, and bulks, weight of loading, etc., while bulk-grain conditions are not changed.

Q. The contention is this: That the transfer service in New York Harbor is remunerated at the rate of 3 cents per 100 pounds, and that this service is performed by a company composed largely of and controlled by the principal owners of the trunk lines, and for that reason they prefer to have the grain moved from the west in the form of wheat rather than in the form of flour. You doubtless have, or can obtain, information concerning that definite contention?—A. I have that information now and can characterize it as without foundation. There are delivering companies, not "a company," and they handle flour as well as grain, charging more on the flour. While I was vice-president of the Erie Railroad Company I made contracts for the delivery of freights about the harbor of New York at a specific rate per ton, in all cases, including grain, and on west-bound as well as eastward-bound freight. I would like to disabuse the minds of this commission of the proposition that the carrier at New York City is compensated for this terminal service at the rate of 3 cents per 100 pounds. The fact is, that

freight rates to and from New York are fixed without reference to what the terminal charges there are; the rate Chicago to New York being 20 cents, the rate to Philadelphia is 18 cents, the rate to Baltimore is 17 cents. That 20 cents, with 3 cents afterwards taken into account as if it were cut out, would prove that the railroads carry freight from Chicago to Jersey City as cheap as to Baltimore, but for a considerably longer distance.

Q. (By Mr. FARQUHAR.) What is the reason for the difference?—A. The present differences were settled originally at the Brevoort House, New York, April, 1877, by the presidents of the trunk lines, every one of whom are now dead. I was present. At that time the great bulk of export property went through Boston, Montreal, Philadelphia, and Baltimore. The ports of Galveston, New Orleans, Pensacola, Norfolk, and Newport News were not then factors in the adjustment reached. Given a shipment of flour seeking through transportation from Chicago to Liverpool, it was not a transaction to the seaboard, but to Liverpool via various routes. The purpose of the railroad companies making that arrangement was to deliver freight from Chicago and elsewhere to Liverpool and elsewhere abroad at uniform rates through all ports, precisely as the rates from Chicago to New York are uniform throughout all western junctions—Pittsburg, Buffalo, Toronto, Wheeling, etc. That was the purpose set forth in the memoranda and testimony delivered to the Hepburn committee. In making these rates there were some of the elements which entered into them: In the first place, sail tonnage; in the second, steam vessels; third, lake and rail; fourth, lake and canal; finally, and in a small part only, rail and canal, the Ohio River to Cincinnati or Pittsburg, and the competition at that time, mainly as to cotton, at New Orleans.

To reach results fairly, after a long, bitter, needless, and fruitless rate war, file after file and volume after volume of rates were obtained to show what inland rates would most nearly average a parity of through rates to foreign ports upon the grain. I can only cite a few difficulties. Steamship companies and sailing vessels changed their rates, perhaps, every day, and the rates from different ports were, of course, dissimilar. I know of a case where one line changed its rates four times in one day, by reason of foreign war rumors, shortage of tonnage room, and various local causes. We could not change our rail rates four times a day from Chicago to Liverpool, affecting St. Louis, Peoria, Milwaukee, Detroit, etc., to Liverpool, yet Liverpool rates, perhaps, decided London and other European rates. Ship agents frequently made contracts for a ship in midocean, bound westward. In such cases someone had to hold the cargo until the vessel arrived. Incoming steamships were delayed at sea, etc. If a 10-day vessel was 17 days westward at sea, its return cargo might stand on the dock. Sometimes through eastward engagements were made by railways taking the risk of ocean rates, and I have known the entire inland charge to be absorbed in making such through rates good, by reason of advances in ocean rates. With only the former railroad lines and sea-going lines from the smaller number of ports of export, with orders coming from Liverpool, London, Marseilles, Brindisi, Bremen, Hamburg, Havre, and with Chicago, St. Louis, Kansas City, Milwaukee, Cincinnati, and Peoria competing for the land transportation, the problem was daily to fix a basis which we could give shippers, promptly upon application, of through and assured rates of freight between these points on a multiplicity of articles. Only a few of the entanglements of the foreign-rate problem stand before you. Therefore, after most exhaustive examinations and trials of different rates and methods; after Mr. Vanderbilt had spent or wasted millions of dollars in trying to fix a parity between New York and the ports in competition therewith, the seaboard lines abandoned fighting and entered into closer negotiations. Even then, as now, through rates can not be made on the bulk of our exports. They had to make rates to the seaboard, and to do this they had to take the past years and average all these different and conflicting rates and conditions to what would represent a just approximation. At that time 3 cents was only agreed to be a fair difference to New York higher than to Baltimore, and 2 cents as compared with Philadelphia. After so fixing the differences of rates to New York, it never was thought what the charge was at New York for handling, any more than at Chicago. The Erie company's grain lighterage in New York was then performed by the firm of McCartan & Logan, and no officer of the company had one dollar of interest in it. All its heavy freights were lightered by the New Jersey Lighterage Company. The New York Central road had employed Mr. Starin to perform their harbor service, in part, and he also performed it for the Lackawanna.

The Pennsylvania Railroad Company employs a terminal company at New York. It has been and is a favorite theory of some shippers, and was of a

railway president now deceased, that there must be a personal interest hidden somewhere in this lighterage. Whether that business costs 3 cents or not is something to explain further. The Erie Railroad Company alone had 7 regular stations in New York Harbor, and had made deliveries and received freights at 105 other points; in all, 112 points, to and from which the rates were the same as New York. It cost more then to deliver property to and from Jersey City at Staten Island, including fire and marine risks, than it cost to carry it from Milwaukee to Chicago; therefore, when the Western lines, as was then the custom, put upon their bills of lading, "Deliver to any point in lighterage limits of New York Harbor, as consignees may direct," we might as well have put on a Chicago west-bound bill, "Deliver at Milwaukee, if consignees direct." We finally advised our Western connections that they had no such right. We had abundant regular stations in New York, and would receive and deliver at any of them at the uniform New York rate; but the 105 other points must be provided for in some sense, and someone besides us should pay for it in due share. The charge, at first $3\frac{1}{2}$ cents, was subsequently reduced to 3. Now, as to who pays that charge. In a remote sense the shipper does, but the rate is not increased by that amount or any part of it to provide for it. Assuming the distance from New York to Buffalo to be one-half of the distance to Chicago—the New York Central, for example, will receive from its connections but one-half of that amount, because it is deducted from the through rate before the remainder of the rate is divided.

Q. (By Mr. KENNEDY.) A distinguished railroad president appeared before the commission in Chicago and said that the tariff schedules which were filed in freight departments and the Interstate Commerce Commission were so intricate and so technical that no shipper could possibly understand them; that he could not understand them himself, and that if he found it necessary to get information concerning them he would have to get an expert in the employ of the company to assist him. I would like to ask you if that is, in your opinion, true?—A. No; no experienced president in the country ought to have said that so broadly. Perhaps he meant rates and divisions and rules, etc. I regard rate making and rate maintaining as the most responsible and important functions a railway president can exercise. We employ experts to work out the details, but all presidents presumably understand the basis or measure and principle of rates. As to shippers, they are acute and vigilant. Many of the large forwarders in Chicago and elsewhere have their own traffic managers, as the railroads do. It is their duty to keep up, from time to time, with new roads that are opened, new rates that are published, etc. I will give you an instance: The Seaboard and Roanoke road is about to complete its line into Florida, shortening the distance. They have absorbed some lines and are building some part of a new route. That will necessitate revisions of tariffs, without doubt. In such an instance I can not understand how a president would say what you quote. He should be able to tell what will be the rate policy of his roads, and perhaps would have to get some experts to prepare tariffs for them, but he should possess knowledge that the traffic is mainly carried by other lines at open rates which he can not exceed and may reduce. There is not a shipping firm in Chicago, of any magnitude, that has not the rates in its offices. They also have the official railroad guides and directions. Then follows the classification and the rules and regulations, the forms of bills of lading, releases, and everything else requisite to enable the shipper or tariff maker to know the rates. The difficulty the president referred to, perhaps, lies in the original construction of the first rate. This being assumed, it is then a question of changes only. Both of those should receive his approval. For example, an important line has recently come to the conclusion, that their material at present prices averages to cost about 50 per cent more than the same materials cost them in like quantities 2 years ago. Nobody should claim that they shall not have some increased rate compensation for that condition; every other calling has. For example: If a railroad paid last year \$17.50 per ton for rails and now pays \$35, except on contracts, it should make a reasonable rate advance to compensate for the greater outlays. The people should pay in part for the rails over which they and their merchandise are carried. Other concurrent causes may fortify this justice. In sending grain to the Transvaal, England may legitimately alter the price for our rail carriage of grain as well as of the grain itself. Steel rails, iron manufactures, structural material, etc., are also cases in point. When it comes to deciding the tariffs from such causes, conclusions as to rates become important, wide reaching, and intricate and a problem of duty to the public as well as to shareholders. No one man can do that, even be an expert. I therefore favor the coming together of the shippers of iron, coal, merchandise, grain, etc., for more conferences with the railroads. We want to recognize as well as be recognized.

The unit rate is from Chicago to New York, and the rates of thousands of articles to hundreds of intermediate points depend upon that unit. What would the Interstate Commerce Commission do with propositions like that?—five men that have but small experience undertaking to cope with that and all other rate difficulties all over the United States. Surely if your Chicago witness was correct, that railway presidents can not make rates, the Interstate Commerce Commissioners can not do it. If the grain and provision rates were advanced or reduced, say from Chicago to New York, they would doubtless be followed to New Orleans and Galveston, Kansas City, St. Louis, and Louisville. That can only be done by committees and conferences at these various places adopting several rates on leading articles.

There is one fact which is important, and I would like to discuss it a moment, as I omitted it from my paper this morning.

My point relates to the extent to which discriminations in rates are caused by the frauds of shippers on the railroad companies and reacting on each other. You will be astonished, perhaps, when I tell you that last year the west-bound inspection bureau of the trunk lines from Boston, New York, and Philadelphia, and not including Baltimore or other points, discovered 270,000 misrepresentations by merchants of the goods purporting to be contained in the packages forwarded.

Upon asking the chief inspector how many of those cases he considered intentional, he said that aside from a few cases where, for example, some linoleum of certain size might have been classed different from oilcloth, that every other one of the instances was an intentional inroad upon the railroad company's rates. It must be so, for each shipper knows what he sells. Furthermore, this can not be a fraud upon the railroad companies without being a fraud upon other merchants. I have been asked how the facts were ascertained. It is by opening the packages, as the customs inspectors do. This did not include Albany, Troy, Rochester, Schenectady, Syracuse, Trenton, New Haven, or any other points—Bridgeport or Harrisburg—nor interior business, nor east-bound business, nor any territory but ours. While it is so prevalent to accuse the railroad companies of being the discriminators, I trust your body will consider this great discrimination as well.

Q. (By Mr. FARQUHAR.) Are they large shippers?—A. Some are.

Q. (By Mr. PHILLIPS.) What do you mean by opening the packages?—A. A box, really silks, may be represented to us as shirrings, the rates New York to Chicago being, let us say, 75 and 50 cents per 100 pounds, respectively. The inspectors simply pry such boxes open, taking the due responsibility therefor, and find the facts as stated. Yet the shippers know that in the event of losses they can not collect for more than the value of the articles they certified were shipped.

Q. (By Mr. FARQUHAR.) It can readily be seen where it could occur in articles of that kind, especially in hardware?—A. Speaking of hardware, an officer of an association of hardware manufacturers said to me, jocularly, at a trade dinner in New York: "It is so easy to beat your railroads. You charge manufactured brass goods at so much and iron piping at so much. I shipped a case containing only manufactured brass goods, except one piece of iron pipe joint, and I called it 'iron pipe.' It went through, and I saved about \$2.30 per box to a far Western destination."

Q. (By Professor JOHNSON.) He had no more compunction?—A. No; he thought it a good joke.

Q. (By Mr. FARQUHAR.) Does not that help the question of uniform classification?—A. No; because evasions as well as detections under one classification are as easy as under another, and the more the inspections under different classifications the greater may be the chance of detection. It would assist us in other cases. The system of inspection which we have is much like that of the custom-house in identifying the character and valuations of goods under invoicing. Our inspections are carried on to a larger extent than formerly, and we are gradually circumscribing the wrongs they discover. We had over 100 inspectors a year ago, and the frauds and errors discovered paid the whole cost of the bureau 11½ times.

Q. (By Mr. RATCHFORD.) Do the railroads seek to justify their discrimination because of the fact that advantage is taken of them by shippers in the manner in which you state?—A. Not at all.

Q. You simply make reference to that to show that the shippers who sometimes charge these discriminations are not doing the fair thing themselves?—A. That is true. I do not justify railroad companies in any preferences, excepting those that are legal and reasonable under the terms of the act, but I do not justify shippers in any, any more than in smuggling.

Q. (By Mr. PHILLIPS.) Have you any remedy to suggest in the way of remedial

legislation, either to Congress or the various States, both as to shippers and to railroads?—A. The discriminations by railroads will largely cease if what I believe to be the best method is legalized, and that is the railway right of mutual contract. If we had the right to so organize for 5 years we could immediately proceed to the more comprehensive and permanent correction of these abuses. Certain companies take certain half-way measures because of this uncertain legal status and certain shippers get advantages over other shippers. Some railways think this laxity helps to build up their business against future contingencies and let such things pass and keep the regard and traffic of the shippers thus unjustly benefited. If, however, we could make long-term contracts, we could put a stop to these wrongs and act conclusively. The railroad companies would then present a more united front to both disturbing railways and shippers and discriminations would diminish. The shippers would have a more wholesome regard for the law if they knew that the railroads stood together to enforce it permanently and that it authorized us to proceed against them in this respect. That is the principal thing to be done, for we can not legislate rectitude into a man or make paper mandates prevail against lack of integrity and yet not build the machinery by which those mandates must be carried out. For example, if I alone possessed all the powers of Congress to render decisions to the effect that certain practices were wrong, they would not stop, nor could I stop them, unless I provided due means to carry those measures into due effect. The carriers in daily contact with the subject and interested practically and not as mere reformers in the upright purpose must do the work. Then we could have some united peace and some thoroughness of joint action and cooperatively stop these discriminations.

Q. That is as to the shippers?—A. That is both as to the shippers and as to ourselves. The New York Central company, for example, might not hesitate to act if it had a long term and enforceable legal contract which it could set in motion, nor then hesitate to proceed against others for the violation of joint agreements.

Then a company not as strong as the New York Central would hesitate about cutting the standard legal rates, knowing that they were going to be proceeded against, perhaps by the Interstate Commerce Commission or rival carrier under due terms, conditions, and limitations. It is impracticable to reach this wrong except by practical laws. Theoretical legislation will not do it. Let us get rid of that will-o'-the-wisp.

Q. Then have you any special form in which you would put this?—A. Nothing except the law substantially as I proposed it generally this morning.

Q. (By Mr. KENNEDY.) Is it true that some years ago the railroads of the country came very near to adopting a uniform transportation classification, and that two east-and-west trunk lines defeated it?—A. It is true that of the leading lines of the East some were prominent in opposition. It was also true that certain other lines in the South and West added their dissent, and perhaps disclosed it more after the proposal was defeated than while it was being considered. I nevertheless believe it may be brought about. When I went to the Central Traffic Association, in Chicago, as its commissioner, our eastward tariffs contained 13 classes, practically. Upon suggesting that they be reduced to 10 I was advised that they could not be so curtailed.

Subsequently, when the interstate-commerce act was passed the 13 classes were merged into 6, proving what can be done. This was exclusive of commodity rates.

I do not think a uniform classification is a cure for most of the difficulties which are complained of in that respect, but it is a help for unbroken through rates. It helps the merchant shipping now to have the classification from Chicago to New York, from Chicago to New Orleans, and another one to Galveston or San Francisco, although they differ, replaced by one classification basis.

It would be a help where 3 classifications prevailed to merge them into 1, and I would regard it as a railroad convenience and aid to have continuous through rates under some uniform classification. It will also operate to more uniform rates per mile in the tariffs.

Q. (By Professor JOHNSON.) You think, then, that uniform classification can be secured without the cooperation of the public? I understood you this morning to be opposed to the Government, through the Interstate Commerce Commission, undertaking to insist upon uniform classification.—A. Perhaps I was misunderstood or misunderstood you, on that point. I think that if the Interstate Commerce Commission were to issue a call, under law, that it contemplated taking active steps toward the unity of classification, and notify the railroads to that effect, that the railway companies would meet, as they met before, but under perhaps the more favorable auspices of time, increased prosperity of the country, etc., and it might be thus accomplished. If it be thus achieved I would not, for

one, object to requiring that on and after a certain date, which allowed full consideration, the railroad companies should have a uniform classification. I have elsewhere given my views on this subject fully. That is very different from the proposal I discussed this morning, which was to give the Interstate Commerce Commission the right to say what articles should be in each class and what changes should take place from time to time in that classification, which is conferring upon them the rate-making power in the largest sense.

Q. Failing in the adoption of uniform classification by the railroads within the time limit, would you give the Interstate Commerce Commission power to prescribe it?—A. I would not object to giving them the power to say that a uniform classification should take effect within a certain time and that, failing in that, they would call for the use of a special and uniform classification.

Q. Is not that essentially what the Interstate Commerce Commission wants on that particular point?—A. On that particular point the case is well made up, if that is all they mean.

Q. (By Mr. CLARKE.) Please give us, in this connection, your idea of uniform classification.—A. That is almost impossible. There are now, I think, approximately, including the import tariffs, rates on over 4,000 articles, taking those sent locally and through and in all directions. To comprehend the original proposition of a uniform classification, the number of classes being reduced from 13 to 6, to say which one of these present classes shall then prevail in lieu of 13 over all railways, which article of the 4,000 should go into this or that class in each and all parts of the country, would be impossible without having each article before us, and discussing its merits and bearings, and even those would differ as the territories differ, as the Canadian may differ from the States' classification, much as the conditions on tickets and bills of lading may and do differ. I can not, therefore, as much as I would like to do so, answer your question satisfactorily to you or myself. There are many things to be reconciled, both in trade and railway interests, as I said this morning. The classification of cotton in the cotton producing States, the classification of wool, and the classification of zinc differ, depending upon the volumes and conditions under which they are produced and sold and carried; lead and precious ores, sheep, cattle, lumber, and all the articles which constitute the complex proposition. I should, perhaps, not be so decided in my advocacy of the general proposition if it had not approached, as Professor Johnson well says, almost a consummation at one time. At the same time, I think you overestimate the value of a uniform classification. It is desirable, but not essential, and its adoption will not stop discriminations. That goes deeper than classification and is your principal problem.

Q. It will be an aid to the shippers, I suppose?—A. It would be an aid to shippers and to the railroads also.

Q. And would it not be desirable to all that the same articles should go in the same classification in all parts of the country?—A. I think so and said so this morning, but, as I have endeavored to show, the subject bristles with difficulties. Two of them, on which I have not enlarged, are now undergoing scrutiny and publicity. One is the difference of rates between the classes, and the other is the differences between carload and less than carload rates.

Q. (By Mr. FARQUHAR.) You made a statement this morning that in your experience with all pools heretofore made, you never had rates arranged in the pools. Now, what form of pooling contract would you suggest as between roads? That is, what would be the contract features of the pool that you propose now, provided that the Congress of the United States would give you the authority?—A. I think I could dictate now, on one page of paper, a proposed pool, something like this: "The following railroads (naming them) operating from and through ———, to and through ———, hereby agree that to observe and give due effect to the tariffs from time to time legally issued, they will, from ——— for a period of ——— years from said date, divide their tonnage therefrom and thereto and the earnings produced thereby at the published rates substantially in the proportions in which the shippers have delivered it to them heretofore. The proportions in which the said business shall be carried by the several parties hereto shall be as follows: (Specifying the percentage due to each.) If any company carries more than its said proportion, it shall in the next month transfer such excess of tonnage, computed at the gross rates shown by said established tariffs, to the company or companies in deficit, or, failing to so transfer the tonnage, it shall pay money in an equal or agreed amount within 30 days thereafter."

Some details would, of course, follow, but, materially, that is all there is in a pooling contract. Now, then, comes the question of rates, which is the vital public concern. If such a contract could go out with the seal of the Government authorizing it, that is all we want, and no one has ever gainsaid its equity.

Next, as to changes in such rates: We should be authorized to get together and fix them. If we then say the rate will be 20 cents from Chicago to New York, in lieu of 18 cents, there lies the public interest. We proposed to submit all these agreements to the Interstate Commerce Commission before issue or effect, under conditions mutually protective, in some such a bill as that which I proposed here this morning and will discuss hereinafter.

Q. Maintaining the Interstate Commerce Commission in its present form with the present number of members?—A. I think the membership of that commission ought clearly to be not less than seven, for the reasons I have stated.

Q. Provided that you had this pooling system established by law, and the reconstruction or enlargement of the Interstate Commerce Commission, what would be the character of the personnel that you, as a practical railroad man, would want to see on that commission?—A. I have very strong views about that. By one of those anomalies, which I regard as unjustifiable, the present law provides that no man who owns a share of railroad stock, etc., shall become a member of this commission. The English law requires that its board shall contain someone experienced in transportation. One night, at a dinner with some officers of the Army, the effect of the interstate-commerce law upon transportation of troops and supplies for the Spanish war on the part of the Government was discussed, leading to the general discussion of the interstate law, and I said then what I now repeat, that it would be similar to appointing a committee for the purpose of making recommendations as to our coast defenses if there were a clause in such a law that there should not be an army officer on the board; or, in the increased construction of new ships, if such men as Dewey and Sampson were prohibited by law from sitting on that board.

Q. (By Professor JOHNSON.) Do you mean to say that railroad men can not be appointed on the Interstate Commerce Commission?—A. Yes; if they own stock.

Q. You would not say that a man on the commission ought to be a railroad man at the same time?—A. I think Representative Cannon made the correct statement. He reported a banking law and acknowledged he owned bank stocks. I think he is a better lawmaker because he does, and that both sides get a better and more experienced judgment. The people exact no such poverty conditions as to their Senators or Representatives, and they sit in their Houses and vote nevertheless. Such conditions ought not to disqualify any honorable man. It does not disqualify a candidate for membership on the Interstate Commission that he has received fees for arguing for or against railways as an attorney prior to his appointment. If I was sitting upon a commission I know that I would like to have a man beside me who owned railroad stock, and knew the true bearings of that interest. I would like to discuss the topics with him because he would understand the subject from that standpoint as I might claim I did from mine.

Q. Would you say that a man could be an impartial commissioner who owned stock in one of the companies of the United States?—A. I know many of them; yes. We all know of Senators who are impartial, yet own corporate securities.

Q. That seems rather impossible.—A. I know it is so regarded, but I do not.

Q. (By Mr. FARQUHAR.) In your Joint Traffic Association how many were in your main consulting board?—A. There were 32 signers of that contract, all of whom attached the seals of their companies after receiving authority to that effect from their boards. They then appointed 9 managers, so that each system, beginning with the Canadian Pacific on the north and ending with the Chesapeake and Ohio on the south, should speak for the signing roads. That was the general constituency of the board. These 9 men considered 22,000 subjects in 4 years within the territory that they covered. With all that experience and my own, and multiplying that number by passenger matters on all railroads of the country, by complications attending each and every thing relating to them, it is my judgment, without reflection upon the members of the Interstate Commission, that it would have been utterly impossible for the latter to have performed that detailed service or laid down a general rule to cover them. As a transportation man I would favor an increase in the board. I would favor a retention of the present geographical and political apportionment, and I would favor the proposition also that they hold stated meetings in different parts of the country. I would favor their right to call not only upon shippers, but railroad presidents for periodical consultations, and that they should undertake to ascertain from each what their views were as to the benefits which could be added to changes in transportation rates, fares, classifications, and rules. When I had been 8 days on the stand in New York before the Hepburn committee I wound up by favoring the appointment of a State commission, as I had done repeatedly before, for this reason, if for no other: That it would act as a buffer between the railroad companies on the one side and the intelligent public on the other; and it so turned

out in practice. If A, B, C, or D has a patent safety device which he thinks should be ordered used on cars, or some one wanted an order for some safety appliance at country crossings, or if the street-railway managements favored something alleged to oppress the public, or, on the other hand, if the railroads did something that would oppress the public, that commission would, I believed, balance the contentions. The result has been that they do act to correct public misunderstandings, and they correct the railways by urging the concessions which the public should enjoy. I recently had a conversation with Mr. Hepburn, who was the chairman of that great New York committee and who is now vice-president of the Chase National Bank of New York, and asked him if he thought the mercantile community had derived any benefit from this discussion. He said he started his examination in the belief that the railways were mainly wrong. He ended finding he had misapprehended and misjudged them, and I certainly did him. So these difficulties and differences became reconciled or modified. We went over our road and collected hundreds of cases, not alone on that road where the trouble was supposed to be created, but on others where it was shown they existed. The aggregate result was of great mutual benefit.

I believe in that form of consultation now and I believe it the more, as I said in the opening remarks this morning, when such conferences take on a national character. But I believe the powers of the commission should be fully and carefully limited and defined. I do not want them to be denied access to any features that will enable them to protect the public. I want them to assist and that we aid them to that end. I want them to be clothed with the right to protect the railroads, too. These things have not gone together heretofore. The partings of the ways have had too many right angles in them.

Q. You are also aware that the American public are very jealous of the railroads?—A. Oh, yes; and that, whatever the enlargements of the functions of this Interstate Commerce Commission, that public jealousy will continue to demand increasing railway concessions to the verge of socialism or beyond it. Even when the interstate-commerce bill was being considered, judged by its terms and, more so since, by the new powers asked, I concern that this country will never wholly surrender the regulation of railroads. I do not want it conceived that I have hostility toward the Interstate Commerce Commission, although I think their new demands should in very many respects be resisted by all due argument and legal effort.

I had occasion, at a meeting of the American Board of Certified Accountants, to say that it seemed to me that the Interstate Commerce Commission was wise in providing uniform terms for the various headings, periods, and definitions of railroad companies' accounts so far as they could compass that purpose. Take the floating debt item for example.

I fancy each member of this commission, as intelligent as they are, would have a different idea and a different definition of what the floating debt of a railroad corporation really is, when it begins, matures, and what it consists of. If I buy 50 tons of iron and it is delivered, but it has not been vouchered, has that account become a floating debt in law? If I have issued a note for it which has not become due and may be renewed in part, its relation as a floating debt may be treated differently. I therefore think a uniform system is necessary to clearness and to define clear standards of credit and responsibility. I believe that the whole subject should be approached in a candid, national spirit. The one side too often says, "We want so and so and decline anything less." We all know people will never get together on that basis. We ought to have conferences, and we ought to have the cooperation of the national commission and they should have ours, within fair boundaries for both. It is only by getting together that we can accomplish good things, and then we must be prepared with olive branches as well as thorns.

Q. (By Mr. PHILLIPS.) It has been suggested that the Government of the United States should grant charters to railroads. Have you ever given that consideration?—A. No; I have not.

Q. That the charter where the road was doing an interstate business should be granted only by the Government of the United States?—A. No; I think it better that the States shall continue to grant charters and whatever interstate traffic passes over them shall pass under due interstate regulation, as on unchartered waters. National charters would conflict constantly with the rights of the States. There are also important railroads in the country which lie wholly in one State—like the New York Central and Pennsylvania proper—a great majority of whose earnings are derived from State traffic. It would be hard to draw the line if law gave to Congress alone the right to determine the charter of a new road. If so, it would appear to carry the power over all the charges of such a railway, and this can not be constitutional, of course.

On the subject of new roads, pardon me for saying a word more.

There are too many railroads in the country. We furnish more miles of road now for every 100 persons, or 100 tons, averaged throughout the country, than any other country. I have submitted figures elsewhere in this connection, and they establish another claim to national consideration. I therefore contend that, having built so many miles for so few people, we think that these earlier roads should receive protection against newer roads unless their public necessity is made apparent, as in England. This being assured, it might more fully warrant fuller control over the rate questions at issue. In other words, if there are two railroads from Washington to Baltimore—the Pennsylvania and the Baltimore and Ohio—and a third company asked for a charter, I do not think it ought to be granted, except under the amplest needs and safeguards against reducing reasonable rates and fares. We should not be indiscriminately subjected both to new competing lines and, after they are opened, to new competing rates, especially by those who claim we are but agents of the Government and performing public duties. That being so, it becomes in a sense an attack upon the Government, as it is a clear violation of its laws. I think if Government decline such consideration to the older lines, they should at least say to the new companies, in effect, "this multiplication of bonds and stocks is needless." They are equivalent to the watered stocks which we complain of so much and insistently against the older companies. At the same time, if they establish a public need for additional railroads, of course they can not be denied proper franchises.

Q. (By Mr. CLARKE.) Are you familiar with the laws of the several States regulating that subject?—A. No; I am not.

Q. In regard to public exigencies?—A. No; I am not.

Q. You are aware, I suppose, that it is embodied in some States?—A. I believe it is embodied in the Massachusetts law. I am not familiar enough to answer you affirmatively. England requires it, and the public good is manifestly conserved.

Q. (By Mr. A. L. HARRIS.) Has the pooling system been adopted in any other country?—A. Yes. In a part of the paper, which I desire to lay before you and which your Chair was good enough to allow me to bring in hereafter, I will submit that feature quite fully. That will give you an exact statement of the recent situation of pooling abroad. I invite particular attention now to the notable utterances upon the subject by Professor—now President—Hadley of Yale College.

Q. Is it the pooling system called the Joint Purse Association?—A. Called the Joint Purses in England, and so designated in the blue books, and only infrequently there called pools.

Q. (By Professor JOHNSON.) Are there pools on the Continent of Europe also?—A. There are pools in Italy, France, Germany, Austria-Hungary, and throughout the United Kingdom. For example, the London, Chatham and Dover and the Southeastern road, running from London to the Channel, have for years had the Channel passenger division—I think they call it—and yet they continue to contend for that large business actively within legitimate lines. There is also, as I remember, a pool between Glasgow and London. At first the people were in opposition to these plans, but now—as the railways give cheaper transportation and they get better facilities—the people of Glasgow have become reconciled, as they have in various districts elsewhere.

Q. (By Mr. PHILLIPS.) How do they differ from the Joint Traffic Association, with which you were connected?—A. The Joint Traffic Association was in terms almost identical in general features, but did not divide business or money as they are used abroad. This committee should perhaps better understand the difference between the English clearing house and their own joint purses and our association service. There are 2,000 or more clerks and attachés in the English clearing house service proper, and, as that name indicates, it simply clears the earnings in gross. They have stated meetings of the different district committees—the Lancashire district, the London, the Manchester, and others. These are held in the clearing house, but are not essential to its first purpose. If a railroad company desires to change a rate, it is submitted to the proper committee for the district affected, together with the reasons which fortify it, and these requests are sent to the members of such committee. The rate is not thereafter changed arbitrarily unless the competitors and connections consider and act upon it, which is showing only a due regard for all interests. If one company opposes the proposal, it goes over to the next meeting, and at the next meeting the rate can not be changed except by a two-thirds vote of the members, not of the whole conference, but that particular committee, unless the proposer acts summarily for itself, which is most rare. The changes of classification are more fully and generally reviewed. That is the way to get a new rate acted upon in England,

and the result is that every man who goes into business there is certain that he will have like and permanent rates with his fellow-merchants and railways; that there is stability and uniformity, and he knows if he wants a rate different from that in the tariff or classification, he has to go through this procedure to get it, and everybody else has to go through the same procedure. A man can not go into a railroad office there and get 2 or 3 cents paid back on freight at an hour's notice, and get a commission on tickets or scalp a fare; and yet we Americans, who clamor so loud for disturbing methods, were calling them competition, and go over there and adapt ourselves to their better procedures without any reason for demur.

At a dinner I attended in London, I asked what percentage of the entire business of the British Isles proper was carried on at established rates, and the answer was, 99 per cent or more. "Well," I said, "what becomes of the other 1 per cent?" and was told of a practice not much known in America, viz. the giving of credits for freight, which is equivalent to a drawback, but only to the extent of the rate of interest on the amount of the continuing credit. In other words, a large concern doing an immense business may be given £10,000 credit on the freight bills. In one case cited that night a large credit had run for 20 years. The railroad company was, to that extent, a partner in the business, furnishing considerable capital toward its development.

Q. What position did you occupy in the Joint Traffic Association?—A. I was its commissioner.

Q. When was it formed?—A. Three years ago last July, but it expired with the decision of the Supreme Court a year ago last October.

Q. What territory was embraced in that association?—A. Substantially all the territory south of the Great Lakes, including the peninsula in Michigan, and south of Lake Ontario and the St. Lawrence River on the north, to the Potomac on the south, taking in the Chesapeake and Ohio road, and west to St. Louis on a line drawn thence by way of the Alton road from Chicago. Subsequently the Canadian Pacific and the Grand Trunk became parties; except as to their local business, and the Canadian rates extended beyond the St. Lawrence so that we have had about 78 per cent of the tonnage of the United States and 75 per cent of the earnings of the United States in our territory, but only the freight and passenger traffic to, from, and through the western termini of the trunk lines at Buffalo, Pittsburg, etc.

Q. Were not other railroads doing business in the same geographical position almost compelled to join the association?—A. No.

Q. By force of circumstances?—A. No.

Q. They were not asked?—A. As a rule, no. They were notified by all their connections, party to the association, that the board of managers of the association would act for or with them in any case they might desire to submit, and it was also provided that any officer of a company not a member of the association in the territory had a right to appear and argue his case. For example, the lake lines, the Central of New Jersey, the Lake Erie and Western availed of this plan. The contract is on file with the Interstate Commerce Commission.

Q. (By Mr. KENNEDY.) A previous witness has said that if the railroads could have a pooling arrangement, and a company refused to go into the pool, remained out and pirated rates, that under cover of law they could combine against this other company. Did companies remaining outside of the pool pirate transportation rates; and if so, what steps did you take against those companies?—A. There have been no pools, of course, since 1897. At the time when the interstate law was approved those preexisting were promptly discontinued throughout the United States; therefore, the conditions to which you refer were prior to that time. The most notable pools that then existed were those west and east of Chicago. There were a number of roads west of Chicago that did not go into the pools and a number of roads east of Chicago that did not go into the Eastern pools. The pooling lines pooled only a small share of their whole business. For example, Buffalo to Albany. Washington to all points, Rochester to Boston were all outside the pool, etc. The pools east of Chicago were only few in number, and one pool did not cover the whole business or any considerable part of it. Chicago, Peoria, Louisville, Cincinnati, and Indianapolis, and St. Louis in that territory were the only points that were pooled, and that was east bound. Those pools represented an average of about \$12,000,000 a year, the largest balance ever accruing in one year was \$300,000, and two-thirds of that amount was subsequently returned to the companies that first paid it, because they reduced their tonnage so as to equalize the traffic. It was clearly not to their interest to carry the freight and then pay the proceeds to other companies. So all this clamor represented, in that great territory, about \$100,000 net. Dividing \$300,000 by the

tonnage handled from those points, it represented the enormity and public danger of 2.2 cents per ton, while the customary rebate would not be then looked at unless it was about 50 cents per ton. The other points were not pooled eastward. For example, Cleveland was not pooled, nor Detroit, Toledo, Terre Haute, Columbus, nor any of those places. They continued to transact their business the same as they had before, and measurably with the same losses and discriminations in rates. Then the pooled cities objected to the privileges enjoyed by the smaller ones. Now it is the smaller points which demur at the discriminations given larger points. There never was a threat made against a company, to my knowledge, that if they did not go into this or that pool they could not do joint business. As to the attempts of roads outside the pooled points to demoralize business that is true, and they were assisted in it by large shippers who diverted business to such open or unpooled channels. For example, if there was a line intermediate between Chicago and Peoria, or Peoria and St. Louis, through which a connecting company or a large firm could ship its freight and avoid the pool, they took that line and its rebates. In this and every other conceivable way the outside companies, plus concurring begging shippers, sought conflicts with the pools and to defeat their just purposes. The railroad companies that were pooled had no right to force others in and did not attempt it. Nor did they care whether they were in or out if they only observed the tariff rates. We had no rights or powers of enforcing our views, and finally these causes demoralized our business. Then came the organization of the Joint Traffic Association in our territory where the same conditions existed. The Norfolk and Western road, running to and from Norfolk, was not in the association. It used the same steamships east of Norfolk that were used by the Chesapeake and Ohio, and we never interfered with them. We simply asked them to maintain the transportation rates, which were the lowest in the world. That is all there is of it. If they did so, they aided the interstate law and our own wise purposes. If they did not, they introduced conditions we jointly condemn, but can not agree to jointly abolish.

Q. Suppose pooling were legalized, and in the competitive region a great railroad remained outside that pool and pirated rates, would not the companies in the pool be compelled in self-defense to take some concerted action against that railroad?—A. Only to this extent: If pools were ever made again, more railways ought to be pooled, and from more points, for the cogent reasons just now stated. If, however, important roads on the west or east—say, of Buffalo—would not take part in the pools, from whatever motive, the pooled lines would, under those circumstances, give them notice that, inasmuch as this pool was formed to preserve equal rates, they could not receive their traffic except on the same conditions, or, in other words, not more favorable than those existing between the concurring companies. If they still refused, the pooled lines would have to stand together as to rates so as to secure them. As to any other ways of discriminating than that, I have never heard them proposed.

Q. (By Mr. A. L. HARRIS.) You say the object was to maintain the lowest possible freight rates?—A. I say the rates which are the lowest of the world. I did not say to maintain them in any other sense than the observance of legal, just, and reasonable rates.

Q. The object is to maintain living rates?—A. Yes.

Q. Does that not destroy the natural law of competition?—A. No; I went very fully into that this morning. Our plan gives, in other words, full play to that purpose. Suppose, for example, that our rate from Buffalo to New York was 10 cents a hundred, as the result of a railway warfare which reduced the rate from 15 cents. Under the right to contract we might maintain the former rate, or, say, make it 12 cents. That rate comes duly published before the Interstate Commerce Commission, who might say they saw no reason why it should not be 12 cents with the altered conditions, after considering the 10 and 15 cent rates issued under the conditions suggested. There will then be two tribunals to consider the three rates, first, the railroad companies, which have the major interest in this matter, although they can not in any case get more revenues than their environments will permit, and second, the shippers. If this rate is under 15 cents, legitimate competition has more chance to work out its own rights and show its wrongs than it had at 10 cents, because the attitude of 10 cents is not that of competition, but strife and ruinous reprisals. The general public believe that all these things are competition, but do not know about it. The shippers, however, do know. We will say, as to the Pennsylvania from Pittsburg, or the Baltimore and Ohio, that there is no water route from Pittsburg to the Potomac or Delaware rivers. That is, there are no lines parallel, as is the Erie Canal to the New York Central and other railroads from Buffalo to New York. If, therefore, the competition of the Erie Canal may be ignored, why do not the interested companies

push up their rates to 15 cents from Pittsburg or Wheeling to Baltimore or Washington? It is because the unwritten law of actual competition says you can not maintain that rate. It is a natural law, and therefore beyond academic statutes which say you can not maintain against the Erie Canal from Buffalo to New York any undue rates. You have no water alongside your rails, but you have a line way off in Canada that will make a lower rate Chicago to Montreal, and you have another line from Cincinnati to Newport News which have as live an effect as if they were both adjacent to your rails. The railroad engine and the canal boat run side by side from Buffalo to New York with the West Shore Railway. That is just competition, although the State assists the canal and frowns on the railway.

Thus legitimate competition does its due work and strifes undo it and substitutes chicanery and demoralization. No mere makeshifts can adjust this issue. It must be thorough.

Q. (By Mr. CLARKE.) I would like to ask the witness about the frauds practiced by so many merchants, to which he alluded. Suppose those merchants were to combine their business, forming a vast corporation. Would their opportunity for fraud or for influencing discriminating rates be any greater than it is now?—A. Yes; for the reason that if 50 New York firms combined, like, we will say, Claffin, Arnold & Constable, and such houses as that, in dry goods, which pay 75 cents, the highest freight rate, and consolidated all their traffic on one line, they might say: "We will give you our combined business if you will not open these packages and make examinations; or, if we find you have done that, we will go to some other road, and take our traffic away from you. Our business now is in one central firm, pooled as you can not pool, and our business is worth \$2,000,000 a year. The business of any one of us was worth not over \$300,000 before. Now we want to be treated as a \$2,000,000 concern." They might also claim rebates, special time facilities, liberality in the payment of claims, etc., and get them.

Q. If the railroads were permitted to pool lawfully, so that the contract could be enforced, would that be an effective remedy against such powerful influences of large combinations?—A. I think so; undoubtedly, in the end. It would be effective against large combinations because it would give the opposing railroads incentives for building up the smaller men by like methods if they were not discarded. In every city of which I know anything the aggregate of all smaller shipments exceeds that which comes from the principal large shippers, and the smaller shippers, whether it be west bound in dry goods or east bound in something else, are ordinarily willing that their trade shall be transferred from road to road for the purpose of equalizing rates, because through such equalization they get trade they long for but have not had equal rates to secure. I say frankly that I do not see what is going to become of the great bulk of the small dealers if the great evil of discrimination goes on increasing, nor do I see how we are going to stop it except by good faith or by pooling. The principal reason is, however, that large and small railroads will have a common incentive to maintain rates through the knowledge that then if they do not get the tonnage they will receive the money therefor. The final reason is that railroads do not desire to build up large shippers, because it enables such forwarders to combine and dictate yet more onerous transportation terms. The first has surely been more of a failure than the last. It is in the nature of a surety bond to be collected against defaulters or wrongdoers.

Q. (By Mr. FARQUHAR.) Do you believe that the adoption of legalized pooling would abolish these discriminations?—A. Substantially; particularly if we had the right to make long-term contracts, in which period we could get rid of useless officers, offices, and agents, and bad methods, and so on. When the joint traffic association was formed the original proposition was to have it continue for not less than 5 years. It finally got down to 1 year, with a year's notice, which was substantially equivalent to 2 years; but when it came to the expense of offices in Broadway the railroads could not get rid of them, because they did not know what might happen in 2 years which might leave them, or some of them, stranded for business and their traffic gone to some other road. If that feud, more farseeing because more unbelieving, was done away with and we had the legalized right to make longer contracts we would go ahead and make them and let the public and weak lines and dishonest lines see that we were in earnest and treated all shippers alike, and these discriminations would then gradually cease.

Q. You are aware of the general statement, which, I think, is very generally accepted throughout this whole country, that no trust could live that did not receive railroad discrimination. What do you say about that?—A. I never heard it so put, but it is not true. If it is true you should legalize a motive and a method to stop it, and you can not do it unless you do.

Q. Well, is it true that what are now trusts, or the great businesses of this

country, whether the Standard Oil Company or others, have been built up by railroads?—A. To what extent that may be true I do not know.

Q. Has not that been accepted among railroad men as a fact?—A. It has been, unfortunately, the fact in the past that large shippers of all kinds of products have received and are now receiving advantages over other shippers. Whether that may be called fostering trusts you will judge. In some cases they may have been erected into the equivalents of trusts without incorporating them. But I can answer you, in part, by saying that if this thing keeps on they will have that effect; and if the large combined shippers find that no action is taken jointly by the Government with the railroads to stop their discriminating advantages they will unhesitatingly organize themselves into trusts or conferences. It is a very curious state of facts that the law passed against trusts does not reach or apply to them, and while it was not intended for railroads, it strenuously clutches them.

Q. You made this morning also the broad assertion that railroads do not pay rebates unasked ordinarily. The shipper does not need to go to a railroad to get a rebate, does he?—A. Yes.

Q. Up to 4 or 5 years ago have not your freight solicitors always offered them direct to the shippers, without their ever approaching an officer?—A. No; I am not aware of any such usage as that. Some companies may have sent their solicitors around to try and get freight away from some other company, and the latter may have sent theirs to keep it; but what occasion would I have, for example, as manager of one of the lines east of Chicago, to go to the largest dealer in a certain article and solicit his business and offer him a rebate when I was already getting his business at published rates? There always are, in all large cities and districts, certain railroads that, with a view of diverting business from their rivals, will go to shippers in that way; but when they go to the shipper or the shipper goes to the railroad it is the shipper who asks for the rebate and says he will change the route of his business, but that he wants so much, or the conditions desired are so and so, or that bills of lading be so granted, etc. Then the bill of lading is always made at the legal rate and the net result is arrived at by an agreement which, in every instance, makes both parties participants in the crime. That is what I meant by railroads not granting these allowances unasked.

Q. (By Mr. KENNEDY.) Your solicitude as to what may befall the small shippers if this practice of railroad discrimination goes on would seem to place you somewhat in harmony with many other witnesses who have been before the commission, who, however, have testified that the railroads, through discriminations and rebates and transportation favors, are the fathers and mothers of trusts. Do you take that view of it?—A. I do not think that they are the fathers and mothers of trusts. I think the railroad owners, as capitalists, have combined more capital to help themselves in perpetuating their control of certain lines and business and to help their shippers as well as themselves; but as to being influential in forming shippers into trusts for that purpose, I think there is no railroad company in the country that does not wish to control the carrying of the traffic of trusts, because the rebates and favors granted them—falsely in the name of competition—are gradually erecting them into such dimensions that they can control the terms of shipment, what they want and what they will accept in detail, exceptional conditions in foreign freights, and so on in the chapter, and therein lies the mutual public and railway apprehension which cooperative governmental and railway methods can most effectually restrict. If these shippers have erected themselves into substantial trusts now they have done so largely by the conditions I have mentioned, and they will push their advantages. For example, Mr. Carnegie, with all his public philanthropies and high character, built a railroad from Pittsburgh to Lake Erie to get lower rates than he had enjoyed as a favorite patron. That does not seem like a railway desire to build up a trust, but to avoid doing so.

Q. (By Mr. CLARKE.) Do you see a public danger in large shippers becoming heavy stockholders and directors in railroads?—A. No. I wish there were more of them. They could be reached then by the law, in the first place, and, in the second place, I think they would always be in the minority, and that the other directors would feel a keener sense of their public duty, and that the shippers who were directors would better understand the general relations of the railroad companies and carriers and their own duties to the public.

They would then necessarily lose sight of themselves as merchants, in part, in their large interests and responsibilities as carrying officers. I believe the large merchant is a large merchant because he is big enough to look at it in that way. I know some of the large owners of private enterprises who get into railway companies and make the best of directors, the most cautious and conservative of men, from the fact that they see then both sides of the issue. This is, as a vice-president of the Union Pacific road told me at one time, that perhaps the most con-

scientific and painstaking member of their board was Mr. Gould, who, having made his fortune by questionable methods, sought to maintain it and establish a new repute by methods that were unquestionable.

Q. (By Mr. PHILLIPS.) Have you given the subject of taxation any attention?—A. I have not the slightest. I have been so absorbed in these traffic matters that I have never seen a tax bill and never have had occasion to, and I have never paid any attention to anything of that kind.

WASHINGTON, D. C., February 13, 1900.

TESTIMONY OF MR. ANDREW FURUSETH,

Secretary of the Sailors' Union of the Pacific; chairman of the legislative committee, and international secretary of the Seaman's Union.

The commission met at 10.50 a. m., Vice-Chairman Phillips presiding.

Mr. ANDREW FURUSETH was introduced as a witness, and, being duly sworn, testified as follows, the topical plan of inquiry on transportation being followed:

Q. (By Mr. PHILLIPS.) You will please give us your full name and place of residence.—A. Andrew Furuseth, No. 106 Stewart street, San Francisco, Cal.

Q. What has been your occupation, and what is your occupation at present?—A. I have been a seaman since 1872, and have sailed under Norwegian, Swedish, German, Holland, English, and American flags. Since 1892 I have been engaged as secretary of the Sailors' Union of the Pacific. Being a member of that organization, I was elected to the secretaryship. On several occasions during that time I was sent to Washington in the interest of legislation for the seamen.

Q. For about how many years have you represented them in that capacity in Washington?—A. Five years.

Q. You are here now in that interest, are you?—A. I am here as representing the seamen and also the American Federation of Labor, being a member of the legislative committee of the American Federation of Labor.

Q. (By Mr. RATCHFORD.) Is your organization affiliated with the American Federation of Labor?—A. Yes; our organization is affiliated with the American Federation of Labor, and has been since 1892.

Q. (By Mr. FARQUHAR.) How many organizations of seamen are there in the United States?—A. There is one national seamen's organization only.

Q. (By Mr. PHILLIPS.) Where is their headquarters?—A. Its headquarters is in Boston.

Q. (By Mr. FARQUHAR.) What sections of the country do the seaman's union cover?—A. The Pacific coast, the Great Lakes, and the Atlantic coast.

Q. Have you any idea of the number of members that are in all these various unions?—A. I can not say exactly, but between 4 and 5 thousand; probably nearer 5 thousand than 4.

Q. How long have these unions been organized?—A. They were organized as an international union in 1892.

Q. What kind of organizations did they have before this international?—A. Local unions.

Q. How long have they been in existence?—A. On the Pacific coast from 1885; on the lakes, with short intermissions, from 1868, and on the Atlantic coast from 1890.

Q. Do you have any benefit organization in these unions, or any life insurance or mutual benefits?—A. No. We have a shipwreck benefit, and funeral benefit; that is, we bury the members. In case of shipwreck and loss of clothing, the organization pays a sum not to exceed \$50 to buy a new outfit.

Q. What are the general objects of the International Seaman's Union as set forth in its constitution?—A. To improve the condition of the seamen industrially, socially, and to improve the maritime law, to get improvements in the maritime law to such an extent as to make the law a help instead of a hindrance in the development of the body of American seamen.

Q. What regulations have you in respect to wages?—A. The local organizations govern their own wages; that is, the Lakes govern the wages on the Lakes, the Atlantic on the Atlantic, and the Pacific on the Pacific.

Q. Have you a national card that is transferable from one local to another?—A. Yes.

Q. Does that national card carry with it any benefits in respect to expense of travel, or what?—A. No; no traveling benefit.

Q. Then a seaman engaged in deep-sea navigation can transfer into the Lake trade, and from the Lake trade to the Pacific trade?—A. Yes.

Q. A seaman on the Lakes can transfer into the Atlantic and Pacific trade?—A. Yes.

Q. Have you any rules in respect to apprenticeship?—A. No. We are governed in that matter by law, or rather by an absence of law. Anybody whom the captain considers a seaman, is a seaman, whether he ever was to sea or not before. He can take anybody he wants.

Q. Is there a cooperation between the unions on the Atlantic seaboard, the Lakes, and the Pacific coast in respect to legislation affecting the seamen of the United States?—A. Yes, naturally so.

Q. Does that come through your executive boards or through legislative committees?—A. It comes through the convention.

Q. How frequently is your convention held?—A. We have had four conventions. The last one was on the first Monday in December, 1899.

Q. Then your legislative committees receive their instructions immediately from your convention?—A. Yes. One convention will instruct a legislative committee, and the next convention will go through what has been done, and then strike out and insert and do just as it wants with it; throw away and put together, just as it pleases.

Q. Have you an executive committee to whom these legislative committees can apply for further instructions as to the line of work that shall be carried on?—A. Yes.

Q. So there is full cooperation between the legislative committees and the executive committees?—A. Exactly.

Q. (By Mr. PHILLIPS.) We would be very glad to have you take up Part III of the plan of inquiry and give us any information you can in regard to the matter.—A. "The navigation laws as affecting the seamen." We, as seamen, hold to be responsible for the lack of American seamen, the laws such as they have been and very largely are yet. We hold that the laws themselves are responsible for the lack of seamen. Up to last year a seaman was subject to imprisonment for refusing to continue to labor in the United States as well as out of the United States. If he left his employment he was subject to being imprisoned, kept in jail for an indefinite period at his own expense, then taken on board of the vessel against his will, and compelled to proceed to sea in the vessel and do the work for which he had engaged. If, on arriving on board of the vessel, or at any later time, he refused to do the work allotted to him he was subject to penal or to corporal punishment and to being placed in irons upon short rations. On arriving in the next port, if he deserted, a certain amount of money would be offered—\$10 or \$15 or \$20, whatever it might be—for his detection and his return to the vessel. If the master wanted to do that he had the power to do it; if the master did not want to do it he had the power to leave it alone. This law was set in motion upon a master's request.

The food—speaking about the food—that is a matter of law. It was fully 50 per cent poorer than the food provided for the prisoners in Sing Sing. It was exactly equal to the English contract scale. It was about 50 per cent below the German scale, and just about 100 per cent below the Danish scale. Seamen rations are usually a matter of law, maritime nations outside of England having recognized that the seamen can not successfully make any contracts on that matter. Their housing—that is, the forecabin, the place where the seaman live—is also a matter of law. The provision is now, and has been for a very long time, that the seamen shall be entitled to 72 cubic feet of air space, not less than 12 feet on the floor space of his forecabin: that is to say, there is a space 6 feet long that way (indicating), the length of the bunk, 6 feet high, the height of a man, and 2 feet wide, the width of a good big man's shoulders. That is the space allotted to each man in all the steamers of the United States. In these new sailing vessels—that is, those built or rebuilt in the last 3 years and for the future—the law has made it 100 cubic feet air space. There has been in the matter of sailing vessels an improvement. In the matter of steamers there has been none. This same space is also the space of Germany and of England, but inasmuch as they do not use any deck loads they have no special temptation to cram and narrow the space. Houses are usually on deck, you understand, and they have no special temptation in that direction, and, therefore, though the law says 72 cubic feet in England, the actual space given is usually about 100 to 120. In the forecabin, which is certified to accommodate 32 men, there may be 24, so you see that makes a very much larger room than it would be if there were 32 men in it.

Now, the law does not provide, at present, any qualification for anyone who is a seaman; that is to say, the law does not set any standard of qualification, and does not specify any number of men to be carried in any vessel. It is left entirely with the judgment of the master or the owners of the vessel. Custom in olden times used to determine the qualification. Four years' apprenticeship is customary yet in England. Apprenticeship has been abolished in most countries. A boy goes to sea as a boy; then he becomes, in Germany, what they call a young man; then an ordinary seaman, and then an able seaman, step by step, and it usually takes him 4 years to-day before he gets certificate as an able seaman. In those vessels the custom of hiring men who have no skill is not as prevalent as it is in English and American vessels. The same condition exists as to Norway and Sweden. In Denmark the boy goes to sea as a deck boy; he becomes a young man; the second year he is at sea he will be called that; the third and fourth year he is at sea he will be called an ordinary seaman, and after he has been 4 years to sea or so, then the captain will give him a discharge as an able seaman. That is to say, the captain makes an able seaman of him. That is very often the case. In the next vessel he ships as an able seaman. In American vessels there are no qualifications at all as to standard of skill. The Navy has a standard, and a very exacting one—the old standard of years ago—and it is safe to say that no more than 15 per cent at the highest of the men engaged as seamen on the Great Lakes could come anywhere near passing the naval standard as able seamen. The vast majority can not pass the naval standard as ordinary seamen. I should judge that about one-half of the men on the Atlantic coast might pass as able seamen; about one-quarter as ordinary seamen, and about one-quarter, well, outside of any standard in the Navy, they would call them landsmen. The same rate of efficiency obtains, about, on the Pacific coast. Our law has been very peculiar, not only with reference to the skill of the seamen, but also with reference to the skill of the masters and officers. The only qualification, up until lately, for any master of an American sailing vessel was that he should be a citizen; and as far as maritime law was concerned, he might come from Montana and never have been to sea in all his life; and the same with everyone on board of the vessel. Now, this subjects the seaman to competition with anyone in a seaport who happens to be out of employment, and whom the "crimps" may induce to go to sea. In addition to that he is subject to competition from all nations and all races, in the same way as with the American on this continent. There is no restriction except as to officers, upon the nationality, upon the race, or on skill, and the result is that the wages of seamen are not really set by the seamen themselves, but it is just about the kind of wages that the idle men in the seaport can be induced to accept.

American vessels carry less men than English, German, or European continental vessels; carry less men measured by tonnage.

Q. (By Mr. RATCHFORD.) Such men as sailors and ship hands?—A. Yes; less sailors, or firemen in a steamer—anyway, less men. The only country that really has a definite law about the matter of manning vessels is New Zealand. They have an efficient manning law, enacted by the parliament, but on the Continent it is governed by custom, and as labor-saving machinery has gone in the number of men have been reduced; but it has been reduced out of proportion, so that there is really not to-day a vessel—and I am now giving what I have read from the German naval architect—he said there is not a sailing vessel efficiently manned to-day.

Q. (By Mr. FARQUHAR.) In Europe or in America?—A. In Europe or in America? Of course from my own personal knowledge and experience I know that many vessels get into serious trouble, taken aback, as we call it, the yards braced up like that, and when it strikes on a vessel that way (indicating), and when she shifts around and comes in from this side, the vessel is thrown aback. Now, the safety of the vessel depends upon quick work; and in 9 vessels out of 10 the only thing you can do is to depend on the strength of the gear and get along the best you can. The ability to swing the yards quick enough is out of the question; that can not be done to-day. Vessels that used to carry—well, we will take the *Glory of the Seas*, as an instance. The ship *Glory of the Seas* used to carry 36 men; she now carries 14. We have vessels on the Pacific coast which, while sailing in the foreign trade, carried 18 and 20 men, but now carry 10.

Q. (By Mr. PHILLIPS.) What is the cause of this reduction; is it on account of improved machinery?—A. They have usually put in a donkey winch to lift the anchor. This donkey is usually used going in and out of port; that is, for lifting the anchor and hoisting sails at once; but at sea there is no fire on the donkey, and the Armstrong patent must be resorted to.

Q. (By Mr. FARQUHAR.) Will you kindly state these improvements that have

Q. Does that national card carry with it any benefits in respect to expense of travel, or what?—A. No; no traveling benefit.

Q. Then a seaman engaged in deep-sea navigation can transfer into the Lake trade, and from the Lake trade to the Pacific trade?—A. Yes.

Q. A seaman on the Lakes can transfer into the Atlantic and Pacific trade?—A. Yes.

Q. Have you any rules in respect to apprenticeship?—A. No. We are governed in that matter by law, or rather by an absence of law. Anybody whom the captain considers a seaman, is a seaman, whether he ever was to sea or not before. He can take anybody he wants.

Q. Is there a cooperation between the unions on the Atlantic seaboard, the Lakes, and the Pacific coast in respect to legislation affecting the seamen of the United States?—A. Yes, naturally so.

Q. Does that come through your executive boards or through legislative committees?—A. It comes through the convention.

Q. How frequently is your convention held?—A. We have had four conventions. The last one was on the first Monday in December, 1899.

Q. Then your legislative committees receive their instructions immediately from your convention?—A. Yes. One convention will instruct a legislative committee, and the next convention will go through what has been done, and then strike out and insert and do just as it wants with it; throw away and put together, just as it pleases.

Q. Have you an executive committee to whom these legislative committees can apply for further instructions as to the line of work that shall be carried on?—A. Yes.

Q. So there is full cooperation between the legislative committees and the executive committees?—A. Exactly.

Q. (By Mr. PHILLIPS.) We would be very glad to have you take up Part III of the plan of inquiry and give us any information you can in regard to the matter.—A. "The navigation laws as affecting the seamen." We, as seamen, hold to be responsible for the lack of American seamen, the laws such as they have been and very largely are yet. We hold that the laws themselves are responsible for the lack of seamen. Up to last year a seaman was subject to imprisonment for refusing to continue to labor in the United States as well as out of the United States. If he left his employment he was subject to being imprisoned, kept in jail for an indefinite period at his own expense, then taken on board of the vessel against his will, and compelled to proceed to sea in the vessel and do the work for which he had engaged. If, on arriving on board of the vessel, or at any later time, he refused to do the work allotted to him he was subject to penal or to corporal punishment and to being placed in irons upon short rations. On arriving in the next port, if he deserted, a certain amount of money would be offered—\$10 or \$15 or \$20, whatever it might be—for his detection and his return to the vessel. If the master wanted to do that he had the power to do it; if the master did not want to do it he had the power to leave it alone. This law was set in motion upon a master's request.

The food—speaking about the food—that is a matter of law. It was fully 50 per cent poorer than the food provided for the prisoners in Sing Sing. It was exactly equal to the English contract scale. It was about 50 per cent below the German scale, and just about 100 per cent below the Danish scale. Seamen rations are usually a matter of law, maritime nations outside of England having recognized that the seamen can not successfully make any contracts on that matter. Their housing—that is, the forecabin, the place where the seaman live—is also a matter of law. The provision is now, and has been for a very long time, that the seamen shall be entitled to 72 cubic feet of air space, not less than 12 feet on the floor space of his forecabin: that is to say, there is a space 6 feet long that way (indicating), the length of the bunk, 6 feet high, the height of a man, and 2 feet wide, the width of a good big man's shoulders. That is the space allotted to each man in all the steamers of the United States. In these new sailing vessels—that is, those built or rebuilt in the last 3 years and for the future—the law has made it 100 cubic feet air space. There has been in the matter of sailing vessels an improvement. In the matter of steamers there has been none. This same space is also the space of Germany and of England, but inasmuch as they do not use any deck loads they have no special temptation to cram and narrow the space. Houses are usually on deck, you understand, and they have no special temptation in that direction, and, therefore, though the law says 72 cubic feet in England, the actual space given is usually about 100 to 120. In the forecabin, which is certified to accommodate 32 men, there may be 24, so you see that makes a very much larger room than it would be if there were 32 men in it.

Q. Asiatic sailors you would class as Japanese, Chinese, and Lascars?—**A.** The Lascars are East India sailors; then the Chinese, then the Japanese, then the Manila men—what we call, in sailor language, the Manila man—really Tagals. The vessels that trade between Hongkong and San Francisco, and Hongkong and Puget Sound and way ports, irrespective of their nationalities, whether American, British, or Japanese, ship their men in Hongkong or in Yokohama; the Japanese ship men in Japan; the English and American lines ship their men in Hongkong; and the wages are, as I said, \$16 Mexican. That is permitted to our shipowners under section 20 of an act to remove certain burdens on the American merchant marine, and encourage the American carrying trade, and for other purposes, approved June 26, 1884. The substance of that section is that the master of an American vessel may ship his crew in a foreign port to come to the United States and return to any foreign port one or more trips, and he need not reship any of them in the ports of the United States: so, as far as deep-water and line steamers are concerned, whether sail or steam, there is no such thing as American wages. It is international wages; it is wages of the port where the vessel is.

Q. What is the proportion in the deep-sea marine service of these Asiatics, of the men of all nations?—**A.** Well, England has about one-fourth, I think; one-fourth of our merchant marine is manned by Asiatic seamen; that is, not Asiatics altogether, but including the Turks and Arabs.

Q. (By Mr. CLARKE.) Why are the sailors employed in the coastwise trade better off than those in the deep-sea trade?—**A.** Because in the coastwise trade, from 1874 and up to 1890, the seamen were free to quit. Being free to quit work, he was free to organize; that is one reason. Another reason is that he has to do more and harder work, and it requires a better class of men.

Q. (By Mr. RATCHFORD.) In the coastwise?—**A.** In the coastwise.

Q. (By Mr. PHILLIPS.) That is because of landing more frequently?—**A.** Yes, and handling the cargo. They carry a small number of men, and for this and several reasons want the best men they can get.

Q. (By Mr. RATCHFORD.) Taking into consideration, then, wages as between the two classes of men, you believe those in the deep-water trade are better off, do you?—**A.** No.

Q. Those in the coastwise trade are better off?—**A.** Those in the coastwise trade are indisputably better off. The wages are better, and the treatment is better.

Q. (By Mr. CLARKE.) The coastwise trade is exclusively American, is it not?—**A.** It is exclusively American as to vessels but not as to seamen.

Q. (By Mr. KENNEDY.) And the nationality?—**A.** It is open, as far as seamen are concerned. The coastwise trade is as open to the world as any other trade. There are no restrictions as to nationality, skill, or race.

Q. What is the proportion of the nationalities?—**A.** Well, on the Pacific coast I should think that the Scandinavians, including with them the Finns, predominate; next would be Germans, and last of all, Americans.

Q. (By Mr. RATCHFORD.) What proportion are Americans?—**A.** Not more than 10 per cent at most.

Q. Do the vessels in the Pacific coastwise trade that are manned by foreign nationalities float the American flag?—**A.** Why, of course.

Q. All the vessels in that trade float the American flag?—**A.** No vessel can get in the coastwise trade at all unless she floats the American flag. She can not carry passengers or cargo from one port to another unless she is built in the United States and owned in the United States and carries the American flag.

Q. (By Mr. CLARKE.) You understand that the coastwise trade is prosperous and has been from the beginning of the Government, or from the passage of the first navigation laws making it exclusively an American trade?—**A.** Well, the coastwise trade is prosperous; for what reasons it is prosperous I do not know, particularly. It is not manned by Americans.

Q. Do the masters of coastwise vessels have the equal opportunity to engage foreign sailors that the masters of transoceanic vessels have?—**A.** Certainly. That is to say, they can not go over to Liverpool to engage them there, but they engage anyone who happens to be in New York or Philadelphia, or in Boston—they must get them on the American coast somewhere. As to the proportion of Asiatic seamen, I will say Germany uses none. It is a very rare thing to have an Asiatic on a German, Scandinavian, or French vessel. The only nations who use them are England and America; that is, to any extent.

Q. (By Mr. KENNEDY.) What is the proportion of Scandinavians, German, and Americans in the Atlantic coastwise trade?—**A.** I should say about 10 per cent Americans, and the rest are made up of men from all over the world.

Q. Scandinavians and Germans, mostly?—**A.** Probably Scandinavians predominate.

Q. That is the order which the secretary of the Atlantic Coast Seamen gives them. He says, however, the majority are American citizens or have declared their intentions.—A. I am speaking of men born in the country.

Q. Are the majority American citizens or have declared their intentions to become such?—A. He has better acquaintance with that than I. I am satisfied, of course, that a great many are citizens. I know on the Pacific coast a great many were citizens. Prior to 1893 about one-half of the entire lot of coasting seamen were citizens or declared their intentions to become citizens. During 1893 and 1894, however, just about one-half of the entire personnel, as far as seamen were concerned, left the Pacific coast; and as to the proportion now I can not say.

Q. (By Mr. PHILLIPS.) You referred to "crimps." How are sailors obtained?—A. In this way: The master of the vessel, or the owner of one or more vessels, goes to or receives a visit from a marine employment agency, I should judge you would call him; we call him a shipping master. In ordinary language among us seamen he is called a "crimp;" and he makes a contract with this marine employment agent, or "crimp," to furnish a crew for him, or crews for his vessels, as the case might be. They agree about what the wages are to be, and the seamen have no more to do with it under ordinary circumstances than has the man in the moon.

The captain meets the crimp and says to him, What can I get a crew for? Well, where are you going? I am going to Cape Town, say, this being New York City. Well, \$18 a month; \$18 allotment to the original creditor; that is, they do not call it so; they call it advance, \$18 advance and something on the side. The captain says, There are lots of men around New York at the present time; I would like to know how much you are going to pay me back out of that \$18. Well, I am not going to pay you anything back. Well, then, I will go and see Jones; I guess he will give me back something, a part of the \$18. So a part of the \$18 or part of the amount that is given as an advance goes back to the captain of the vessel. Now, the arrangement is made between the crimp and the master of the vessel, and the crimp says he has a shipping office down South street or West street, and men come around there looking for employment. And he says, Well, I have the *None-Such*; she is going to Cape Town, and I want a crew for her; \$18 a month; will you go? No, I will not. Somebody else goes around and asks for employment, and he asks them the same question. Well, they go. That is how the employment is made. If he does not get any men in that way, he speaks to the boarding master; that is, the seamen's landlord, as they call themselves. They keep boarding houses in which sailors live usually; and the shipping master speaks to them and asks, Have you any men for the *None-Such*? Oh, yes. Then it becomes a dicker between them what is going to become of the \$18 or whatever advance is being paid, and if there is any blood money, what is going back of the blood money. And again, no matter how it is fixed, the sailor goes to sea for the wages that they have set, and his first month's wages goes with it. It used to be about two month's wages, but the last Congress changed it to only one, not exceeding one month's wages allotment. We have it changed; we tried to have it brought down to nothing.

Q. (By Mr. RATCHFORD.) To make that clear, that allotment is money advanced to the sailor by the shipping master?—A. No; it is money advanced by the vessel; it is money advanced by the vessel ostensibly to the sailor. The sailor must sign an order upon the vessel in favor of blank for one month's wages. He settles up with the shipping master and the shipping master draws the order after the vessel has gone to sea.

Q. Well, you spoke of some of this money being returned to the captain?—A. Yes. When the sailor has signed the order and the captain has accepted the order, certified to its correctness, the shipping master gives the captain so much, whatever they have agreed upon.

Q. (By Mr. CLARKE.) It is a private perquisite to the captain, is it not?—A. Yes; that is a private perquisite to the captain.

Q. (By Mr. FARQUHAR.) Under the present law is not the matter of advance abolished? It was nothing but allotment.—A. That is right; the advance is abolished, but the allotment is paid now, three days after the vessel leaves port. So, while it is called an allotment, it is an advance.

Q. What is the whole amount that the sailor can make by allotment?—A. He can allot not to exceed one month of his pay now.

Q. The old way he allotted—he could mortgage everything?—A. Well, not quite that much, not to exceed \$10 a month, and prior to that everything.

Q. (By Mr. CLARKE.) This allotment then practically is often divided between the sailor, boarding-house keeper, shipping master, and the captain of the vessel?—A. Exactly.

Q. (By Mr. FARQUHAR.) The allotment then is simply to pay the sailor's shore debts?—A. That is what it is meant to be.

Q. (By Mr. RATCHFORD.) Is it compulsory in case he has not any debts?—A. He can allot part of his wages to his relatives.

Q. (By Mr. FARQUHAR.) His family?—A. To his family. To the question as to whether it is compulsory, whether he has any debts or not, I should say yes. Anyone shipping out of New York or San Francisco in a deep-water vessel without taking an advance is such a rare man that I would like to see him. No matter whether he likes it or not—that cuts no figure. The shipping master must have something, and he can only get it by advance or allotment.

Q. (By Mr. RATCHFORD.) And I understand you to say that this is provided by the law?—A. Yes.

Q. If he reaches the other port within a month, or within the time necessary to render equivalent labor for the amount of money he has drawn, is he privileged to quit the vessel then?—A. He is not privileged to quit the vessel, irrespective of whether he has had any allotment or not. He can be reclaimed. A sailor that deserts in England, Africa, Australia, or China can be reclaimed. That is the term used by the law. He can be reclaimed, put in prison, and held there until the vessel is ready to put to sea, and then put on board and made to go to work. According to the Commissioner of Navigation's report, 80 men were thus reclaimed in Callao last year, in Singapore 1, and in Yokohama 1; and 1 was punished besides; that was in Singapore.

Q. (By Mr. KENNEDY.) Do the crimp and the boarding-house keeper generally work together to keep the sailor in the toils by making him take advances, thus keeping him in debt?—A. Certainly; yes. One knows how much money he had when he came ashore, and the other governs how much money he will get when he is going; and as a usual proposition he has to spend it all before he goes to work.

Q. (By Mr. FARQUHAR.) Has your union proposed and submitted to Congress any remedial law about this matter of the crimp and the shipping master and the allotment?—A. Yes.

Q. Have you any remedies whereby those men could be taken away from these boarding-house keepers, from the parties that follow them and feed them with liquor and everything of that kind and debauch them?—A. Yes; we have. If Congress will abolish the allotment to original creditors and make a law compelling the vessel to pay the seaman one-half of what is actually due in every port where the vessel loads or delivers cargo, and give the seaman the full right to quit wherever he is, the crimp will be starved to death and have to go out of business. We say that will take place, because we know what has taken place in England, Plymouth, Portsmouth, and Sheerness, the three men-of-war ports of England, were the worst crimping dens in the United Kingdom. The admiralty decided to pay the men their wages monthly irrespective of where they happened to be, and the result of that arrangement completely wiped out the crimping dens of those three ports.

Q. (By Mr. KENNEDY.) Is it true that the crimps never slip a member of your union if they know him to be such?—A. If they can help themselves; no. That is true as a general proposition.

Q. (By Mr. RATCHFORD.) Has your organization at any time taken action upon this matter by offering protests?—A. We have been engaged in offering protests for the last 6 years and asking for legislation, and some of it has been obtained.

Q. (By Mr. PHILLIPS.) "Proposed amendments to our navigation laws; foreign navigation laws compared with ours;" what have you to propose in that regard, and what is your organization proposing?—A. The best answer to the question as to what we have to propose would be to give what we have actually drafted—a bill to amend the laws relating to American seamen and to improve the personnel of the merchant marine.

Q. You might briefly state what you propose to accomplish by this law or these amendments.—A. Well, we propose to abolish crimping altogether, as far as it can possibly be abolished by law. We propose to increase the space in the fore-castle; to give the seaman one-half of what is actually due him in every port where he loads and discharges cargo, and to give the seaman the right to call for a survey of any vessel that he may happen to be in without the officers of the vessel taking part in the request; and to establish a standard of skill and experience for those who sign as able seamen; and to get a law providing for the standard or number of men to be carried by vessels according to their tonnage and rigging. Those are the contents of this bill.

Q. (By Mr. FARQUHAR.) In the case of a survey, how many of the crew do you propose shall join in the request?—A. A majority of the crew, exclusive of

officers. The manning bill proposed here is taken directly out of the recommendation made by the British commission on manning of vessels. There was a British commission for that purpose, and after listening to some 180 expert witnesses, they made certain recommendations to Parliament; and we have taken their recommendations and put them in as our bill. England has no manning law; Australia has. Germany and the Scandinavian countries only have by custom; that is all. There is no specific law in any of these countries as to how many men a vessel shall carry.

Q. (By Mr. CLARKE.) When you say Australia do you mean all the Australian provinces or some one of them?—A. Well, I mean particularly New Zealand in this matter. With reference to the reason why England appointed this commission, it was that England found that where she used to have about 20,000 apprentices, she has now less than 3,000, and there has grown to be a greater and greater scarcity of British seamen. That is the reason they appointed this commission, and this is what the commission has to say: "Owing to unrestricted competition and the absence of any requirement as to qualification, the quest for employment in the mercantile marine has degenerated in many cases into a mere scramble in which very little consideration is bestowed on the condition of the service so long as employment is secured."

Q. What is the date of that report?—A. 1896. Report of the committee appointed by the board of trade to inquire into the manning of British ships.

Q. (By Mr. PHILLIPS.) Upon the whole, are the foreign laws more favorable than the laws of the United States in regard to the seamen, their duties and privileges?—A. At present, taking it altogether, no. They are much superior in some instances; in some instances they are not as good as the foreign. In the matter of forecables, in the matter of general treatment on board of a vessel, that has very little to do with the law. We have a law forbidding brutality now—prohibiting corporal punishment—and it is being administered, and is being used continually, all the same. The law is being violated. It is not a common thing at all in continental or English vessels; it is a very rare thing. They have laws forbidding it, too, but they are better obeyed than ours. If amendments could be made to the existing laws, such as are proposed here, our law would be up to the best.

Q. (By Mr. CLARKE.) How frequent is this corporal punishment, and what form does it take?—A. Well, it takes the form of a club—a belaying pin. That is a stick like a policeman's club—a blow over the head with that is the most frequent kind. We use these in the rail of a vessel to make fast ropes on, and it is very handy to take one out and use it.

Q. Is that punishment administered by the officer of the vessel at his own caprice and without any order from his superior, or without any control as to the man's offense?—A. Yes; that is right.

Q. Usually done in haste, then; sometimes in passion?—A. Always in passion, I would rather say.

Q. (By Mr. PHILLIPS.) And always by some officer of the vessel?—A. Yes.

(By Mr. KENNEDY.) I am informed that the law which was passed recently through your assistance is considered very satisfactory to the seamen, at least on the Atlantic side, if it was enforced. The ship owners or the masters say that there never was a law enacted for the benefit of the sailors that they could not drive a horse and cart through. I would like to ask you if that is your experience with any of those laws that have been enacted for the benefit of the sailors in this country, and how it is in other countries?—A. Well, the expression that you can "drive a horse and cart through" is generally used to signify that the law is not enforced and that it is evaded. There are certain errors and mistakes in that law that was passed last year. They were pointed out at the time, such as the repealing of some of the old law that had worked well. That causes the law that was passed last year to be ineffective in some instances, just as good as useless in some instances. That law provides that foreign vessels shipping crews in American ports shall be subject to the provisions of that act, which is that they shall pay no more than one month's allotment to original creditors; pay no more advance than that. They violate that continually, have been violating it right along, and there is no means of getting after them, because you can not get the evidence. They pick up some man going aboard of some vessel and take him away, and when they get to the other place, as soon as he is out of the jurisdiction of the country, then that settles it; they take away the evidence, take the evidence away with them, and unless their articles be subjected to inspection by the custom-house officers, they will no doubt continue to use that kind of means of evading the law.

Q. (By Mr. CLARKE.) If you can not get the evidence of the evasion, how do

you know they do evade it?—A. We know it, because we know it afterwards when the time to prosecute is gone by. We know the evasion of the law takes place. But there is a great deal of difference between knowing a thing and being able to prove it legally.

Q. (By Mr. RATCHFORD.) Are there some beneficial features to that law?—A. Oh, yes.

Q. On the whole, it has been a benefit to the seamen?—A. On the whole, it has been a very great benefit.

Q. You speak of the law that was enacted by the Fifty-fifth Congress?—A. By the last Congress; on the whole, it has been a very great benefit.

Q. (By Mr. FARQUHAR.) Has any other nation any better law?—A. As far as that law goes, and on the points upon which it touches, no.

Q. Have you any fault to find with the law in respect to the quantity of food? You spoke of the small rations that the American seamen receive in comparison with other countries.—A. The only complaint we have in that direction is the water. We would like to have an increase in the water from 4 quarts or 1 gallon to 6 quarts, and an increase in the butter from 1 ounce to 2. That is put in this bill, and that is the only improvement in the scale of food that we desire to ask for. With those two exceptions the scale of food is perfectly satisfactory to us.

Q. Can you give the commission hereafter a comparative food scale of five or six of the nations?—A. Yes; I now submit the American, Australian, German, and Danish scales:

Scale of provisions required by law on ships of American merchant marine.

| | | Sunday. | Monday. | Tuesday. | Wednesday. | Thursday. | Friday. | Saturday. |
|--|--------|---------|---------|------------------|------------|-----------|---------|-----------|
| Water | quarts | 4 | 4 | 4 | 4 | 4 | 4 | 4 |

GERMAN SCALE.

[Bremen decree, March 17, 1899.]

| Ration. | Daily. | Twice weekly. | Weekly. |
|------------------------|--------|---------------|---------|
| Bread.....pound.. | 1 | | |
| Mess beef.....pounds.. | 1½ | | |
| Fish.....pound.. | | 1 | |
| Butter.....do..... | | | 1 |
| Coffee.....ounces.. | | | 6½ |
| Tea.....do..... | | | 1½ |
| Water.....quarts.. | 4 | | |

In addition each member of the crew must receive three-quarters of a pound of vegetables (potatoes or sauerkraut, etc.), one-quarter of a pound of dried fruit, 11 ounces of sugar or molasses, and one-half pint of vinegar weekly.

Leaving a home port, beer to the amount of 45 quarts for each of the crew must be carried, to be served out at discrimination of the master. When the ration of beer falls short from any reason, the daily ration of coffee shall be increased to 1½ ounces.

Dried pease, beans, or oatmeal to be served in sufficient quantities.

Mess pork or bacon may be alternated or substituted with beef, at the rate of 1 pound and 1½ pounds, respectively. After salt meat has been used for six weeks continuously, a ration of 1 pound of preserved meats twice a week must be substituted. If the ship's complement consists of ten or more hands, one extra ration of meat, fish, and water must be served.

A six months' supply of butter must be stored on board at the home port. One and a quarter pounds of lard, or 1 pint of olive oil, or an additional ration of 1½ pounds of beef, or 6 ounces of bacon may be substituted for butter.

DANISH SCALE.

| Ration. | Weekly. | Ration. | Weekly. |
|-----------------------|---------|---------------------------|---------|
| Bread.....pounds.. | 7 | Coffee.....pound.. | 1 |
| Mess pork.....do..... | 1½ | Sugar.....do..... | 1 |
| Mess beef.....do..... | 3 | Tea.....ounce.. | 1 |
| Butter.....pound.. | 1 | Barley (pearl).....pint.. | 1 |
| Codfish.....do..... | 1 | Beer.....gallons.. | 1½ |

Water in sufficient quantities, without waste.

Potatoes, pickles, cabbage, horse-radish, or dried or preserved vegetables must be given at least twice a week at sea and in port.

Fresh mess, consisting of at least one-half pound of preserved meat, without bones, and one-half pound of bouilli, must be given once a week at sea.

The ration of hard bread may be substituted by soft wheat or rye bread at the rate of 7 pounds or 10½ pounds each, respectively.

Instead of butter may be given one-half pound of olive oil, with the necessary vinegar, or 2 pounds of mess pork.

Whenever the circumstances of the voyage will permit, the stipulated ration of beer must be kept on board. Under other circumstances wine may be substituted at the rate of one-half pint per day, or grog (French brandy or rum) at the rate of 1 gill per day, or Danish corn brandy at the rate of one-half gill per day.

Mustard, salt, vinegar, sirup, prunes, and dried fruit must be given daily in sufficient quantities.

Q. Is there any question about the quality of the food?—A. Well, of course, we are not getting the new scale. In the deep-water vessels they are not giving it; they are not giving it even in some of the coastwise vessels. It has not come into general operation. Just as in a vessel on the Atlantic coast, where the men insisted upon having the scale, the master gave it to them without cooking it. He says, "The law does not provide for cooking it."

Q. What is the permanency of employment in the Continental and English marine? Do men ship and do they perform work on the same vessel for, say, 10, 12, or 14 years?—A. No.

Q. How long?—A. No; usually about a year or two. They ship for a year.

Q. But you take what are called the liners, freight and passenger, what is the

average time of employment on those continental or English ships?—A. That I do not know. I have never sailed on them.

Q. Is there as much shiftiness of employment with the European marine as there is with the American?—A. I could not say.

Q. Have any of the other nations this right that you contend for—that a seaman shall ship for a certain point and then have his discharge, whether he makes the return port or not?—A. No.

Q. Is the American better?—A. On that point it is better than most of them, except England. The English law gives the seaman the right to quit in England, but with the other nations, after having shipped and left the home port, he can not quit at all; he becomes a deserter and can be taken back.

Q. What are the penalties for desertion of a ship?—A. Penalties for desertion at the present time? There is really no penalty for desertion in a home port. The sailor has a right to quit in the home port; simply takes his clothes with him and goes. He leaves all the money he has earned behind him. That is the penalty.

Q. That is the forfeiture?—A. He forfeits what money he has earned. That is the penalty. In a foreign port he is taken back as I stated.

Q. Now, in the case of a sailor being left sick or in a hospital, say at Hongkong or elsewhere, what are the provisions of this Government for the return of that sailor through the consul or commercial agent?—A. Congress appropriates annually a certain amount of money for the return of sick and disabled seamen; and being left behind by a vessel in some place where the consul can not ship him, and left on the consul's hands in that way, he can be returned to the United States at the expense of the United States. Congress appropriates money for that purpose.

Q. (By Mr. CLARKE.) Therefore to protect the United States it is not necessary that there should be a law requiring a sailor to return in the vessel that he shipped upon from American ports?—A. It would be much better for him if they would abolish the return to the United States and leave the sailor free to quit.

Q. Well, how about the Government?—A. Well, the Government would not have any expense then.

Q. (By Mr. PHILLIPS.) And leave the sailor free to quit?—A. Leave the sailor free to quit and to get his money, too.

Q. (By Mr. CLARKE.) I think I have recently seen a statement by a consul that a great many sailors who have left their vessels become dependent, and he has to help sustain them, and then help them back to the United States at the expense of the Government. Is it desirable that that condition of things should be avoided?—A. It does not strike me as being of any importance at all. These men are in all probability driven out of the vessels they were in, without receiving any money for the work they had done. They came ashore and went to some boarding house or some place and then they were thrown on their own resources, afterwards thrown out by these boarding masters, and the result was that they were destitute. Now, if they had received no allotment when they shipped and had received the money that was due them when they quit, they would have had money enough to live on until they could get another vessel, and would not be in need of any charity either from the United States or from individuals.

Q. Why do you say they were probably driven out of the vessels?—A. Because vessels lying in a port waiting for cargo, do not keep the men on board. The law of 1884 provides that the master may discharge the men if they consent to be discharged, by paying them what is due them. Now, sometimes the master will not do that; he will not pay them what is due them. They will ask to be discharged and he will say "no." He will treat them in such a way that they will have to get out of the vessel and leave the money behind them.

Q. You mean that they are driven out by bad treatment?—A. Yes.

Q. And that this is a scheme of the master of the vessel to save money?—A. Yes.

Q. Well, can you provide against that by law?—A. By saying that when a man leaves a vessel he receives all the money he has earned.

Q. (By Mr. RATCHFORD.) How frequently do sailors receive their wages now, under our present system?—A. With an average good master of a vessel, when he comes into a port like Singapore or Hongkong, if he does not want to keep them on board, he says, "Well, any of you that want your money can get it;" and he takes them to the consul and pays them off, and they go.

Q. That is entirely left with the master?—A. The payment. He can not go to the master and say "I want to quit the vessel and get my money." If the master does not want to give him his discharge and his money, he can not get it. If the master wants to give him his discharge and his money and he refuses to take it, he will leave in a week or two without it invariably, because then the treatment becomes such that he will be glad to leave the vessel.

Q. Could you state one or more cases in which the master of the vessel has

held money or wages of his men for an unusual length of time?—A. The way that the articles are signed nowadays—and I do not know how far back the practice extends—is, no money except at the master's option; shipped for 12 months and no money except at the master's option. Go to the master and ask for some money and he says "no." I have been 6 months on board of a vessel and could not get a cent. I have been again in other vessels where I would get whatever money I wanted—that is, reasonably, whatever money I wanted; and that is the experience of every sailor. As a usual thing, when the master refuses to give a sailor any money he means by that, "You better get out of here." He refuses him that money in order to drive him out of the vessel.

Q. (By Mr. CLARKE.) Why does a man sign a contract that he will serve without money except at the master's option?—A. Because he has no option in the matter.

Q. That is to say he is poor and ignorant and perhaps— —A. (Interrupting.) He is not necessarily ignorant but he is poor. I am a sailor—know my work, I can do it on board of a vessel—taking me as an instance: I refuse to sign that kind of a contract. There is a man who has never been to sea in his life, knows nothing at all about the life he is going to lead, knows nothing at all about the kind of vessel he is going on board of, knows nothing about the work he is going to do. He is asked, "Will you go on board of the vessel and work for those wages and sign that kind of a contract?" "Yes." So it is purely a question of how many men there are around that seaport who can be coaxed to go to sea. The man who says he will not sign that kind of a contract will stay ashore.

Q. Do you see any objection from your point of view to a law that would require the wages to be paid regularly?—A. None whatever. That is what we have been asking for.

Q. (By Mr. FARQUHAR.) Would you have very serious objections, on the part of a married man who ships and there is an allotment of \$10 a month for his family? Why is it not proper that that family should be safeguarded against this man's expenditures in foreign ports and away from home?—A. I think it is proper. Of course, there should be an allotment in the case of a married man. We are not opposed to any allotment to an immediate and dependant relative; not at all. Allotments of that description given to wife, mother, and children are proper allotments, and it would be a hardship, a very great hardship, upon seamen to have that abolished. We would not see that abolished. It is the allotment to the original creditor that we want to have abolished, because he is not a creditor at all in nine cases out of ten.

Q. (By Mr. RATCHFORD.) Do our statutes now provide for the establishing of homes for aged and disabled sailors?—A. No.

Q. Would not such a statute be very desirable?—A. There is one such institution in the United States now; that is Snug Harbor, in New York. It is an excellent institution, does an immense amount of good, and, of course, as a sailor, I would not say that it would not be a good thing on the part of the United States to establish those kind of things; but I doubt whether it would be a proper thing to do. Under our existing law I am sure it would not be a proper thing to do, because all the sailors of the world would have an opportunity to go in there.

Q. Well, is it not to be presumed that if such institutions were established in America they would be for American sailors?—A. Answering your question generally, I would say this: We have not discussed this particular question that you bring up, and I can not speak for the sailors' union upon that subject; but, taking it generally, we look on those questions as eleemosynary institutions, and, though they are a good thing, they have a tendency in the wrong direction. The idea that the sailors' union has had right along is to clear away all the laws that make a kind of a child out of a sailor, to put him on his own resources, stand him on his own legs, and tell him, "Now, take care of yourself, and if you can not, why, that is all the worse for you."

Q. We are speaking of when he gets too old, for instance, to have any legs to stand on; taking care of him in old age or in disability.—A. In case of disability, there are marine hospitals now, and they are very good things. And there is also established, on the recommendation of Surgeon-General Wyman, down in Arizona, I think it is, or in New Mexico, a farm where consumptives are sent and placed up in the dry atmosphere; and that is an excellent institution. It will probably save hundreds upon hundreds of lives in years to come, because consumption is extremely prevalent amongst the seamen, owing to the crowded quarters in which they live.

Q. Now, you speak of marine hospitals. Have the sailors, both in the deep water and in the coastwise trade and on the lakes, access to these marine hospitals?—A. Yes.

Q. (By Mr. FARQUHAR.) How do they contribute to them?—A. They do not contribute to them now. We used to contribute 40 cents a month to these hospitals until the passage of the law of 1884, when that was wiped out, and it comes out of the tonnage dues or tonnage taxes on the vessels.

Q. (By Mr. RATCHFORD.) You spoke of the New York home; how is that maintained?—A. A gentleman, who died years and years ago, willed a farm on Manhattan Island to establish an institution for old and disabled seamen, to be called Snug Harbor. Well, the land that he willed to this institution has grown so enormously in value that the institution is extremely rich and can do very much; but you see it is a bequest.

Q. (By Mr. FARQUHAR.) It is private benevolence?—A. It is private benevolence.

Q. (By Mr. RATCHFORD.) How is it supported?—A. From the same source. It does not cost the sailors or the Government or the State anything.

Q. (By Mr. CLARKE.) How is the consumptives' home in New Mexico or Arizona supported?—A. It is supported by the United States Government.

Q. (By Mr. FARQUHAR.) Marine-Hospital Service?—A. Marine-Hospital Service.

Q. (By Mr. PHILLIPS.) We will pass to topic 65, "Proportion of American vessels engaged in our foreign commerce as compared with vessels under foreign flags so engaged." Have you any information on that question?—A. Well; statistics would give such information as was valuable much more closely and reliably than I could possibly give it.

Q. Tramp steamers are different from liners?—A. The tramp steamer is a vessel that goes anywhere where she can get anything to do—carries cargo anywhere, from one port to another. She goes anywhere where the traffic carries her and brings her.

Q. Do you have any information in regard to the number of those as compared to the liners?—A. I do not think we have any under the American flag.

Mr. KENNEDY. I would suggest that the witness glance over the plan of inquiry and pick out any topic upon which he desires to speak.

The WITNESS. The question has often been raised, Why do not American boys go to sea?

To begin with, because there is not any prospect for a man to make a living and keep a family by going to sea. The wages of the seamen have been stationary, while the wages of men working ashore have increased. The cost of living has increased in about the ratio of improvement in the wages, and the result is that the seaman's wages is not sufficient to keep himself, far less keep a family. Now, a boy may go to sea out of romance; he may read Captain Marryat and the rest of the writers, and get into his head that he wants to be a sailor; and he goes to sea and makes one or two trips, and he finds out what the sea is, what kind of a life it is, what kind of work he has to do, what kind of wages he is likely to receive when he is a grown man, and he says, "There is nothing in this for me," and he quits and looks around for something else to do. And it is the same, not only in the United States, but in other countries. Norway used to furnish an enormous amount of seamen. When I first went to sea, the wages of the seamen in purchasing power was such that he was really better off than the ordinary mechanic at shore. Ninety per cent of them were married, had little homes of their own in the little gullies along the seacoast, or wherever they might happen to be, and their homes were neater and usually a little better furnished than those of the ordinary mechanic. Now, the condition of shore employment has increased in that country to such an extent that the standard of living of the shore mechanic has risen vastly above that of the seaman, and the boy does not go to sea any more as he used to. The Norwegian vessels are now very largely filled with Swedes and Finns. Take English vessels. Englishmen used to go to sea just for the same reason and under the same conditions. The wages of the English sailor to-day runs between £4 and £6 a month—between \$20 and \$30 a month. That is the English wages around England; it is anything between those figures. Now, he can make a great deal more wages and be at home with his family, if he has one; or he can afford to furnish himself with one and stay home with them and get better wages by working at something ashore. The boy who has the stuff in him to be a sailor must be healthy physically, and must have a fair average intelligence, or else he is no good at sea; and in order that he may remain at sea, or be willing to go to sea, the conditions of sea life must be such as to give him the inducement, or at least give him the ability to live in the same way as his neighbors do—come up to the ordinary standard of living of everybody around him; everybody that he knows and has been brought up with. Now, sea life will not do that; it will not keep those who go to sea for any length of time. On an average now the sailor goes from port to port looking for something else to do. He comes

into New York and gets paid off with \$30 or \$40 or \$50 after a long trip. The first thing he does after he comes into New York is not, as shore people think, go and get drunk; not at all. There is much less drunkenness than people who do not know have any idea of. People ashore have a tendency to say that any man they see drunk around the water front of a seaport city is a sailor. In a majority of the cases he is not. The sailor goes ashore and looks around, and goes up around the city, goes into the employment offices and other places and looks to see whether there is anything else to do, and if there is anything he can get to do he is glad to quit the sea. He becomes a bridge builder, he becomes an architectural iron worker. I suppose that 75 per cent of the men who work at architectural iron work at New York, Philadelphia, Boston, and Chicago are sailors.

Q. (By Mr. FARQUHAR.) You mean the fitters?—A. These men that put up this architectural iron work. He becomes a bridge builder on the railways; becomes a gripman on the street cars. Going to sea, he learns certain things; he learns to keep his head cool and his feet warm, as we call it at sea; to have his presence of mind with him. He works with both hands; or he steadies himself with one hand; balances his body with his feet; works for the vessel with the other hand and thinks. If he can not do that he is no good at sea; he is a burden on the vessel instead of really an efficient man. Well, a man who gets accustomed to that—to think and work at the same time—receives a certain training that makes him a valuable man in other employments, particularly in such employment as street cars. It is very much like the steering of a vessel; very much like it. And so it is with all kinds of work in a vessel, where you must use your hands and your brain and meet new conditions all the time. The real training of the sailor consists in these things, and that makes him capable of doing other work. He comes ashore in New York and he finds that architectural iron workers get \$3.50 a day, and he gets employment among them, and he says, "Good-bye sea; I am done with you." Now, that is the meaning of all that, and it is the meaning of it in England. Along with this case there comes this additional thing, that that which will not produce sufficient for the living of a family is looked down upon by everybody; and at the present time there is no calling so looked down upon in this country and in England as the seafaring calling—as going to sea. The ordinary man ashore speaks about the sailor as a poor fellow; he would not go to sea if he could do anything else; he is not worth any more anyway; that is all he is good for. That is about the idea, and he loses social caste by going to sea, loses the respect of the people whom he has been associated with. That tends to prevent men from going to sea.

Q. (By Mr. PHILLIPS.) Have you any remedy for that?—A. Improving the general condition of the men in such a way that it is brought upon a level with the earning capacity and general condition of the rest of the ordinary mechanics.

Q. (By Mr. FARQUHAR.) Is it in a wage way that you would have that done—more privileges or better wages?—A. In both ways it will have to be. Wages could be permitted to attend to themselves. Wages would tend to settle themselves if the sailor were given the opportunity to help himself; but the trouble is that he is not given that opportunity; he has not been permitted to organize.

Q. (By Mr. KENNEDY.) He could not formerly?—A. He could not organize because anybody who can not quit can not organize. If you can not strike you can not organize. Take away the right to strike and you take away all that organization is worth. In order to make an organization effective you must be able to quit work. That is one thing, and, then, there is this: He goes away 2 or 3 or 4 months. Once a man is on board of a vessel, irrespective of whether he has any skill or ability or not, he must remain there because the vessel is at sea, so that the competition that he is subjected to is much more fierce than that of the ordinary man; and, in addition to all that, the actual sailor has to do the work for this kind of people; it puts more work on his shoulders, and makes his life still harder; and some stop and say, I am going to quit.

Q. (By Mr. FARQUHAR.) Suppose the Seamen's Union of America here did order and get an advance of, say, 20 per cent in wages; do you think there is any way in the world that the continental wages could be raised to equal that?—A. Of course. All sailors' wages are on a level. England will be forced to change the condition of her seamen; absolutely forced to do it. Her national life will compel her to do it. Military and naval experts to-day put that down as beyond any doubt. I will show you what a naval expert says (reading from newspaper clipping): "The discussion is said to have narrowed to Great Britain, Japan, and the United States, and one paper holds that England and the United States will soon be checked in the increase of their navies by the question of manning their ships."

Q. (By Mr. CLARKE.) Will the reforms which you propose make the running of vessels any more expensive?—A. Yes; it will make them a little more expensive.

Q. Now, if American vessels become more expensive to operate, can they compete with foreign vessels and get business?—A. There is much that would go in answer to that. Take the condition of England. The cost of running an English vessel is greater than the cost of running an Italian vessel, and yet England can more than compete with Italy. The cost, altogether, of running a vessel includes so many things that the wages of the men employed in the vessel forms only a small part of it; and whether the improvement of the seamen's condition and the increase of the seamen's pay would materially affect the cost of running a vessel, is more than I can say at present. I should judge that it would affect it to some extent.

Q. (By Mr. PHILLIPS.) Would it affect it more in sailing vessels than in steam vessels?—A. No; I do not think so.

Q. (By Mr. RATCHFORD.) Is it not to be supposed that the increased wages and improved condition and treatment of the men would result in a better class of service and a better class of men?—A. No doubt.

Q. And in that way counteract the increased cost?—A. That used to be the case when, some 50 years ago, the American merchant marine was practically supreme upon the water. Faster vessels and better manned, it was said, and the better stowing of cargoes and the better care taken of cargoes, and the speedier and quicker, the shorter time required to bring them from place to place, caused the American vessels to get a higher rate than other nations, I believe. I have seen that stated. I do not know whether it is so or not, but I believe it is true.

Q. (By Mr. FARQUHAR.) Independent of the extra cost to the ship in its being manned, is not the great loss to the ship the lack of employment—lying by?—A. Lack of employment, of course.

Q. Is not that the great loss to the ship, entirely independent of what you pay in wages, insurance, or anything else?—A. I suppose so. However, somebody else can count the cost of running a vessel, and all that kind of thing; somebody else is much more fitted to give that to the commission than I could.

Q. (By Mr. PHILLIPS.) Would not that be true in regard to the labor employed? Does not the seaman's loss of time enter into it very largely, and might that not be one reason why the sea is being deserted and people are seeking employment on land?—A. It is one of the reasons, of course, but it is not by any means the main reason. The main reasons are those I gave—the condition of the vessel, the small pay, the small crews carried, and so on.

Q. (By Mr. CLARKE.) If something is done to make the American merchant marine more profitable, so that it can pay better wages and in other respects improve the condition of the sailors, would that meet it fully unless you have some legislation such as you propose?—A. I do not think it would follow at all. I have never seen, whether in good times or in bad, any master of a vessel paying any more than he had to pay, or giving any better food than he had to, as a general proposition. The general proposition is that if the wages were \$25 a month he would want men for \$20; it does not make any difference how much his vessel earned.

Q. Whatever is done, then, by way of encouragement of the American merchant marine, you think, should be done on condition that they will at the same time provide for an improved condition of the seamen?—A. I suppose you have in mind at the present time the general talk about improving the American merchant marine by subsidies, and that is a matter upon which I do not care to go into any discussion of, except to say that none of the schemes that I have seen so far, or heard discussed so far, has anything in it that would in anyway increase the number of real American sailors, or cause any American boy to go to sea, or stay at sea, or in anyway make it any easier for the merchant marine or Navy to obtain real American sailors.

Q. You would think, however, that some of these measures might be taken to increase the business of the American merchant marine?—A. Yes; probably.

Q. Well, then, if these measures were accompanied by such measures as you suggest for the improvement of the condition of the sailors, you think it would be of general benefit to the country?—A. Then the improvement, so far as the sailor is concerned, would come from the measures accompanying the measure, and not from the original measure.

Q. But the original measure might tend to make it easier or possible for the vessels to comply with the condition of improvement which you suggest?—A. That would make it easier. If the earning capacity of the vessel was increased, I suppose it would be easier to pay better wages.

Q. (By Mr. FARQUHAR.) Do you think the bounties proposed in these subsidies, in these bills, to the fishing fleet are going to be of any advantage in bringing more into that, and then ultimately augmenting the marine?—A. The bounty given seamen?

Q. Yes.—A. No; not a bit of it.

Q. You think it will be simply absorbed where it is?—A. The seaman, instead of getting \$20 a month, will get \$19 a month from the man who hires him and \$1 from the Government. It is simply another way of subsidizing the vessel; that is all; adding so much to the subsidy paid to the owner of the vessel, and will not do the sailor one iota of good. There is just a doubt in our minds as seamen, a very grave doubt, as to whether that section which proposes to subsidize the fishermen in that way does not at the same time make the seaman subject to be impressed. Being in the service of the Government, recorded by the Government, and having received the Government's money, and having done that under a general bill under which everything else that receives any money is taken by the Government, the proposition seems fair that he, after receiving money, should be taken by the Government. And that is one of the reasons why the convention of the seamen which met in Chicago condemned that bill. If they strike out section 7 and make a proviso in section 14 that contracts entered into between the vessel and seamen should be abrogated if the vessel was taken into the United States service, and if the words "and seamen" were stricken out of the title, it would have nothing to do with seamen, and seamen would not care whether it passed or did not pass.

Q. They object only so far as it affects them directly?—A. In so far as it affects us and is a menace to our liberty.

Q. But there is no objection to the general principle of building a merchant marine?—A. Of course not. It may be a question as to just the best way to do it; but that the seaman is in favor of the increase of the merchant marine, of course, goes without saying.

Q. (By Mr. KENNEDY.) You object to it because you fear that if the bill is enacted into law it would force your patriotism or the patriotism of your craft instead of leaving you free to exhibit it in your own way as other citizens are?—A. It might be put in that shape and answered yes. We think the seamen of the United States have always been willing to volunteer when needed; they have always volunteered as freely as any other people, and why any press gang should be sent after the seamen any more than any other people we can not understand.

(After a recess from 1.03 to 3.15 p. m., the hearing of Mr. Furuseth was resumed, as follows:)

The WITNESS. The manning of vessels ought to be important to the public for this reason—that in passenger vessels, whether they be sailing on the lakes, on the Western coast, or crossing the Atlantic, none of them has sufficient life-saving apparatus to take care of the people on board in case of wreck or disaster of any kind; and there are not enough seamen actually skilled men to handle those that exist. The great loss of life in such cases as the *La Bourgogne* and *Elbe* arises from this particular point. It usually takes place between 4 and 6, or between 3 and 6, in the morning. It is called by the name of "the graveyard watch," and it is said by the seamen that the graveyard is then open—if the men are overworked and do not get the necessary sleep. About 4 o'clock in the morning is when one watch goes off and another watch goes on deck, and is the most dangerous time. Those who go on deck have had but 4 hours sleep that night, and are usually far from awake when they take charge of the vessel. Anything happening just then is sure to cause a large loss of life in a passenger vessel, and a loss corresponding to the number of actually skilled men that the vessel has got. Thus, it is a matter of common knowledge or record that the Cunard Line of steamers sailing out of Great Britain has never lost any passengers, whereas the White Star and other vessels sailing in the same trade have lost passengers repeatedly.

Q. (By Mr. FARQUHAR.) On that point suppose you state how the 24 hours are divided?—A. The 24 hours are divided in 7 watches. The crew, to begin with, is divided into 2 watches. They are called the starboard and port watch. The starboard watch, say, will go on duty, take charge of the deck at 12 o'clock noon. They will hold the deck until 4 o'clock p. m., and then the port watch takes charge of the deck at 4 p. m. and holds it until 6. The starboard watch takes charge at 6 and holds it until 8. The port watch takes charge at 8 and holds it until 12, and the starboard watch takes charge at 12 and holds it until 4. The port watch takes charge at 4 and holds it until 8, and the starboard watch goes on at 8 and stays on until 12. This completes the 24 hours.

Now, there is in some vessels—passenger vessels and others—a custom of keeping the men on deck during the daytime. They should not. When they are not on watch, they should be asleep. But they say that it is too much sleep, and so the afternoon watch, from 12 to 4 in the afternoon, is very often used to have both watches on deck. This gives too little sleep and rest, and makes the men too much subject to sleepiness to be effective either at the wheel or on the lookout during the night.

There is another custom growing up, and it is only of late origin, which is called the kalashi watch; that is, all hands on deck all day, and called out at any time when they are wanted during the night, leaving on deck only a watchman, a lookout man, and the wheelman, and, of course, the officers on the bridge. If a disaster happens to vessels of that description, the men go out from the forecabin half asleep; they go out in the light and are half blinded, and for the first 15 minutes are practically useless, and thus increase the danger to the passengers and to the vessel; and at the same time, of course, it makes it much harder for the men to work hard all day and be called out at night.

Another matter that is of considerable importance, the British commission says, and as practical seamen we know it is true, is that no man is actually capable of proper lookout or proper work at the wheel for more than 2 hours at a time. In any case it means intense watchfulness, and to be more than 2 hours at it is too long. In a storm and on very serious occasions, 1 hour is long enough, and sometimes too long. I have myself come away from the wheel feeling as though I had been through a sickness, absolutely useless for hours afterwards.

One of the reasons why they use kalashi watches is that vessels can thus be run with 2 or 3 men less than they otherwise would have to have, and it means to the particular owner in question the saving of the wages of 2 or 3 men. This system is in use at present on practically everyone of the passenger steamers sailing on the Eastern coast of the United States. It is largely in use on the Pacific coast, but not to such an extent as on the Eastern coast, and it is a system which has not been applied in Europe. On the Great Lakes men stand at the wheel for 4 hours, sometimes as much as 6 hours. That is in an ordinary freight steamer. I do not know what time they have in the passenger steamers running between Buffalo and Duluth.

Now, these improvements are matters which the seamen themselves can not deal with, under existing conditions at least—with the existing law—and the British commission has dealt with it succinctly in this book here [indicating] under the several heads of "Seamen seldom examine ships," "Particular in articles insufficient," "Results of breach of contract." There are some matters here that I would like to ask permission to have inserted, because it deals particularly with this subject. If agreeable, I will read it.

MR. PHILLIPS. You might state the substance of it.

THE WITNESS. It says that the seamen can not deal with these matters, because they do not know what kind of vessel they are going in. They do not ship always in the port in which they join the vessel. Thus, a vessel lying at New York may go to Boston—send to Boston for her men—or to Philadelphia. The men go aboard in New York while the vessel is lying out in the bay, and the men who go on board have no idea at all as to what manning the vessel should have, or as to what kind of vessel it is, or what kind of men they are going to go with; and the vessel may be undermanned, she may have but one-half the crew she ought to have, but if they work hard enough and are particularly lucky, do not run across any gales or have any accidents, they may see in one trip that the crew they have taken the vessel across or down or up the coast with, as the case may be, at this time is a sufficient crew for the future. This is what the two articles state in substance. They are as follows:

"41. Owing to unrestricted competition and the absence of any requirement as to qualification, the quest for employment in the mercantile marine has degenerated in many cases into a mere scramble, in which very little consideration is bestowed on the conditions of service so long as employment is secured. Articles of agreement containing particulars respecting the ship, the voyage, the crew, and the provisions are indeed read over to the parties by a superintendent of mercantile marine before being signed, and it has been suggested that if a seaman or fireman is not content with the information contained in the articles he has it in his power to examine the vessel for himself. The weight of the evidence shows conclusively that such an examination is in practice seldom made, as the seamen and firemen are generally under the impression that if they were inquisitive they 'would not be wanted,' and when men are taken out in tugs, or shipped at night, or engaged at another port and sent by train, such an examination is out of the question.

"42. The conditions and circumstances of sea service differ in fact so widely from those of any employment ashore that there is not, and can not be under existing circumstances, such a thing as a contract entered into on equal terms by employers and employed. It has been declared by the witnesses who have given evidence on behalf of shipowners that there are various considerations, not even referred to in the articles of agreement, which must be taken into account in determining a proper crew for a ship, such as rig, sail area, steering gear, winches, number of fires, coal consumption, position of bunkers, etc. In signing articles the seaman can have no adequate knowledge of such considerations nor of the extent of work to which he binds himself, and he has subsequently practically no appeal. It is greatly to the credit of the general body of shipowners that their position in dealing with the sailor is not frequently taken advantage of, but such virtue is scarcely to be expected from every member of a large body, and it is therefore incumbent on the State to provide reasonable safeguards for the seamen in those respects in which he can not practically help himself.

"43. A case may be quoted illustrative of the conditions and results of a contract entered into in the United Kingdom in time of labor disputes. The crew of a vessel signed articles at Liverpool to join at Newport, but were actually put on board from a tug in Barry Roads. After sailing, the crew came to the conclusion that the ship was undermanned and refused duty on the master refusing to accede to their demands to put into the nearest port. The ship eventually put into Bahia, where the men were tried by a naval court for 'insubordination, refusal of duty, combining to disobey lawful commands, neglecting duty, impeding navigation of the ship and progress of the voyage,' and 18 of them were sentenced to imprisonment at Bahia for 10 weeks each, and one for 12 weeks. The court did not express any opinion as to the plea of undermanning, although both the mates admitted that the vessel was undermanned. It is, however, immaterial to the present inquiry whether this particular vessel was or was not undermanned. The case is illustrative of the manner in which contracts for sea service are sometimes entered into. Men are brought from a distance and put on board ships at night without an opportunity being afforded them of judging as to the state of the ship or her requirements as to manning. By working for their lives they may succeed in reaching their destination, and thus they will have established their number as a proper crew for the vessel until a further reduction is made; but should they refuse to fulfill their contract, which may perhaps involve excessive risk and work for a whole year, they may, as in this case, be thrown into a foreign prison."

Here is a document that was issued by the British merchant shipping—"Reports of certain foreign and colonial ports respecting the desertion of seamen from British ships, presented to both Houses of Parliament by command of Her Majesty, 1899."

The report from one of the consuls, the consul at Nagasaki, Japan, goes closer into the condition and feeling of seamen, and the circumstances and hardships that cause them to quit going to sea, than any other of these parties. I have never seen anything that states it so clearly as this does, and it is not very lengthy. It deals with the subject of not being permitted to go ashore. It deals with the subject of not being permitted to receive any money while lying in port; being kept on board of the vessel all the time, and kept at work all the time; lying out in the bay under the hot sun of the Tropics, etc., and the general condition on board the vessel, and the desire that each one has to go out of the vessel. And he suggests to the British Government certain important changes in existing conditions.

The report above described follows:

"Memorandum by Mr. J. H. Longford, Her Majesty's consul at Nagasaki, Japan, on the desertion of seamen from British ships.

"The question of the desertion of seamen from British merchant ships has recently attracted attention in the House of Commons, and instructions have been given by the secretary of state to Her Majesty's consuls at the principal ports in the United States to report upon it. The local conditions of Japan are such that, although attempts to desert are pro rata as frequent on the part of merchant seamen in Japan as they are in the United States ports, they are rarely successful, the difficulties either of temporary concealment or of final escape being such that the men guilty of them are almost invariably arrested and returned to their ships before their departure from the port. In almost all these cases there are present two characteristics—that they take place from sailing ships and among the members of the crew who are of British birth. The deser-

tion or attempted desertion of a seaman from a steamer, not only from those of well-known and wealthy lines, in which the same picked men continue to be employed from voyage to voyage and year to year, but even from those of the ocean-tramp type, is so rare as to be practically unknown; while it is almost equally rare that several attempts are not made by the seamen of every sailing ship manned by non-Asiatic crews which enters a Japanese port after a long voyage. Even in cases where no serious attempt at desertion is made, the offense of absence without leave is frequently committed, involving to the seamen guilty of it both loss of wages and liability for fines and expenses incurred in connection with their arrest and imprisonment.

"Having for several years past, when at ports at which the opportunity has been afforded, given special attention to the subject of merchant seamen; and having, through an active participation in the management of sailors' homes, been brought into much closer connection with many of them and thereby learned more of their condition than I could have hoped for in the ordinary course of official duties, I trust I may venture, though uninvited, to offer some opinions on the subject which has been referred to Her Majesty's consuls at other places, and on the circumstances which my experience gives me strong grounds for believing to be its primary cause.

"In the annual report on the trade and shipping of Hakodate for the year 1890 I dealt with the subject at length, and the report at the time both received the commendation of the secretary of state and was extensively quoted from and commented on in the English press generally, and especially in that portion of it mainly devoted to shipping. I have unfortunately not now a copy of that report to refer to, but I pointed out in it certain disabilities under which merchant seamen labored, the removal or amelioration of which would, I considered, tend greatly to the general improvement of their condition and consequent popularity of their service. Since then a new and exhaustive merchant shipping act has come into operation, but not one of these disabilities is dealt with in it, and they still remain, as I consider them, main causes why the merchant sailing service—the only school in which competent seamen can be made—is, as is undoubtedly the case, yearly becoming less popular with British subjects. They were, shortly stated: (1) No alteration in the scale of provisions that had been in use for many years; (2) enforced total abstinence; (3) the absence of any right to shore leave when in port, or to part payment, prior to the arrival of the ship at the final port of discharge, of wages already earned.

"The first of these disabilities—the scale of provisions—has since the publication of my former report been discussed by the Seamen's Union, and also been the subject of investigation by a committee of the House of Commons, and as the result of inquiries made by the latter (the merchant shipping victualing scale committee, 1892), a scale was recommended somewhat more liberal and in a slight degree more varied than that in common use. A list of substitutes and equivalents of articles that might from time to time be used in lieu of those mentioned in the scale was also drawn up, and still more a weekly bill of fare, which provided a diet of very palatable nature, varying each day, was also drawn up as a suggestion, the latter, I believe, having been largely adopted from one already in use in American ships. Since then a printed form has been provided on the articles of British ships for the insertion of this bill of fare, but though every master to whom I have spoken on the subject has unhesitatingly expressed his opinion that its adoption would be an undoubted boon to the men, an immense improvement on their present diet, and involve very little extra cost to the owners, not one instance has yet come to my knowledge in which it was either entered on the articles, or even without that formality availed of for the men. Not only that, even the recommendations for the improvement of the scale on the articles have, so far as my experience goes, been entirely without result. In steamers men are, as a rule, fed liberally and well, the short duration of their sea runs admitting of frequent supplies of fresh meat and vegetables. In some sailing ships preserved potatoes and vegetables, currants, pickles, calavances are occasionally dealt out, but the scale of provisions in the articles, to which alone the men have a legal claim and which in many ships is all that is allowed to them, continues to be exactly the same as it was 30 or 50 years ago—the same unvarying round of salt beef and salt pork—notwithstanding the immense advances that have in that period been made in the science of preserving and the cheapness at which preserved meats, fruits, and vegetables in great variety and of the best quality can now be supplied in large quantities. Lime juice continues to be the sole antiscorbutic. Fruit while at sea is unknown to the English sailor. Preserved potatoes and vegetables are furnished to him neither universally nor continuously, and his daily food is the same in quantity and quality whether in the North

Atlantic in midwinter, or becalmed, it may be, on the equator. Thirty years ago this may have been necessarily so, but at the present day there can be no reason, scarcely even that of economy from its strictest point, why the sailor should not have a varied and palatable diet suited even to the different climate conditions to which he is subject. But he can never rely on this until the entry is made a *sine qua non* on the articles, the present form of which admits of this being most easily done.

"The board of trade has, perhaps, done all that is in its power to remedy this disability, and its final removal must be left to arrangements between ship-owners and their crews, or to the Seamen's Union; but the others under the above headings might very easily be removed by regulations under section 114 of the merchant shipping act, 1894, though it is possible that a very slight alteration might be required in the terms of paragraphs (d) and (g) of clause 2 of the section. All these disabilities are already provided for in the regulations for Her Majesty's navy, and these specific regulations might, *mutatis mutandis*, be included in the printed conditions of agreements with the crews in the form approved of by the board of trade.

"The question of total abstinence is one of so controversial a nature that it can scarcely be expected that any suggestion for the removal of its enforcement on the merchant seaman would meet with unanimous approval from those who are most ready to consider his interests. But longer experience has only served to confirm my previous opinion that the issue of a daily dole of spirits to merchant seamen, who cared to take it, would have the best effects—either spirits or malt liquors—for continuous periods of from 4 to 6 months or longer. The consequence is, that on arrival in port the fullest indulgence is given to a craving intensified by long deprivation. Whole outfits of clothes are exchanged for the vilest spirits, either on shore or over the ship's side, and the most degrading exhibitions given of drunkenness in its worst forms. The system of a daily ration of spirits works well in Her Majesty's navy; the number of total abstainers in the Navy is *pro rata* incomparably higher than in the merchant service, so that it can not be considered as fatal to the cause of temperance; and it is difficult to understand why a system which is so well suited to one should be entirely inapplicable to the other service.

"Both the above points, however—those of diet and total abstinence—fade into insignificance as compared with the grievous hardship very frequently suffered by sailors of merchant sailing ships in consequence of the third—one in which they are entirely at the mercy of their respective masters, and one which is, in my experience, by a long way the chief incentive to desertion, and to the minor offense of absence without leave. Fortunately, it is one which can arouse no controversy, and the advocacy of its removal can give no offense. It is at the present day exceptional for any of the ships of Her Majesty's navy to be ever at sea or in any place where leave, however, under the special circumstances, men have been necessarily confined to the ship for such a period, it is the invariable custom, immediately on arriving at any port, the circumstances of which admits of their landing, to give general leave, in alternate watches for 48 hours; and in a recent visit to Japanese ports by one squadron of Her Majesty's fleet on the China station this period was extended to 96 hours, every man in every ship in the squadron having thus enjoyed an unbroken period of 4 days on shore. When a ship remains continuously in one port, all men of first-class character are practically permitted to go ashore on every alternate evening, with leave until 7 o'clock on the following morning. Twice in each week, on Thursday and Saturday afternoons, general leave is given every man who is not on the defaulters' list, thus getting on shore for an afternoon and night at least once in every week. The men receive their wages monthly, and they are, therefore, seldom without both money and the opportunity to spend it on shore as they please. Their lives, too, on board ship are characterized by every physical and mental comfort that the most thoughtful care can provide for them. The lower deck of one of Her Majesty's ships, with its airiness in summer and its warmth in winter, its perfect sanitation and cleanliness, its abundant room and ample provision of mess furniture, could no more be compared to the fore-castle of a merchant sailing ship than could the lodging of a respectable mechanic and his family in a model dwelling in London to the overcrowded dens in St. Giles or Whitechapel rookeries. The abundant and wholesome food can be supplemented at most moderate cost with anything, with the single exception of intoxicating liquor, that taste can fancy, from the ship's canteen, which is in itself a small cooperative store, managed by the men themselves, under the presidency of an officer. Concerts, variety entertainments, and theatrical performances are constantly organized. There is always a good ship's library, and abundant supplies of magazines and papers are handed on from the officers'

messes. Officers and men alike take part in cricket, football, sailing matches, and athletic sports, and, generally speaking, nothing whatever that can be done is left undone to promote relaxation and amusement, the whole result being that the men are thoroughly contented with their service, and that there are few better specimens of Her Majesty's subjects than the naval blue jacket.

"In merchant steamers, which now are, at least in the Eastern trade, seldom at sea for more than a fortnight continuously, it has grown to be a custom little less forcible than a regulation to permit the men to go ashore while in port, in alternate watches, every evening after 6 o'clock, when the day's work is done, and for the whole of Sundays when once the ordinary morning scrubbing and polishing are finished. The whole voyage, out and home, of a steamer rarely exceeds 6 months, at the end of which a man is paid the balance of his wages in full; and not only in all large lines, but in nearly all steamers, it is the custom also to make him reasonable advances, at his option, from month to month. Nominally, the old board of trade regulation diet is preserved as in sailing vessels, but in practice little use is made of it, no more, perhaps, than makes it even an agreeable variety on the constant supply of fresh provisions and vegetables that the short runs at sea admit of being provided.

"The consequence is that in the merchant steam service, as well as in the navy, the men, having every reason to be contented with their service, and never being wholly without money or reasonable leave, abuse neither. Their savings banks' accounts are numerous and substantial, and an attempt at desertion on the part of, or a charge of being absent without leave against, a seaman of a merchant steamer is as exceptional as it is frequent against those of merchant sailing vessels, notwithstanding that there is an immense inferiority in the total number of the latter.

"During the last 8 weeks more than 6,000 sailors of Her Majesty's navy have had liberal shore leave in this port, without one single charge of any kind for misconduct on shore having been preferred against them. Cases of intoxication were seen among them here and there, but their number was small in proportion to that of the whole on shore, and not one was of a nature to require the interference of the police. In the case of one British sailing ship that visited and remained some time in this port during the last 8 months, the practice of the steam service of giving leave in alternate watches every evening and on Sundays was adopted by the master, with satisfactory results.

"But the practice in most sailing ships is quite the reverse of this. As a rule, ships arrive in Japanese ports, after a voyage of from 4 to 6 months' duration, from Cardiff or Philadelphia, and they remain continuously in port for any period of from 1 to 2 months. All leave and advances of wages are, during this period, entirely at the option of the master; and, as a concrete instance of the rigor with which their power is sometimes exercised by masters in this respect, I may mention the case of a large iron sailing ship now in this harbor, which arrived from Cardiff with a cargo of coal after a voyage of 4 months' duration. The ship lies less than half a mile from the shore, in full view of the town, with picturesque green hills on both sides, and her stay in port will last for, at the very least, one full month. The master refused any leave, but said he might give some prior to the ship's departure from the port as soon as she was ready for sea. In the meantime all the men were to be detained on board for a whole month, occupied during the day in scraping and painting the ship's sides, in the full glare of an Eastern sun in August, without a particle of protection against it in the shape of either awning or proper head covering, choked with the fine, penetrating dust that Cardiff coal gives out during unloading, and both themselves and the ship in a constant state of most grimness. On being remonstrated with very forcibly on this line of conduct, the master consented to give both short leave and a small advance of wages, but this was not until the ship had been in port for a full fortnight and until after several of the men had broken out of the ship, and one, at least, had attempted to desert, and to raise money had not only sold all of his own clothing, but some of his shipmates, for less than one-tenth of its value. This is by no means an isolated instance, and in cases where leave is given advances of money already earned by the men are often made only under such conditions as prevent the latter enjoying more than half their benefit. One glaring instance of injustice in this respect was quoted in my previous report, and I believe both that such an instance was not exceptional and that similar ones are occurring at the present day, and, strange to say, not a single word of complaint as to their injustice is ever made by the seaman.

"What are the consequences of such a line of conduct? Forecastle life in a sailing ship is utterly devoid of every semblance of the smallest approach to the comfort that the poorest agricultural laborer enjoys in England, with the single

exception that the men, if coarsely and monotonously, are at the same time substantially fed. The men are confined in small, ill-ventilated spaces. In heavy weather at sea even this limited space must all be kept closely shut, and the atmosphere in the Tropics, with damp clothes and oilskins hung everywhere in it to dry, must then be little short of horrible. Neither tables, crockery, nor cutlery is provided, lighting is of the scantiest description, and the food is eaten from a tin pannikin on the men's knees, seated either on a bunk or a chest.

"Books, papers, or magazines are unknown on board, nor is any provision of any kind made for the amusement of the men in such leisure hours as they may have. Can it be wondered at that human nature revolts at such experience unnecessarily prolonged, and that, refused leave and money, the men lend a ready ear to the blandishments of crimps and grogshop keepers, and if they do not desert, forfeiting all their wages for the sake of a week's ease on shore, the cost of which has to be paid from advances on reemployment in another ship, incur the penalties of being absent without leave and obtain money by selling the whole of their kit for one-tenth its value. Recklessness, the feeling that there is no future for them, encourages them in the most abandoned dissipation, and exhibitions on shore of degrading drunkenness, in the full view of jeering natives of the lower orders, are a deep cause of humiliation to their fellow countrymen residing on the spot. And even if the man continues in one ship till the end of his original engagement, and is finally paid off with a balance £50 or £60 to his credit, what is the too frequent result? Totally unaccustomed to money, he knows not how to use a large sum, and falling a ready prey to sharpers of every description, a week or a fortnight sees him as poor as ever and forced again to take any employment that offers itself to him. Had this balance been only half what it is, and had he been accustomed during his service to the regular use of small sums, a small portion would probably satisfy his immediate requirements, and the facilities of the board of trade savings banks be used for the disposal of the remainder.

"Writing after a long experience of seamen and after having given much thought and attention to their circumstances, I can have no hesitation in stating my strong belief that a complete reform in these points, and especially in those of leave of absence and advances of wages, would tend very greatly to the improvement of the conditions of the merchant seaman's life on board sailing ships, and thereby render him more contented and law abiding than he now is. The character of the British sailor has, it is to be remarked, entirely changed during the last 30 years from what it was in the days when steam had not yet commenced to figure as a serious factor in ocean navigation, or even when it was as yet only in its infancy as such. His old peculiar dress—the blue guernsey, wide trousers, and oilskin hat worn on the back of his head—have entirely disappeared and are replaced by clothes little distinguishable from those worn by a shore mechanic, and with his dress have gone his old simplicity of character, the jovial good humor and rollicking sportiveness that made him on his trips on shore at once a pet and a wonder to the rest of the community. When on shore now he only too often appears a loafer, sunk in debauchery and sodden with drink (I am writing only of those in sailing ships), an object of disgust or at best of compassion to all who see him. He has no yarns to tell, no songs to sing, his conversation and thoughts are mainly confined to his grievances. He is more often than not a sea lawyer with a keen sense of what privileges or rights the law gives him, but with an equally keen sense of how few and limited those rights and privileges are. No longer the trustful child that he was in former days, he feels that he is still treated as a child, bound by restrictions and liabilities that would not be tolerated for a year in any other trade in life, and liable for the slightest breach of those restrictions to the treatment and penalties of a criminal. Once committed to the sea life, other openings are practically closed to him, and for better or worse he is bound to it as long as he lives. Its hardships, its rapid changes of climate, with total absence of provisions for adapting himself to those changes, render his life comparatively short; but it is no longer a merry one. Now and then a drunken spree, a short space of liberty, lawful or unlawful; if the latter, enjoyed only as a hunted fugitive and purchased by the sacrifice of what it has taken months of hard and dangerous work to earn, are its sole bright spots, and the inevitable end is, if not an early death, too often the workhouse. Is it to be wondered at that when the conditions of the life of not to say a skilled mechanic—and such is the proper prototype on shore of a trained and skilled seaman—but even of an ordinary laborer are compared with these, that in the present day, when education is widespread, mercantile marine life should fail to attract any but those who are committed to it when they are too young to choose for themselves, or who have altogether failed in other lines? And how different might be the case is shown by that in the Navy. Every improvement I have suggested

exists and has existed for many years in the latter, and the consequence is that recruiting for it never fails and that desertion is as rare in the one as it is the reverse in the other. Nor is there any lack of competent men, of excellent men, for service in steam lines, who, if they no longer appear in their old sailor's garb, afford when on shore the spectacle of a steady, respectable, well-to-do English workman, just as much as the sailor of the sailing ship often does the reverse.

"Several of the disabilities which I have mentioned exist also in the mercantile marine of the United States. 'Going on shore in foreign ports is prohibited, except by permission of the master,' and 'no grog allowed, and none to be brought on board by the crew,' are conditions printed on the articles of American ships, and are, I presume, therefore universal. And a third condition, 'no money will be advanced to crew aboard except at master's option,' is also frequently added in writing. But American merchant seamen receive higher wages than English, their accommodation is better and their diet is, in nearly all ships, incomparably better and more varied."

Dealing with the matter of laws that provide for a penalty for desertion, I would like to add to what I said about that before: We used to say in former years, I have shipped; I have engaged myself with so and so; I have shipped with such and such a vessel. To-day it is changed; and I have heard them state, "I have sold myself." The feeling that the sailor does not belong to himself, that his body does not belong to him, that he belongs to the ship just as much as the mainmast or the anchor does, and that somebody can go after him, put a reward on him, and bring him back just as if he had run away from prison—that feeling that the sailor has to-day makes him particularly bitter, and it is so well known in seaports that that is the usual condition, and that that is being done, that the sailor is looked upon as not equal to other men on that account. We tried to overcome that matter by an appeal to the Supreme Court under the thirteenth amendment, but the court ruled against us; held that the seaman does not come under the thirteenth amendment to the Constitution; that the thirteenth amendment does not apply to seamen at all. The feeling, however, has been since that the statutes under which that decision was given ought to be wiped out, and the House would have wiped them out altogether last year if it had not run up against the Senate on the subject. At the present time it remains only in the foreign port. Thus a seaman in a port of Asia, Japan, China, Australia, Africa, or Europe is yet in the condition that when he goes ashore and does not turn up again, the captain issues a reward for him; publishes a reward if he wants him very badly, and he is met, took up, and brought on board by the police under treaties with foreign countries and under the statutes here. And inasmuch as the seamen are the only ones who are subject to that, it becomes so much the more onerous; men feel it more than if other people were in the same condition. One of the first things that ought to be done to give the sailor the idea that he is as good as other men, has as good a right as other men, is to give him the right to go, wherever the vessel is lying in the harbor.

Q. (By Mr. FARQUHAR.) If that was made the contract, that they could go just as soon as they got to port, would there be a great difficulty and delay to the vessel in securing a new crew?—A. None whatever.

Q. Did you ever know of cases where the whole crew desired to leave the ship, unless in extraordinary circumstances?—A. No; under ordinary circumstances the whole crew would not want to leave.

Q. Then if it were an open contract that they might leave the ship at the port of destination or port of touch, do you think there are sufficient sailors to be found in those ports to man the ship again without unnecessary delay?—A. Yes; I do. The usual thing is to pay the sailors or to drive them out, and then let the vessel lay there without any sailors until she is ready to go to sea again, and then go and hire new ones. Where there is a port where there are no vessels coming, of course, the sailor would not want to leave—such as a port in some little island in the southern Pacific, or some place like that. The sailor would not want to leave; he would be marooning himself if he did.

Now, on the matter of the coastwise trade. The coastwise trade is absolutely protected from any interference or any competition of foreign vessels. The seamen in the coastwise trade are in absolutely the same condition as if they were in the foreign trade. There is no difference. The result of that has been that even in the protected coastwise trade, lake trade, there are practically no Americans, and there are comparatively few men who stay in the trade any great length of time. They come and go. Out on the California coast men will come from deep water, stay a year or two, or three or four years, and go again. There are comparatively few who stay altogether. They are usually men who have attach-

ments there, or they get attached to a place for some other reason than that the party wants employment there.

Q. (By Mr. RATCHFORD.) Is it acceptable to your organization, so far as its influence is concerned, that the wages of sailors be fixed at the port from which they ship, regardless of their nationality?—A. We have never given any thought to that matter. It is a matter of such settled custom for years and years back that no one can remember it ever to have been otherwise.

Q. (By Mr. FARQUHAR.) In other words, a sailor is a sailor independent of his nationality?—A. Yes.

Q. (By Mr. RATCHFORD.) It has also been a custom, I suppose, for a long time, in the nature of things, that the unemployed sailors in every port practically fixed the rate of wages?—A. Certainly; the unemployed sailors and the unemployed—I was pretty near saying soldiers—but the unemployed who are neither sailors nor soldiers.

Q. Would-be sailors?—A. Yes; the unemployed would-be sailors; that is right.

Q. (By Mr. FARQUHAR.) Is there much use for the old style able-bodied seamen on the steam marine?—A. Yes; he is just as necessary now as he ever was. "Able-bodied seaman" does not mean being able to rig a vessel. The rigger can do that, and yet be useless when he gets to sea. An able seaman is a man accustomed to the sea; a healthy man in his active years accustomed to the seas who has received the peculiar training that makes it possible for him to apply his wits to the conditions as they come, and he is just as necessary now as he was in the days of the sailing ship. A naval officer told me on the Pacific coast that they had found that out in the Cuban war that the actual seaman was the one that had any value; that the landsman taken on board a vessel was simply lumber.

Q. In the cutting down of the crew, which has occurred within the last 20 or 25 years, has it not been the fact that the ordinary seaman is the person who has suffered most?—A. Yes; that is true. Vessels do not carry ordinary seamen any more. American vessels do not carry ordinary seamen or boys any more. What are called American seamen are foreign seamen, who are just at the present time sailing under the American flag.

Q. (By Mr. RATCHFORD.) I want to ask a question with reference to the comparative wages paid in the Pacific coast trade to American seamen and to the Asiatic seamen. According to your testimony American seamen are paid from \$30 to \$40, and in some cases \$45.—A. Yes.

Q. While the Asiatic seamen are paid about \$16 in Mexican money?—A. Yes.

Q. I want to ask whether the American seaman finds any opportunities open to him to obtain employment as long as it is possible to secure the cheaper class?—A. No; he does not. The vessels that go to Hongkong—the old vessels that trade between Hongkong, China, and San Francisco and Puget Sound—all those vessels, whether under the American flag or the English flag, or Japanese flag, sign all their men in China or Japan. They carry white quartermasters and white officers, but not any white sailors or white firemen or in the steward's department. There is no employment to be obtained in these vessels at all, except as quartermasters.

Q. How do you account for the great difference in the wages of the seamen?—A. It is due to the different ports in which they are signed and the different kind of men.

Q. In other words, supply and demand, I suppose?—A. And then, of course, they must carry more Chinamen than they would white men; they carry about double. English vessels that carry Kalashis carry about 3 times as many of them as they do of white men.

Q. To do the same work?—A. Yes.

Q. In the end they are no cheaper, are they?—A. I don't know. They could not be a great deal cheaper—a little, perhaps. Those that carry them say they are more amenable to discipline; they are not so apt to get drunk or to leave the vessel; they are more docile; for all of these several reasons. Whether these reasons are real good reasons or not I do not know.

Q. Well, is it a fact that they do not require the same care or the same living as American seamen?—A. They are usually fed on their own kind of food—rice, and curry of different kinds. Of course their food costs much less than that of white men.

Q. Do they attain the same high standard of skill as American seamen as a rule?—A. No. Where it comes to where real seamen are needed in a storm or in disaster of any kind, then they are useless, practically.

Q. (By Mr. PHILLIPS.) Why so?—A. Because they have not the self-control, nor the coolness, nor the courage, nor the strength of the average white man.

Q. (By Mr. RATCHFORD.) There is a large proportion of them Chinamen, is there not?—A. Of those that come to San Francisco and Puget Sound, yes.

Q. They are not reached by the exclusion laws, are they, this class?—A. No.

Q. Then the sailor has no protection from these laws?—A. Absolutely none. Nor from the immigration laws. He is always exempted. When the exclusion law was passed he was exempted, and when the immigration law was passed he was again exempted.

Q. You spoke in the early part of your testimony about a higher standard of skill, or something to that effect, among seamen. Could you, in closing your testimony, explain as fully as you care to what you would advise or suggest along these lines to cover the points not yet touched upon? There are no qualifications provided, I presume.—A. The only qualification that is provided in this bill, and it has the English commission's recommendations for it, is that the seaman signed be an able seaman; must be more than 18 years of age; must have served 3 years at sea on deck; he must have 3 years' experience.

Q. That bill has become a law?—A. No. That is what we propose. It is hard to specify just what he shall be able to do; that would hardly be possible.
(Testimony closed.)

WASHINGTON, D. C.,

Monday, February 19, 1900.

TESTIMONY OF MR. CHARLES H. KEEP,

Secretary of the Lake Carriers' Association and of the Buffalo Merchants' Exchange.

The commission met at 10.55 a. m., Vice-Chairman Phillips presiding.

Mr. CHARLES H. KEEP, of Buffalo, N. Y., was introduced as a witness, and, being duly sworn, testified as follows, the topical plan of inquiry on transportation being followed:

Q. (By Representative LORIMER.) Will you state your name and official connection with organizations, together with the names of the organizations?—A. Charles H. Keep, secretary of the Lake Carriers' Association and Buffalo Merchants' Exchange.

Q. Will you give the commission a little history of the Lake Carriers' Association, that it may know the purpose of the organization?—A. My own connection with the Lake Carriers' Association has lasted about 11 years. The association was in existence for 3 or 4 years before that time. I can not tell you the exact date on which it was formed. It began in a small way. A few of the managers of the principal fleets of vessels on the Great Lakes saw that there were various questions coming up from time to time in which vessel owners had common interests, in such matters as the building of needed light-houses and the legislation with reference to channels; some such matters as that principally; and they decided that they would form a little organization to act together in matters of common concern. That organization was formed. In the first instance it was comprised principally of owners who lived at Buffalo, N. Y., and gradually owners from other places have joined the association. About the same time another organization called the Cleveland Vessel Owners' Association was formed at Cleveland. That organization had a slightly different purpose; it was largely to look after business matters connected with the running of their boats, and particularly the supplying of labor to their boats, and they opened shipping offices at Cleveland and put shipping masters in charge, employment officers, to get men for the boats. The two associations ran along side by side, sometimes taking a little different view of things, until finally about 1890, on some matter, I do not remember exactly what it was, the Carriers' Association favored one thing and the Cleveland Vessel Owners favored just the opposite; and out of that grew in 1891 the consolidation of the two organizations into the Lake Carriers' Association; and since that time the Lake Carriers' Association has been the only vessel owners' association on the lakes. It has comprised most of the tonnage there and has general charge of the questions in which vessel owners act together. At the present time the work of the association is to interest itself in legislative matters relating to the lakes, opposing hostile legislation, endeavoring to get needed channel improvements and needed improvements in the aids to navigation, the supplying of necessary private lights and the maintenance of necessary shipping offices. The lake waterway being an international waterway and the Canadian government not having a great interest in the commerce, there are quite a number of places in which there are not sufficient lights on the Canadian

side; and the Lake Carriers' Association has built the requisite lights, and contracts each year with light keepers to keep the lights there. There are certain places on the American side where they do the same thing. They maintain shipping offices for the furnishing of men to vessels at a number of ports on the lakes—Chicago, South Chicago, Milwaukee, Cleveland, Toledo, Ashtabula, and Buffalo.

Q. Is your association interested in any proposed legislation now before Congress?—A. We are always interested in river and harbor bills, appropriations for light-houses and life-saving stations, and matters of that kind. Aside from that we have no special interest in any legislation now before Congress.

Q. Have you anything in mind that you wish to give to the commission concerning your business, any grievances?—A. No; I do not think we have. I may say that the lake business is so thoroughly understood, its magnitude and importance so thoroughly understood now by Congress that the matter is in a very different shape now from what it was when the Lake Carriers' Association was first organized. We have only to present our requests to Congress to insure a good hearing of them, and we try not to present any unless we have such an overwhelming case that it will appeal to the favorable action of Congress. The whole policy of the association since it was formed has been to act upon a few things, and only those things which they thought they were entitled to and could get. We entirely exclude all matters of local improvement and attend only to matters of general concern.

Q. Are the people that you represent getting into any controversy, especially with reference to their employees, or have they had any recently?—A. No; they are having none now and have had none recently; there has been very little trouble of that kind on the lakes since my connection with the transportation.

Q. No trouble on either side?—A. There has been some little trouble, but nothing of great importance.

Q. Would you mind stating to the commission what that trouble was?—A. The question of union and nonunion labor has come up once or twice, but only in spots and in a small way. The schooner *Mabel Wilson* lay at the breakwater at Buffalo with a crew of nonunion men on her, and a boatload of union men went out from the city and pulled off the crew and assaulted the captain. We took that matter up and two of the ringleaders we sent to State's prison—punished in the United States court and sent to State's prison.

Q. What was the original cause of that?—A. Only the unwillingness of the union men to see a nonunion crew on the boat. I know of no other cause.

Q. Not one of the wages paid?—A. No; none at all. The Lake Carriers' Association from time to time issues a card, called its wages card, of the wages that they will pay to the different classes of employees; and that card is raised in good times and lowered in poor times. There has been little or no dissatisfaction with it of late years; we have had very little controversy, almost no controversy, with labor. During such seasons as 1898 the wages were very much lower than they were in 1899, which was a much more prosperous year; and this year the wages card will undoubtedly show a higher rate of wages than it did in the spring of last year.

Q. (By Mr. RATCHFORD.) In this case that you speak of did the union employees refuse to work for the rate of wages that were paid to that crew?—A. I can not tell you. I do not know anything about the hiring of men for any particular vessels, and I have no recollection or knowledge of the facts in that regard of that particular vessel. I do not remember the cause of the controversy. I only remember the assault and the arrest and the prosecution and punishment of the ringleaders. It was under the new act of Congress, I think, which had then made the laws of the high seas applicable to the lakes.

Q. And you do not know the cause of the controversy?—A. I do not know the cause of the controversy.

Q. (By Mr. KENNEDY.) You recognize committees from organized seamen?—A. Yes.

Q. Do they have any voice in determining this rate of wages stated on this card?—A. They sometimes send in communications when they know that the wages card is about to be made or altered. They sometimes send in communications stating their wishes and these communications are taken into consideration.

Q. Are all the vessels on the lakes bound by this rate of wages that you fix and send out?—A. The rate is a maximum rate. Members of the association only are bound by it at all; members of the association are not supposed to pay more than the card rate for the various classes of employees.

Q. (By Representative LORIMER.) Do they frequently pay less?—A. Sometimes, yes. The card rate is understood to be the maximum rate. The law of supply and demand enables owners to get their men at less.

Q. (By Mr. SMYTH.) What proportion of the seamen on the lakes are organized?—A. I can not tell you. Their organizations have not been very active of late years. They have a seamen's union, a fireman's union, and an engineer's organization.

Q. (By Representative LORIMER.) When this scale that you speak of is made up, do I understand that you say it is made up by the association members?—A. Made up by the executive committee of the association, and changed when they may deem it necessary from time to time.

Q. And the employees either accept that or not, or else there is trouble?—A. They have accepted it. As far as I know it has been satisfactory to them.

Q. (By Mr. FARQUHAR.) Is not this high rate of wages of seamen governed a great deal by the freight rates that are established?—A. Yes; the policy of the vessel owners has been to raise wages and pay liberal wages in good times, and during very hard times, when the vessels can not make any money, to reduce the wages; and they have expected that the men would recognize the fairness and justice of that arrangement, and they have done so.

Q. (By Representative LORIMER.) Now, when they have been compelled to reduce wages, have they had any controversy with the men on account of reduction?—A. Very little; no.

Q. So it is generally satisfactory all around?—A. So far as I know it is generally a satisfactory arrangement.

Q. (By Mr. FARQUHAR.) Now, in the loading and unloading of vessels around at these various ports, there are unions of stevedores. The trouble you have had at Buffalo, was not that from the parties that made these contracts, outside parties?—A. The grain shovelers' trouble at Buffalo—they are in no respect employees of the Lake Carriers' Association. They are employees of a stevedore contractor. The Lake Carriers' Association makes a contract with some individuals to do the necessary shoveling for the elevators of grain at Buffalo, for the entire season; and the contractor had some trouble with his men.

Q. There were two unions at Buffalo at that time, were there not?—A. Yes.

Q. Both contending for the same rate of wages?—A. Yes. The question was not in its final form a question of wages at all.

Q. It was as to the parties to the contract?—A. Largely a question of personal animosity, it turned into in the end. The men belonging to one of the organizations there declined to work for the contractor of the Lake Carriers' Association on any terms. That was their position for some time.

Q. (By Representative LORIMER.) Would you mind telling the commission what you know about that trouble?—A. The last annual report of the Lake Carriers' Association, of which I have a copy here, contains a pretty full account of that controversy. There is a page or two that I might either read or submit.

Q. If it is not a very lengthy matter, we would like to have you read it.—A. (Reading:)

"The contract for shoveling grain at Buffalo during the season of 1899 was awarded at the last annual meeting to W. J. Conners, of Buffalo. It became apparent before navigation opened that there was to be a labor controversy at Buffalo between the contractor and the shovelers. It is not necessary to recite here the history of the differences of opinion between the contractor and the shovelers. It is enough to confine ourselves to the position taken by the Lake Carriers' Association and to recite the part which it took in the troubles at Buffalo during the early part of the season of navigation.

"The greater proportion of the grain fleet arrived in Buffalo on the 3d and 4th of May."

That is, the fleet that was loading all winter at Western ports—as soon as the Straits of Mackinaw were opened they came down and arrived in Buffalo. (Reading:)

"The work of unloading the boats proceeded very slowly. At no time was the work of unloading entirely discontinued, but the force of men employed was much smaller than under ordinary circumstances. Whatever form the differences between the contractor and his men had taken in the first instance, soon after the opening of navigation the shovelers took the position that they would not work under the contract system, but that they would return to the system of shoveling grain under boss scoopers at the different elevators, which had prevailed before the contract system was put into effect. Under these circumstances the executive committee of the Lake Carriers' Association, at their meeting in Cleveland on May 3, adopted the following resolution:

"Whereas the system of grain shoveling in vogue at Buffalo for three seasons past had operated to correct many abuses: has furnished good wages to the men actually doing the work: saved vessels from delays and extortions and been of

marked advantage to the grain trade of Buffalo, and for the mutual advantage of the shoveler and the vessel this system should continue; and

"Whereas a contest has been excited in Buffalo to do away with this system and compel a return to the old system with all the abuses:

"*Resolved*, That the members of the Lake Carriers' Association have confidence that their contractor, W. J. Conners, is ready and willing to give the men fair treatment and the same wages as last year, and that they stand by Mr. Conners in this contest and insist on the performance of the work under his contract.'

"On the 5th of May a conference was held at the Iroquois Hotel in Buffalo between members of the executive committee of the Lake Carriers' Association and a delegation from Local No. 51, headed by President McMahon. This meeting was practically held under the auspices of the New York State board of mediation and arbitration. Messrs. Goulder, Wilson, Coulby, Corrigan, and Brown attended on behalf of the Lake Carriers' Association. The various labor interests in Buffalo were represented by officers, and a number of elevator men were in attendance. The position of the Lake Carriers' Association was stated by Mr. Goulder to the effect that the association had entered into a contract with Mr. Conners; that he had given them a bond for the faithful performance of the contract, and that the association had determined to stand by its contractor and by the contract system.

"On Saturday, May 6, another conference was held at the Iroquois Hotel, at which representatives of the Lake Carriers' Association, the State board of mediation and arbitration, representatives of the elevator association, and all the various labor organizations of Buffalo were present. At this conference a paper was drawn up and signed by the various interests, proposing a basis of settlement. This basis included the preservation of the contract with Mr. Conners, abolishing the saloon evil, the appointment of an inspector to see that the saloon evil was abolished, in fact, the abolition of all dummies from the pay rolls, and strict supervision in this regard by the inspector. This proposition, though signed by prominent labor leaders in Buffalo as a basis of settlement, was rejected at a meeting of the shovelers, after which the Lake Carriers' Association, through Mr. Goulder, made a statement showing that they had made earnest efforts to settle the trouble in a manner satisfactory to the scoopers and contractor, and had submitted what they considered a fair proposition to the scoopers, which they had refused to hear. In this statement Mr. Goulder suggested for the first time the name of Bishop Quigley, of Buffalo, to act as arbitrator."

Bishop Quigley was the Roman Catholic bishop of Buffalo. (Reading:)

"On the 7th of May Bishop Quigley agreed to endeavor to reconcile the contending parties, and on Monday, May 8, a prolonged conference was held at the house of Bishop Quigley, at which were present, in addition to the bishop, representatives of the Lake Carriers' Association, New York state board of mediation, International Longshoremen's Union, Buffalo Local No. 51. Little progress toward an agreement was made at this conference. During several days thereafter conferences were held at the house of Bishop Quigley, and on Saturday, May 13, a basis of agreement was arrived at and put in writing, and signed by Mr. Goulder, for the Lake Carriers' Association, and the attorney for the shovelers. The basis of settlement agreed upon was as follows:

"First. That the price of \$1.85 per thousand bushels should be paid to the men actually doing the work of shoveling, with not exceeding one foreman at each elevator leg; no other person to participate therein.

"Second. Each gang to select a timekeeper from its own number.

"Third. The timekeeper and inspector provided for at the conference to have free access to bills of lading and other documents showing the quantity of grain elevated.

"Fourth. Wages to be paid at elevator offices.

"Fifth. No bar bill or other accounts to be deducted from wages.

"Sixth. No boss or paymaster to be directly or indirectly connected with any saloon.

"Seventh. An inspector to be appointed by the bishop to see that the provisions of the agreement were carried out, and to report any violation to the bishop and to the Lake Carriers' Association; the inspector to be removable by the bishop with power to appoint another, if necessary, to be paid by the Lake Carriers' Association.

"Eighth. Bishop Quigley to have power to appoint a disinterested arbitrator to hear and finally determine complaint.

"Although this agreement was entered into by all parties to the controversy, upon the following Monday morning the scoopers did not return to work as expected, alleging acts on the part of the contractor inconsistent with the agree-

ment. Representatives of the Lake Carriers' Association, therefore, gave out a statement that they had entered into an agreement which provided a remedy for every abuse and evil that had been complained of by the men; that they had done all they possibly could to put an end to the labor trouble at Buffalo, and not having been successful in inducing the men to go to work, they could only withdraw from further negotiations, leaving Bishop Quigley to deal with the matter as he saw fit. Meanwhile, the steam shovels and a force of two to three hundred men were steadily at work in unloading grain at Buffalo, and giving, under peculiarly difficult circumstances, as good dispatch to vessels as was possible. Meantime, also, without participation by representatives of the Lake Carriers' Association, various questions between the contractor and men, such as the selection of bosses, the temporary suspension of objectionable bosses, and the employment of men not members of local 51, had been the subject of negotiations between the contractor and shovellers, and on the 23d of May the settlement of these questions was so far advanced that the men returned to work at all the elevators. Bishop Quigley appointed Timothy P. Donovan inspector, to see that the various terms of agreement which had been arrived at by all parties were faithfully carried out, and to report any complaints of violation of the agreement to Bishop Quigley or his representative."

That is the history of that; there was no trouble after that.

Q. (By Representative LORIMER.) Can you give the commission the number of vessels and the tonnage that moves down the Great Lakes?—A. Yes. On the 30th of June, 1899, the total number of vessels on the lakes was 3,162, and their tonnage was 1,446,348 tons. That was out of a total of 22,728 vessels of all kinds in the United States. The total marine tonnage of the United States was 4,864,238 tons. A little less than one-third of the tonnage of the whole country is on the lakes.

Q. Have you information that would tend to show the number of American vessels and the tonnage used in ocean commerce?—A. Well, you mean by ocean commerce coastwise and others?

Q. Yes.—A. I can give you those figures in a moment; that is, practically the whole tonnage of the country, less that of the lakes and the Western rivers. The tonnage of the country is divided into 4 classes: The Atlantic and Gulf coasts, the Pacific coast, the Northern lakes, and Western rivers. Now, the total tonnage in 1899 was 4,864,238, of which the Atlantic and Gulf coasts had 2,614,869, the Lakes 1,446,348, the Pacific coast 539,937, and the Western rivers 263,984. Those are the figures, but in a way they are somewhat misleading. Now, there is a total number of vessels on the Lakes of 3,162. That includes boats, harbor tugs, scows, steamers, canal boats, river excursion boats, and all that. We have in the Lake Carriers' Association about 600 vessels out of the 3,162, but their tonnage is a little over 1,000,000 tons out of 1,400,000 tons that make the whole.

Q. They are practically the carriers, then?—A. They are the carriers; the freight carriers.

Q. And your association has practically all the carrying tonnage within the association?—A. There are some exceptions, but we have probably somewhere from four-fifths to nine-tenths of the whole freight-carrying tonnage.

Q. Many of those vessels are owned by the large railroad transportation companies, are they not?—A. Some of them are; not a large proportion.

Q. Have you any idea of what percentage?—A. I can tell you. Out of about 600 vessels in the Lake Carriers' Association 72 are owned or controlled by companies having affiliations of some kind with the railroads.

Q. What is the tonnage?—A. The tonnage of those vessels—the tonnage given by the Government's reports—is what is called gross tonnage, and our tonnage that we keep in our books, and on which our association is supported by tax, is what is called the net registered tonnage. Those boats have a net registered tonnage of 122,000 out of a net registered tonnage in the association of 760,000, a little less than one-sixth of the association.

Q. (By Mr. KENNEDY.) Are the fleets of the iron and steel manufacturers in your association?—A. Yes.

Q. (By Mr. RATCHFORD.) What railways are interested in those vessels?—A. I have a list of those boats here. The Great Northern Line, which is connected with the Great Northern Railroad, has 8 vessels, of which 6 are freight and 2 passenger. The Canadian Atlantic Transit Company has 5 vessels; the vessels are American; the company is Canadian. The Western Transit Company, which is affiliated with the New York Central, has 13 vessels. The Anchor Line, affiliated with the Pennsylvania, has 16 vessels. The Wabash Line, 4 vessels. Ogdensburg Transit Company, which is the Central Vermont Line, 8. The Soo Line, which is the St. Paul, Minneapolis and Sault Ste. Marie Railroad, 5. The Union

Steamboat Company (vessels) is affiliated with the Erie Railroad. The Lehigh Valley Transportation Company (vessels) is the Lehigh Valley Railroad fleet. The Lackawanna also has a line. Now, I may say that those are all what we call on the lakes package freight boats. They are engaged in different business altogether from the ordinary lake vessel. The ordinary lake vessel is built to carry bulk freights, either coal, or ore, or lumber, or grain. The package boats have an extra deck. They have a hold in which they carry grain or coal and then a between decks in which they carry package freight; and they are built to carry miscellaneous merchandise for what is called the lake and rail route; that is, a New York Central agent in Chicago will contract for some freight to be taken through to New York by lake and rail. They use the Western Line of steamers from Chicago to Buffalo and then the New York Central from Buffalo to New York.

Q. Are any of the grain boats affiliated with the railroads?—A. A few owners build their boats with the decks so that they may charter them for the season to some of these companies that are short of boats; but that is rather disappearing from the lakes. The great object with the lake vessel owner in building a boat is the speedy handling of cargo, and if the boat is to be engaged most of the year in bulk-freight business, such as coal or ore, the deck is in the way of the handling process; so they build their boats without any between decks.

Q. Speaking of ore, do you know of any railroads, or any trust, or any corporation other than the transportation companies that own and control their own boats for the shipping of ore?—A. Many of the mining companies have separate companies organized for owning vessels, and those vessels usually have some affiliation with the owners of the mines. The stock may be identically owned, or may be to a certain extent owned by the same interests—the stock in the mines, the stock in the steel company, and the stock in the boats.

Q. Has the Standard Oil Company a line of boats?—A. My impression is that they have just one tank boat on the lakes that is engaged in carrying oil in bulk from Chicago to Duluth.

Q. Are they engaged in the shipping of ore?—A. No; Mr. Rockefeller has ore interests, but the Standard Oil Company has not, as far as I know.

Q. (By Mr. PHILLIPS.) You understand that Mr. Rockefeller has, and not the Standard Oil Company?—A. That is my understanding.

Q. Well, who built what are called the whaleback boats of recent years?—A. The inventor of the whaleback was a man named Alexander McDougall. He lived in Duluth and he interested some New York capitalists in a shipyard, and he built a fleet of whalebacks, or a fleet of whalebacks was built by a company called the American Barge Company. They have a fleet of about 30 boats.

Q. Who is the principal owner of that fleet?—A. I can not tell you that, but it is supposed that that fleet has been bought by Mr. Rockefeller since the close of navigation last fall.

Q. Bought entirely?—A. I think he had some interest in them before, but it is understood that he is the owner of that fleet now.

Q. Well, are those the boats that handle the Carnegie or the Bessemer ore?—A. No; the Carnegie ore has been handled quite largely by the fleet of the company called the Bessemer Steamship Company. That company is owned by Mr. Rockefeller.

Q. Do you know whether Mr. Carnegie proposes now to carry his ore or not?—A. Some half dozen boats are now building for the Carnegie people.

Q. This Carnegie line connects with the railroad built by Mr. Carnegie from some ports on the lakes to his works?—A. There is a railroad built from Conneaut, Ohio, to Pittsburg—the Pittsburg, Bessemer and Lake Erie Railroad, I think it is called—on which Mr. Carnegie has much of his ore carried. It is carried by the Bessemer boats to Conneaut.

Q. Could you state what effect the building of these whaleback boats has had on the other boats and people engaged in shipping?—A. The whaleback boats are not the largest boats by any means on the lakes. There are other boats which are larger.

Q. But upon those built in recent years by these other companies, have they had any great effect on the people doing this business, the building of these large boats, whalebacks and others?—A. It is impossible to state what effect they have had on the smaller boats. The smaller boats have made a great deal of money this year; have had a very prosperous year. They have had this year perhaps as prosperous a year as they ever have had.

Q. For a time did it effect other shippers?—A. 1897 and 1898 were dull years, but in 1899 there was a great deal of freight to be carried by vessels. There was a good deal of tonnage that had been contracted for the season at a very low rate,

and the larger vessels that had contracts to carry throughout most of the season had to carry for a low rate, although the vessels that had not contracted for the season were getting extremely high rates. The variation was as great as that between 60 cents a ton and \$2 a ton—60 cents a ton, the season contract rate, which was made in the winter of 1898 and 1899, and \$2 the highest going rate from day to day that prevailed for quite a time during the navigation season of 1899.

Q. (By Mr. SMYTH.) These larger boats require an additional number of firemen and an additional number of seamen?—A. Yes; they employ more men than the smaller. There are more men in the engine room. But the advantage of the large boat is that with a comparatively small increase in the expense of running, comparatively small increase in the crew, the carrying capacity is greatly increased.

Q. Are these large boats built for any special trade?—A. The ore trade is the great trade of the lakes; it is more than twice what the total grain trade is and more than twice the coal trade. The great item in the carrying of freight on the lakes is the ore.

Q. That business has very largely increased in the last few years?—A. Immensely; there were about 20,000,000 net tons of ore carried on the lakes in 1899.

Q. These large boats, then, were built to meet the demand, I suppose, for tonnage for carrying this ore?—A. Yes; that is what they were built for.

Q. (By Representative LORIMER.) Do you know what percentage of the traffic was ore last year?—A. The total traffic on the lakes is a thing that no man can give, and there are no records that can enable you to say what the total amount of traffic carried on the lakes is. The traffic to and from Lake Superior—a record of that is kept at the entrance to Lake Superior, the Soo Canal—and that traffic of Lake Superior is about half of the total traffic on the lakes. I can give you the proportions of the different commodities in the Lake Superior traffic, and from that a deduction can be made as to how the proportions run in the entire lake traffic. The total freight traffic through the Soo Canal last season was 25,255,810 tons, and of that 15,328,000 tons, or about 60 per cent, was ore.

Q. That would be the total tonnage of ore, then, would it not, about 15,000,000?—A. No; there is ore also shipped from Escanaba in Lake Michigan and from Gladstone in Lake Michigan.

Q. Could you give the commission an idea of the tonnage shipped on Lake Michigan, of ore?—A. The total shipments by lake of iron ore in the season of 1899 were 17,901,000 gross tons, or a little over 20,000,000 net tons, and of that 17,901,000 gross tons the shipments by ports were as follows: Escanaba, which is in Lake Michigan, 3,720,218 tons; Gladstone, which is in Lake Michigan, 381,457 tons. The other ports are all in Lake Superior. So that of that 18,000,000 tons, about 4,000,000 were shipped from Lake Michigan and about 14,000,000 from Lake Superior. That 14,000,000 tons would be 15,500,000 tons if converted into net tons.

Q. About the ownership of the mines along the lakes; do you know who own them?—A. I do not. I have no information as to that.

Q. Will you give the commission the grain traffic on the lakes for last year?—A. I can give you the Buffalo traffic, which is probably about 80 per cent of the total grain traffic on the lakes; that is, the traffic in the Georgian Bay, to Erie, Ogdensburg, and down the St. Lawrence, is about one-fourth of the traffic to Buffalo. There was a falling off in the grain traffic on the lakes last year, due principally to two causes. The first of these causes was the prolonged labor controversy at Buffalo, in the spring of the year, which shortened the season; and the second and more important cause was the extremely high rates prevailing for the carriage of iron ore. The steel companies were so anxious to get ore that they bid the freights up to get boats, and, of course, the grain trade could get no boats without bidding against the rates the ore people were offering. This raised the grain freight so materially that the railroads, who find it difficult to compete with the lake trade in seasons of low rates, were able to compete actively last season when the freights were so high, and a considerable quantity of grain was diverted last year from the lakes to the all-rail route. I will give you the figures for last year and the year before, which was the largest year in the history of the grain trade. The grain receipts in Buffalo in 1899 were 153,000,000 bushels and 10,000,000 barrels of flour; in 1898 they were 12,500,000 barrels of flour and 204,000,000 bushels of grain.

Q. Have you the other commodities on the list?—A. Yes.

Q. Will you kindly give those to the commission?—A. I have a complete statement of the imports by lakes at Buffalo and the coal exports.

Q. Have you the exports of coal there on that list?—A. The shipments of coal from Buffalo last year were the largest in the history of the port.

Q. (By Mr. RATCHFORD.) Have you the imports of coal from points in Canada to the United States?—A. The movement is the other way. There is quite a ship-

ment of coal from the United States to Canada, but there is no coal received from Canada into the United States by lake.

Q. (By Representative LORIMER.) If you can, will you just give us the total?—A. Well, I can not give you the total of the trade. I can give you the Buffalo business. There was shipped last year from Buffalo 2,648,425 tons of anthracite coal by lake, and 126,140 tons of bituminous. Buffalo is the principal port of anthracite shipment by lake, and it is just beginning to be a small shipping point for bituminous coal; but the most of the bituminous that is shipped by lake is shipped from ports farther west—Cleveland, Toledo, and Ashtabula.

Q. That is shipped to all ports?—A. Shipped to all ports, most of it American, and some of it Canadian. There is coal shipped on Lake Ontario from Charlotte and Oswego and other ports to Toronto, and other points in Canada.

Q. You do not know what that amounts to?—A. I can not tell you about that.

Q. Do you know the percentage of vessels now owned by individuals?—A. Very few vessels are owned by individuals. Vessels are becoming too large and expensive. A group of men will get together and build a boat, but as a rule they organize a company and the boat is owned by the corporation. The corporation, however, consists of a few individuals who perhaps own other vessels in different proportions, and organize a separate company for each new boat.

Q. There are very few boats now being sailed by their owners?—A. Very few.

Q. Have you any idea of what percentage of vessels are sailed by the owners?—A. Some of the smaller lumber schooners; that is all.

Q. A few years ago a great many of the vessels on the lakes were owned by individuals, were they not?—A. I have no knowledge. That is before my connection with the lake business. The class of tonnage was totally different from what it is now.

Q. (By Mr. FARQUHAR.) I think the commission would like to have some knowledge of these freight rates for this season, and say for last season. We have the tonnage, and we have every other feature now, but we have no notion of these great raises in freight rates, and what caused the increase of the rates, for instance, on ore; and if you have figures that are official, or as near official as they can be, the commission would like to have them.—A. The freight rate on the lakes varies from day to day. The high rates prevailed through the season of 1899 solely because there was a great demand for boats. Every furnace in the territory dependent on lake ores was in operation at full capacity, and the demand for ore was very great, and the demand for boats to move it was very great, and the freight rates went up automatically.

Q. Have you a table of freight rates for 1898 and 1899?—A. I have the grain figures for 1898 and 1899, and they will serve equally well with the ore. There is a relation between them that is a fixed one. If the grain freights were higher than the ore freights why it would immediately be equalized; boats would leave one trade for the other. I will take the rate from Chicago to Buffalo on grain. In 1898 the highest rate was $3\frac{1}{2}$ cents on wheat, and the lowest $1\frac{1}{4}$. The average for the season was $1\frac{1}{4}$.

Q. Is that in the bushel, or what?—A. That is per bushel. In 1899 the highest was $3\frac{1}{4}$, the lowest $1\frac{1}{4}$, and the average $2\frac{1}{4}$.

Q. What is the minimum rate at which the railroads can compete with boats at Chicago?—A. I can not say. I have no knowledge.

Q. You suggested that on account of the high rates the railroads handled a great deal of the grain trade?—A. That is an inference from the fact that the rate was much higher and the grain movement by lake decreased.

Q. You have no idea about what was the minimum rate at which the railroads could compete?—A. No.

Q. (By Mr. A. L. HARRIS.) Has your association anything to do with fixing freight rates?—A. Nothing whatever.

Q. (By Mr. FARQUHAR.) Well, are the freight rates fixed on the exchanges of the various cities?—A. The freight rates are largely fixed from time to time by the supply and demand of vessels at the shipping ports, as far as grain is concerned. So far as ore is concerned, what is called wild tonnage is decreasing all the time, and what is called season tonnage is increasing all the time. The greater part of the ore—the carriage of it down the lakes—is contracted for by contracting it in large bulks during the winter to be carried during the next season. The reason for that is easily seen. In the first place, as soon as the ore is sold the tendency is to cover the ore, cover the freights by chartering tonnage to carry it, and the two transactions go on together. Then, in the next place, so far as the vessel is concerned, the owner of a vessel that carries 1,000 or 2,000 tons may be willing to take his chances on getting cargoes from trip to trip during the seasons; but if a man owns a boat that carries 7,000 or 8,000 tons, his boat carries so much more that he can not as easily pick up loads when he wants to, and safety

requires that he should take a block of cargo to be carried, and take it during the winter, and get the vessel something to do during the summer; so that the owners of a large class of tonnage are inclined to contract for the season and not take chances on wild-trip rates. The owners of smaller boats are willing to take that chance.

Q. (By Representative LORIMER.) Is it generally understood what class of freight Mr. Rockefeller intends to carry with the boats that he has purchased, or are they to be put in the general shipping business, do you know?—A. They are what are called ore boats. They are built for the ore business. As a matter of fact, the Rockefeller boats carry ore, like most of the large boats, during the midsummer and perhaps carry a load or two of grain in the fall of the year, before the close of navigation, and perhaps a load or two in the spring before the ore movement begins. In the first place, the Straits of Mackinaw sometimes open before the St. Marys River opens and boats will carry a load of grain from Chicago to Buffalo before the ore trade opens. And in the fall of the year the ore is full of moisture, and as soon as the extreme cold weather comes it freezes in the ore pockets and it becomes difficult to load vessels, whereas grain can still be loaded from elevators into the vessels, and many of the vessels carry one or two loads of grain in the fall of the year after they have closed up their ore contracts and before they go into winter quarters.

Q. What percentage of ore is carried by boats that are presumed to be owned directly or indirectly by the mine owners?—A. I can form no estimate of that whatever. I have no knowledge.

Q. (By Mr. FARQUHAR.) What is the character of the return cargo of those boats from the Eastern ports to the Western—the return cargo?—A. Very many of them return light. Coal is the only large item of west-bound shipment on the lakes.

Q. Do the ore boats take coal as a return cargo?—A. Very often. Many of them return light.

Q. Do the grain boats take a return cargo at all?—A. Very often. The east-bound movement is two or three times as large as the west-bound movement. Therefore the majority of the fleet returns light.

Q. (By Representative LORIMER.) Has there been any discussion in your association on the opening of the drainage canal and the probable effect of it on the lake levels?—A. There has. We have had the general subject of lake levels under discussion in our association. There is no question but what the opening of the drainage canal will affect the lake level. The only question is about the amount. This has been estimated to be about 3 inches by Major Marshall, the engineer at Chicago. Other engineers have estimated that the drainage canal would lower the lake level of Lakes Huron and Michigan by 7 or 8 inches.

Q. Has your association had any discussion as to what effect that would have on commerce, on the boats that are now used in transportation over the lakes?—A. We have had the whole matter up in connection with other projects for diverting the water. There is at the present time building at Sault Ste. Marie, Mich., a power canal which is to draw water from the St. Marys River or out of the basin of Lake Superior above the rapids and return it to that river below the rapids. Now, as that canal is built proposing to pass a volume of water equal to nearly 50 per cent of the entire flow of the St. Marys River at low-water stage, the engineer of the power company has estimated that if no compensatory works to obstruct the flow in the rapids were built, that canal would lower the level of Lake Superior 2 feet before a condition of equilibrium was again established. The company proposes to build compensatory works in the St. Marys River to obstruct the flow over the rapids by an amount equal to that which they take through the canal. Our association had a hearing before the River and Harbor Committee last Friday morning, on the question of necessary legislation to protect the interests of navigation there, and not permit the level of Lake Superior and the available draft of water in all its harbors and in the canal at the head of the lock there to be affected. It was shown by figures to the River and Harbor Committee that a diminution of 1 inch in the available draft of water would amount to \$150,000 a year to the vessels, net loss.

Q. Have they discussed any legislation on account of the drainage canal at Chicago?—A. Not in connection with that project especially; but the question of legislation on the whole subject of the control of lake levels is one of the questions before the association now. The most serious effect, I might say, so far as we can see it at the present time, is the effect on the harbor of Chicago itself. It is making a dangerous current in the Chicago River, and it has lowered the draft through that river in which the drainage is carried off—the water in the upper part of Chicago River is lowered 2 feet. It has lowered it over the Washington street tunnel, which is one of the places where the draft of vessels is limited, by about 6 inches.

ment of coal from the United States to Canada, but there is no coal received from Canada into the United States by lake.

Q. (By Representative LORIMER.) If you can, will you just give us the total?—A. Well, I can not give you the total of the trade. I can give you the Buffalo business. There was shipped last year from Buffalo 2,648,425 tons of anthracite coal by lake, and 126,140 tons of bituminous. Buffalo is the principal port of anthracite shipment by lake, and it is just beginning to be a small shipping point for bituminous coal; but the most of the bituminous that is shipped by lake is shipped from ports farther west—Cleveland, Toledo, and Ashtabula.

Q. That is shipped to all ports?—A. Shipped to all ports, most of it American, and some of it Canadian. There is coal shipped on Lake Ontario from Charlotte and Oswego and other ports to Toronto, and other points in Canada.

Q. You do not know what that amounts to?—A. I can not tell you about that.

Q. Do you know the percentage of vessels now owned by individuals?—A. Very few vessels are owned by individuals. Vessels are becoming too large and expensive. A group of men will get together and build a boat, but as a rule they organize a company and the boat is owned by the corporation. The corporation, however, consists of a few individuals who perhaps own other vessels in different proportions, and organize a separate company for each new boat.

Q. There are very few boats now being sailed by their owners?—A. Very few.

Q. Have you any idea of what percentage of vessels are sailed by the owners?—A. Some of the smaller lumber schooners; that is all.

Q. A few years ago a great many of the vessels on the lakes were owned by individuals, were they not?—A. I have no knowledge. That is before my connection with the lake business. The class of tonnage was totally different from what it is now.

Q. (By Mr. FARQUHAR.) I think the commission would like to have some knowledge of these freight rates for this season, and say for last season. We have the tonnage, and we have every other feature now, but we have no notion of these great raises in freight rates, and what caused the increase of the rates, for instance, on ore; and if you have figures that are official, or as near official as they can be, the commission would like to have them.—A. The freight rate on the lakes varies from day to day. The high rates prevailed through the season of 1899 solely because there was a great demand for boats. Every furnace in the territory dependent on lake ores was in operation at full capacity, and the demand for ore was very great, and the demand for boats to move it was very great, and the freight rates went up automatically.

Q. Have you a table of freight rates for 1898 and 1899?—A. I have the grain figures for 1898 and 1899, and they will serve equally well with the ore. There is a relation between them that is a fixed one. If the grain freights were higher than the ore freights why it would immediately be equalized; boats would leave one trade for the other. I will take the rate from Chicago to Buffalo on grain. In 1898 the highest rate was $3\frac{1}{2}$ cents on wheat, and the lowest $1\frac{1}{4}$. The average for the season was $1\frac{1}{4}$.

Q. Is that in the bushel, or what?—A. That is per bushel. In 1899 the highest was $3\frac{1}{2}$, the lowest $1\frac{1}{4}$, and the average $2\frac{1}{4}$.

Q. What is the minimum rate at which the railroads can compete with boats at Chicago?—A. I can not say. I have no knowledge.

Q. You suggested that on account of the high rates the railroads handled a great deal of the grain trade?—A. That is an inference from the fact that the rate was much higher and the grain movement by lake decreased.

Q. You have no idea about what was the minimum rate at which the railroads could compete?—A. No.

Q. (By Mr. A. L. HARRIS.) Has your association anything to do with fixing freight rates?—A. Nothing whatever.

Q. (By Mr. FARQUHAR.) Well, are the freight rates fixed on the exchanges of the various cities?—A. The freight rates are largely fixed from time to time by the supply and demand of vessels at the shipping ports, as far as grain is concerned. So far as ore is concerned, what is called wild tonnage is decreasing all the time, and what is called season tonnage is increasing all the time. The greater part of the ore—the carriage of it down the lakes—is contracted for by contracting it in large bulks during the winter to be carried during the next season. The reason for that is easily seen. In the first place, as soon as the ore is sold the tendency is to cover the ore, cover the freights by chartering tonnage to carry it, and the two transactions go on together. Then, in the next place, so far as the vessel is concerned, the owner of a vessel that carries 1,000 or 2,000 tons may be willing to take his chances on getting cargoes from trip to trip during the seasons; but if a man owns a boat that carries 7,000 or 8,000 tons, his boat carries so much more that he can not as easily pick up loads when he wants to, and safety

Q. Could not be equipped?—A. That is a question I could not answer.

Q. (By Mr. PHILLIPS.) What is the capacity of the largest vessels in tonnage on the lakes?—A. Those vessels now building by the American Ship Building Company at Loraine—498 feet long, steamers—have a carrying capacity on 18-foot draft of water of 7,900 gross tons, which is about 9,000 net tons.

Q. What amount of tons would the largest vessel carry 10 years ago, as compared with those you named now?—A. The largest cargo brought from the upper lakes down to Lake Erie, down to 1891, was 3,527 tons, and the largest cargo that passed through the St. Marys Falls Canal last year (1899) was 8,315 tons.

Q. Could you tell about the difference in the freight rate during that period—along about that period—and at present?—A. Last year's freight rates were high. A better comparison, as showing the course of freight rates downward as the vessels increased, would be the rates of 1898 as compared with 1890.

Q. We would be glad to have that comparison.—A. The rates on ore in 1891 from Lake Superior ports to Lake Erie ports varied during different parts of the season from 90 cents a ton to \$1.50 a ton, the average for 1891 being about \$1.15 or \$1.20. In 1898 the large proportion of the iron ore was brought down at 65 cents. The vessel has to pay for loading and unloading out of these freights.

Q. (By Mr. KENNEDY.) Can you make a comparison between the freight rate for a given number of years and the wages paid on these vessels? For instance, you state that the rate last year for freight was very high; I would like to know if the rate of wages was correspondingly high.—A. I have not the data for that; I can not give it to you.

Q. Will not your cards that you say you send out from year to year show that?—A. Yes; and if I had the cards here I could form some estimate; but I haven't them.

Q. (By Mr. PHILLIPS.) Could you furnish that information to the commission?—A. I presume I could send you cards showing the rate of wages last year, in the season of high freight rates, and in the year before, which was a season of low ones.

Q. (By Mr. KENNEDY.) Will you do that; put it in your testimony?—A. Yes. The cards change variously during the year. The cards are based on supply and demand to a certain extent, as well as the rates of freight. When men get scarce a higher card goes into effect.

Q. Is not that true also of freight rates?—A. Yes; they change the same way.

The Lake Carriers' Association has never since its organization undertaken the slightest interference with the natural law of supply and demand as far as freight rates are concerned. On ore the freight rate is largely now a season rate, for reasons I have already stated. On grain the freight rate fluctuates from time to time, purely and simply on the question of supply and demand of boats. The rate may rise one-fourth cent at Chicago for a shipment of corn to Buffalo because the boats are scarce, and it may go back the next day. It operates entirely and under the control absolutely of competition.

Q. No doubt these figures you have in regard to the rates in force during the last year will show that the lake traffic people enjoyed great prosperity. Have the men that work on the boats been enjoying a proportionate share of that prosperity?—A. I will try and send you a set of the cards. I might say in that regard, however, that the prosperity of the season of 1898 was very unequally distributed on the lakes on account of this question of season contracts. Many of the vessels had tied up their tonnage at a very low rate for the greater part of last season, and they did not get the profit out of the season that the vessels did that got the going rate for the season. Now, during the coming season the contract rate is higher than last year, and the vessels that tie up at the contract rate for next season will do much better than those who tied up to it last season. The owner of the smaller vessels had the best profits last year, because, rather than tie up his boat at a low rate for the season, he took his chances on the wild rate, and he got the high rates last year, whereas the man with the large carrying capacity did not dare to trust to trip charters, and as a rule he tied up his boat under a season contract at the lower rate.

Q. (By Mr. FARQUHAR.) Is it not a fact that it is almost impossible to make an average as to seamen's wages on the lakes for the season, or as to freight rates?—A. Yes.

Q. Have you ever known of an average being made?—A. No.

Q. Fluctuations are of such character that it is utterly impossible to take two figures and divide at either extreme?—A. Yes; you can not do it. The freight rate may be the prevailing rate for two weeks, for example, on grain in Chicago, and it may be so high as to shut off the business; and it may go down one-fourth cent, and in a few days there might be more business done than during that two weeks. So, taking into account the time they remained in effect and the

amount of trade during the time they remained in effect, no true average can be obtained.

Q. Is the passenger business on the lakes growing?—A. The passenger business on the lakes is growing.

Q. You have some exclusively passenger boats?—A. Yes.

Q. What is the size of the boats?—A. The Great Northern Railroad have two passenger boats nearly 400 feet long and costing them about \$800,000 each running between Buffalo and Duluth, and making the round trip in 6½ days—2,000 miles. They are fitted with the very best accommodations in every respect, as luxurious as the best ocean liners, and they carry not a pound of freight. They are very large twin-screw vessels, and built exclusively for the passenger service.

Q. Do they carry a large number of passengers?—A. The season is short. They do not go into operation until early in June; generally stop running in September; but they are crowded during that season.

Q. (By Mr. KENNEDY.) Tourist traffic?—A. Tourist traffic. Then there is another class of vessels that are doing a large passenger business in connection with the package freight business, such as the boats between Buffalo and Cleveland, between Cleveland and Detroit, night service between Detroit and Mackinaw, and night service between Chicago and Mackinaw, and Chicago and Milwaukee.

Q. (By Mr. PHILLIPS.) Is there considerable service between the United States and Canada?—A. There is a line running from the mouth of the Niagara River to Toronto—one or two boats daily in the summer time—a passenger business of considerable size. That is the only international service—that and the ferry service at Detroit, except on the St. Lawrence River.

Q. (By Mr. FARQUHAR.) Are the facilities of navigation at the Soo now large enough to take care of the whole traffic of Lake Superior?—A. They need very extensive improvement, just as soon as they can get at it. There were two blockades in the Soo River this last season, which cost the vessels a million dollars in delay. The Soo channels in several places are only 300 feet wide. They are running boats down there 500 feet long. In one case last summer the steamer *Geoffrey Houghton*, of the Bessemer Company, broke her wheel chains just as she was approaching a turn, at a point called the "Sailor's Encampment," where the channel is only 300 feet wide. She was towing a large barge and had 7,000 or 8,000 tons of cargo; she swerved and stuck her nose in the bank and her stern swung across, and the barge came down and collided with the steamer and sunk her. It took about 5 days to get her out of the channel, and it cost the vessels about three-quarters of a million dollars in time.

Q. Is there more than one channel from the Soo down to Lake Huron?—A. Practically only one—what is called the Hay Lake Channel. There was an old channel from the Soo down to Lake Huron, which had about 14½ or 15 feet of water. The Government has since constructed what is known as the Hay Lake Channel, which cuts off the old channel, and the available draft of vessels through the Hay Lake Channel is about 18 feet. The old channel is therefore practically not available. Although there is 15 feet of water, it is not available for the class of vessels now running. So when this vessel, the *Geoffrey Houghton*, sank in the channel she tied up the tonnage. The other boats were heavily loaded and could not go through the old channel.

Q. What are the proposed improvements?—A. Two plans are proposed; one to widen the channel where it is now 300 feet to a minimum of 600 feet, and have no points where it is less than 600 feet; the other is to diverge from the present channel, just below the "Sailors' Encampment," and make the West Neebish Channel, leaving the old channel 300 feet wide and making a new one 300 feet wide. The latter is the plan which the vessel men favor, as you can not blockade two channels at once. It is only a question of time when we will get 600-foot boats which will blockade a 600-foot channel; but you can not blockade two 300-foot channels with one disaster.

Q. Is the Hay Lake Channel navigable at night?—A. Yes; the boats not loaded to full capacity come up; but where they are very heavily loaded they will not dare go down at night. They wait until daylight, or plan their trips so as to reach the river in the daytime.

Q. Have you any comparative figures of the traffic through the Soo locks and through the Suez Canal?—A. I have a table showing a comparison between the Soo and the Suez Canal, as far as traffic is concerned. The last figures for the Suez were 1897. The traffic through that canal, in ship tonnage, was 7,899,373 tons. During the same year the traffic through the St. Marys Falls Canal was 18,982,755 tons. The traffic of the St. Marys Falls Canal has since increased so that the vessel tonnage through it in 1899 was 21,958,347 tons, about 24 times the traffic of the Suez Canal, and the St. Marys Falls Canal is open less than 8 months in the year.

Q. Your facilities for loading and unloading in port are considerably more than they were 6 or 8 years ago, are they not?—A. The methods of unloading and loading boats are constantly improving. The lake season being a short one, and the vessels being only in commission about two-thirds of the year, the question of dispatch in port is one of great importance to the boats. The machinery has been very greatly improved in the last few years for the handling of cargo.

Q. How long would the detention of a boat be now for unloading, supposing you got her docked on arrival?—A. A vessel could come into Buffalo with 260,000 or 270,000 bushels of wheat and be unloaded—she might arrive in the early morning, have her cargo unloaded and get a load of coal and get out the same night.

Q. (By Mr. RATCHFORD.) When does the lake season begin?—A. With the opening of the Straits of Mackinaw; about the 20th of April.

Q. Is there not a specified time in which the insurance takes place?—A. Not for the opening. As a rule the insurance expires on a certain day, but season insurance begins when the straits are reported open.

Q. Formerly did not the insurance on a boat begin some time about the middle of May and end about the last of October?—A. Not so far as I know. That must have been long before my connection with the lake business.

Q. (By Mr. PHILLIPS.) What day does insurance end now?—A. There has been some variation in that of late years. Some of the policies expire the 1st of December, some the 5th, some run as late as the 12th. They expire at noon of any one of those days. If the vessel is on a voyage at that time the insurance covers her until she completes the voyage.

Q. (By Mr. FARQUHAR.) Is there any fault found with the terminal or transfer charges at Buffalo now with respect to grain?—A. That is a rather hard question to answer. There is always fault found with all charges, but the charges at Buffalo have been decreased during the last 2 years; and those that know what the charges are now, I think, are not inclined to find fault with them. The transfer charge on grain at Buffalo is only one-half cent per bushel now.

Q. Is there any combination of the elevators at Buffalo?—A. There is an elevator association; yes.

Q. How many working elevators does that association control?—A. Last season there were no elevators in the association except working elevators.

Q. Are these elevators combined with reference to a division of profits?—A. The elevator association last season was an association solely of working elevators, having rail connections; houses that were not working or that were situated on islands and that could only unload into canal boats and not into railroad cars, were not in the association. The elevators in the association are some of them owned by individuals, some by companies, and some by railroads.

Q. (By Mr. PHILLIPS.) Is this association a joint stock concern?—A. I think not.

Q. (By Mr. FARQUHAR.) Is it a pooling arrangement?—A. It is a pooling arrangement.

Q. How much of the elevator business of Buffalo does it control?—A. It did almost all the business last year. A few of the canal houses, not taken into the association transacted a little business in taking grain out of vessels and loading it into canal boats—but the association did practically all the business.

Q. Do the trunk lines have their own elevators?—A. They have; most of them. The New York Central has its elevators; the Erie has its elevators; I think the Lehigh Valley has none; the Lackawanna, I think, has one small elevator; the Great Northern Railroad has its own elevator, and the Pennsylvania Railroad has an elevator.

Q. You say the charge is now one-half cent?—A. Yes. That includes the elevation of the grain and 10 days' storage.

Q. What was the old rate?—A. The old rate was seven-eighths cent.

Q. How long did seven-eighths cent remain as the rate there in Buffalo?—A. I can not tell you the number of years; quite a number of years prior to 1898. In 1898 there was no association and no fixed rate. In 1899 an elevator association was again formed and the rate was made one-half cent. It had never been lower than seven-eighths cent before.

Q. Is the commerce of the Erie Canal increasing or decreasing?—A. Decreasing.

Q. What is the reason; railroad competition?—A. Railroads have improved their service and lowered their rates, and the canal itself has not been improved for a long period of time. The canal-boat business has not been a profitable or prosperous business, so there have not been any new boats built. Even if freight rates materially advance now, there are no boats to do any large business on the canal. The number of boats on the canal in condition to carry grain cargo is decreasing every year as the boats get older, and there are no new boats being

built. The Erie Canal must, therefore, in a few years drop out of the grain business altogether unless some radical change in the condition of the canal is made.

Q. What was the rate on wheat to Buffalo last season?—A. It is difficult to say; I can not answer. Most of it is contracted through from the West, including lake and rail. It is impossible to say what the rail rate east of Buffalo is.

Q. You are not aware of any rates made from Buffalo through to New York?—A. There are rates called "ex-lake rates" from Buffalo to New York, but I can not tell you what they are. They vary according to the rail situation.

Q. So you would say it is impossible for the canal, in its present condition and the character of the freight carriers on the canal, to compete with railroads?—A. It certainly is impossible.

Q. What is the position of your firms: is it favorable to the improvement of the canal?—A. Favorable toward an adequate improvement of the canal. I think the general understanding among lake men and well-posted transportation people in Buffalo is that the canal should either be abandoned or adequately improved. A small improvement would be of no use; it must be built over practically—modernized.

Q. Are you aware of any sentiment of the farmers of the Northwest in respect to the improvement of this canal?—A. There has been a sentiment in the West for a deep waterway from the lakes to the East.

Q. A ship canal?—A. A ship canal. Probably that same sentiment would be in favor of a barge canal if it could be shown that a barge canal could handle the freight as economically as a ship canal. Major Simons made a pretty exhaustive study of the question, and he has reached the conclusion that freight can be carried from the lakes to the sea much more cheaply by barge than by ship canal. In other words, to put the expensive lake ship into the canal with its great number of locks and stops and slow progress would be a more expensive way of carrying the grain than in barges built cheaply. The extra transfer would be more than made up by the fact that you were carrying the grain all the time in a vessel best adapted to that use; that you were carrying on the lakes in a vessel built just right for the lake service, and on the canal in a vessel best adapted to the canal, and on the ocean in a vessel best adapted for ocean service. In a boat adapted to all of these services you would lose in efficiency.

Q. You had a commission in New York that passed on this matter?—A. The State commission has just reported to the governor, urging the improvement of the Erie Canal by making it 11 feet deep, with an available draft of water for boats of 10 feet, and capable of handling boats 25 feet wide and 150 feet long, with 10 feet draft of water, with all the single locks arranged so as to take in 2 of these boats at once. The idea is that the boats would be handled with 1 canal steamboat pushing 1 barge ahead of it, and towing 2 behind, 1,000 tons to the load, making the total tow 4,000 tons.

Q. And the prospective cost of that is reported as how much, by the commission?—A. For the improvement of the Erie Canal proper about \$58,500,000, and for the Oswego Canal, the completion of what is called the Seymour plan, some \$3,500,000 more, making a total cost of \$62,000,000.

Q. This great commerce of the inland lakes and the prosperity that has come to those cities and States, and the development of all these lines, has come from the legislation, has it not, of the National Government, so far as navigation is concerned?—A. Originally there was only about 9 feet of water in the shallow parts of the St. Marys and Detroit rivers; and, of course, it was by the improvement of the channels and harbors that this traffic was made possible.

Q. (By Mr. PHILLIPS.) It was done by the General Government?—A. Yes.

Q. (By Mr. FARQUHAR.) What is the depth at the lowest points between Duluth and Buffalo, now?—A. The Government is engaged in the dredging of a 20 and 21 foot channel; 20 feet in still water and 21 feet when subject to wave action; but up to date the available draft is 18 feet on the average.

Q. What is the highest tonnage you can use on 18 feet?—A. The largest vessels will carry about 9,000 tons of freight. The vessels now building and that will be out this spring will carry about 9,000 tons. Up to the present time the largest cargo has been about 8,300 tons.

Q. Are you acquainted with the United States statute that protects all lake navigation and lake trade?—A. (Reading.) "Section 4 of the act of 1817. No goods, wares, or merchandise shall be imported under penalty of forfeiture thereof from one port of the United States to another port thereof in a vessel belonging wholly or in part to a subject of any foreign power; but this clause shall not be construed to prohibit the sailing of any foreign vessel from one to another part of the United States, provided no goods, wares, or merchandise, other than those imported in such vessels from such foreign port, and which shall not be unladen, shall be carried from one port or place to another in the United States." It is a general provision for the protection of the coastwise trade.

Q. Is not that really the foundation of the great lake trade, the fact that the Canadians can not interfere with your commerce?—A. It is impossible to say what proportion of the commerce the Canadians would have carried on but for that statute. I might say they do not carry on much of the foreign commerce on the lakes. The commerce between American and Canadian ports is almost entirely in the hands of American vessels.

Q. The Canadian tonnage cuts a small figure?—A. Very small, indeed.

Q. Can you give the figures?—A. To show the proportion between the business done by the American and the Canadian vessels: During the season of 1899, through the St. Marys Falls Canals, American vessels carried 96.9 per cent of the freight and the Canadian 3.1 per cent.

Q. The Canadians have their own canal, have they not?—A. Yes. They have the free use of our canal and we have the free use of theirs. While the most of our vessels take the American canal, if they find they are going to be subjected to delay they go to the other lock. There is no charge by the Government for the use of the canal. Some years ago a question arose between the Lake Carriers' Association and the Canadian government as to the right of the Canadian government to make certain regulations that they were making at the Welland Canal. They were charging a toll of 20 cents per ton on all freight carried through the Welland Canal, but if they carried the freight to Montreal they rebated 18 cents of the 20 cents, while if it stopped at Ogdensburg or some other American port they rebated nothing. The Lake Carriers' Association called the attention of the State Department to the matter and complained of it as a violation of the treaty of Washington between the United States and Great Britain. The State Department took the ground that our contention was well-founded, and complained to the Canadian government, and the result was that, no relief being obtained, our Government made discriminating tolls for a short time at the St. Marys Falls Canal against Canadian vessels. That was before the foreign lock was completed, and as a result of that one season the discrimination at the Welland Canal was abolished and a uniform rate of 10 cents was made whether the grain went to Montreal or Ogdensburg.

Q. (By Mr. FARQUHAR.) Has there ever been any effort made to control freight rates on the lakes by any kind of combination? Do you think it is possible that any combination could last over one season?—A. No effort has ever been made, so far as I know, and it would be a very difficult matter. The boats are owned by a great variety of individuals and companies and the business has always been on a competitive basis. No attempt has been made to control it, and nobody has ever thought they could control it. There was some talk 2 or 3 years ago, during a very dull season, when vessels were tying up at the docks and making no money, about an effort to get the vessel owners together and agree on a minimum freight; that no one would carry at less than the minimum rate; but no progress was made and it was given up as impossible. Aside from that I never heard of any attempt to control freight rates.

Q. From your preliminary remarks as to what the association was and what purpose it had, borne out by your answers, it might be inferred that the association, possibly, is a monopoly itself.—A. It owns no vessels and is not engaged in the transportation business. It is simply an association of vessel owners to act together in matters of common interest. They never have taken up the question of freights.

Q. Has not the Lake Carriers' Association's purpose been to gain from Congress and from the National Government aids in the way of navigation laws?—

A. That has been one of its principal purposes; but it has existed for the purpose of carrying on the necessary private lights, maintaining these shipping offices and contracting with contractors for uniform prices for loading and unloading lake freights of various kinds.

Q. Now, where the Government had neither erected nor maintained a light at any point, and navigation needed that light, did the Lake Carriers' Association establish one and maintain the expense of it?—A. In some cases. Not in all cases; but at vital points in the St. Marys River and Detroit River and St. Clair River, where vessels were going through crowded, narrow channels and where lights were needed in the water, or on the Canadian shore, and were not supplied by our Government or the Canadian government, we have supplied them at our own expense.

Q. (By Mr. SMITH.) How many?—A. It varied from season to season. A number that we used to maintain have since been taken over by our Government; but there are at least 6 lights in the Lower Detroit River which we have maintained for the last 10 years.

(Testimony closed.)

ARGUMENT OF DAVID J. LEWIS (CUMBERLAND, MD.)

IN FAVOR OF THE PURCHASE AND OPERATION BY THE GOVERNMENT OF RAILWAYS ENGAGED IN INTERSTATE COMMERCE.

THE UNITED STATES INDUSTRIAL COMMISSION.

Subcommission of Transportation, Washington, D. C.

GENTLEMEN: In response to the letter of the Hon. J. L. Kennedy, dated February 23, 1899, suggesting that he thought "testimony" from me "on the subject of transportation would be very valuable to the Industrial Commission," I beg leave herewith to present my views on the subject of railway transportation. I observe in your syllabus on transportation, section No. 58, the query, "Ownership and operation by the United States of railroads engaged in interstate commerce, arguments for and against it." My contribution is intended as an argument in favor of the governmental ownership of all railways so engaged in interstate commerce. An impartial investigation of the subject has convinced me that the following great attainments may be secured:

First. The just security of the capital invested upon the basis of its commercial worth. Precarious securities will become things of the past.

Second. Uniformity and equality of freight rates among shippers: the elimination of quasi natural discriminations as well as willful.

Third. A half-cent passenger rate per mile over the entire country.

Fourth. An 8-hour day for all railway workers; and the consequent employment of 165,000 of the unemployed to fill this one-fifth reduction in time.

Fifth. The greater development of the natural resources of the country by a sensible application of the capital now invested in "parallels," etc.

Sixth. A juster distribution of railway mileage to the population and area of the several States; the grossest inequality is the necessary effect of the present system.

Seventh. The establishment of a system of postal express, which it seems might be conducted, in conjunction with the post-office, at half the present cost to the public.

Eighth. The institution of accident insurance for passengers, employees, and freight under certain limitations.

Ninth. The emancipation of public men from the evil influences of railway "politics," and the attainment of free elections.

Tenth. The adoption by the Government of punitive freight rates, when considered necessary to destroy existing trusts and discourage the formation of others.

It will be observed from the reading of the following chapters that, first, the real railway owners are justly protected: second the shipping interests of the country fully secured under the assurance of equal freight rates; third, that the 800,000 railway employees will be engaged by the prospect of an 8-hour workday; fourth, that the general public will be profited by the half-cent-a-mile passenger rate, while, fifth, every patriotic mind must be deeply impressed with the certainty of a better railway development of the entire country, the safety of railway travelers and employees, a system of railway accident insurance, the institution of postal express, and, finally, the elimination forever from our industrial and political systems of discriminations in rates, rebates to favored shippers, etc., on the one hand, and passes, railway lobbies, alliances with trusts, railway politics, the corruptions of legislatures, etc., which have made the history of our country in the last 30 years almost too sickening for patriotism to read.

It is submitted that no just interest of either the railway owners or the public is attacked, while all the American people are favorably engaged by the attainments which I believe are easily reached. Independently of the conclusions deduced from a study of the data of railway economics shown in the Interstate Commerce Commission's reports, we have the definite and uniform experience of more than a half dozen different nations who own and operate their respective railways. Germany, Austro-Hungary, Belgium, British India, and each of the Australian colonies have shown, by their experience, the complete consistency and practicability of low passenger rates, equality of freight rates, reduced hours of labor, perfect freedom from "politics" under State ownership and operation of their railways.

A very dark prospect is presented to this and coming generations unless we imitate their prudence in our own country. It is now a fact recognized by all observant citizens that the "pass" evil, the legislative lobby, the interference in primaries and elections, the general preference of "trust" shippers over their fellow competitors, and the treasonable influence exerted by railway managers upon their dependent employees during elections, have each and all become permanent features of modern business, legislation, politics, and private railway management and ownership.

Can merely regulative and repressive legislation cure these evils inherent in our present system of railways? Twenty years of attempted regulation and repression answer no. It is in the hope that they may be cured by the only means competent to cure them, namely, the elimination of private interests, that I have submitted my testimony in favor of government ownership to your commission.

It is always a fair question in a republic, "Will this proposal be popular among the people?" My uniform conversation with them leads me to emphatically answer yes. They have long despaired of good from the present system, and while the studious generally commend the governmental assumption of powers, which have long since outgrown the coexisting powers of the Republic, the others have become accustomed to look rather to some ill-determined day of revolutionary accounting. Looking to analogous proposals we do know that municipal ownership and operation of varied industries, ranging from water, electric, gas, and street-railway enterprises, have not lost a single election in any city in the United States, and have been attended in their practical operation by the most gratifying success.

It is in the hope that your honorable commission will not hesitate to recommend any proposal which convinces your judgments of its value, and in the belief that the perpetuation of the collective interests of a people is the first duty of a citizen, I submit to your commission my testimony under the invitation you have so kindly given me.

Respectfully submitted,

DAVID J. LEWIS.

CUMBERLAND, MD., March 3, 1899.

THE RAILWAYS AND THE STATES.

[Extract from speech of James A. Garfield in Congress, June 22, 1874.]

Since the dawn of history, the great thoroughfares have belonged to the people, have been known as the king's highways, or the public highways, and have been open to the free use of all, on payment of a small uniform tax or toll, to keep them in repair. But now the most perfect, and by far the most important roads known to mankind, are owned and managed as private property by a comparatively small number of private citizens.

In all its uses the railroad is the most public of all our roads; and in all the objects to which its work relates, the railroad corporation is as public as any corporation can be. But in the start it was labeled a private corporation; and, so far as its legal status is concerned, it is now grouped with eleemosynary institutions and private charities, and enjoys similar immunities and exemptions. It remains to be seen how long the community will suffer itself to be a victim of an abstract definition.

* * * * *

It is painfully evident from the experience of the last few years, that the efforts of the States to regulate their railroads have amounted to little more than feeble annoyance. In many cases the corporations have treated such efforts as impertinent meddling, and have brushed away legislative restrictions as easily as Gulliver broke the cords with which the Lilliputians attempted to bind him.

In these contests the corporations have become conscious of their strength, and have entered upon the work of controlling the States. Already they have captured some of the oldest and strongest of them; and these disrowned sovereigns now follow in chains the triumphal chariot of their conquerors. And this does not imply that merely the officers and representatives of States have been subjected to the railways, but that the corporations have grasped the sources and fountains of power, and control the choice of both officers and representatives.

* * * * *

The consolidation of our great commercial companies, the power they wield and the relations they sustain to the State and to the industry of the people, do not fall far short of Proudhon's definition of commercial and industrial feudalism. The modern barons, more powerful than their military prototypes, own our greatest

highways and levy tribute at will on all our vast industries. And, as the old feudalism was finally controlled and subordinated only by the combined effort of the kings and the people of the free cities and towns, so our modern feudalism can be subordinated to the public good only by the great body of the people, acting through their governments by wise and just laws.

I.—RAILWAY CAPITAL.

The real railway capitalist, that is, the bona fide owner of railway stocks or bonds, is, I believe, to be first considered in any general legislation or social measures undertaken with relation to our railroads. I refer, of course, to the people who have in fact invested their money in this form of property, and who are entitled presumably to the same fruits of abstinence usually accorded to other investors. That there is an immense amount of such capital so invested in railways, that it is the most useful in the economic sense, that it deserves the same respect in which we hold other acquisitions of wealth, not even the crimes and misdoings of some railway managers will lead me to deny. Let me say, then, that I propose to treat these owners of property just as I should treat any other investor or investment; that is, as the general commercial world would treat them if it desired to purchase their property.

It is a fact that railway investments, permanent though the subject-matter is, have been almost the most precarious property in all the range of public securities. One should not expect this charge to be true. The railway is itself more permanent than houses and land; banks may go under, great droughts may palsy the harvests of labor, forms of government themselves vacillate, while the railroad and its traffic is almost as constant as the currents of the sea. Laid deep and induring in the soil of the continent they are physical facts more lasting in character than other property, and yet experience teaches us that the stock and bond holders of American railways are the most uncertain and perhaps the least recompensed of all its capitalists.

The reason for this must be found in some other explanation than the subject, matter of his investment. That we believe is even more constant than any other species of property. The reason we believe to be the inefficiency of private railway ownership and management.

THE INSTABILITY OF RAILWAY CAPITAL.

At this point I invite the reader's attention to a list of the 30 principal railway systems of the country, operating 95,270 miles of road, for the purpose of showing the almost frightful instability of railway capital. (The fractions are omitted.)

| Name of railway. | Miles operated. | Stock, 1897. | | Stock, 1898. | | Bonds, 1897. | | Bonds, 1898. | |

| Total | 95,270 | | | | | | | | |

The total railway capital is seen to fluctuate in stocks anywhere from 30 to 300 per cent, and in bonds from 5 to 100 per cent, in each of both years. Is this fair to the people who must invest their savings in railways? For somebody must. It certainly is not good for them, when the principal fluctuates considerably above the expected interest. It may be contended that these quotations represent but a part of the capital, and that the larger part never changes hands. That is a mistake. According to Henry Clews & Co.'s statement for 1897, more than 50,000,000 shares of railway stock were sold on the New York Stock Exchange in that year alone, being more than the full equivalent of the total railway stock. In the same year \$500,000,000 of railway bonds were sold in the New York Stock Exchange alone. Crediting London (and an immense amount of railway securities are held there), Paris, Boston, Philadelphia, Baltimore, Chicago, San Francisco, and other cities together with an equal amount for that year, it seems certain the full equivalent of our railway stock and at least one-quarter of the bonds were covered twice. But can there be any question that sales on the Stock Exchange fix the price? Suppose the whole stock or bonds were offered, would they bring more or fluctuate less? Now, as to the proposed form of capital which it is designed should replace the present, will it fluctuate? The question answers itself.

Of course, Government capital will eliminate this evil, an evil that honest investors should at once correct. For just as this great field of vacillating values is redeemed by the substitution of stable capital, the gambler will give place to the savings bank and sober thrift. The lottery has long been recognized as a crime against society. What, then, can be said for that railway capital which necessitates a condition as much worse as it is infinitely greater in proportion. The stock exchange may not be blamed. It is the character of the stocks and bonds, which, inspiring alternately hope and fear, demoralizes alike the minds of great and humble. This instability creates fortune hunters who in other circumstances would be willing to live by their work instead of their wits.

Railway stocks and bonds constitute about 75 per cent of this gambling media, and if they were redeemed as proposed a like reduction of this crime and folly must result. Besides, this proposal would seem to guarantee the perfection of capital by eliminating all hazard. It delivers this great body of active wealth from the hands of anarchy and plants it forever in the realm of security. But grant that many who thrive in stock gambling may be forced to work, will not those who fought so fiercely for financial stability in 1896 apply their influence to correct the prodigious disorder which dominates the railway capital of to-day?

It will not be denied that two railways, operating in a district where one can meet the needs of society, represent only waste of capital, waste of labor, current expenditures, a double system of capital and expenditures, which, not enlarging the supply of traffic, must either result in advanced rates to support these charges or fall with ruinous havoc upon the real owners of the road. If they indeed compete, this only hastens and aggravates the disaster which a false principle applied to railway capital naturally insures. On the other hand, human selfishness can not be safely trusted with a monopoly in the railway business any more than in any other where men's interests conflict. Not a State constitution but does inhibit the granting of a monopoly, and yet competition in the railway business is as impossible. I was going to say, as a struggle between the planets. The people will not permit monopoly or a trusting of the interests involved, and competition will, if in fact indulged in, destroy all the capital invested.

My proposal, then, is this: That the whole people of the United States become the owners of our railway capital, and thus establish complete harmony of interests. That is, that the capital now invested in the 183,000 miles of railway be bought by the Government at its market value, and the railways then operated on the general principles of our Post-Office. This would not be a monopoly; every citizen would be a stockholder and equally enjoy the advantages flowing from such ownership and management.

The owners of railways should not object to this; they would secure for their property its full market value, in cash, which they could invest in the bonds of the United States, or in such other property as they may think proper. It was Daniel Webster, I think, who said, "If a thing can be done, a wise man who knows it can be ought to be able to tell us how it can be done." I shall now endeavor to indicate "how" it can be done.

The first question which will occur to the thinking reader is, "To buy the railways the Government must know how much they are worth; how can it determine their value?" Switzerland, Great Britain, and other countries have recently answered that question.

The method adopted in Switzerland (1898) in the purchase by that Government of her railways was to take the net profits of the railroads for 10 years, add them

together, then divide by 10 to get the annual average profits, and then capitalize such profits at from 4 to 5 or 6 per cent. Thus suppose the average annual net profits were \$1,000,000; this sum capitalized at 5 per cent. would make the capital invested \$20,000,000, which would thus be the full value of a railroad yielding such annual profits. Let us then apply this very just and commercial standard to American railways, and find what they are worth on the markets of the world, and what it would cost to purchase them.

At this point, then, let us see what the net profits upon American railways have been, i. e. the interest on bonds and the dividends on stock. The following tables are taken from Poor's Railroad Manual:

Miles of railroads operated, capital invested, earnings, and dividends in the United States from 1871 to 1897.

[Prepared by John P. Meany, editor of Poor's Railroad Manual.]

| Year. | Miles operated. | Capital and funded debt (stock and bonds). | Earnings. | | | | Dividends paid. |
|-----------|-----------------|--|---------------|---------------|---------------|------------------|-----------------|
| | | | Gross. | Net. | From freight. | From passengers. | |
| 1871..... | 44,614 | \$2,661,627,645 | \$403,329,209 | \$141,746,404 | \$204,430,322 | \$108,898,886 | \$56,456,681 |
| 1872..... | 57,523 | 3,150,423,057 | 465,241,055 | 165,754,373 | 340,931,785 | 132,369,270 | 64,418,157 |

The total railway capital is seen to fluctuate in stocks anywhere from 30 to 300 per cent, and in bonds from 5 to 100 per cent, in each of both years. Is this fair to the people who must invest their savings in railways? For somebody must. It certainly is not good for them, when the principal fluctuates considerably above the expected interest. It may be contended that these quotations represent but a part of the capital, and that the larger part never changes hands. That is a mistake. According to Henry Clews & Co.'s statement for 1897, more than 50,000,000 shares of railway stock were sold on the New York Stock Exchange in that year alone, being more than the full equivalent of the total railway stock. In the same year \$500,000,000 of railway bonds were sold in the New York Stock Exchange alone. Crediting London (and an immense amount of railway securities are held there), Paris, Boston, Philadelphia, Baltimore, Chicago, San Francisco, and other cities together with an equal amount for that year, it seems certain the full equivalent of our railway stock and at least one-quarter of the bonds were covered twice. But can there be any question that sales on the Stock Exchange fix the price? Suppose the whole stock or bonds were offered, would they bring more or fluctuate less? Now, as to the proposed form of capital which it is designed should replace the present, will it fluctuate? The question answers itself.

Of course, Government capital will eliminate this evil, an evil that honest investors should at once correct. For just as this great field of vacillating values is redeemed by the substitution of stable capital, the gambler will give place to the savings bank and sober thrift. The lottery has long been recognized as a crime against society. What, then, can be said for that railway capital which necessitates a condition as much worse as it is infinitely greater in proportion. The stock exchange may not be blamed. It is the character of the stocks and bonds, which, inspiring alternately hope and fear, demoralizes alike the minds of great and humble. This instability creates fortune hunters who in other circumstances would be willing to live by their work instead of their wits.

Railway stocks and bonds constitute about 75 per cent of this gambling media, and if they were redeemed as proposed a like reduction of this crime and folly must result. Besides, this proposal would seem to guarantee the perfection of capital by eliminating all hazard. It delivers this great body of active wealth from the hands of anarchy and plants it forever in the realm of security. But grant that many who thrive in stock gambling may be forced to work, will not those who fought so fiercely for financial stability in 1896 apply their influence to correct the prodigious disorder which dominates the railway capital of to-day?

It will not be denied that two railways, operating in a district where one can meet the needs of society, represent only waste of capital, waste of labor, current expenditures, a double system of capital and expenditures, which, not enlarging the supply of traffic, must either result in advanced rates to support these charges or fall with ruinous havoc upon the real owners of the road. If they indeed compete, this only hastens and aggravates the disaster which a false principle applied to railway capital naturally insures. On the other hand, human selfishness can not be safely trusted with a monopoly in the railway business any more than in any other where men's interests conflict. Not a State constitution but does inhibit the granting of a monopoly, and yet competition in the railway business is as impossible. I was going to say, as a struggle between the planets. The people will not permit monopoly or a trusting of the interests involved, and competition will, if in fact indulged in, destroy all the capital invested.

My proposal, then, is this: That the whole people of the United States become the owners of our railway capital, and thus establish complete harmony of interests. That is, that the capital now invested in the 183,000 miles of railway be bought by the Government at its market value, and the railways then operated on the general principles of our Post-Office. This would not be a monopoly; every citizen would be a stockholder and equally enjoy the advantages flowing from such ownership and management.

The owners of railways should not object to this; they would secure for their property its full market value, in cash, which they could invest in the bonds of the United States, or in such other property as they may think proper. It was Daniel Webster, I think, who said, "If a thing can be done, a wise man who knows it can be ought to be able to tell us how it can be done." I shall now endeavor to indicate "how" it can be done.

The first question which will occur to the thinking reader is, "To buy the railways the Government must know how much they are worth; how can it determine their value?" Switzerland, Great Britain, and other countries have recently answered that question.

The method adopted in Switzerland (1898) in the purchase by that Government of her railways was to take the net profits of the railroads for 10 years, add them

cost, whether more or less than their quoted price. It would be unjust, therefore, to adopt any other standard for computing the values of railway stocks or bonds when the owners bought them on the market by commercial standards; and it would be equally unjust for such owners to ask any higher price for such stock and bonds than they are quoted at as productive securities.

Now, I have indicated how the Government might determine the value of the railroads as an entirety. The reports of the Interstate Commerce Commission, compiled from the sworn accounts made by the companies themselves, show exactly the capitalized values of all railway bonds and stocks as shown above. The next query a thinking man will make is, "How will you determine the value of the stock and bonds of each particular railway?" My answer is just precisely as we have determined it for the whole. It will take time and labor, of course; all business endeavors do. But having determined what it should pay for the roads as a whole, i. e., what their stocks and bonds are commercially worth, the Government would then take immediate possession of all the roads, and settle with individuals at its leisure, paying them usual profits during such delay.

I say it would take time to investigate the books of each company and determine from its average annual net profits the value of its stock and bonds. There are about 1,985 different companies. A year or two would suffice.

Now, I want to ask, is not this proposal perfectly just to the owners of the railways? It would substitute an absolutely certain Government bond for their precarious bonds or stock. Surely, then, real stockholders and bondholders can have no objection, as such, to the Government ownership of our railroads.

I will not cite cases as to what their lot at present is, and for years back has been. The American public knows their sad history only too well. The common stock of the Baltimore and Ohio Railroad sold some years ago, I am told, as high as \$200 the share, while in the last three years it has been as low as \$8. This is but one road; but very few of them can tell another tale. The rule is that railway securities are the most precarious and uncertain of all securities on the market. It is for that reason the stock gambler can mimic the marvels of Aladdin. For example, the Commission's report shows that for the year 1896, railway stock amounting to \$3,667,503,195 paid no dividends. It is a mistake to suppose that none of this stock represents a real investment. A large portion actually was paid for. Then the same report shows that \$860,559,442 in amount of their bond indebtedness paid no interest whatever; that another billion paid only from 1 to 3 per cent. I append hereto that statement to show how deeply concerned the investors of this country should be in any just proposal having for its object a fair and certain return to the people who put their savings in railway property.

The Interstate Commission reports show for the years 1895 and 1894, dividends paid to stock of \$85,961,500 and \$101,607,264. It would thus appear that my statement of average annual profits on stock were too low. But if the reader will notice in 1895 the deficit was \$29,845,241, and in 1894 the deficit was \$15,851,294, and in 1897 just \$6,120,483. Thus the average dividend is about as stated. Just think of the viciousness of paying dividends that have never been earned, and refusing to pay the expenses of operation, in order to pay such false dividends. Suppose a bank did this? Would not the Government at once close its business?

The series of summaries which follows is designed to show the amount of dividends paid on railway stocks, and of interest paid on railway bonds. This information is presented in such a manner as to show the amount of stocks paying no dividends and of bonds paying no interest, as also the amounts paying at the several rates named.

Condensed statement of stocks and funded debt, classified by rate of dividend or interest, 1896.

| Per cent paid. | Stocks. | Per cent of total stocks. | Funded debt (exclusive of equipment trust obligations). | Per cent of total funded debt. |
|-------------------|-----------------|---------------------------|---|--------------------------------|
| Nothing paid..... | \$3,667,503,194 | 70.17 | \$860,559,442 | 16.36 |
| From 1 to 2..... | 38,663,859 | .74 | 251,556,380 | 4.42 |
| From 2 to 3..... | 138,160,882 | 2.64 | 438,582,628 | 8.29 |
| From 3 to 4..... | 87,569,821 | 1.68 | 429,346,647 | 7.95 |
| From 4 to 5..... | 290,062,078 | 5.55 | 1,270,172,756 | 24.01 |
| From 5 to 6..... | 356,315,879 | 6.82 | 1,138,644,031 | 21.52 |
| From 6 to 7..... | 204,150,574 | 3.91 | 573,997,916 | 10.85 |
| From 7 to 8..... | 228,300,610 | 4.37 | 302,800,486 | 5.72 |
| From 8 to 9..... | 142,144,170 | 2.72 | 19,816,000 | .38 |
| From 9 to 10..... | 5,405,736 | .10 | 15,217,795 | .29 |
| 10 and above..... | 68,230,475 | 1.30 | 16,412,900 | .31 |
| Total..... | 5,226,527,200 | 100 | 5,200,033,571 | 100 |

It will be observed that under present management honest and dishonest stock and bonds fare alike in the matter of dividends and interest. Stock and bonds for which you have paid full value are just as liable to receive or not receive profits as the like investments representing only water and fraud. It is true as a general proposition that the bonded indebtedness represents the actual rock-bottom value of the roads, while the stock represents only the chicanery of promoters and managers, used principally to gain control of the roads.

Again, bonds of railways no longer represent a fixed security, although supported by mortgage; for the courts will not allow the bondholders, like other mortgagees, to sell the mortgaged roads to make their money.

It would appear then that no class of persons could be more interested in asking for Government ownership than the real owners of American railways. Besides, investigation will show that all the life insurance companies and other corporate investors require some more satisfactory and safe line of securities than the present railways offer. The change advocated would provide them with the best securities the world knows. Six and a half billion dollars in United States bonds would be ample investments for all that class of investors, growing every year more numerous, who ask a certain rather than a high return.

It may be urged by the overcautious that the financial operation involved in the issue of enough securities to purchase the railway capital (6½ billions of dollars) would be too great for the Government. The answer is that only a change in the form of the present holdings would be rendered necessary; at least 60 per cent of the present holders would but exchange securities; the market would lie in the displacement of the old stocks and bonds. Such an issue would in no true sense involve the Government in debt; the railway asset would fully balance the liability. Taxation would not be required either for interest or principal; so that none of the elements of indebtedness proper would belong to this operation.

Finally, there can be no reasonable question that the United States of America might market such an issue, independently of the special market created by the extinction of the old railway securities. And this could be done at the 2½ per cent interest rate proposed, by fixing the term of maturity at either fifty or a hundred years. She has already borrowed at a 2 per cent rate, and those bonds, although payable at the option of the Government, are quoted at par (May 21, 1899). But it is inquired, Would that be true of a 6½ billion dollar issue? In answer to this question, let us look to the experience of some other country some country not esteemed as stable as our own.

I refer to France. Her public debt now amounts to 31,094,356,744 francs, which, estimating the franc at 19 cents in our money, equals a debt of \$5,907,927,781.36. The population of France is less than 39,000,000, making the per capita debt about \$162. Our population, according to Government estimates, will just double that in 1900: so that, adding the proposed issue to the subsisting debt, the whole would be something less than \$100 per head. Well, France pays 3 per cent and her bonds are above par. It would seem that the stationary point of interest on absolutely sound and immediately and universally convertible securities is somewhere between 2 and 2½ per centum. That is the lowest point at which men will be willing to abstain from the immediate enjoyment of their wealth. These conditions may be realized by France, Germany, Great Britain, or our own country. It would seem then that the experience of France is conclusive as to our ability to float the required issue, even regarding it as a submergence into debt. It only remains to suggest that these bonds could be invested with the privilege of being exchanged for Treasury notes in time of monetary panic, and be redeemed by the Treasury on presentation of an equivalent amount of such Treasury notes. This would provide the elastic feature so much desired in our currency.

A parting word to the railway capitalist. You know not what the future may have in store for you. Your turn may come next in a bond or stock disaster which will steal away in a single day a quarter or half or nearly all of your stock or bond investment. The Supreme Court has warned you that the roads can not legally combine into traffic agreements to maintain rates. They must compete, and thus destroy each other. You know the temptation to which each road is subject in its suicidal struggle for the other's lifeblood—to wit, its business. I think it may be safely said that the people will not allow the roads to combine under private capital. How black and hopeless then must be the future for the railway capitalist.

II. UNIFORM FREIGHT RATES.

The demand for uniformity in freight rates has its basis in the right to equal justice. To deny this uniformity to the shipper is as unjust as to deny him equality before the law. Moreover, it is not merely a question of individual

justice, but of national concern. If an anarchy of freight rates is to be the lot of American shippers, prudence would dictate that no investments be made except under circumstances of the most extraordinary promise. Men will not invest their capital when a varying freight rate may destroy it in a day, or when such uncertainty destroys the basis of their confidence. Thus national industry will suffer; and thus uniformity of freight rates becomes the most pressing requirement of an industrial country. Congress has recognized this exigency by constituting the Board of Interstate Commerce. It will be admitted, I think, that so far as obtaining the desired object is concerned that board has itself confessed in each of its annuals a complete failure. The reason for this is hardly abstruse. It is found in the differing needs and situation of each particular road. Let us look at the facts.

It costs a given amount by reason of location, distance between points, past management, amount of traffic, population, etc., to construct and maintain a particular road. Another road commanding all or some of the same points of traffic supply may cost immensely less or immensely more; thus, conditions being different, uniformity of rates under the present system is impracticable; the contending roads are not equal, and can not enter the contest as equals. Then, again, when some road has sole control of a point of traffic, but at other points a competition is kept up, the point thus monopolized is discriminated against in order to supply the deficiency at the competitive point; or indeed for any other motive that may inspire the managers of 1,000 different companies among which such uniformity is sought.

It is thus seen that a railway company commanding the traffic of a given town or district holds the power of life and death over its commercial relations with the balance of the world. The roads being unequal, their accommodations to the point of traffic must be unequal, thus effecting, whether intentionally or otherwise, a substantial discrimination against such town or city. This is a defect of their nature that no amount of just or wise management on their part can repair.

I shall not go into a long indictment of the discriminations of a voluntary character which have made the cry for uniformity of rates the most urgent requirement of the last 20 years. The real owners of railways must regret this condition as much as the general public. Of the purposed discriminations which have succored the childhood and nursed into vigorous being the principal trust, the Standard Oil Company, of this country, I will speak somewhat later on.

Again the thinking man will ask, How can public ownership attain the object desired? Namely, uniformity.

The interstate commerce reports show that the number of tons of freight carried 1 mile (average) was 95,139,023,225 in 1897; that the number carried an average of 1 mile in 1896 was 95,328,360,278, being practically the same freight carried in both years. The average earnings from the freight service for the whole country was for each ton of freight carried just 8.6 mills in 1896, while in 1897 the average charge per ton per mile was 8.1 mills. Now it being thus well known what the average freight rate is, not only for the whole country, but in each of the ten districts into which the Commissioners have divided the Union, this average rate may be adopted by the Government for the determination of what uniform rate it will employ in the transport of freight—that is, generally speaking, that uniform rate would be about 8 mills per ton per mile. Good results in one instance could be made to correct the deficiencies in others; so that single control and management might equalize and reduce to uniformity the freight rates for the entire country.

It would be found, no doubt, this in matters of freight some differentiation would be practicable in the different freight zones. It is not desired that freight should be carried like letters, without reference to actual cost of the service. But perfect uniformity certainly can be reached by this proposal just as certainly as it is impossible of realization under the anarchy of railroad interests which now dominate the freight traffic. By the way, no complaint of discrimination is ever made in Germany. Why? Manifestly because the reasons which make uniformity impossible here, conflicts of railroad interests, have been removed there by Government ownership and regulation.

The consensus of opinion, I believe, would concede that Government ownership, and that alone, can achieve a perfect equality of rates. Certainly 1,000 different managements can not, even if they desired. Moreover, 10 years of experience have shown us that this object can not be gained through mere measures of repression by the board of commerce. If anyone will take the trouble to read their reports, he will be satisfied on this point. The commission can not bring about a uniform classification, much less such rates. Hear them—report, 1897:

It will be observed that under present management honest and dishonest stock and bonds fare alike in the matter of dividends and interest. Stock and bonds for which you have paid full value are just as liable to receive or not receive profits as the like investments representing only water and fraud. It is true as a general proposition that the bonded indebtedness represents the actual rock-bottom value of the roads, while the stock represents only the chicanery of promoters and managers, used principally to gain control of the roads.

Again, bonds of railways no longer represent a fixed security, although supported by mortgage; for the courts will not allow the bondholders, like other mortgagees, to sell the mortgaged roads to make their money.

It would appear then that no class of persons could be more interested in asking for Government ownership than the real owners of American railways. Besides, investigation will show that all the life insurance companies and other corporate investors require some more satisfactory and safe line of securities than the present railways offer. The change advocated would provide them with the best securities the world knows. I think it may be safely said that the people will not allow the roads to combine under private capital. How black and hopeless then must be the future for the railway capitalist.

II. UNIFORM FREIGHT RATES.

The demand for uniformity in freight rates has its basis in the right to equal justice. To deny this uniformity to the shipper is as unjust as to deny him equality before the law. Moreover, it is not merely a question of individual

Besides, this general reduction would but slightly reduce the revenues of the railways when compensated by the costless and immense increase of traffic set forth above. Charging an average rate of 2.019 or 2 cents and 2 mills a mile, as they did in 1896, the service only netted them on the 13,000,000,000 passenger miles \$366,562,533, while the 26,000,000,000 miles at one-half cent would have brought \$130,000,000; and yet such a reduction would add immensely to the traveling facilities of 70,000,000 of people. Let those who would willfully stand in the way of such a consummation speak out their objections or clear the path. Railways were peculiarly ordained for social accommodations, and the most efficient management for that purpose is entitled to demand control. As we have seen, the real owners of the roads can have no valid objections; they would be better off with Government than railway bonds. Shippers are clamoring for a uniformity of freight rates which only public ownership can attain, and now the entire public, it is seen, may be secured a half cent a mile fare. Shall then a stubborn crowd of railway managers (not owners) defy the interests of every class of citizenship merely to perpetuate their grip upon managerial powers?

Little need be said as to the educational and refining influence of general travel. This method of passenger service would bring the entire continent under the command of a laborer's weekly pay. At least 90 per cent of even the American people have never seen the Capitol, or even one of our principal cities. It is a social crime to needlessly continue such a state of things. And what more effective agency for socializing our citizenship can be suggested than a cheap method of intercommunication. By this means alone can men find suitable location for their individual tastes and needs. The crowding of the colored population in the South might at least be considerably relieved; and laborers might move from place to place in harmony with the local demands of the labor market.

The prime purpose of public railways, like the post-office, would be service. It is almost marvelous what great ends may be accomplished when this principle governs and the consideration of "profit" is eliminated. Institution or method counts for almost as much as individuality; and we shall see how completely the advantages of each are realized by means of public railways.

At this point I deem it necessary to show what I conceive will be the revenues derivable under public ownership, what the necessary expenditures will amount to, and generally to consider income and expenditures under the present and under the projected system. For this purpose I shall rely wholly upon the reports of the Commerce Commission.

Here are its summaries for 1896:

Summary showing number of employees, total yearly amount paid each class, and average daily compensation of each kind of employee for the year ending June 30, 1896. Railway mileage covered, 181,982.

| Class. | Number of employees. | Amount paid each class. | Daily wages. |
|--|----------------------|-------------------------|--------------|
| General officers | 5,372 | \$12,497,957 | \$9.19 |
| Other officers | 2,718 | 5,301,119 | 5.96 |
| General office clerks | 261,328 | 19,037,816 | 2.21 |
| Station agents | 29,723 | 17,050,117 | 1.73 |
| Other station men | 75,919 | 39,076,478 | 1.62 |
| Enginemen | 35,851 | 41,354,307 | 3.65 |
| Firemen | 30,762 | 23,724,854 | 2.06 |
| Conductors | 35,457 | 26,798,485 | 3.05 |
| Other train men | 64,806 | 38,379,035 | 1.90 |
| Machinists | 29,272 | 19,312,746 | 2.26 |
| Carpenters | 38,846 | 22,948,595 | 2.03 |
| Other shopmen | 95,613 | 48,497,887 | 1.69 |
| Section foremen | 30,372 | 17,097,832 | 1.70 |
| Other track men | 169,694 | 54,521,113 | 1.17 |
| Switchmen, flagmen, and watchmen | 44,266 | 24,950,907 | 1.74 |
| Telegraph operators and dispatchers | 21,682 | 13,695,587 | 1.93 |
| Employees—account floating equipment | 5,542 | 3,221,200 | 1.94 |
| All other employees and laborers | 88,467 | 43,398,416 | 1.65 |
| Total | 826,020 | 408,824,531 | |

It will be observed that under present management honest and dishonest stock and bonds fare alike in the matter of dividends and interest. Summary of receipts under Government ownership of railways.

| | |
|--|---------------|
| Passenger miles traveled, 26,000,000,000 at one-half cent per mile.. | \$130,000,000 |
| Tons carried 1 mile, 95,328,360.278, at 8.4 mills per ton per mile.. | 786,615,837 |
| Receipts from mail service in 1897, \$33,754,466 | 32,379,819 |
| Receipts from express service | 25,880,384 |
| Other earnings from passenger service | 6,691,279 |
| Other earnings from freight service | 3,885,890 |
| Other earnings from operation (not classified) | 28,574,237 |
| Income unclassified | 579,398 |

Total receipts under public ownership..... 1,013,606,843

Summary showing expenditures under public operation.

| | |
|--|---------------|
| Expenditures for maintenance of way and structures | \$148,920,960 |
| Expenditures for maintenance of equipment | 125,019,432 |
| Expenditures for conducting transportation | 414,000,539 |
| Expenditures for general expenses | 33,289,835 |
| Unclassified expenditures | 51,258,278 |

Total as per experience of all roads for 1896... 772,989,044

| | |
|--|-------------|
| Interest at 2½ per cent on \$6,502,186.396. United States century bonds employed to purchase bonds, stock, and rented property as set forth in this work | 162,534,659 |
| Appropriation to sinking fund to pay off this indebtedness in 100 years | 25,000,000 |
| Reduction of number of hours of labor from 10 to 8, by employing one-fifth greater number of men, namely, 165,324, at same wages hitherto paid for ten hours, namely, one-fifth of \$152,025,455, excluding officers | 90,205,090 |
| To raising daily wages of 169,664 truckmen from \$1.17 to \$1.30 per day of eight hours | 6,000,000 |
| Indemnity of \$2,000, paid to each employee killed, average for 1896 being 1,861 | 3,722,000 |
| Indemnity of \$5,000, paid each passenger killed on roads, average being 238 in 1896 | 1,190,000 |

Total expenses (without deduction of savings). 1,062,545,793

Savings.

The following deductions must, however, be made from expenditures for operation:

| | |
|--|--------------|
| Salaries of 1,500 railway presidents; superintendents discharge their duties | \$12,000,000 |
| Law expenses; present law officers in employ of Government would suffice, besides 90 per cent. of litigation would disappear | 5,233,788 |
| Advertising would, of course, be unnecessary | 3,014,518 |
| "Commissioners to seek for business" | 1,211,298 |
| Three-eighths of salaries of general officers; uniform management would dispense with these | 3,000,000 |
| Insurance. No receipts credited by me from this source on "gross receipts" | 3,215,625 |
| Savings on printing and stationery; resulting from uniformity, etc. (one-half) | 4,300,000 |

| | |
|---|----------------------|
| Rent, hire, equipment, track yards, terminals, buildings, other property rented; all these items are funded in purchased price of roads, see page 6, being items 34, 43 in summary operating expenses | \$18,463,288 |
| Item 40 "Outside agencies" | 11,308,133 |
| Savings from abolition of Traffic Association | 2,000,000 |
| Exclusive use of shortest routes | 15,000,000 |
| Consolidation, depots, staffs, etc. | 8,000,000 |
| Savings by uniformity of rolling stock, accounts, machinery, manufacture; innumerable economies of a vast company, under single control, etc. | 15,000,000 |
| Avoiding strikes and cultivating better spirit with employees | 3,000,000 |
| Abolition of fund for legislation, corruption, lobbies, etc. | 10,000,000 |
| Elimination of pass evil, etc. | 5,000,000 |
| Elimination of private cars, etc. | 1,000,000 |
| Total saving | \$120,746,642 |
| Total net cost of operation, interest, sinking fund, insurance, etc. | \$941,799,151 |
| Net surplus and revenue for the Government from annual operation | 71,807,693 |

It will be remarked that a great uniformity prevails in the annual amount of business done, as well as in the receipts derived from this immense business. Examination will show that the amount of the passenger traffic has not varied more than 7 per cent since 1890, while the freight business has preserved a slight increase from year to year. Accidents, wages, rates, and all other features of these totals for the United States maintain the same general uniformity from year to year.

This fact means much. It enables the railroad economist, like the life insurance expert, to predict results and predicate all reasonable conclusions thereon. This is indeed the key to efficient economy in railway management. While on one road the most inexplicable variability of results will follow the year's operations, yet when the entire system is considered conclusions are as constant as the principles of mathematics. For a comparative study of this subject, drop a card to the Commerce Commission for its annual abstract.

It is thus seen that, basing calculations upon the unquestioned data of past railway receipts and adopting an average freight rate of 8.6 mills, together with an average passenger rate of one-half cent per mile, and the other incidental receipts, the Government would realize \$1,013,606,843. At the same time, it is seen that, accepting the present cost of operating these roads, that is, \$772,899,044, and adding thereto the annual interest charge of the \$6,500,000,000 of bonds necessary to purchase the entire system (along with the reduction of the hours of labor from 10 to 8 per diem and the consequent employment of 165,324 additional men, and the insurance provided) that the Government would still be ahead, on comparison of annual receipts and expenditures, the immense sum of \$71,807,712.

It should be observed that 40 millions of this balance is the savings resulting from the elimination of State taxation. Under the proposed plan this revenue would go to the General Government, and not to the States. In view of the ever increasing difficulty of securing Federal revenues, and the easy methods available to the States, I believe the General Government might well retain this revenue. Besides, would it be wise to leave the railroads subject to taxation by 45 States, and about 2,000 different county and municipal bodies? Even if Federal jurisprudence should permit such an exercise of the powers of taxation, I think it would be much better for the States to resign this power in the interest of the common weal.

It will be observed by the reader who has followed the business statement of the roads as at present conducted, and the second statement giving a forecast of its necessary finances under public ownership, that I have adopted nothing but the experience of the railways themselves, saving some half a dozen items in which it is claimed immense savings must result from each public operation.

In the statement of "Summary of receipts under Government ownership" I assume that the passenger traffic would increase from 13 billions of miles traveled to 26 billions, and that no appreciable increase of expenses would result.

First, would passenger traffic so double? It will be observed that the rate charged for such service would be reduced from 2½ cents to one-half cent per mile. That reduced fares augment the traffic every excursion will testify; but I want the reader to consider the definite experience of Hungary on this very point.

Hungary owns and operates her railways as public property, and here is what the British consul, Sir A. Nicolson, said of a general reduction of passenger fares in that country:

"The year 1889 will be noteworthy in the history of Hungarian railways, as it witnessed the introduction of the zone tariff on all Hungarian state railways. I have on former occasions reported on this subject, so that it is needless to go into details, beyond mentioning that since the introduction of the new cheap traffic on the 1st of August, 1889, to the 31st of December, 1889, the passenger traffic increased by over 3,000,000 persons, and the gross receipts by over £50,000. As the total number of passengers annually carried by Hungarian railways has not heretofore exceeded 15,500,000, the largest increase in five months is remarkable, and would appear to be of good augury for the permanent success of the new system. It is said that no extra expense has been incurred, and in fact that economies have been effected in the ticket-issuing department, owing to the facilities now afforded for obtaining tickets at post-offices and other places in towns."

Such, then, has been the effect among the circumscribed population of Hungary; there the reduction of rates was about one-half and the augmentation of traffic about 50 per cent, and the gross receipts are said to have increased \$250,000. Can there be any doubt, then, that a corresponding increase of the passenger traffic would result here if the cost of travel were reduced four-fifths? Not much. I consider this point settled.

But it may be argued you have allowed nothing extra for carrying this increased traffic.

Well that also seems to have been the effect of the change in Hungary, according to the consul quoted above. Let us see why this fact can be true:

The interstate-commerce reports show that the average number of passengers in each train moved in 1896 was 39 passengers; in 1895, 38; in 1894, 41; and in 1893, 42; 1892, 42; 1891, 41. The report does not give the passenger capacity of the average train, but we may safely place it at 3 cars to the train. Allowing 50 passengers to the car we would thus have a carrying capacity of 150 persons for each train, or 275 per cent more than has been used during the last 7 years. It appears that only 28 per cent of the passenger capacity is actually employed; and as a consequence that the 28 per cent have to pay for the other 72 per cent, who are, perhaps prevented from taking the empty seats reserved for them by the high rate which private management exacts. Now, it is patent that an empty train is as expensive to haul as one loaded to its full capacity. One hundred and fifty passengers, each weighing 150 pounds would equal about 11 tons. An engineer or fireman could not tell whether such a burden got on or off at the last station. The conductor service would, of course, remain the same, and so all other services worthy of account.

Then so far as "receipts under Government ownership" are concerned, may I not say I am justified in assuming an immensely increased passenger traffic, with no appreciable augmentation of expenditures on that account.

As this is the only item in "receipts" which differs from the past experience of the companies themselves, I think I may safely pass on to the account for "expenditures and maintenance," etc.

It will be observed that in estimating the amount of necessary expenses I have adopted the past experience of the companies, just as in the account showing "receipts."

The first item of difference in "public expenditures," as compared with the past expenses, is a saving of \$165,000,000 in the annual interest charge. That results from the simple and indisputable fact that the United States Government can borrow money at one-half the rate at which nearly 2,000 disorganized, struggling, mismanaged frequently, and antagonistic railways can. The 3 per cent bonds of the United States are now quoted at from 8 to 9 per cent above their face value; and I believe there can be no doubt that bonds to the amount of \$6,500,000,000, providing a safe investment for 100 years, would be easily negotiated at a 2½ per cent rate of interest. Thus the interest charge would unquestionably be cut in two, and \$165,000,000 annually saved.

The next items of difference are two charges to expenses of operation, involving an outlay of \$90,205,000 and \$6,000,000, respectively. The first is over and above the amount now paid, and is incurred in order to reduce the hours of labor from

10 to 8 per diem for all employees except officers. I do not intend to grow eloquent on this topic, but I should like to emphasize the prudence of alleviating the damages and dangers of railway industry by this greatly needed reform. The resulting safety to life and property, the immense opportunities which this reduction of hours would open to those relieved (800,000 men and their family associations), and, over and above all, the 165,000 now unemployed, who would thus find means of decent self-support, are subjects which I shall only suggest in their infinite potentialities of individual betterment and national progress.

Besides, it may be taken for granted that society would not conduct the railways upon the minimum wage scale. Some reduction of hours of labor or increase of wages would be among the most worthy ends at which the nation might aim. Indeed, the railway workers may safely expect that, like their brother workers of the post-office, they will be paid according to their work, not according to the barometer of the overcrowded labor market.

I have added \$3,000,000 to the expenditures to cover an increase of wages for trackmen, of from \$1.17 to 1.30, numbering about 170,000 in the United States. Small wages may not always make small men, but only herculean character will be able to feed, clothe, and educate an average family of 5 on \$1.17 a day. If one stops to consider the awful labors of these trackmen, burned by the heat of summer and frozen by our winter winds, working 10 hours with bent backs from "morn to noon, from noon to dewy eve," it would seem that the railway manager who first established this rate and thus compelled his competitors to follow him, has a heart that "would shame hell in its palmy days." This increase of wages to the trackmen would be in addition to the reduction of the day's work from 10 to 8 hours.

I have also allowed an item to cover insurance for employees, allowing them \$2,000 when killed in the course of their employment. This subject needs no argument, and I will make none. An allowance of \$5,000 is made for each passenger killed. An allowance of \$2,000 to the non-trespassers who may be killed upon the railways should also be made. So great a loss is too much for the individuals composing a family alone to bear; and where the deceased is himself innocent, society may well make this appropriation for the people killed on her railways. Some distinction might be made between children and others, but that some provision ought to be made above that provided by suits for negligence most men will agree.

I now come to the "savings" which it appears to me would result from the unified management of railways. Why do railways insist upon a uniform gauge? Is it not for the economy it inaugurates? Now, it does seem to me that uniformity of management will be equally prolific of advantage in the active operation of the roads. The first item of this kind which I submit would be saved is \$12,000,000 for some 1,500 railway presidents. This does not imply that we believe the roads will be able to get along without competent brains and training to superintend them. Outside of this item, some \$10,000,000 is allowed for "superintendence." The fact is that railway presidents in most instances represent the financing rather than the actual management of railroads. The superintendents are usually trained railroaders, while the president is the fellow with the largest amount of stock.

There are exceptions, doubtless, but with uniformity and no clashing of interests among the different branches it is readily seen that the "railroad president" function will pass away. Superintendence, of course, will be even more useful than now, in its highest sense, but the item for that has not been impaired by this deduction. Law expenses, advertising, commissions, amounting altogether to about \$12,500,000 (see statement), would absolutely pass away. Litigation, the biggest element, is the child of private interests in railways, and whatever remained could be attended to by the regular officers of the Government. As to insurance, the Government would do its own; besides, nothing has been credited in "receipts" for this item, which would make it, therefore, an improper charge. I have cut the item for stationery in two. With uniformity in the forms of stationery and their manufacture in large amounts at least 50 per cent could be saved.

The next item is \$18,463,288, which is credited as a saving on rent, hire, equipment track yards, terminals, and other property rented by the companies. All this has been funded and is charged up in the 6½ billions, which would purchase all this rented property, so far as necessary, along with the roads themselves; so that this item can not be disputed.

Here follow 9 items, amounting to 70 millions, all of which speak for themselves. They are of necessity more or less conjectural as to details, but the principle upon which they would certainly be saved is the unquestionable value of associative labor and capital over antagonistic and anarchic effort. Every trust seeking to combine and prevent division of those engaged in the same business is a living

proof of the eternal value of cooperation and the futility of conflict; besides, in the statement of "expenditures" by the present companies, you will find an item of \$52,000,000 charged up to operating expenses which can not be classified, that is, the character of which the companies have refused to make known to the Interstate Commission. They may have some reason for this. It seems to be the money spent by the roads to get business, etc.

Let me say that I am not alone in my contention of the certainty of the savings to be effected in "operating expenses." I beg leave to append the estimate of a railway man who has written upon this subject. Mr. C. Wood Davis, formerly general freight and passenger agent on a Chicago road, in his work in favor of Government ownership makes the following estimate of the savings which would result:

| | |
|--|--------------|
| From consolidation of depots and staffs | \$20,000,000 |
| From exclusive use of shortest routes | 25,000,000 |
| Saved on free passes | 30,000,000 |
| From the abrogation of the commission evil | 20,000,000 |
| By dispensing with high-priced managers and staffs | 4,000,000 |
| By disbanding traffic associations | 4,000,000 |
| Dispensing with presidents, etc. | 25,000,000 |
| By abolishing all but local office solicitors, etc. | 15,000,000 |
| Of five-sevenths of the advertising account | 5,000,000 |

A few of Mr. Davis's estimates far exceed what my study of the interstate commerce reports would lead me to believe might be realized. He computes a total of 160 millions as being within the economies of railway operation by the Government, with all the innumerable eliminations which must follow.

My effort has been in all cases to discount rather than dilate or amplify the savings on public operation, and I am firmly of the opinion that I have understated the economies which must certainly follow the introduction of universal principles into the management of our great railway system.

IV. FUTURE RAILWAY DEVELOPMENT.

The statement given above shows a balance in the railway treasury each year of some \$50,000,000. In this connection we should not forget how important the railway is to modern life. It has taken the place of the public roads for every purpose of practical life; and if our country is to develop, it can only be by a prudent and steady extension of her railway service. I should suggest, therefore, the importance of some competent guaranty in this matter. We are so accustomed to regarding our immense railway mileage that we forget the immense tracts of country that have no such accommodations, and whose resources are rendered, thus, beyond the reach of men.

It is an old saying that "we have twice too many railways, and yet not half enough." I have no complete data at hand going to show the amount of socially unnecessary railways, but the useless duplications of competing roads must indeed be great. In Allegany County, Md., where I write this paper, there are four railways when two would abundantly meet the needs for which railways, like public highways, should be built. Perhaps one-fourth of the capital now invested in railways is wasted in such duplication.

This, however, is only a suggestion of what must continue to happen if the roads are to remain in private hands. For example, a road now running from Cumberland, Md., to Baltimore is in the hands of receivers, presumably because the traffic will not sustain the regular bonded interest charge. And yet it is now in contemplation by certain "West Virginia interests" to parallel the Baltimore and Ohio Railroad along this very line.

Thus is railway capital systematically wasted by "private interests" which are incompetent to realize the highest needs of society. Who would suggest paralleling the county roads? And where is the political economist who must not recognize in railway duplication a prodigious waste of the national resources?

We know that private interests have seemed to justify this improvidence in the past, and it can not reasonably be expected that this inherent defect of private railway capital will pass away but with the "interest" of its master. In short, nothing but the General Government ownership of the railways can reconcile the national demands of political economy with the highest service and advantage to the individual citizen; so that the proposal of this work stands finally confirmed if only with reference to the general claims of national economy of capital.

How different the situation would be if social service were the only test applied in railway building as well as management. The building of new railways should

be determined by general considerations of social and national character. Say a given mileage to a given amount of territory and population. The average mileage to the 10,000 of population for the United States as a whole is just 26 miles; and yet the actual distribution of mileage throughout the country bears no sort of harmony with any unit of comparison. This fact is another inherent shortcoming of private railways. Only social as opposed to private methods can correct it.

Comparison showing unequal distribution of railway mileage in fourteen States.

| Name of State. | Railroad mileage to the 10,000 inhabitants. | Population to 100 square miles. | Railway mileage to 100 square miles. | Per cent of difference. |
|----------------------|---|---------------------------------|--------------------------------------|-------------------------|
| California | 37.38 | 775 | 3.24 | |
| Florida | 71.38 | 722 | 5.76 | 77 |
| Utah | 59.08 | 253 | 1.67 | |
| North Dakota | 123.18 | 200 | 3.59 | 113 |
| North Carolina | 19.29 | 3,330 | 7.19 | |
| Wisconsin | 32.65 | 3,068 | 11.32 | 57 |
| Maryland | 11.14 | 10,572 | 13.19 | |
| Ohio | 21.23 | 9,010 | 21.41 | 62 |
| Kentucky | 14.55 | 4,647 | 7.56 | |
| New Hampshire | 28.67 | 4,181 | 13.42 | 83 |
| Arkansas | 20.22 | 2,127 | 4.82 | |
| Minnesota | 42.26 | 1,664 | 7.74 | 81 |
| Missouri | 22.04 | 3,898 | 9.62 | |
| Iowa | 39.82 | 3,446 | 15.36 | 70 |

I have thus shown that in the comparison for some 14 States Florida, under identical conditions with California, has 77 per cent greater mileage; North Dakota 113 per cent greater than Utah; Wisconsin 57 per cent greater than North Carolina; Ohio 62 per cent greater than Maryland; Kentucky 83 per cent less than New Hampshire; Arkansas 81 per cent less than Minnesota, and Missouri 70 per cent less than Iowa. The States compared are in effect identical in their population to the area compared, except that in each case the State having such excess, in the distribution of mileage, has the smaller population to the area, thus still further augmenting the excess enjoyed. It is true that the railway manager is in no sense responsible for this discrimination against States. Private interests build for themselves not for society. And yet the discrepancy is so terrific that if such a policy were attempted in taxation the suffering States would, indeed, secede.

Yet, still the discrimination in the distribution of railway mileage is quite, if not fully, as disastrous to the States named as if they were compelled to pay all the taxes of the favored ones. This subject has not hitherto, so far as I can find, been studied by any public man. It certainly deserves their attention. A great deal of this excessive distribution to some States may consist of "parallels" and useless duplication. In that case the inequality could be readily remedied under public ownership. No roads would be built but from social considerations.

States and counties thinking themselves entitled to greater railway accommodation could bond themselves to cover the cost of construction of new roads under the supervision and to be operated by the General Government; if the roads were justified by the supply of traffic, then the prudence of their construction would appear, when the General Government would assume the bonds. If such roads failed to pay more than the cost of operation, the local body would have to remain liable and accept the responsibility of its own desires. At the same time they could not be sufferers; for the construction of a road, even at the points of low traffic, would inure to their benefit in improved land values, which could thus be made to bear the burdens of the investment. Some objection has been made to nationalization on the ground that "political roads" would be built where the traffic would not justify it. I am quite sure the institution outlined above would prevent that. The local body should be made first responsible; and only in the event of the traffic justifying the investment, i. e., paying cost of operation and interest, should the Government accept responsibility. In this way the needed new roads would be built by local initiative and responsibility, and the Government preserved harmless.

Thus again we see the anarchism which prevails in railway distribution; only to be compared with an equal anarchism of rates, fares, dividends, and public service. There is no data obtainable, but I would wager a dare that there is no

such disproportion in the distribution of the public roads of the United States. There is as little reason for one as the other; and besides the immense development that would result from devoting the capital now used for useless duplications of railways to opening up accommodation for the backwoods farmers and others, an equally great object would be attained in preserving some principle of balance in railway distribution.

I think, then, I may safely add "Development of the country" as one of the urgent arguments in favor of railway socialization.

V. SAFETY OF RAILWAY PASSENGERS AND EMPLOYEES.

I only desire to suggest on this topic that the difference between the number of deaths and injuries on American railways, as compared with the same in Germany and Austria-Hungary (government railways), is enough to intimate mayhem and murder as the principal object of railroad management on this side of the Atlantic. The figures are for the year 1890 in each country, the average journey being 24 miles in this country and 16 miles in the others.

Is this terrible comparison justly drawn between public and private ownership of railways? I candidly believe it is.

About a year ago, when the railways applied to the Interstate Commerce Commission for an extension of the time to complete the air-brake and patent coupler appliances, it was argued that the poorer railways could not afford to expend the money necessary under the law. Of course, it would be almost useless for the more solvent roads to do it unless the conditions were made universal in this respect: and so with "poor railways" (and such, indeed, many of them are, 10 per cent in the hands of receivers, etc.) these great measures of safety, with even an act of Congress commanding them to be done, have dragged along from year to year defying every consideration of humanity and of law.

But if the railways were the property of the people that act of Congress would have been an appropriation, and in 2 years these great measures would have been finally realized as facts. I do not propose to denounce the individual roads for this neglect, nor grow eloquent over the carnage and slaughter. But this state of things must stop. If there is any other means than public operation which can achieve this end I have not heard of it.

I only want to add on this topic a common observation. Many of the accidents are attributed to overwork. I believe that the reduction of the day's work from 10 to 8 hours will completely remove this trouble.

Besides, when the roads are socialized improvements in safety appliances can at once be utilized. Only the fact of their utility needs be satisfactorily determined; after that the improvement would follow, of course.

VI. A SYSTEM OF RAILWAY ACCIDENT INSURANCE.

The principle of insurance is designed to eliminate the dominion of chance and accident over the lives of individual workers. It is eminently just that, where a person accepts a particular work for himself and society, when the unforeseen happens his partner society should share with him, according to their relative capacity, the losses as well as the profits of the enterprise. Whether consciously or not it is a fact that the railway employee and society are partners, and the terrible afflictions which the former has to bear ought to be distributed as far as possible ratably to the partnership liability. It is shamefully unjust that the relatively weak individual should bear alone "the slings and arrows of outrageous fortune." All civilized Governments recognize the obligations of society in this respect by providing pensions for the victims of their only great industry—war, war hardly as ferocious to legs and lives as the railway traffic.

Here is the proof. (United States.)

Table of railway carnage.

| Year. | Killed. | Injured. | Year. | Killed. | Injured. |
|-----------|---------|----------|------------|---------|----------|
| 1888..... | 5,282 | 25,888 | 1893..... | 7,346 | 40,393 |
| 1889..... | 5,823 | 26,300 | 1894..... | 6,447 | 31,889 |
| 1890..... | 6,335 | 28,027 | 1895..... | 6,136 | 33,748 |

| 1892..... | 7,117 | 36,652 | Total..... | 57,812 | 288,601 |

Does this difference between public and private management arise out of personal malevolence of railways on this side of the water? Certainly not. It arises out of a difference of methods. What is the only known difference of method? Ours are private railways and the German "government" owned and operated. So much for the value of institution. Individuality may enjoy a great helpmeet in wise methods or institutions. It will be remarked by the reader that there is a striking uniformity of death and accident during 9 years given, taking substantial increase into account. That is accounted for by the increased number of men at work. Now, this fact of uniformity is of invaluable importance in the scheme of railway insurance proposed. With a practical foreknowledge of what is going to happen in the way of accident, the Government could well discharge the duty of society in this partnership of the laborer and the public well-being.

I shall not indicate here what compensation should be made in each class of accidents. It should be liberal and yet not so great as to induce indifference to personal safety, as some might argue. What I particularly desire to say is that, under the Government, certain and adequate insurance could be had because it would be master of all the facts. Under the dispensation of 1,985 different railway companies no half satisfactory provision can be made. My proposal is that the Government should bear half the cost of sustaining sufficient insurance; that the employee should bear the other half. That in addition thereto crippled employees should have an opportunity to educate themselves for the sedentary employments about railways, should pass examinations as to their fitness to hold clerical positions, and that, other things being equal, they should enjoy a preference for the employment for which they were fit.

It may be said in answer that so far as insurance is essential it exists in the numerous casualty companies which are anxious to write policies. That is so, but they are so grossly inefficient that they defeat the purpose of insurance. I mean by the charge of inefficiency that they charge more than two prices for their insurance, and thus place it beyond the reach of the pressing poverty of the more than half million railroaders who need it. Besides, the railways should pay one-half of the insurance, a thing they will never do while some of them are too poor to employ patent couplers and air brakes, saving legs and lives instead of insuring them.

I have said the casualty companies are inefficient because of their charges. There are some 29 of these companies in this country, and here is their business statement for the year 1898:

Summary of 29 companies, taken from Standard Publishing Company, insurance statistics.

| | |
|--------------------------------|--------------|
| Gross assets..... | \$49,866,711 |
| Gross liabilities..... | 30,779,473 |
| Surplus to policy holders..... | 19,107,244 |

| | |
|---|---------------|
| Premiums received during 1897..... | \$16,018,536 |
| Dividends paid during 1897..... | 604,132 |
| Losses paid during 1897..... | 6,393,741 |
| Gross amount at risk December 31, 1897..... | 2,672,880,735 |

It will be observed that they charged \$16,018,536 in premiums; while all they paid out to the insured was \$6,393,741. Every casualty company will show this low ratio of "losses" to "premiums." Eighteen hundred and ninety-seven is in no sense an exceptional year. It thus appears that they only paid back to the people who sought their insurance 39 per cent of what they exacted for insurance: in other words, the railway employee would have to pay 60 per cent more than actually necessary to cover the actual cost of his insurance. It is patent that railway insurance of railway subjects would not cost more than 6 per cent to administer it in conjunction with the railway finances. It only costs that amount to administer the "sick, invalid, old age, and accident insurance" carried on by the German Government for its laboring population. (See Fourth Special Report, Commissioner of Labor, Washington, D. C.)

Now, if you add to the 39 per cent 6 per cent, to cover governmental cost of administration, the total cost will be just 42 per cent of the sum now necessary with the casualty companies. Dividing that between the railroads and the individual employee the cost would be just 21 per cent, or one-fifth of the amount now necessary to insure with casualty companies and secure compensation for his individual loss.

At the same time the traveling public could avail itself of this institution, and have the fortunate travelers cooperate with the unfortunate in amending peculiarly the misadventures of railway locomotion.

I need hardly argue that the present companies will never adequately correct this great evil. The "fellow-servant" rule of law excuses them absolutely from any responsibility to their employees, and when a passenger or a freight disaster happens the sufferer has usually a lawsuit instead of insurance. If he secures a verdict he divides it with his lawyers, unless it has previously been consumed in appeals to higher courts.

VII. POSTAL EXPRESS.

The demand for a parcel post and Government assumption of the express system has long attained the point of almost universal desire. Of its convenience for commerce and the accommodation of the people I shall not think it necessary to speak. My remarks upon this subject will be confined to showing that if the Government should undertake the railways this service would follow, as a matter of course. I think I shall be able to show, besides, that the express service under these circumstances could be conducted at half the present cost to the general public; that allowing the same railway charge for carrying, which is at present paid by the express companies, and adding thereto the cost of distribution in connection with the post-office, the service would be almost as greatly improved in the matter of delivery as in the reduction of rates.

Mr. Weir, president of the Adams Express Company, stated before a committee of the United States Senate that the usual compensation paid by the company to the railroads was "not less than 40 per cent of the gross receipts;" they guaranteed that: that in some cases it might rise to 50 or even 60 per cent. (See Congressional Record, May 6, 1898, and Senator Pettigrew's speech of that date.)

It would appear that more than half of the cost of express service goes to other sources than railway carriage, viz. to independent offices, warehouses, staff officers, accounts, dividends, handsome salaries, etc. The only service performed by them which is of social utility is delivery by wagons in the larger cities.

It is readily seen that if conducted between a government railway and a government post-office this necessary service could be reduced to its most efficient and economical basis; and the necessary cost of delivery in connection with postal matter decreased so that the whole service might be had for just 50 per cent of the present cost.

Besides, the present express companies carry on a wasteful (socially) competition with each other. This means the multiplication of rents, accounts, dividends, salaries, wagons, etc., all of which would be eliminated by the socialization of the service. For example: An intelligent driver of an express wagon in a town of some 18,000 people, upon being asked as to the number of wagons necessary for the delivery of express matter, replied: "We have altogether 5 wagons running; there are 2 different companies. If one company had the whole business 3 delivery wagons would do the work just as well." This is the testimony of a man who knew whereof he spoke, but did not know the writer's object in asking

the question. I consider it fair to expect that the post-office could conduct this service, in connection with public railways, at about one-half of the rate now required by the private companies.

I will not argue this question further. It is merely incidental to the proposal for public railways. If we should get them the express system would come as a matter of course. If we can not get the railways, I fear the express service had as well be left where it is; for the example of the carrying of the mails and the charge exacted therefor under private ownership of the railways leads me to think that instead of "40 per cent" the railways would secure about 80 per cent for carrying the express, and thus in effect defeat the other economies of postal management.

VIII. A SYSTEM OF RAILWAY CIVIL SERVICE.

I believe no person has ever advocated public railways but in the same breath to demand the most rigid enforcement of genuine civil service. I should, indeed, be quite the last to omit this requirement, urgent in every public employment, but especially urgent in the operation of a system so intimately concerned in our industrial, social, individual, and national life. I conceive the system of civil service to aim at the maintenance of merit in the active work of the Government. In that respect I regard the system of railway civil service not so much a measure tending to insure as high an order of ability and devotion as we hitherto have had, but as an adjunct to the service which must immensely improve it over what we have known in the past.

Consider a few suggestions on this point. As a matter of course, all the interferences with legislatures, county and city public functionaries, courts, as many believe, as well as Congress, will pass away with the private interests which inspire them. Passes, discriminations, overhounding and stocking, building upon one community at the expense of another, etc., must disappear with the interests which render them profitable. We have only one possible apprehension left then. "The roads will get into politics." I think it but a fair question to ask, Where are they now? What is meant by this objection is that employment will become a matter of partisan selection.

Well, let us see what this can mean at worst. Out of the 826,620 men employed in 1896 only 5,372 were general officers. Other officers were 2,718, and here the "offices" cease, unless clerks (25,828) and station agents (29,733) are included. Of offices, about one-half would be abolished as unnecessary, so that at most there would remain not more than 5,000. I believe no one will contend that the other 820,000 employees would be in danger from this influence. No firemen, engine-men, station men, conductors, train men, machinists, carpenters, shopmen, track men, etc., would be in peril of their employment from political desires at Washington. Thus it is seen that the subject-matter of railway employment does not offer the same temptations as other activities of the public service. Besides the "offices" which are now dealt out to the friends and relations of the railway "president" and "board of directors," being incidents of private ownership of stock, etc., will be dropped, and thus the only nook which your "office seeker" could fill will be out of reach. Real and responsible appointments could not be taken except by those who had spent their lives in the railway service. Nature would protect us from the attack of the office seekers. There would be no "offices" to give. Not even your sleek politician could dispatch a train, adjust a schedule, and I do not think we should stand in any peril from his desire to engineer or watch a switch. If he endeavored to foist himself on the railway management, an indignant public, solicitous of their lives and limbs, would either ridicule or bound him off the earth.

The fact is that the elimination of "private interests" would remove the possibility of this abuse. The general public knows that this evil exists to-day in its very worst form in private railway management. The railway president, who is he? Not 10 in 100 are experienced railway workers. Their merits and appointments are usually ascertained by their "stock." They are not selected; they appoint themselves, and hold their positions as long as they hold their stock. And in other cases are they not systematically chosen to "protect certain interests?" Saving a few small roads and the Pennsylvania Railroad, your railroad president is invariably the representative of "certain interests," not a railroad man, but the agent of a clique. How seldom, very seldom, do we see a railway president who "rose from the ranks up."

I need hardly say that under public ownership, with an efficient commission having charge of all the "superintending service," great lawyers and great bankers, adepts in their own calling, would not be seen in such appointments. A system of

rules could be readily arranged providing for competitive examination in knowledge of railway operation linked to life service as a railway worker; and thus confining the "superintending service" to real railway men, your politician would be effectually excluded. The commission would also have charge of freight rates, passenger fares, the building of new roads. When the limit of their ability to attend to their duties had been reached, other boards with definite powers and duties would begin. Each member might be sworn, like a judge, to allow no consideration but merit and the good of the service to influence him in his conduct or appointments.

With the railway service confined to railway men, no one being eligible to advancement but some railway man who had passed the required examination, and who, as in the post-office, had least errors marked to him in his last department, the possibility of partisan selection is, I submit, effectually removed.

But let us see what a vista of hope this arrangement would insure the railroader. The head of the service being supplied exclusively from the service itself, every railroader of spirit, intelligence, sobriety, and ambition might look forward to promotion, and we can readily see how this spur would wake to life the latent energies, aptitudes, and ambitions of almost the entire railway service. Their promotion should be made conditional upon their attaining the highest marks in their previous functions, along with the required preparation for the one to which they seek advancement; and in this way the most powerful motives of human nature could be brought into play for the perfection of railway operation.

The merit system? Yes. Not because we desire the roads run as well as now, merely, but because we desire to cure the nepotism which is more rampant in railway management to-day than it is in any of the departments of the public service. We desire civil service for the same reason we desire lower passenger rates, and we propose public ownership because we know it alone will give us both.

With the systematizing of this great service on the lines of the highest economy will come a tendency to a thorough renovation of all the public departments. Not that they are more in need of it than the private enterprises of the country, for I am sure it will be found upon enlightened comparison of the public service with the private that the palm of highest efficiency must be rendered to the post-office as on the whole the best managed industrial enterprise in the United States. Look over the list of annual failures shown in the Government's business annuals and there will be found an average bankruptcy among private business enterprises of some \$200,000,000 every year for the last 20. And this terrific waste and ravage does not include "the bad debts" of an individual character, but only such failures as are of general concern and are reported to Dun and Bradstreet. It is far from true that the business of the Government is less successful than that of private enterprise. The opposite assertion is nearer just.

I have only to add under this title that no difficulty has been found among other nations in applying economic methods to public railway management. In Germany, Austria, Hungary, Belgium, India, Japan, New Zealand, Victoria, New South Wales, Russia, and, indeed, in all countries that have tried the proposal of this work, no word of discouragement is heard on the matter of "civil service." People naturally expect a rigid management on just business principles, and in no single case has there been a word of complaint.

But this should make us none the less urgent in the demand for nonpartisan control of the department of railways; and, let me say again, the idea has never been advanced but in conjunction with the emphatic requirement of such a principle.

IX. THE TEST OF PAST EXPERIENCE.

"Experience is the best of teachers. We are always prone to look for precedents." The facts are that every possible species of political government has made the experiment of public ownership—some 54 different countries now owning their railways, either in the whole or in part.

One of the first features observable in the results of this system is the complete absence of the corruption and monopolies which grow out of our system.

Another is the fact that in some countries the railway traffic is made a source of political revenue. In Germany in 1890 the net profits were 38½ per cent of the entire railway receipts, or \$119,159,147.51 revenue, and this immense sum was turned into the imperial treasury. It is attested, too, that the net profits of the German system have increased 41 per cent during the 10 years, while wages are said to have been increased 1.21 per cent over the wages of private management. On third-class fare in that country one may ride 4 miles for a cent, and 10 miles on the Berlin road for a like amount.

The experience of Belgium is like that of Germany, according to Vail, who has written an excellent work on this subject. There fares and freight rates have been reduced one-half and wages of employees doubled under government operation. The net profits for 1891 were \$11,313,175. In New Zealand the roads yielded a net profit of \$2,179,473 in 1893, while the advantages which are said to have accrued to the colony in cheapened transportation are inestimable.

In New South Wales the government owns 2,351 miles of railways, which in 1893 returned a profit of \$9,565,868. The value added to public lands would more than pay the entire cost of her roads. This is equally true of all the other Australian colonies. In Australia one may ride 1,000 miles first class for \$6.50, while workmen may ride 3 miles for 1 cent. Yet wages are from 25 to 30 per cent higher than in this country, while the working-day is but 8 hours.

In Russia some 6,800 miles are public, which, together with the new Siberian line, make 11,000 miles. This entire distance may be covered for \$50, being less than a half cent per mile, through an unsettled and almost uncivilized country. The net return to the Government in 1891 was \$25,000,000. All the other railways revert to the Czar in periods from 35 to 85 years. Workingmen there regularly ride at the cheap rate of \$6 for 2,000 miles. In France the railways revert to the republic in specified periods.

The experience of Austria-Hungary tallies with the rest. Her net profits from railways in 1888 were \$50,457,822. But since that year immense changes have been made. The "zone" has been substituted mainly for the per mile rate, each zone increasing in breadth as the total journey is an extended one. Mrs. Marion Todd, in her work "Railways of Europe and America," gives an exhaustive description of this institution.

Thus we have the project tried and tested by every kind of government. Whether in the most radical democracies, like the Australian colonies, or in the most untoward despotism, like that of Russia, whether among the people professing the endowments of western civilization or among the Hindoos or Japanese, the experience of each and all attests the immense advantage, as well as the practicability, of the public railway. Institutional lines can not then, be drawn upon its advocates, for under every kind of political institution has this system been tried with the one result, elimination of the rottenness of irresponsible private power and an immensely augmented public service. Experience, then, would seem to favor nationalization.

Professor Ely informs us that, without exception, every man he met in Germany considered the test of experience as demonstration of the superiority of public ownership. "Even those who were once bitterly opposed to the undertaking are now convinced of their error, and no one wishes to return to private ownership."

It seems, then, in our case that it is only a question of being behind the age.

X. TRUSTS—DESTRUCTION BY PUNITIVE FREIGHT RATES.

It has become almost a universal principle in pathology that the most effective method for curing a disease is to be found in the inoculation of the patient with its virus. The business men and observers of events well know that the parent of trusts has uniformly been a preferential freight rate. The Standard Oil is a well-known example of this fact; and anyone who cares to know the definite relations of this company to preferential freight rates may be well referred to a most excellent work by Henry D. Lloyd, entitled "Wealth against the Commonwealth."

It has been seen in the last 10 years that civil prohibitions are simply meaningless as against those great combinations of wealth. In the last few days we have seen offered to the attorney-general of the State of Ohio a straight bribe large enough to have subsidized ninety-nine of every hundred known kings in history. Monnett has proved stronger than the Standard Oil, but I am afraid to think how many have in the past and how many will in the future yield under so prodigious a burden. How few have ever stopped to consider that moral endurance, like physical endurance, has its well-defined limits; that while some may bear the small burden and others the greater, that still for the great mass of the human race the limit of endurance is reached far below the point at which these great monsters can disburse their bribes. Moral endurance has its limits, just like physical endurance; and while a strong man may bear up under a burden of 500 pounds, yet if the load is raised to a ton in weight he will be crushed to atoms. Little wonder is there that the moral instincts of the masses have taken fright at these omnipotent forces of corruption; and great indeed should be the anxiety of Americans in every station to curb and overpower these organizations, already more potent than any of the peace powers of the Republic.

To this end I have but one suggestion to make. If preferential freight rates were

the means of lending economic strength to these great monsters, then punitive freight rates may most certainly be made the means of their undoing. Let there be a commission whose duty shall be to determine when an industrial organization has become a trust. With the Government owning the railroads (and this suggestion is only made upon that condition), the production of such trusts could be so discriminated against, on the principle of our protective tariffs, that the trusts must soon give way. The commission having determined that certain subjects of transportation were the productions of a trust, it could then issue its orders to every freight agent in the Union, commanding them to impose 100 per cent additional for the transportation of such freight, or prohibit its transportation entirely, if it were found that consumers might rely upon another market. In this way society would be meeting one economic fact with another; and history should have taught us by this time that economic factors are the only ones with which to do intelligent battle with other economic factors. A punitive or prohibitive freight rate would so harass the operations of the trust that it could not reach its market, and voluntary dissolution would follow the application of such a force.

These trusts have been recognized by the statutes of the Union and by the common law from time immemorial as crimes against the law. The suggestion, therefore, that such measures as punitive and prohibitive freight rates might be unconstitutional is hardly called for. The Constitution certainly was designed to punish crime and not to protect it. The clause therein relating to interstate commerce applies to legitimate and laudable commerce, to be determined by Congress, and where an article or manufactured product were being unlawfully produced and vended the Congress, in the interest of interstate commerce, would have the clear and unquestioned power to prohibit such traffic. The Louisiana lottery is an example of constitutional principles when applied to unlawful avocations; so that I do not perceive any valid legal objection to the practice of punitive and prohibitory freight rates.

I think it is not an assumption to say that if the proposal of Government railways were supported only by the incidental prospect of the discouragement and destruction of trusts, the American people would be nearly unanimous in favor of this measure. Certainly they have long despaired of lawsuits under antitrust legislation, for they well know that the administrators of the law are helpless in their practical impotency as against malefactors who possess the only active powers of effective government—that is, direct power over the millions of their fellow-citizens.

X. OBJECTIONS CONSIDERED.

I now come to the consideration of the few objections which, when an objector is found, are sometimes made against the proposed system of national railways.

The most general of these is the one expressed in the aphorism "The least government is the best government." I do not think this maxim applicable to the subject; for in a literal sense railway administration is hardly government. The adage was born in another age, in response to censorships, government expurgations, imprisonment for debt, State religion, and all the trying annoyances of monarchical governments in the centuries past. It can not justly be quoted against coordination and cooperation, which, in the interest of economy, it is here sought to introduce.

But, in another sense, suppose it is admitted that the proposed transformation will place upon the roads the complexion of government—let us see what will be gained or lost.

I think it can not be denied that the systematic exercise of power by any set of persons over another number of persons is in itself "government," whether the arm of power is exerted in the name of the Government or not. Substance must be looked to, and not the mere forms of speech. Now, this being true, what are the facts in relation to private railways?

The facts are that more than four-fifths of a million of American citizens are employed by these private railways. They are dependent on their employment for the physical means of subsistence. Their necessities are their highest laws, and any power that can consciously govern their necessities can govern them. The interests or prejudices of the superior may make it desirable for him to do this frequently; to do it systematically; to make it a matter of employment or no employment if the employee, thus dependent, refuses to submit. When it becomes a question between the man's subsistence and his independence, we well know how we would act ourselves, and we well know that the vast majority of the employees thus put in terrible jeopardy may yield to what the hour seems to indicate as most convenient. He will not, as a rule, make an individual sacrifice merely for "his rights" and lose his living. A family and a lot already sufficiently reduced in its

proportions make his "rights" and his necessities come in fatal conflict, and he feels that he can not retain the one and secure the other. With this power over the lives of 800,000 citizens, do the companies "govern?" If not, what name shall we give to the systematic acts of effective railway power?

For example, the writer knows of a supposed "relief fund" conducted in connection with one of our largest railways. The motives which inspired its foundation were in all probability just enough. The purpose was to raise a fund to compensate the widows and orphans as well as the injured—made such by the railway accident carnage of our system.

Every employee on penalty of his job was compelled to subscribe to this fund. Some government, I should say. After some years a surplus of \$600,000 was accumulated from the excessive levies made by the company. Every provision was ostensibly made so that the accumulations should be safe, etc. A few years ago a receiver took charge of the railway, and found that the \$600,000 had been swallowed up by the managers who preceded; and there is not a man in the employ of that company to-day who would dare inquire what has become of the "widow and orphans' fund"—nor will the reorganizers pay it. I refer to the former management of the Baltimore and Ohio Railroad.

Thus, it indeed becomes a question what is the least government? The managers, of course, say "ours." The love of power is deeply planted in the human breast, and the managers prefer to continue their "governing."

Does not the principle "the least government" require the transfer of this system to the hands of that institution which has no desire to oppress, no motive to plunder, no earthly reason for "governing" in the railway business any more than in the post-office?

The least government is the best government, and the least government is that with the least motive for oppression, plunder, waste of railway resources, etc.; and with these motives will pass the abuses and possibilities of too much governing.

The assertion that the roads would get into politics is met in the chapter on "Civil service." It would be almost trite to speak of how far they are now in politics. Lawson, in his text-book on railway law, gives it as his opinion, after examination of the decisions of the supreme court of Pennsylvania, that "the Pennsylvania Railroad Company seems to run that court with the same facility that it runs its trains." Politics is an important branch of the present dispensation. Railway interests daily come in conflict with the concerns of society. Taxes, rights of way, laws of negligence, grants of rights of way to competitors, and a thousand different elements make the private management think it necessary to go into "politics." Sometimes they have to "put up" to be served. Congressmen, legislators, governors, judges, tax assessors and their election are all of the deepest concern to your private railway. "In politics!" A politician would call you an idiot if you forgot to consider "the railway influence." As a general proposition every officeholder, sheriff, deputy, select magistrate, judges of lower and higher courts, all State officers, legislators, congressmen, lobbyists, indeed every officer from constable to the cabinet are the special recipients of their passes, the coin current of the railway realm. With this currency they succeed in establishing a disposition, unconscious perhaps, in their favor. If the pass does not work, something bigger is proffered, so big that, as Brice has said, "ordinary virtue turns pale." This is the inevitable consequence of the immense interests at stake, and railway managers will resort to this as long as these powerful incentives remain—i. e., as long as the exigencies of private railways exist.

I am not one of those who believe that a railway manager is necessarily a corruptionist. He does just what other speculators do in smaller affairs. The trouble is that in his case a single "coup" shakes and shatters the social fabric; his subject-matter is so great, like that of the East India Company, that entire races suffer from his operations. His doings are shifted from the circle of individual consequence to that where society itself feels the weight of his hand. The fact is that your petty stock-jobbing concerns are schools of training for him; he mostly comes through that form of chrysalis, and will emerge into your railway sultan. The remedy lies not, then, in measures of Sunday-school restraint and legislative restriction. The temptation of the "inside" on a rising or falling stock market will always prove too much; if the vaccinations do not come frequently enough he will produce them by artifice. You can not, therefore, redeem private railway management without reforming society to its depths; and the only relief predicable is that which advocates the removal of the subject-matter entirely away from the private passions and interests which dominate the railways now.

That the railways are now deeply immersed in politics to the infinite demoral-

zation of public virtue, while the Post-Office, with nearly 200,000 employees in its service, is comparatively free from politics, I believe no one can gainsay.

Show me a single instance of the Post-Office trying to bribe a public officer or anyone else? And if there is now and then a slight change of incumbency does the service suffer; can society complain?

But it is patent that the nation will insist upon a much more rigid enforcement of civil service as to railways; and even if there were some change now and then in administrative heads, would that be without daily and hourly precedent under the present form?

But I shall quit arguing a point so plain, for it is quite clear that with the elimination of private motives from the service its economical administration would be as free from this objection as the great postal service.

It may be objected that this project is "unconstitutional;" that the present powers of the National Government would not permit it to assume such ownership.

GOVERNMENT OWNERSHIP CONSTITUTIONAL.

I have omitted to state that the power of Congress to construct, establish, and maintain interstate railways has been set at rest by numerous decisions of the court of last resort. In 1888 the case of *California v. The Central Pacific Railroad Company* was decided. It involved the validity of the old acts of Congress incorporating the Pacific roads. Judge Bradley, speaking for the whole court in that case, said:

"The power to construct, or to authorize individuals or corporations to construct national highways and bridges from State to State is essential to the complete control and regulation of interstate commerce. Without authority in Congress to establish and maintain such highways and bridges it would be without authority to regulate one of the most important adjuncts of commerce. This power in former times was exerted to a very limited extent, the Cumberland or National road being the most notable instance. * * * But since, in consequence of the expansion of the country, the multiplication of its products, and the invention of railroads and locomotion by steam, land transportation has so vastly increased, a sounder consideration of the subject has prevailed and led to the conclusion that Congress has plenary power over the whole subject. Of course, the power of Congress over the Territories, and its power to grant franchises exercisable therein are and ever have been undoubted. But the wider power was very freely exercised, and much to the general satisfaction, in the creation of the vast system of railroads connecting the East with the Pacific, traversing States as well as Territories, and employing the agency of States as well as Federal corporations." (127 U. S. Reports, 156.)

In the year 1892, in the case of *Monongahela Navigation Company v. United States*, a full court again says:

"Notice to what the opposite view would lead: A railroad between Columbus, Ohio, and Harrisburg, Pa., is an interstate highway, created under franchises granted by the two States of Ohio and Pennsylvania, franchises not merely to construct but to take tolls for the carrying of passengers and freight. In its exercise of its supreme power to regulate commerce, Congress may condemn and take that interstate highway, etc. It may be suggested that the cases are not parallel in that in the present (a river) there is a natural highway; while in that suggested it is wholly artificial. But the power of Congress is not determined by the character of the highway. They are simply the means and instruments of commerce, and the power of Congress to regulate commerce carries with it power over all the means and instrumentalities by which commerce is carried on." (Justice Brewer, in 148 U. S. Rep., 342. See also *Cherokee Nation v. Southern Kans. R. Co.*, 135 U. S., 641; *Luxton v. North River Bridge Co.*, 153 U. S., 526; *Western U. T. Co. v. Pendleton*, 122 U. S., 347, and numerous other cases.)

The power of Congress to condemn existing roads has also been affirmatively determined. See *Monongahela Navigation Company v. United States*, as above given; likewise that corporate franchises may be condemned, and that such proceedings would not interfere with the inviolability of contracts. *West River Bridge Company v. Town of, etc.* (6 Howard, U. S., 507). The General Government possesses the power of eminent domain, etc. (*Kohl v. United States*; see 91 U. S., 367.) Congress might authorize an entry and the taking possession of the roads immediately, by providing a remedy against the Government for just compensation. (*American and English Encyclopedia of Law*, second edition, vol. 10, p. 1139, and 2 McCreary, 203; 4 Fed. Rep., 298; and *Cherokee Nation v. Southern Kansas Railroad Company*, 135 U. S., 641.)

These leading cases have been noted and approved by the Supreme Court in the following cases: *Covington, etc., v. Sanford* (164 U. S., 594); *United States v.*

Stanford (161 U. S., 410; 162 U. S., 404; Re Debs, 158 U. S., 565; 166 U. S., 322-323; 162 U. S., 91, and especially 98 U. S., 708).

Congress, then, has the unquestioned constitutional power to maintain the railways; to acquire them by condemnation of the franchises and property of the present owners, and may take possession of the same by a simple act of Congress, and provide for the payment of the owners in due time, when the market value of the roads is properly determined. The organic law presents no obstacles to the immediate realization of national railways.

Again it may be said by some that it is not within the sphere of government to operate railways. But the practice of three-fourths of the nations of the world is against this contention. It is not only within their sphere, but they are doing it. How about the Post-Office, the Weather Bureau, the schools and public roads? Some profess to believe that the state should only act as a policeman. But why should it act as a policeman? Obviously because it alone can do it efficiently and with due regard to social justice. In short, because the state can discharge that function better than the private citizen.

It may not be out of place to note what John Stuart Mill, one of the noblest and wisest of mankind, thought upon this subject. Discussing the exceptions to the doctrine of "laissez faire" he says:

"In attempting to enumerate the necessary functions of government, we find them to be considerably more multifarious than most people are at first aware of. * * * We sometimes, for example, hear it said that Governments ought to confine themselves to affording protection against force and fraud, etc. But why should people be protected by their Government, that is by their own collective strength, against violence and fraud, and not against other evils, except that the expediency is more obvious?" And again: "The third exception which I shall notice, to the doctrine that government can not manage the affairs of individuals as well as individuals themselves; has reference to the great class of cases in which the individuals can only manage the concern by delegated agency, and in which the so-called private management is, in point of fact, hardly better entitled to be called management by the persons interested than administration by a public officer. Whatever is left to spontaneous agency, or can only be done by joint-stock associations, will often be as well and sometimes better done, as far as the actual work is concerned, by the state. * * * Against the very ineffectual security afforded by meetings of stockholders and by their individual inspection and inquiries, may be placed the greater publicity and more active discussion and comment, to be expected in free countries, with regard to affairs in which the General Government takes part. There are many cases in which the agency of whatever nature by which a service is performed is certain from the nature of the case to be virtually single: in which a practical monopoly * * * can not be prevented from existing. I have already adverted more than once to the case of the gas and water companies, among which, although perfect freedom is allowed to competition, none really takes place, and practically they are found to be even more irresponsible and unapproachable by individual complaints than the Government. * * * This applies to the case of a road, a canal, or a railway. These are always in the greatest degree practical monopolies." (Political Economy, Vol. II.)

I think it is clear that the state can operate the railways better than private interests, and thus there is the same justification for Government railways as Government police. It will be found that men's ideas of the sphere of government spring mainly from their prejudices and party associations, rather than from a calm analysis of the functions of government. Whether the active forces of society shall be exerted in this or in that case depends on the facts of the case. If they are such as to demand social intervention, that alone being adequate to social need, then society should do its duty and assume its full responsibilities. Railways are far from being individual affairs; they are national in character and consequence. Only the nation is strong enough to control them; and that, as experience has shown, can not be done but by owning them. The Government is but the common agent of society to conserve its interests where the individual units can not act efficiently for themselves. Unless this is so government should be abolished and supremacy left to the strongest, and the *lex talionis* set in general operation.

"Government administration of the roads will be costlier than the present." And it ought to be in some respects. Any railway manager who offers an employee less than a dollar for a day's work, such as navvies sometimes receive, is an anarchist at heart, infinitely dangerous to the country of Washington. But this fact has been provided for in advance, and \$90,000,000 are set to this account for the general reduction of the hours of labor from ten to eight. No government could or should desire to run the roads on the minimum wage plan, but rather with a view to the greatest social service.

But, as I have shown, instead of being costlier, one-half of the interest charge can be saved, and about one hundred millions besides in the economies which will result from the unification of the 1,985 different companies. These economies must increase from year to year, for the Government can take advantage of every labor-saving device and improvement, saying nothing of the immensely increased social service. To show that government service is not necessarily "costlier" I append a statement giving relative cost of service in some nine different European countries. Private railways and public, for the same countries, alone are compared. The table is taken from Todd's Railways of Europe and America.

| Countries. | State line. | Companies line. |
|----------------------|------------------|------------------|
| | <i>Per cent.</i> | <i>Per cent.</i> |
| Germany..... | 9.40 | 13.19 |
| Austria Hungary..... | 6.50 | 8.47 |
| Belgium..... | 5.05 | 10.13 |
| Denmark..... | 6.89 | 5.77 |
| Italy..... | 6.49 | 8.78 |
| Norway..... | 7.30 | 7.00 |
| Holland..... | 5.30 | 10.35 |
| Roumania..... | 4.40 | 10.80 |
| Russia..... | 9.27 | 13.70 |

"The roads should be left to the free action of competition." We have seen that in order to pay interest on the investment and cost of operation it is necessary, in 90 per cent of the country, that a road should secure all the traffic. Two roads mean two bad ones, poorly equipped, cheaply paid labor, business disaster, no interest, no dividends; finally combination or agreement as to rates—a monopoly at last. No law can make it other than profitable for the roads to agree rather than fight and waste their resources. Sound economy of capital and labor requires that social service rather than "competition" should be the aim of railway administration. The railways themselves are against competition. They have had a bill introduced in Congress known as "the pooling law," which seeks to drive away forever the principle of competition, and to combine them for the purpose of profit. If they should succeed in this object we should then have a private corporation collecting more revenue each year than all the city, county, State, and Federal governments, and dispensing more in interest and dividends every year than the United States does to administer the Government, while it would have on its pay roll an army of voters larger in numbers than the commands of both Grant and Lee. And experience has shown us that private owners covet and vote them. This can not be fairly said of the post-office. Who would own the Government then? Is it not better that the people should own both the roads and the Government? And "competition," where would it be? "Gentle shepherd, tell me where."

Now all these objections were singly and collectively made before the Government of Germany assumed the ownership of the roads, and each and all of them have happily proved to be invalid. Professor Cohn, of the University of Göttingen, says that in Germany the question of state ownership and management has been settled by the test of experience.

To sum up, then, there are some 10 great objects which can certainly be secured by nationalization of the railways:

(1) The perfect security of the capital invested; precarious railway securities must pass away. A vast body of certain investment will arise instead.

(2) Uniformity and equality of freight rates throughout the different freight zones; all shippers will enjoy equal opportunities, the national desire of 20 years. Only this system can cure quasi natural as well as willful discriminations.

(3) A half-cent passenger rate per mile over the entire country. A volume would be necessary to describe the resulting educational, industrial, and social advantages.

(4) An 8-hour day for all railway workers; trackmen elevated from helotism; the immediate use of all safety appliances. A volume more would be needed to state the benefits to the workmen and society at large which must result from the introduction of these principles and the employment of 165,000 additional men, now tramping the streets of our towns and cities begging for work.

(5) The greater development of the resources of the country by a wise application of the capital now wasted in "parallels."

(6) A juster distribution of railway mileage as between the different States: the grossest discrimination and inequality is the practical effect of the present system.

(7) The emancipation of public men from the influence and evils of "railway

corruption and politics." I do not mean this as denunciation, but as my sober judgment of the unavoidable consequence of leaving such prodigious power and temptations to the natural selfishness of at most a very few men. Moral endurance, like physical strength, is a limited quantity; nations should take competent notice of this fact by abridging the artificial power of "positions."

(8) The establishment and operation of a postal express; that I tried to show might be the means of reducing the cost of the express service 50 per cent. The advantages to commerce are beyond computation.

(9) The gradual inauguration of a system of accident insurance for passengers, employees, and, perhaps, to cover losses of freight.

(10) The availability of punitive freight rates to destroy or discourage monopolies.

Besides, this great body of capital thus released, in effect, from the railways, could be used to build up the country in various directions.

Now, in view of all these great ends I desire to ask, in perfect candor, those who have hitherto opposed this proposal (and they are among the most powerful), are you not in honor bound, by the great gifts with which our common country has enriched you, to examine again, perhaps a little more impartially and generously, a proposition which will mean so much for this generation and the countless generations destined to live their lives in this quarter of the globe? Are a few aphorisms of doubtful validity, such as "least government," "not in the sphere of government," and "may get into politics" more to you than the collective interests of an entire race? You know how received ideas have been shaken up by modern science; do you not think this great topic worth a frank study from the other standpoint, the claims of society? I believe you do, and if your interest could be earnestly engaged I am quite certain a great problem could be settled right.

I might occupy as many more pages in narrating the history of railway scandal in the last 20 years. I do not desire to "play with the feelings" of the reader, who in all probability is as well acquainted with that subject as rehearsal could make him.

I now desire to refer the reader to the sources from which this work has been compiled. The Interstate Commerce reports, most excellently edited and reliably prepared from the accounts of the companies, are my principal sources of information. They may be had for any year since 1888 from the courteous members of the board. This board has succeeded in achieving a greater purpose than was contemplated by its founders. It has settled, by its reports, this whole question from the standpoint of political economy in favor of nationalization.

THE FUTILITY OF REGULATION.

Even those who have opposed the Government assumption of the railways have not denied the intolerable evils of private ownership. Their hopes of betterment are, however, based upon the idea that the Government should merely interfere and regulate the traffic. This suggestion of compromise between two irreconcilable powers and two discordant interests can only meet, has only met, the fate common in attempts to balance two inherent enemies. As a matter of *a priori* argument it would seem clear that a regulation of the railways must be premised upon a set of conditions which can never exist among some 1,000 different companies. Uniformity of practice, rates, classifications, etc., presupposes common interests, aims, and conditions. No rule can be made on any material matter as to which the violation will not be more advantageous than the observance to a considerable number of the regulated railways. Therefore the temptation will come to violate, and such a violation throws the whole outfit into anarchy. But this "regulation" has been tried. Let the regulators narrate their grief. (Report Interstate Commerce Commission, 1898, p. 6):

"There is, therefore, a constant temptation to obtain it at any cost. Now, the rates between two competitive points have been published. The manager of one road finds that business has abandoned his line, and he believes that it is moving by a rival route. He can draw but one inference, and that is that his competitor has secretly reduced the rate. Under these circumstances what shall he do? Shall he maintain the published rate and thereby abandon the business? But that means disaster to his road, the loss of his reputation as manager, and ultimately of his employment. What most managers actually do is to get the business by making whatever rate is necessary. * * * Meanwhile the situation has become intolerable, both from the standpoint of the public and the carriers. Tariffs are disregarded, discriminations constantly occur, the price at which transportation can be obtained is fluctuating and uncertain. Railroad managers are distrustful of each other and shippers all the while in doubt as to the rates secured by their

competitors. Enormous sums are spent in purchasing business and secret rates accorded far below the standard of published charges. The general public gets little benefit from these reductions, for concessions are mainly confined to the heavier shippers. All this augments the advantages of large capital and tends to the injury and often to the ruin of smaller dealers. These are not only matters of gravest consequence to the business welfare of the country, but they concern in no less degree the higher interests of public morality."

The commission, then, confesses the disorder. But it also confesses that it is beyond regulation. I shall quote freely from its reports, for they contain the sanction of experience, the highest reason. (See Report 1897, pp. 32 to 47.)

FAILURE TO MAINTAIN PUBLISHED RATES.

"If the act were amended in accordance with the foregoing suggestions, we believe it would in the main secure the establishment and publication of just and reasonable tariffs. If such rates are published, shippers will see to it that they are not charged too much. This, however, is but half the problem. It is one thing to secure the publication of a proper rate and another thing to secure adherence to it. Discrimination may be occasioned not only by charging too much, but as well by charging too little. We are constrained to believe that one of the worst features in the present situation arises from a departure from the published rate in favor of particular shippers, and that this might continue to be so.

"It is well understood that the statute at the present time makes it a criminal offense, punishable by fine or imprisonment, for an officer or agent of a railroad company to receive for like service less from one shipper than from another. It is also a crime, punishable in the same manner, if any shipper takes a rate less than the published rate. It was assumed when these provisions of the law were enacted that they would secure compliance with the open rate. It speedily began to be said, however, that carriers did not maintain their rates, and the commission undertook the investigation of complaints of this character; but upon inquiring of those persons who had knowledge of the transactions, either as agents of the carrier or as shippers, objection was made that the witness could not be obliged to criminate himself and was, therefore, not compelled to answer. This left the commission entirely without power to obtain evidence of offenses of this character, since neither the shipper who received the rate nor the railroad official who gave it could be compelled to testify to the fact. In order to meet this difficulty, the law was so amended as to exempt the witness from all further prosecution for that offense, and this provision was held in the Brown case to be a constitutional one.

"The Brown decision was announced in April, 1896, and thereupon railroad managers immediately became loud in their protests that whatever might have occurred in the past, upon the strength of the notion that it could not be discovered, should no longer occur, and that rates from then on would be scrupulously maintained. It soon began to be said, however, that conditions were becoming much the same as they had been before. Railroad men themselves tacitly admitted that rates were not maintained. The press openly charged it, and what inquiries the commission could make led us to the same conclusion. Finally, for the purpose of ascertaining what could be developed in the way of investigation, we began that inquiry into grain rates between the West and the Atlantic seaboard which is referred to in another part of this report. It is only proposed to observe here in reference to that inquiry that it was participated in by the several members of the commission in person; that those officers of the different railroad companies engaging in that traffic, who must have known had the rate been departed from, were called before us and compelled to give evidence under oath. That evidence was, without exception, that the rate had been in all cases maintained.

"Now, these gentlemen must have known whereof they spoke. Their testimony covers a period in which rates of the kind involved were said to have been more than ordinarily disturbed, and that testimony shows that during all that time and in reference to all those shipments the published tariff was scrupulously exacted. Nevertheless, there are strong reasons for believing that the fact is otherwise. Those who are in a position to know say that this is so. Railroad managers themselves, with one accord, declare it to be so. Facts which are morally convincing, although not of a character to secure a legal conviction, lead us to the same opinion. We have no doubt that at the present time very large quantities of competitive traffic are carried at other than published rates.

"The effect of this rate cutting is most unfortunate. Incidentally it prefers the large to the small shipper. Rebates can not be given to-day as they were before the passage of this act, nor as they were before the Brown decision even.

Various devices are resorted to. Only a few can know of the transaction. The whole matter must be covered up and kept secret, with the result that the large shipper, the trust, the monopoly, is able to secure the concession, while the small shipper is obliged to pay the published rates, and this concession, while at the present time small as a rule in individual instances, is often very large in the aggregate.

"But the most unfortunate feature of the whole situation is the fact that it often prevents the honest shipper from doing business at all. It being a crime to accept less than the published rate, one who believes that the law of the land should be obeyed can not accept a reduction from that rate. It is only the dishonest trader that can and does accept it. This concession is often the only profit in the transaction. A margin of a cent a bushel on grain when handled in large quantities for export is considered a fair one, and this is not a large nor unusual concession in the freight rate. The result is therefore that not only is the honest dealer at a disadvantage, but he may be absolutely prohibited from engaging in that business.

"The same thing is true with the carrier. It is a crime for the agent of the railroad company to give this concession in rates, and no honest man can, on behalf of the railroad company, a party to such a transaction; so that the carrier which would obey the law is deprived of the business that legitimately belongs to it.

"It is not suggested that railroad managers wantonly violate the law in this respect. As a rule, they are apparently anxious to obey it. The failure to do so not only makes them criminals, but inflicts enormous losses upon the properties they represent. Why, then, should not rates be maintained? 'Because,' says the carrier, 'this law, under existing conditions, puts it into the power of the dishonest railway and the dishonest shipper to compel every competing railway and every competing shipper to be dishonest also or withdraw from the business.' The shipper declares: 'If I pay the published rate, I must close my warehouse.' The carrier asserts: 'If I exact the published rate, the traffic which belongs to me goes to my rival and my stockholders are without dividends.'

"It is difficult to conceive a graver charge than this or a more outrageous situation than that which is assumed to justify the charge. To what extent that situation actually prevails the commission has no definite knowledge. That it exists to a considerable extent seems certain; that there is pressing need of a remedy can not be denied. The carriers insist that such a remedy lies in the enactment of a pooling bill, which they earnestly demand."

As to "pooling" and its wisdom the commission does not agree. I quote again:

POOLING.

"As to the wisdom of this legislation the commission is not agreed. In the first place, we do not agree as to the probable effect of such a law. There is no precedent by which we can be fairly guided as to the result. * * *

"At the same time it must be remembered that if pooling produces any beneficial result it necessarily does so at the expense of competition. It is only by destroying competition that the inducement to deviate from the published rate is wholly removed, and it is only to the extent that competition is actually destroyed that beneficial results can be expected. Notwithstanding the specious arguments of carriers to the contrary, this is and must be the fact. By the legalizing of pooling the public loses the only protection which it now has against the unreasonable exactions of transportation agencies. We are all agreed that the enormous power which such a measure would place in the hands of railroad companies ought not to be granted, unless the exercise of that power is properly restrained in advance. * * * The members of the Interstate Commerce Commission wish to say in the strongest possible terms that they are unanimous in the opinion that to overturn the trans-Missouri decision, to repeal the fifth section and enact in its place a pooling bill, thereby permitting and inviting unlimited combination between carriers, would be little better than a crime against the people of the United States, unless this tribunal, or some other tribunal, is at the same time invested with adequate powers of control, and that nothing less in degree than those outlined in this report or their equivalent would be adequate."

That is, a system of regulation, etc., of the "poolers" shall be tried again. I do not mean to speak disparagingly of the members of that board. The public has not sufficiently, in my opinion, appreciated the high integrity of its labors—labors none the less trying, arduous, or commendable because unattended with the desired results. It is, indeed, extremely gratifying to know that men may be obtained in the public service for a small pittance to pass upon subjects of such

immense financial proportions without a single suggestion of impropriety or partiality in 10 long years.

But to come again to the pooling project. The railways want that. The commission believe it would be a crime unless accompanied with adequate power of control, etc. It is not claimed that pooling would prevent discrimination in favor of "large capital," i. e., trusts and the like. And of what avail would it be to the people? There would be none of the economies of a single organization as against one thousand. The old line of expense would remain intact. Its object is to maintain rates and protect the railway owners from the disadvantages of competition. Under such circumstances we might see some 4 billions of railway stock now cursed to barrenness by its parents, "water and fraud," rise into predatory vitality again. How much better to proceed the entire way, as has been done in Germany and some 50 countries, and own and operate them on principles which everyone concedes should control. Common ownership and common interests will secure us every end deemed so desirable. The commission admits that transportation is a governmental function. (Report 1898, pp. 19, 20).

"While railway transportation in this country is carried on by private capital, it is essentially a Government function. This appears from the necessary conditions of railroad construction. It is a universal maxim that private property can not be taken for private uses, but only for the public use. Yet no railroad can be built without the appropriation of private property. It equally appears from the relation of the carrier's business to the community. A merchant may sell to one customer for one price and to another customer for another price, as best subserves his interest, without violating any sense of right and wrong, but it is to-day universally felt that the rates of public transportation should be uniform to all. As we have already said, the railway is, from its very nature, in respect to the greater part of its business, a virtual monopoly. The essential feature of a Government function or of a monopoly is that it excludes the idea of competition, and this notion prevails in almost every civilized country to-day."

Moreover, the railway managers will not consent to accept the pooling arrangement when incumbered by the conditions, the absence of which the commission considers a crime against the people. Milton H. Smith, president of the Louisville and Nashville Railroad Company, in the *North American Review* for April, declares that "it might be decidedly better that the Government should acquire the roads" than to submit to the rate-making power in the commission.

Very respectfully submitted.

DAVID C. TAYLOR

CUMBERLAND, MD., May 25, 1899.

STATEMENT OF MR. WALTER E. WEYL,

On American and European Passenger Rates.

The following table shows in a general way the contrast between the passenger traffic of America and that of European and East Indian railways. The number of passengers on American railways is less than that on British and German railways, and in proportion to population the American people take a considerable smaller number of trips than do the English or Germans, or indeed the French, Belgians, or Swiss. The average distance traveled per passenger, however, is considerably greater in the United States than in the States of Western Europe, and the total number of miles traveled by all passengers on American railways is greater than that for any other country, although in proportion to population it is only about as great as that of Germany or France and probably considerably less than that of Great Britain, while in proportion to our total mileage our passenger traffic is quite insignificant. Our receipts per passenger are considerably higher than those of other countries, our fares averaging 2 cents, while those of Europe average generally from three-fourths cent to 1½ cents. The peculiarity of American traffic, however, is that high fares are associated with empty trains (as may be seen from a comparison of the receipts in the various sections of the United States), and the receipts per passenger train made on European railways are not much below those on American railways.

The comparison often made between the day-coach service in America and the first-class cars on the Continent is defective since, as the following table shows, the great mass of travel in Europe is in the third or fourth class. The comparison between first-class in America and third-class in Europe shows a superior service in American lines and a cheaper service in European roads. India offers the example of exceedingly poor and remarkably cheap service, together with good returns to the railways.

The accompanying statement has been compiled from the most trustworthy accessible resources, and it is to the best of my knowledge and belief correct.

WALTER E. WEYL.

INQUIRY CONCERNING LEGISLATION AFFECTING RAILWAY LABOR.

The questions in the commission's "Inquiry concerning legislation affecting railway labor" are set out together below. The answers thereto follow, each being marked to correspond to the question to which it is a reply.

I.

What legislation, if any, would you recommend the States and Congress to enact concerning the employment and discharge of railway employees?

1. Legislation to insure to employees the right to membership in their brotherhoods and associations.
2. Legislation regarding blacklisting.
3. Would it be advisable to regulate by law the conditions under which railway employees may be discharged?
4. Please suggest such other legislation as you may think advisable concerning employing and discharging railway employees.

II.

Is it desirable to regulate by State or Federal legislation the hours of labor in any branches of the railway service? If so, what legislation would you suggest?

III.

1. What legislation, if any, would you recommend for the purpose of limiting the power of the State and Federal courts to issue injunctions in cases of disputes between railway companies and their employees?

2. Should there be a limit put upon the power of Federal courts to imprison for contempt?

3. Would it be desirable to allow only the Attorney-General of the United States to invoke the equitable jurisdiction of the Federal courts in controversies between common carriers of interstate commerce and their employees concerning wages and terms of employment where irreparable injury is threatened?

IV.

1. What State and Federal legislation would you recommend for the modification of the common-law provision exempting the employing railway company from liability for damages received by an employee as the result of the negligence of a "fellow-servant?"

2. Would it be possible, and would it be desirable, to require Federal courts to follow the rules of law laid down by State courts in cases involving injuries to railway employees?

V.

Is the law of June 1, 1898, concerning conciliation and arbitration, satisfactory? If it is unsatisfactory, what changes would you recommend? In discussing the law, will you please state, among other things, what you think concerning—

- (a) The feasibility or practicability of compulsory arbitration.
- (b) The desirability of additional legislation regarding the relief departments established by railway companies.

VI.

What additional State and Federal legislation, if any, do you desire on the subject of safety appliances?

VII.

If any State or Federal legislation that you may think desirable is not suggested by the foregoing questions, will you please state what you think that legislation should be?

REPLY FROM THE CHIEF EXECUTIVE OFFICERS OF BROTHERHOOD OF LOCOMOTIVE ENGINEERS, BROTHERHOOD OF LOCOMOTIVE FIREMEN, ORDER OF RAILWAY CONDUCTORS, BROTHERHOOD OF RAILWAY TRAINMEN, AND ORDER OF RAILROAD TELEGRAPHERS.

AUGUST 18, 1899.

To the Sub-Commission on Transportation of the Industrial Commission.

GENTLEMEN: Answering the inquiries bearing upon the subject of "Legislation affecting railway labor," we submit the following suggestions. We desire that this evidence shall be understood as supplementary to that prepared by us and submitted during the early days of the hearing before the commission (see p. 64). We further desire to be understood as speaking from the standpoint of the employees composing our organizations, and as reflecting the consensus of the opinions which are held by them.

I.

1. We believe that the right of a railway employee to hold membership in a reputable and lawful organization of his choice should be as inalienable as his right to worship God according to the dictates of his conscience.

Our organizations are permitted by and are recognized in the laws of the United States. The jurisdiction of Congress over interstate railroads is unquestioned. To the credit of the vast majority of the railway managers be it said that it is the sentiment and the actions of a very few which render any legislation on this subject desirable.

We believe that discrimination of any kind on the part of an officer of a railway against an employee or an applicant for employment on account of membership in a lawful organization should be met with a punishment so swift, so sure, and so severe as to not only prevent a repetition of the act on the part of that particular employer, but to afford an object lesson which will have a salutary and the desired effect upon others who may be similarly inclined.

By reference to section 10 of the act of June 1, 1898, commonly termed the "arbitration law," it will be seen that this point was sought to be covered. If that enactment can be strengthened or reinforced we should be greatly pleased to see it done.

2. It will be seen that section 10 of the act of June 1, 1898, just referred to, makes "blacklisting" a misdemeanor. We are of the opinion that existing laws, State and national, are sufficient to prevent any open blacklisting of exemployees. It will probably be impossible to entirely stop the secret practice unless a penalty sufficiently severe to make fear of the penalty outweigh the desire to violate the law can be attached. We favor such a penalty.

3. We may well doubt the advisability of such legislation. Our organizations afford pretty full protection against unjust dismissals of our members, except where in a few instances the employees have no thorough organization and are not permitted, through fear of loss of employment, to perfect such organization.

4. We reaffirm the statement in our first answers (see page 66): "Railroad companies have recently adopted with practical unanimity the requirement of a

searching physical examination of all applicants for employment, under which the man who has suffered amputation of a portion of a hand or foot, or who has suffered from some other injury while in the service of some railway company, is refused employment by other companies. If a man who has sustained such injury, which in reality does not prevent or hinder him from performing in an able manner the duties of his position, or who has attained a certain age which leaves him the prime of life yet to be lived, is to be refused employment under the operation of a rule adopted in concert or contemporaneously by the railroads, it seems but fair that the employee should look to the railroads for compensation for his injury or pension for his age." Moral obligations, even though strong and weighty, are not always met and cheerfully discharged. This moral obligation should be laid upon the railway companies and should also be made a legal obligation which could not be evaded.

II.

The necessity of changing train and engine crews at established points where terminal facilities are provided renders it impracticable to arbitrarily fix the hours of labor of train and engine men. We think the hours of labor of yard and office men should be shortened, and we think they could reasonably be fixed by law. For train dispatchers and yard employees in large or busy yards, 8 hours should constitute a day. In all other classes of service 10 hours should be recognized as a day's work, and all time on duty in excess of 10 hours for a day's pay should be paid for as extra or overtime.

We would suggest an act specifying the legal workday as above and legalizing claims for extra pay for extra hours worked.

III.

1. In addition to the provisions incorporated in the act of June 1, 1898, we think it would be well to enact substantially the following:

"Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That contempts of court are divided into two classes, direct and indirect, and shall be proceeded against only as hereinafter prescribed.

"SEC. 2. That contempts committed during the sitting of the court or of a judge at chambers, in its or his presence or so near thereto as to obstruct the administration of justice, are direct contempts. All other are indirect contempts.

"SEC. 3. That a direct contempt may be punished summarily without written accusation against the person arraigned, but if the court shall adjudge him guilty thereof a judgment shall be entered of record in which shall be specified the conduct constituting such contempt, with a statement of whatever defense or extenuation the accused offered thereto and the sentence of the court thereon.

"SEC. 4. That upon the return of an officer on process or an affidavit duly filed, showing any person guilty of indirect contempt, a writ of attachment or other lawful process may issue and such person be arrested and brought before the court; and thereupon a written accusation setting forth succinctly and clearly the facts alleged to constitute such contempt shall be filed and the accused required to answer the same by an order which shall fix the time therefor and also the time and place for hearing the matter. The court may, on proper showing, extend the time so as to give the accused a reasonable opportunity to purge himself of such contempt. After the answer of the accused, or if he refuse or fail to answer, the court may proceed at the time so fixed to hear and determine such accusation upon such testimony as shall be produced. If the accused answer the trial shall proceed upon testimony produced as in criminal cases, and the accused shall be entitled to be confronted with the witnesses against him; but such trial shall be by the court, or, in its discretion, upon application of the accused, a trial by jury may be had as in any criminal case. If the accused be found guilty judgment shall be entered accordingly, prescribing the punishment.

"SEC. 5. That the testimony taken on the trial of any accusation of indirect contempt may be preserved by bill of exceptions, and any judgment of conviction therefor may be reviewed upon direct appeal to or by writ of error from the Supreme Court, and affirmed, reversed, or modified as justice may require. Upon allowance of an appeal or writ of error execution of the judgment shall be stayed upon the giving of such bond as may be required by the court or a judge thereof, or by any justice of the Supreme Court.

"SEC. 6. That the provisions of this act shall apply to all proceedings for contempt in all courts of the United States except the Supreme Court; but this act

shall not affect any proceedings for contempt pending at the time of the passage thereof."

We believe the criminal laws are brought into contempt and lose much of their vitality by the liberal use of the process of injunction restraining men from doing those things which the law prohibits their doing. We repeat that it is much better to depend upon the code and let all men understand that the laws as contained in the code are to be applied alike to all, and are to be enforced without further warning in the shape of injunction, mandamus, or in other form.

2. The dignity of the courts must be upheld and their decisions be enforceable and enforced. For an act of open or violent contempt, committed in the presence of the court, the court should have power to summarily punish. But even then the foundations of our form of government and jurisprudence would be strengthened if an appeal were open for the offender. Judges, though chosen with a view to their especial fitness for the position, are human. If they do in reality possess the judicial mind which they are supposed to possess would they not prefer that an appeal be open for the offender, to the end that the court might be relieved of the charge that unnecessarily severe punishment had been meted out because of the sole jurisdiction of the court?

In cases of alleged contempt, consisting of acts committed outside of the presence of the court a trial by jury should be permitted, if demanded by accused, and appeal to the higher court should be permitted.

3. Where men simply exercise their inalienable right to cease work under an employer or conditions which are no longer satisfactory or acceptable, and where due regard for the public safety is exercised, as is always the case with the men in whose name we speak, we see no occasion for the intervention of the Federal courts. The courts have, not infrequently, interfered with restraining orders under the plea of threatened irreparable injury, when the injury was neither threatened nor irreparable if inflicted.

We invite a careful review of the records in connection with the restraining order issued in December, 1893, by Judge Jenkins of the Federal court in Wisconsin on request of the receiver of the Northern Pacific Railroad, the hearings on motion to modify said writ, the hearing on appeal to the appellate court, and the Congressional investigation of Judge Jenkins's act. We also invite careful review of similar order issued shortly thereafter by Judge Dundy, of Nebraska, on petition of the receivers of the Union Pacific Railway, and the subsequent proceedings in the Federal courts. It will be found that the only injury that "threatened" at that time existed solely in the minds of the receivers.

IV.

1. We have seen no proposed legislation on this subject which seemed more comprehensive and concise than the proposed bill referred to by Mr. E. A. Moseley in his testimony before your commission, and found on page 31 of that printed testimony.

2. We are inclined to doubt the possibility of taking such jurisdiction away from the Federal courts. We believe it would be much better for all concerned if the decision of some court could be made the rule and be followed in all cases to which it could be justly applied. If that were done all interested would understand alike and the hope that another court could differ in opinion from the one whose decision had been handed down would not encourage the prosecution of doubtful cases or the stubborn defense of such as were not doubtful.

V.

The act of June 1, 1898, has not as yet been given a fair test. It must depend for its vitality very largely upon the vigorous and interested way in which the commissioners, who are charged with the duty of invoking its conciliatory provisions and its arbitration features, take hold of any case which is brought to their attention. If dignified with earnestness on part of the Government officials, we believe the law to be pregnant with good. We have no suggestions as to changes in it to offer at this time.

(a) We do not believe that the decision of a board or court, involving the relations between employer and employee, in the appointment of which the parties most at interest have no voice, is or ever can be arbitration. When compulsion comes in, the spirit of arbitration steps out. We do not see how "compulsory arbitration" can be indulged in without creating "involuntary servitude," and that when it is not a "punishment for crime."

(b) Our ideas on relief associations are expressed in our former testimony. (See p. 67 of the printed testimony.) The act of June 1, 1898, makes it unlawful to make membership in such an association a condition of employment. If the association were in fact "voluntary," there would be little in it to criticise.

VI.

We think the existing law sufficient for the present. After the time within which its terms must be complied with has passed, it may develop that additional legislation, State or national, will be necessary or desirable.

VII.

As of great value in compiling accurate data, and as a guide to intelligent conclusion as to the necessity for legislation on any subject originating in or connected with railroad accidents, the causes and responsibilities thereof, we heartily recommend the enactment of the amendment to the act of March 2, 1893, introduced in the Senate of the Fifty-fifth Congress by Senator Pettigrew, known as Senate bill No. 3244, and referred to by Mr. Moseley in his testimony before your commission. (See pp. 37, 38, this volume.)

Yours, very truly,

E. E. CLARK,
Grand Chief Order of Railway Conductors.
P. M. ARTHUR,
Grand Chief Brotherhood of Locomotive Engineers.
F. P. SARGENT,
Grand Master Brotherhood of Locomotive Firemen.
P. H. MORRISSEY,
Grand Master Brotherhood of Railway Trainmen.
W. V. POWELL,
Grand Chief Order of Railway Telegraphers.

REPLY OF MR. F. W. ARNOLD.

Grand Secretary and Treasurer Brotherhood of Locomotive Firemen.

PEORIA, ILL., August 10, 1899.

*The Subcommittee on Transportation,
Industrial Commission, Washington, D. C.*

SIR: I take pleasure in replying to your recent request for answers to certain interrogatories:

I.

1. I would recommend that Congress enact a law giving employees the right to join an organization of their classes for the purpose of better protecting their interests intellectually, socially, morally, and financially.

2. I would recommend a stringent law against blacklisting, so called, as it is clearly un-American, unfair, and unjust. The present law is not complete, nor does it answer the purpose.

3. I think that a railway employee, who has devoted the greater part of his life, and faithfully, to his trade or calling, and who arrives at an age that is regarded by the railroad corporation as objectionable, should not be discharged for that cause alone, and thrown upon his own, generally meager, resources. Also that an employee who has faithfully performed his duties for a long term of years, and who has reached an age that prohibits him from starting successfully in some other walk, should not be discharged simply because he has violated some ordinary rule of the corporation, unless, perhaps, it be of the most serious possible character.

II.

I should judge it highly desirable and necessary that there be Federal legislation regulating the hours of continuous labor on railways, that employees may secure such rest as will enable them to perform their work with safety to themselves, the public, and to the property of their employer. Men on locomotives can not be regarded as safe men unless they have a reasonable number of hours of

III.

1. I would recommend the passage of the bill that has been before Congress for several years, but which has been sidetracked on various occasions, by others than employees, and known as the "contempt" bill. It provides substantially for two kinds of contempt, and was first drawn up by the late Senator Daniel Voorhees, of Indiana. The two kinds of contempt shall be known as "direct contempt" and "indirect contempt." "Direct contempt" shall be that committed within the knowledge of the court and should be punishable by fine only. "Indirect contempt" shall be that committed without the knowledge of the court and shall be tried by jury, the punishment for which should be by fine.

2. I think courts should not be given the right to imprison for contempt committed without their knowledge. From a humane standpoint I think imprisonment for contempt in any particular belongs to the dark ages, since punishment by fine would be, in my opinion, quite as efficacious.

3. I can not say.

IV.

1. I would recommend for State and Federal legislation a law that is now embodied in a bill known as the "Employees Liability" bill, which corrects the shameless injustice in the present law which exempts railway corporations from liability for damages received by an employee as the result of the negligence of a fellow-servant.

2. I should think it possible, and certainly desirable, that Congress should require Federal courts to follow the rules of law laid down by State courts in cases involving injuries to railway employees, and I think it equally desirable that Congress enact a law making a uniform amount of damages recoverable in all States and Territories alike where an employee has received injuries, followed by death, as the result of the negligence of a fellow-servant, and an unstated amount where injuries, amounting to total and permanent disability, have been received under like circumstances.

V.

The law of June 1, 1898, so far as I have been able to observe its application, is satisfactory.

a. I do not regard as feasible or practicable any such thing as compulsory arbitration.

b. I would recommend that Congress enact a law which will prohibit a railway corporation, by threat, insinuation, or innuendo, or in any other manner, to require an employee to involuntarily become a member of or join a relief association or department in order that such employee shall remain in the service of such corporation.

VI.

I have no suggestions to offer in reply to this question.

VII.

I would recommend that Congress enact a law giving to all labor organizations (strictly so) that are not organized nor conducted for profit a right to carry on an insurance business, not for profit, strictly among its members, without the requirement of incorporating, nor of licensing in any State except the State where the headquarters of the organization may be located, and that after procuring such license such organization shall have standing in any court in any State or Territory.

Very respectfully, yours,

F. W. ARNOLD,
Grand Secretary and Treasurer.

REPLY OF MR. JOHN T. WILSON.

Grand Chief of the Brotherhood of Railroad Trackmen of America.

ST. LOUIS, MO., August 12, 1899.

The Subcommittee on Transportation, Industrial Commission, Washington, D. C.

SIRS: I reply as follows to your favor of 19th ultimo with a list of questions inclosed, which were prepared for the purpose of completing the Industrial Commission's inquiry concerning "Legislation affecting railway labor, etc.":

I.

1. When a railway company, through any of its officers or agents, is charged and found guilty of interfering with or discriminating against any of its employees on account of their connection with their brotherhoods, it should be fined not less than \$10 nor more than \$25,000 dollars in each case; 10 per cent of the fine to be awarded to the prosecuting witness and 10 per cent to the prosecuting attorney, the balance to revert to the school fund of the State in which conviction is secured.

A few days ago I received a letter containing the following paragraph: "My husband is dead. He would have kept in good standing with your order, but he was afraid the company would find it out and discharge him. I am a sickly woman, not able to work. I have 5 small children. We were unable to save anything during his lifetime, and if the brotherhood does not help me, God only knows what will become of us."

2. The system of blacklisting is conducted with so much privacy that I hardly think it possible to enact and enforce laws to abolish the evil. I do not think that very many railway managers would condescend to blacklist an employee without he had shown himself to be reckless, unreliable, or unworthy of trust.

3. As railway employees are frequently discharged without just cause by minor officials who have but little, if any, sense of honor or justice, they (the minor officials) should only be permitted to suspend employees under their jurisdiction and should be required to report the cause of suspension to the general manager. The suspended employee should always be given an opportunity to make a statement in his own behalf. The manner in which the Government employees in the United States Mail Service are dismissed would, I think, be a good rule for railway companies to adopt; always making the general manager of the road the highest tribunal to appeal to and permitting his decision to be final.

Last month I was informed by a section foreman on the Union Pacific Railway that the foremen under the jurisdiction of the roadmaster for whom he was working received a letter from their roadmaster insisting upon them to subscribe for a paper known as the Roadmaster and Foreman, and advising them to send him \$4 for a year's subscription. The subscription price of the paper is \$1 a year. It is customary with the publishers to give roadmasters 20 per cent for collecting subscriptions; therefore the roadmaster charged his men \$3.20 each for sending 80 cents of their money to the Roadmaster and Foreman. The foreman who reported the matter to me says: "I think I am the only foreman out of 38 who did not send him \$4, and on account of failing to do so I don't feel at all secure in my position. If you refer to the robbery through the columns of the Trackmen's Advance Advocate, please don't mention my name, as it would be sure to cost me my job."

There are a great many similar cases. Somethings should be done to protect the weak against the avarice of the strong.

4. All applicants for responsible positions on railways, and especially foremen and roadmasters, whose duty it is to protect life and property by keeping the track in proper condition, should always be subjected to an examination which will give evidences of their fitness to fill the positions applied for, of their reliability, etc., before being permitted to enter upon the discharge of their duties.

We frequently read in newspapers reports of bridges going down with trains, trains jumping the track, turning over on curves, of a score or more people losing their lives, etc., and that the officials were unable to discover the cause of the catastrophe. In such cases, as a rule, the real causes are incompetent men in charge of the track, or not a sufficient number of men on a section to keep the track in safe running condition.

Railway companies should be required to employ men enough year in and year out to keep their track in proper order at all times. At the present time it is customary with the railway companies to discharge from 50 to 75 thousand of

their track men in the fall of the year, at a time when it is hard to obtain employment. They are turned out to tramp, beg, starve, steal, and become criminals. Horses receive better treatment from their owners than a great many railway track men receive from their employers.

II.

All railway employees not engaged in operating trains should not be required to work more than 8 hours out of 24 except in cases of emergency. Time served at emergency work should be paid for at regular rates. On account of the nature of the work performed by track men, car inspectors, repairers, shopmen, they will be as much fatigued after pegging away for 8 hours as men engaged in operating trains will be after being on duty 10 or 12 hours.

III.

1. I think all judges requested to issue injunctions in cases of disputes between railway companies and their employees should be compelled to follow the example set by Judge Caldwell, in the case of the Union Pacific Railway *v.* Its Employees, tried at Omaha, Nebr., March, 1894; and that the dissenting opinion of the same judge, in the case of *Hopkins v. Oxley Stave Company* (28 C. C. A. Reports, 108), should be enacted into law and made applicable to all disputes between railway companies and their employees. In case either party believes the judge to be biased and that he will not render a just decision, they should have a right to have the disputed questions of fact in the case tried by a jury, whose findings of fact should be binding on the court, as in ordinary cases.

Give railway employees an opportunity to present their side of the question in court, treat them as equals and not as inferiors of corporations, and they will always submit to the decisions of an unbiased court or jury.

2. Federal judges should have the power to maintain the dignity of their courts, compel witnesses to answer questions, etc., and to compel railway companies and railway employees to abide by their decisions or the decisions of a jury, provided they are rendered in accordance with the suggestions above made in answer to question 1 of Section III.

3. No; this would be vesting too much power in the hands of an officer, who is not elected, but appointed. With the limitations upon the powers of Federal judges, suggested in answer to question 1, Section III, the right to invoke the jurisdiction of the Federal courts could safely be left to the parties interested.

IV.

The fellow-servant laws enacted by the different States vary very much. As railway employees are not permitted to say who their fellow-servants shall be, but must be coworkers with anyone the company sees fit to employ. I think railway companies should be held responsible for damages to their employees the same as they are to nonemployees. A uniform law to govern these matters should be enacted by Congress, and all of the States should enact a similar law.

V.

The law of June 1, 1898, concerning conciliation and arbitration, seems to be satisfactory to railway employees engaged in the operation of trains. According to the Twelfth Annual Report of the Interstate Commerce Commission only 226,617 of the 823,476 railway employees are engaged in train service; therefore, 596,859 railway employees have no protection under the law referred to. The men engaged by railway companies to operate their trains are well organized. The railway officials recognize their power, which causes them to prefer to settle all grievances with them amicably, and especially so unless they think they can invoke the aid of the Government and overawe their trainmen by the use of injunction proceedings.

(a.) While I am not in favor of compulsory arbitration, and am unalterably opposed to strikes, if justice can be obtained in any other way, I believe the Interstate Commerce Commission should constitute a tribunal before which all classes of railway employees, from the president of the board of directors down to the men who spike the rails and tamp the ties, could go and present their grievances concerning traffic rates, wages, hours of labor, or conditions of employment, without fear of being discharged. Under such an arrangement, in case a class of employees fail to have their grievances satisfactorily adjusted by railway officials,

they could place them before the commission, whose duty it would be to determine what is right and just under the circumstances, and their award becoming a document of public record would do a great deal toward influencing railway companies to deal fairly with employees who are being mistreated and oppressed under the present system, which is to pay wages and deal out justice to their employees in proportion to the organized force they have to demand them.

(b) Railway companies having relief departments should not be permitted to manage them in such a way as to prevent injured employees, or the beneficiaries of employees killed by the negligence of the company, from collecting the amount of damages they are justly entitled to. On March 10, 1899, the Atlantic Coast Line organized a relief department. In their book of rules, by which members of the relief department are to be governed, page 42, rule 64, appears the following:

"In case of injury to a member, he may elect to accept the benefits in pursuance of these regulations, or to prosecute such claims as he may have at law against the company or any companies associated therewith in the administration of their relief departments. The acceptance by the member of benefits for injury shall operate as a release and satisfaction of all claims against the company and all other companies associated therewith, as aforesaid, for damages arising from or growing out of such injury; and further, in the event of the death of a member, no part of the death benefit shall be due or payable unless and until good and sufficient releases shall be delivered to the superintendent of all claims against the relief department, as well as against the company and all other companies associated therewith, as aforesaid, arising from or growing out of the death of a member, such releases having been duly executed by all who might legally assert such claim; and further, if any suit shall be brought against the company or any other company associated therewith, as aforesaid, for damages arising from or growing out of injury or death occurring to a member, the benefits otherwise payable, and all obligations of the relief department and of the company created by the membership of such member in the relief fund, shall thereupon be forfeited, without any declaration or other act by the relief department or the company; but the superintendent may, in his discretion, waive such forfeiture upon condition that all pending suits shall first be dismissed. If a claim for damages on account of injuries shall be settled by the company without suit, such settlement shall release the relief department and the company from all claims for benefits on account of such injuries."

In their handbook of questions and answers concerning the relief department, they ask the question, "Are members debarred from bringing suit against the company?" and answer it in the following manner: "They are not. They have the same right in this respect that they would have if they were not members. The injured member may either accept the benefits of the fund or rely upon the issue of a suit. He can not do both." (Reg. 64.)

By examining the rates charged by the company, I find that they charge \$36 a year on \$1,000 insurance and for a few dollars weekly benefits, provided in each case that members shall not receive anything for the first week's sickness; thus, you see, employees of the Atlantic Coast Line Railway system are caused to believe that in order to be secure in their positions they must join the company's relief department, pay exorbitant rates for insurance, then, in case they are injured, in order to collect insurance money that they have paid the company at least a third more than it is worth or that it would cost them in other concerns, they must sign a release, exonerating the company from all blame.

A railway company having a relief department, withholding insurance money which has been paid for by an employee until he signs a release, should be fined not less than ten nor more than twenty-five thousand dollars in each case where conviction is secured.

VI.

It seems the railway companies are doing all they reasonably can to equip their rolling stock with the best safety appliances that have been invented.

VII.

First, the Interstate Commerce Commission should determine passenger and freight rates to be charged by all interstate roads. In fixing the rate to be charged by each road they should be governed by the amount of money actually invested in building and equipping the road, cost of operating, and the amount of traffic. In each case the rate should be fixed high enough to enable the road

to pay all necessary and legitimate expenses and reasonable wages to all employees, etc., and leave margin enough to pay stockholders reasonable dividends on the money invested.

Second, the issuing of free transportation should be restricted to railway employees and Government employees in the Railway Mail Service. Companies issuing passes to other parties should be fined heavily.

The issuing of passes by railway companies to men of political influence has done a great deal to prejudice the public against railway enterprises, and to corrupt society, especially politicians.

The railway companies of the United States give away millions of dollars in passes annually, and, as a rule, they extend favors to those who can well afford to buy tickets.

Third, the occupation of ticket scalpers should be abolished, and the rates fixed by the Interstate Commerce Commission should be maintained by all interstate roads. The States should enact similar laws for the government of roads not under the jurisdiction of the Interstate Commerce Commission. Stop those unnecessary leaks from the railway companies' earnings, and on the majority of roads the cost of transportation can be reduced, all the employees can be paid reasonable wages, it will not be necessary for any of them to work an unreasonable number of hours in any one day, and the men who have invested their money in railway enterprises will receive reasonable profits on their investments. Railways should be blessings to and civilizers of the people. They should not be operated in such a way as to keep up strife between citizens and to corrupt society.

Fourth, the Interstate Commerce Commission should incorporate in their annual reports the amount of wages paid to employees in each class on each road.

Yours, truly,

JOHN T. WILSON,

Grand Chief, Brotherhood of Railroad Trackmen of America.

REPLY OF MR. W. H. RONEMUS,

Grand Chief of the Brotherhood of Railway Carmen.

CEDAR RAPIDS, IOWA, August 29, 1899.

*The Subcommittee on Transportation,
Industrial Commission, Washington, D. C.*

SIRS: I reply as follows to your favor of August 4, with a list of questions inclosed for the purpose of completing the Industrial Commission's inquiry concerning "legislation affecting railway labor, etc.:"

I.

1. When a railway company through any of its officers or agents is charged and found guilty with or discriminating against any of its employees on account of their connection with their brotherhoods, not less or more than \$25,000 in each case; 10 per cent of the fine to be awarded to the prosecuting witness and 10 per cent to the prosecuting attorney, the balance to revert to the school fund of the State in which conviction is secured.

2. I believe the causes for blacklisting will gradually disappear altogether, brought about by the general organization of the employees, as the unreliable will not generally be admitted to the organizations, and by the general recognition of organizations the cause for discontent from this source will become less with time. If it becomes necessary to further legislate against the practice, I believe such legislation can be secured; but under the present circumstances I would not recommend such further legislation.

3. The conditions under which employees may be discharged should be regulated by legislation. Good reasons for the discharge should be given and be approved by a competent officer of the employer, and the discharged employee should have the opportunity to state his side of the case.

The practice exists in some instances of favored friends of department foremen being shown partiality, and worthy and efficient workmen being either discharged or their tenure of position made so undesirable that they are driven to severing their connection with a company, and often can not again secure employment for a considerable length of time.

Railway companies being subject to and deriving rights by States, being granted charter to do business within the State, the States should likewise protect its citizens against unjust discriminations against its citizens by corporations. I think such legislation would cause many injustices, both toward railway companies and employees, to be wiped out. If companies were made responsible for the unjust discrimination against employees on the part of department foremen, very few, if any, employees would suffer discharge without good and sufficient reasons.

4. In the first place no one should be employed for any position of responsibility without having been subjected to a prescribed examination submitted by the head of the department in which the man is employed. The railway service, being of the most importance to the public, no careless, intemperate, untrustworthy, or unreliable person should be installed in a position of trust. A violation of well-selected rules, especially if persisted in, should be cause for dismissal, but no reliable, temperate, and efficient employee should be discharged to make room for one untried in the service.

II.

Humanity to man, the welfare of society, and the best interests of the nation, physically, morally, and intellectually, most emphatically demand as short a work day as is consistent with the best interests of the country and its business. This is true of all kinds of manual toil, but especially is it true of such work as is performed by men in the car department of railroads of the country. While there is not a general demand on the part of these men at the present time for shorter hours, the reason for such seeming satisfaction with 10 and 12, and often more hours per day, is more owing to the men being fearful lest their meager earnings at less hours per day will not assure the life and comfort of the dear ones at home.

I think that in every department where it is possible to do so 8 hours should be considered a maximum day's work. In most classes of shopwork in the car department men would perform almost, if not entirely, as much work in 8 as in 10 hours. The work in most cases being of such a nature that with 8 hours of constant bending, twisting of the body, and lifting, the physical forces of most men become so exhausted that the remaining time they are compelled to work is not productive of much result.

In most cases the hours could well be reduced to 8, and where it could not at once it could be arranged that the utmost exertions of man's physical strength should not be evoked for a greater consecutive time.

III.

1. No injunction should be issued until the employees have had an opportunity to answer after the application for injunction has been made. Either the State or Federal court, or a commission created for that purpose (I would favor a special commission), should determine whether or not cause exists for injunction. Injunctions against men who have committed no actual offense, and who do not contemplate such, for the asking, without proper hearing of both sides, seems to me un-American and discriminating.

2. I believe it would be unnecessary to limit the power of the court in enforcing its orders when made under the provisions above advocated.

The tendency to disobey the order of the court would become less, if it were not entirely obviated. If the employee has the opportunity to be heard before being condemned, he could not reasonably be accused of contempt.

3. The parties to the controversy should apply to the special commission, if necessary, to invoke the jurisdiction of the Federal court, and through such commission such invocation should be made. One-man power should not be vested in any official.

IV.

1. I do not think the employing company should be exempt from liability for damages received by a fellow-employee as the result of the negligence of a fellow-servant. The employing company selecting the fellow-servant and issuing his instructions should be responsible for his actions while in the discharge of his duties as a fellow-servant or employee. By making the company liable for damages received as the result of the negligence of a fellow-servant, the greatest care would be used in employing men to fill the various positions.

The most reliable men being employed in all departments would reduce the number of injuries sustained to a minimum.

2. In deciding cases involving injuries to employees I think Federal courts should, as nearly as consistent, follow the decisions of State courts, based upon statutory enactments of law of the State in which the injury was sustained.

V.

Not having a copy of the law of June 1, 1898, concerning conciliation and arbitration, I can not venture to approve or disapprove the same. I believe, however, there should be a national arbitration board before whom either side in a controversy, feeling that he had been oppressed or was about to be so oppressed, could state his grievances and secure recommendations that would approve or disapprove the grievance complained of. The approval or disapproval of the commission, or board, to be considered as notice to the public as to the merits of the demands of the respective parties. This would act as a mediator in many instances, no doubt, and the force of public opinion would do much to prevent unimportant or ridiculous questions being carried up thus far.

Previous to 1898 some railway companies maintained relief departments by retaining a certain per cent of the employees' wages to maintain same. It was compulsory on every applicant for a position in any department to make application for insurance through this department. A man might be rejected because of the rigid examination, and was therefore denied employment. Many worthy and competent applicants for employment have thereby been prevented from securing employment because of some minor physical ailment. This, it seems to me, worked an injustice to those who could not thus secure employment, when they were in every way qualified to fill a good position and support their families.

There can be no reasonable objection offered to railway companies maintaining relief departments; but no applicant for employment should be so discriminated against as to be denied employment on technicalities. Neither should participation in any relief association bar any employee from collecting damages for injuries received because of such participation. I think most relief associations are more expensive to the employee than the same amount of insurance can be carried for in the brotherhood of which such employee is or should be a member. The organization of the various brotherhoods is made permanent and of the greatest good through their insurance features. Insurance is furnished to members at actual cost and can not be forfeited except by the negligence of the member in paying dues or assessments. The compulsory participation in the railway companies' relief associations prevents many of the poorly paid employees from taking advantage of the cheap and in every case good insurance offered by the organization of their craftsmen.

VI.

Car repairers are subjected to many inconveniences and hardships which could be overcome to a great extent by railway companies furnishing proper places to have their cars repaired in. I refer more particularly to what may be termed rush work, such as a car being disabled while in transit and necessitating repairs at the nearest division point where a force of inspectors and repairers are retained.

The universal arrangement seems to be to run all defective cars on the repair track, where the loaded cars necessary to be repaired must be quickly disposed of. To make the necessary repairs men are required to keep at work constantly, regardless of rain, hail, sleet, mud, and all other inconveniences of the weather, exposing themselves to the cold blasts of the wind and rain, or snow in winter, and sitting or lying in the mud during the wet weather in summer. The nature of the work will not admit of postponing it until the storm subsides or until the sun shines more warmly. No other class of men are thus at the mercy of the weather so much as car repairers. Time must be made by the cargo of freight; the cars must be ready for the next train starting out. The work must be done and under the present conditions it must be accomplished out on the track under the tropical sunshine, the storm of wind, sleet, rain, or snow.

It seems to me that it could not be unreasonable to ask that railway companies be required to erect suitable sheds over at least a part of the repair track, where the men could be sheltered from the storm and snow. Without proper sheds to work under men are in many cases rendered ill and unfit for service for days to come.

I would, therefore, have proper shelter for workmen, classed as safety appliances. This may seem a little ridiculous to anyone not familiar with the duties and requirements of the car repairer, but it is not so to the men who are compelled to render a day's work during all kinds of weather. It can not be expected that railway companies can protect their employees against the inconveniences occasioned by nature in general, but the exposed condition of the average repair track needs attention. Men can render a better service to the company with the repair track properly inclosed to keep out the storm. Men are not competent to

perform the regular day's work in a day where they become chilled from wet and cold; and it would, in my opinion, be a saving to the companies to provide as comfortable and well-equipped regular repair tracks as is consistent with a reasonable outlay for the appliance suggested.

VII.

First, the Interstate Commerce Commission should determine passenger and freight rates to be charged by the interstate roads. In fixing the rate to be charged by each road, they should be governed by the amount of money actually invested in building and equipping the road, cost of operating, and amount of traffic.

In each case the rate should be fixed high enough to enable the road to pay all necessary and legitimate expenses, and reasonable wages to all employees, etc., and leave margin enough to pay stockholders reasonable dividends on the money invested.

Second, the issuing of free transportation should be restricted to railway employees and Government employees in the Railway Mail Service. Companies issuing passes to other parties should be fined heavily.

The issuing of passes in my opinion should be entirely done away with outside of employees while in the discharge of their duties; and a uniform rate on all railways should be adopted for railway employees and their families of 1 cent per mile, so that all employees could avail themselves of a 1-cent per-mile rate at any or all times. This I think would be profitable to the employees as well as the railroads.

Respectfully, yours,

W. H. RONEMUS,

Grand Chief of the Brotherhood of Railway Carmen of America.

REPLY OF MR. ALDACE F. WALKER,

Chairman of the Board of Directors of the Atchison, Topeka and Santa Fe Railway Company.

59 CEDAR STREET,

New York City, September 21, 1899.

UNITED STATES INDUSTRIAL COMMISSION,
Washington, D. C.

GENTLEMEN: I have received your questions connected with legislation affecting railway labor, and take pleasure in stating my views.

I do not favor any legislative action whatever on the subjects enumerated in your circular. Very many matters which are put forward as affording occasion for special legislation will right themselves in due time if let alone. Many other such matters originate in the natural strife of antagonistic social, commercial, or industrial forces; legislative interference on either side will do more harm than good. Such questions present a shifting equilibrium; sometimes the scale appears to turn one way, sometimes another, but in the long run they are self-corrective through the working of natural agencies. Legislative interference can not be otherwise than bungling. It is like a crowbar thrust into the main-spring of a watch.

It is not safe to attempt to devise now legislation as a remedy for every real or fancied grievance. Laws should assert general principles with the least possible detail. Our present system of law—the English common law and equity jurisprudence—molded and adapted by the judiciary of this country since the American Revolution to fit republican conditions, will work out as near absolute justice as anything that man can devise. Unfortunately its principles have been constantly tampered with by special legislative rules framed to meet special cases. The effort to legislate in detail has almost become a mania. The world would wag its way and all civil rights would be well preserved if Congress and State legislatures would devote themselves strictly to questions respecting the carrying on of their respective governmental machinery and would cease attempting to lay down new rules to be observed at common law or in equity. So much of this has already been done that rights and duties have become unsettled and uncertain. I protest against more. I will answer your questions categorically.

I.

I would recommend no legislation concerning the employment and discharge of railway employees. Under our form of government there is no such thing as labor which is not contract labor. All service is a matter of contract, the terms of which are agreed upon between employers and employees as individuals. The nation or the State can not rightfully interfere. Paternalism is next door to socialism. State control involves State protection of the interests subjected to control. Let us either have State ownership or freedom of contract. Any attempt at this time to interfere on either side by way of legislation will inevitably do harm.

1. I do not understand the question. Employees now have the right to membership in as many brotherhoods and associations as they choose. Possibly cases are referred to where rules of brotherhoods have been so framed as to conflict with the rights of employers, and where objection may have been made to membership in particular brotherhoods on account of particular requirements exacted from their members, which, if accepted, would interfere with and perhaps destroy the reciprocity which is essential to freedom of contract. No law should be passed which directly or indirectly would tend to cut off the equal rights of employers and employees in framing and carrying out the contract of service.

2. Blacklisting is largely an imaginary grievance. If a servant is unfaithful, it is not only the right, but the duty, of the master to tell the truth upon inquiry. If he tells untruth he is liable to make full compensation at the common law. If he tells the truth it protects faithful employees, and it is absolutely in their interest that this should be done.

3. It would not be advisable to regulate by law the conditions under which railway employees may be discharged. Their service is one involving the safety of life and property at every moment. The employer is pecuniarily responsible for every act of the employee. The public has every interest in holding railroad companies to their full duty. This responsibility, justly placed upon railroad corporations, involves the necessity that they be absolutely let alone in the choice and retention of their servants. They carry the responsibility and must have corresponding freedom of action. Suppose, under State laws, an employee were retained against the desire of the employer, would the State relieve the employer from liability in case of accident arising from the negligence of such an employee? If any legislation on this subject is to be had, it must provide fully for such a case as that. The State must take the full responsibility of its act.

4. I have no suggestions to make on this subject. I am not aware that anyone is asking for legislation to protect employers. Legislation of a paternal character in behalf of employees is apparently in view. When freedom of contract is interfered with, either on behalf of one party or the other, the sphere of useful legislation is exceeded, especially so when the proposed legislation is in aid of the party which is frequently (if not usually) the stronger of the two, when the struggle comes.

II.

I see no occasion for legislation respecting hours of railway labor. Children are not employed. Overtime is paid for under schedules agreed on with the men. They are usually glad of a chance to work overtime, and if they can get a few more dollars per month in this way why should they not be allowed to do so? Moreover, when trains are delayed it would be impossible to tie them up at the expiration of any stated hour of service. It may be said that there is danger of impaired service resulting from tired and sleepy employees. Such cases, however, are very exceptional—snow blockades, etc.—and the liability of the employer to respond in damages in all such cases is an adequate safeguard.

III.

I see no reason for interfering with the well-established rules of equity covering the issuance of injunctions, punishment for contempt, etc. I have heard much clamor on this subject, but have yet to hear of any actual wrong being worked, except, possibly, in one or two cases in preliminary proceedings, which were reversed on appeal, and where the final judgment of the higher court stands as an enduring precedent. Our courts may be trusted to work out the proper system for treating this subject under well-established rules of general application. Error sometimes may be made by decisions in the courts of first instance, but the body of law is composed of decisions of the courts of last resort. I do not know of any such decisions that legislatures can safely overturn.

IV.

I am not sufficiently familiar with this subject to have an opinion as to whether the common-law rules respecting injuries resulting from the negligence of fellow-servants should be modified by statutes. I am aware that some States have done this. It is a special legislative topic which I have not studied.

V.

I have no faith in the usefulness of laws concerning conciliation and arbitration. Eight years ago I published an article containing my view on this subject, from which I submit the following extracts, which are as true now as when the article was written:

"An arbitration is the nonjudicial determination of a controversy by a tribunal organized for the special purpose by mutual agreement. Its sanction lies in a preliminary consent of the parties to be bound by its result. It is a contract, and is enforceable as a contract, and not otherwise. When two men submit their differences to arbitration the unanimous judgment of the board (unless it be specially provided that a majority may decide) becomes conclusive; not through any inherent value of its own, but solely by virtue of the agreement to refer. Without such an agreement arbitration does not exist. Compulsory arbitration is a contradiction of terms. The essential idea of arbitration is the assent of both parties thereto; without such assent it is naught. What is apparently desired by persons who use the phrase 'compulsory arbitration' is the establishment of some tribunal before which either party to a labor controversy may cite the other party for a final decision of the matter. This would not be an arbitration, but a judicial proceeding; the court thus established would require new process of execution adequate to compel workmen to labor in future at a scale fixed and to compel manufacturers to operate their property in order to provide employment for their men; powers which do not seem compatible with our republican institutions.

"There are some things which, from their nature, can not be arbitrated. The State can not arbitrate with an alleged criminal a question of larceny or of arson. Subjects of special statutory regulation, in cases where a judicial procedure has been established by law, also must be handled by the courts, pursuant to the methods prescribed.

"Before the suggestion of arbitration can properly be entertained there must exist a fair question of disagreement upon which the arbitrator may exercise his judicial faculty, either by ascertaining the right of a doubtful matter or by the employment of discretion in the adjustment of conflicting rights. When no doubt is conceded to exist there is nothing for an arbitrator to decide. If a man lays claim to my farm not under any question of colorable title, but because he wants it for his own, I may very properly decline to admit the existence of a controversy. By every standard of ethics I should be justified not only in refusing to arbitrate, but in kicking him off the place. If the question concern the employment of labor and the claim be asserted that no workmen shall be hired who do not belong to a given labor union, there is nothing in such a demand which calls for arbitration, for every employer has an inherent and essential right to employ whom he will, and every laborer has a right to work, whether he belongs to a union or no. A merchant would be justified in refusing to arbitrate the price of his goods; he may fix his own price, and the customer may take them or leave them. In the foregoing cases and many others the person upon whom the claim is made may properly repudiate the existence of any just demand and may defend his position by force if force is used against him.

"Here we meet the argument that the use of physical force is at all times to be deplored; that it results in pain and distress; that might is not always right; that violence is the argument of the brute; that human nature should find some other method of solving its contests; that, whether the dispute be between nations, between classes, or between individuals, a resort to force is essentially wrong and is inevitably to be condemned. But is this position a sound one? What is the ultimate ratio decidendi among men but physical power? Even the decision of a court, if not voluntarily conformed to, is executed by a sheriff. If his single hand is insufficient, he calls upon his posse. If the power of the county fails, the armed force of the State must assist him. So of controversies between nations. If a fair question of doubt is raised, modern ideas have introduced the possibility of arbitration. But how is the award to be enforced except by war, and how is war to be avoided in case absolute rights are trampled on? The same is true in respect to contentions between individuals. A man's house is his castle, which

he may defend by force. If his own hands are too weak, he may hire the strength of his fellows. It is true that in cases where a mob seeks to take possession of the property of a railroad corporation, a manufacturer, or a miner it would be possible for the party thus attacked to submit for the time being to eviction and to wait for legal process of restoration, with an award of uncollectible damages. But human nature is not so constituted. Such conduct would be craven and disgraceful. Moreover, in organized society man owes a duty to his fellows, and in the long run the minimum of strife is found where rights are most jealously defended.

"The intensity which prevails in labor disturbances at the present time is apparently due to the fact that certain fundamental questions are in process of settlement, which can be settled only by force. Strikers are seeking to ascertain how far they will be suffered to go in the employment of violence to prevent the operation of the properties which they have left and to prevent the introduction of other workmen to take their place. There is no arbitrable question in either proposition. These matters permit of no dispute. The fact is being rapidly demonstrated that strikers shall not employ violent measures to prevent the operation of railroads and manufacturing establishments in their absence or to prevent the employment of other workmen in their place. These questions can only be settled by vis major, and when it is once perceived that the superior power will be employed in every like case, those particular features of strikes will disappear. There is no other way out of it.

"It is worth while to look a little closer into the theory and the history of strikes in order to ascertain just where arbitration may properly come in. No one can question the right of a workman to strike. Unless he is a slave his labor is voluntary, and he may cease if he will. But when he has left his bench and announced his purpose to do no more labor until his demands are complied with he is no longer an employee of his former employer. In common speech it is often said that the workmen employed in such and such an industry are on a strike; but if they have struck they are not employed. They perform no services and earn no wages. They have exercised their undoubted right to cease from both. The contract of employment has been terminated by their own act. They have no lien upon the property and no rights against its owners. They may negotiate for reinstatement, but they may not interfere with its operation at other hands. All this seems too simple to require statement, but the contrary view has been broadly claimed. The sympathy of the American people naturally goes out in behalf of every effort on the part of laborers to better their condition. We are proud of high wages paid and exult over every advance in the scale. The feeling is becoming prevalent, and is supported by many sympathetic and vigorous writers, that the workman has some personal interest in the plant where his labor is performed other than and different from his right to be paid for his labor. It is difficult to see any logical foundation for this claim. Certainly at the outset capital provides the plant and the laborers first employed come in as strangers. In what way do subsequent years of remunerated toil change their relation to it? The workman is a seller of his strength and his skill. He endeavors to get the best price obtainable for his commodity. The market value of labor, theoretically at least, is controlled by the same principle which dominates the value of every other merchantable product. It is fixed by competition. Strikes, as they were first employed, presented to the employer the alternative of the stoppage of his industry or assent to the demands of his workmen. The question was a simple one. Could he fill their places with other workmen at the old rates of compensation or at less if the strike was against a proposed reduction? The striking workmen took the risk of outside competition, and often with entire safety; for the labor market was restricted to narrow localities and the skill required was limited to few. In these modern times movement in every direction is free and cheap. The market from which employers may procure labor is the whole country. It would be the whole world but for restrictive laws. This fact led to the introduction of labor unions, formed for the purpose of restricting and controlling competition in the sale of labor. Their members agree upon the wages they will accept and refuse to enter into vacancies caused by strikes on the part of their associates. To this extent they are within their right. Combinations for mutual protection against disastrous and ruinous competition by the use of legitimate methods are as proper on the part of workmen as of other members of society. The principle involved is the same in respect to all, and the same rules must be applied. Parties making such combinations are always liable to underbidding by outsiders, and this chance is the risk of the game. Excessive and unhealthy competition can be restrained and ameliorated by combination, but competition can not be extinguished by

combination unless every possible present and future competitor is included. In attempting to regulate the competition of laborers the supply has often been too great for trade unions to control. Argument was at first employed to prevent other workmen not members of the union from taking vacant jobs. By easy steps argument changes to abuse and reason is replaced by violence. The trouble is not with the strike itself, but with the methods of the strikers. The peace of the Commonwealth requires that all this illegitimate excess should be restrained. The rights of workmen who are not members of the unions are too readily forgotten. The rights of employers whose tender of employment has been rejected are ignored. Thus once more we reach a point where the power of the State must repel force by violent means. We are beyond the scope of any agency save the exercise of strength sufficient to keep the peace and to protect every citizen in his rights.

"Arbitration is often available in disputes between employees and employers, but the difficulties surrounding its use are many. In the first place there is a doubt as to what considerations may be admitted to control the result. The employer insists that his balance sheet is foreign to the case, and that the only question is the competitive value of the labor under consideration; and he therefore refuses to make known the cost of his product. Nevertheless, the profits of business are often given as an occasion for an advance in wages by liberal-minded employers who feel themselves able to pay a higher scale and who are grateful to their men for their skill and persevering industry. The broad and generous treatment which has again and again been extended to American workmen is thus made the basis of a claim against other employers whose strict legal right hardly supports. The theory of profit sharing has also been introduced in many quarters with a view to securing permanence, efficiency, and good will on the part of the employed; and its value in that direction has again and again been proved. We must not forget, however, that it is a concession and not a right. There can be no interest in profits claimed as a right which does not involve a corresponding liability for losses, unless by virtue of a special contract; and while a scale of wages has often been conceded in which the prospective profits of employers has formed an element, the question whether a wage arbitration should enter upon the field has not yet been answered definitely in the affirmative.

"There are also some other grounds for a feeling of reluctance on the part of employers to arbitrate the claims of their workmen, whether of wages, of hours, or of conditions under which the labor is to be performed. The sympathy of every board of arbitrators is sure to be with the weaker party. If any argument can be found for improving the condition of the workmen, it is almost certain to be applied. Arbitrators are bound by no rules of law in reaching their conclusions, but are entitled to make their award in accordance with what they may consider to be *ex æquo et bono*. They are not required to give any reasons whatever for their decisions. The universal tendency of arbitrators is to 'split the difference,' a process which will inevitably yield something to the laborer. In an arbitration of this kind there will inevitably be advantages upon the side of the workmen, and an employer who voluntarily submits such questions to an arbitration board often feels that he takes his life in his hands, especially in cases where the continued payment of heavy fixed charges stands between him and bankruptcy. Moreover, it is difficult to find men to whom such questions as these may be prudently submitted. The judges of our courts are presumed to stand upon a high plane of rectitude and impartiality, and yet even our judges are often criticised. When an effort is made to go into the business world and constitute an arbitration board through the selection of an umpire, by an agreement arrived at between one party named in the interest of the workman and another party named in the interest of the employer, the chances involved are great. The pecuniary risk is much heavier on the part of the employer than of the laborer. The hazard of the latter is measured by his individual interest in the result. Of the former it is the same, multiplied by the total number of men affected, and intensified by the fact that there is no compensation for added business risks or participation in resulting business losses.

"There is always, also, the question whether both parties are equally concluded by the result. The employer is always bound. The laborer, on the other hand, is not concluded by the acts of a voluntary 'union,' from which he may at any time withdraw, and whose transactions are sometimes regulated by a committee or controlled by a single and autocratic 'chief.' The employer may therefore properly insist upon something more than negotiation with an 'order,' to the end that the result of an arbitration may affect both parties equally; and he may well refuse to admit the interference of strangers in negotiations with his workmen.

"Notwithstanding all the inequalities which have been suggested, it is nevertheless undoubtedly true that so long as labor controversies are in process of negotiation and before employment has been terminated and business suspended by a strike, employers may often well accept a proposal for an arbitration of such differences as do not involve the surrender of any essential right. If adverse claims are made in good faith, not arising from mercenary avariciousness on the one part or from the interference of the walking delegate or other outside manipulator on the other, a resort to arbitration may often be a happy method of attaining that just medium between conflicting claims and interests which negotiation often fails to reach through the too stubborn assertion of the ultimatum.

"Unfortunately, however, the workman on his part apparently seems averse to accepting arbitration as a method of settling his disputes. Again and again arbitration boards have been organized at State expense for the determination of labor troubles; but except in rare cases the effort has been wholly futile. They are repudiated by the very class whose interests they were designed to serve. Even the arrangement provided by the Congress of the United States for the settlement of controversies affecting interstate commerce through a national provision for the payment of arbitrators and the tender of an official arbitration has proved to be wholly unavailing. Arbitration is apparently not wanted by the laborers themselves, and is seldom even thought of by them until a strike has proceeded so far as to become apparently a failure. There are reasons for this also. When an arbitration decides adversely on the workman's claim the result is more impressive than the ordinary result of failure in systematic litigation, where it is accepted as a necessity that one or the other party must lose his cause. An unsuccessful arbitration leads to a sweeping condemnation of the system of arbitration as a whole, and the feeling at once becomes general that no good can be accomplished in that way. This feeling is fostered by the managers of labor unions who find their usefulness and their employment in strikes and the entanglements which attend them; who have devised the sympathetic strike as part of their recognized machinery; who are valued in proportion to the disturbances which they create, and who are defeated in every case of peaceful settlement which is reached without their interference. The unwisdom of this attitude is now clearly perceived by the more intelligent and thoughtful leaders of labor. One and another have broken away from the belief that unlawful violence can help their cause and have affirmed a common interest of labor with capital, trusting to moral agencies and to sound reason for the maintenance of their rights. With those less reasonable the controversy is now waging, and we can but hope that when their methods are shown to be nugatory—when it has been demonstrated that excess will inevitably be controlled and punished, while conciliatory and peaceful negotiations will surely win public opinion and support, there will arise a disposition to employ some other agent than violence to accomplish that betterment of conditions for which the workman is constantly and rightly struggling, and a determination to tender the tribunal of voluntary arbitration again and again. Among business men the remark is often heard that one can not refuse to 'leave the question out,' the meaning being that where there is a fair question of difference as to which some settlement must be made the decision of a court is only the judgment of a man or a group of men at the best, and delays should be avoided by a more summary procedure; or, again, that in cases not apt for the decision of judicial tribunals an arbitration is desirable for the termination of strife and for affording an opportunity for the claimant to make good his standing if he can. This feeling may well be taken advantage of by the laboring man, and a persistent effort in this direction may properly replace the present crude and too often unlawful methods undertaken by him for the amelioration of his condition."

Very truly, yours,

ALDACE F. WALKER.

REPLY OF MR. JOHN H. MURPHY,

Attorney at law, Denver, Colo.

I.

1. Section 10 of an act entitled "An act concerning carriers engaged in interstate commerce and their employees," approved June 1, 1898, reads as follows:

"That any employer subject to the provisions of this act, and any officer, agent, or receiver of such employer who shall require any employee, or any person seek-

ing employment, as a condition of such employment, to enter into an agreement, either written or verbal, not to become or remain a member of any labor corporation, association, or organization, or shall threaten any employee with loss of employment, or shall unjustly discriminate against any employee because of his membership in such labor corporation, association, or organization, or who shall require any employee or any person seeking employment, as a condition of such employment, to enter into a contract whereby such employee or applicant for employment shall agree to contribute to any fund for charitable, social, or benefit purposes, to release such employer from legal liability for any personal injury by reason of any benefit received from such fund beyond the proportion of the benefit arising from the employer's contribution to such fund, or who shall, after having discharged an employee, attempt to conspire to prevent such employee from obtaining employment, or who shall, after the quitting of an employee, attempt to conspire to prevent such employee from obtaining employment, is hereby declared to be guilty of a misdemeanor, and, upon conviction thereof in any court of the United States of competent jurisdiction in the district in which such offense was committed, shall be punished for each offense by fine of not less than one hundred dollars or not more than one thousand dollars.

Many of the States have penal statutes making it unlawful for employers to coerce, intimidate, or use any other methods calculated to prevent employees from belonging to their brotherhoods or to associations of laboring men. Both the United States and State statutes on this subject are violated with impunity, and such laws appear to be impotent to afford a remedy for the evil sought to be suppressed or to protect the rights intended to be preserved to the employee. There is one trunk line of railways running out of Chicago, westward, which maintains a large detective corps for the purpose of ascertaining whether or not an employee does or is about to become a member of a labor organization, and if he has, or is likely to become a member the company watches for a convenient time to discharge him; the dismissal, however, being placed on some other grounds than the fact of his affiliation with labor organizations. So many subterfuges can be used for the purpose of getting rid of employees on account of their membership in these organization that it would be almost impossible to enact, under the present system of hiring and discharging, a law that can be enforced. Perhaps if all such laws were amended so as to make it criminal to procure or furnish evidence of the employee's membership in a labor organization to anyone other than the membership thereof, it would make the law as perfect and complete as it is possible to frame such measures.

It is not desired by the foregoing statement to convey the idea that railway corporations in general are antagonistic to the railway brotherhoods; for, on the contrary, the greater number of them offer no opposition, and a few trunk lines, being particularly observant of the benefits which have accrued to them by reason of the existence of the brotherhoods on their road, encourage their existence in many ways.

2. This question is one that is as difficult to deal with as the question respecting the protecting of employees in their right to belong to their brotherhoods. Nearly all of the States and the section of the United States statute quoted, *supra*, makes blacklisting a penal offense, but owing to the difficulty of getting evidence which would convict one guilty of the offense the laws are ineffectual. It has always been permissible in law for a master to give a statement concerning a servant to an inquiring employer or prospective employer. Such statement, however damaging to the servant, if truthful, may be lawfully made. But this is pernicious and works a great injustice, because a bare statement of certain happenings or acts of a servant unexplained may make him appear as a very undesirable employee, but an explanation may relieve him in the eyes of a fair, prospective employer from blame; so to prevent this injury and blacklisting of all kinds in a more effectual way it should be made unlawful for any corporation or individual to furnish a statement to any other employer, or other person, concerning an employee without first furnishing the employee with a true copy of it. At present statements are promiscuously furnished without the employee knowing anything about their contents, and therefore he is unable to explain or refute false statements which may be made against him. However, the remedy for the present evil will be more fully disclosed in answer to subdivision three.

3. After much observation and consideration of this question by anyone the answer given will certainly be, yes. It is only about a quarter of a century ago when nearly every family conducted a sort of a manufacturing institution so far as necessary to provide crude things for their wants. Sheep were shorn, wool washed, carded, spun, woven into cloth, and cut and sewed into garments by the members of the one household; even the head of the household was usually a shoemaker or cobbler, or he could build a house, do blacksmithing, and like work,

At the present day few people can do more than one thing well. The crude work of the man of many years ago will, at the present day, not be acceptable to any person. He could now find no employment. Therefore it is necessary to follow one or two things and perfect oneself in doing them in order to find and retain employment.

The railroads of the country have numerous departments, and generally the degree of skill required in each department requires strong, active bodies and the highest faculty of the mind to be exercised, and so exacting are the duties in a single department that as a general thing the average man is not only not able to acquire knowledge or fit himself up for other duties in life, but he is unable to acquire knowledge which would enable him to readily fill any of the other departments, and so if discharged, unless he can find work at his usual vocation, it is exceedingly difficult for him to obtain a livelihood. It is to the interest of railroad companies—to the interest of the public in general—to let men work in such places and at such work where the result of their labor is of the highest productive quality and greatest productive quantity. The wealth of the community or nation is, after all, but the combined wealth of the individuals. Every day that the individual workman is out of employment is a day forever lost to himself and indirectly a day lost to the community and nation, and frequent loss of employment finally leaves him in his old age, together with his family, dependent upon the country for support.

Railway companies are owned by a few individuals, and it is not often that those who are real stockholders of the company do the superintending of the various departments, and often the person entrusted in the position of "superintending employee" has his own friends to reward and enemies often to punish, or through some whim or caprice, discharges a faithful and valuable servant to the company, which it would really be to the interest of the company to keep at work; therefore, it would be well to have a labor court in which the employee, if he felt aggrieved, could demand a hearing, and if he was unjustly discharged, he should have a decree in his favor, at the cost of the offending party, that he be permitted to return to his accustomed duties. If he was justly discharged, the cost should be paid by him. This in no way, of course, would prevent a railway company from discharging any employee who was detrimental to the service or for the purpose of curtailing expenses, or from abandoning any department that it was desirable to abandon. On some roads a few of the brotherhoods were strong enough to have been able to enter into a contract with the company to the effect that any member of their organization shall not be discharged without a hearing, and if it is found that he was unjustly discharged, then, in such a case, the company shall pay him full time which he lost during his term of discharge.

Investigation has revealed this rule to be beneficial, both to the classes of employees which it affects and the company, for, on the one hand, men do not work under the nervous tension and strain that no matter how efficient their services may be, through whim or caprice of some individual having temporary authority over them, they will be sent adrift any day, but they rest assured that on performing their duty they may stay in the service of the company continually, and thus they strive to do their duty and reach higher perfection in their work, realizing at all times that it is the one sole condition of their continued employment.

The companies under such contracts, find that they get the highest degree of service and operate their road more cheaply and are able to enforce the highest degree of discipline. As an illustration why this would be beneficial, cases might be cited that occurred years ago before the brotherhoods were in position to influence their members for good or afford material assistance when employees were discharged for trivial offenses and discharged without any hearing. It caused recklessness to grow upon them, and if they got into a little difficulty, or if some of the company's property was accidentally destroyed, they would realize that such meant discharge, and many of them did not save property which might have been saved, or try to lessen the damage or injury in any way whatever; but this certainly is now otherwise since the advent of the brotherhoods and since employees realize that they will be tried fairly and their acts adjudicated impartially. In connection with this matter it might be further urged that railroads are affected with public interest. They get the most valuable franchises from the public; the lives and property of thousands of the public are constantly in the keeping of railways, and therefore the public are interested in having the highest degree of efficiency, and it is further and vitally interested in not permitting a railroad company to have the best service of various individuals for a long number of years, and when they are unable to discharge any other duties acceptably other than the vocation which they have learned, that they be not wrongfully and unwarrantably discharged, and perhaps become a public charge themselves or their families.

II.

Railway work is exacting and exhaustive, especially the work required for the movement of trains, and perhaps the reason that the degree of exhaustion is not more noticed by the public is because the feebleness of mankind do not seek employment in this branch of industrial undertaking, and if they do seek employment, they are generally rejected, so it is only the more strong, healthy, and robust constitutions that come into the service. Therefore, such employees are enabled to stand numerous hardships. Still, for the interest of the public who patronize railroad companies and for their individual safety, men should not be permitted to be on duty more than 12 hours in any 24, except in cases of emergency or other unavoidable occurrence, and in yards and machine shops and in all other departments where the service will not be impaired by one set of employees relieving another, 8 hours a day should constitute a day's work. It is to the interest of the State to have good, healthy, robust citizens, so that they will be capable of bearing arms should the State need their service, and that they will be capable of self-support; also, that they have more time in which to cultivate their mental faculties, and thus generally advance the interest of the race. At the present time society seems to be moving along at such a feverish pace that many evils seem to be creeping in, causing cynics to be everywhere, and nervous and puny forms to appear on all sides. Numerous suicides are being committed and a large army of people are coming to have no fixed purpose or aim in life. They make a feeble attempt to do one thing, then, growing easily discouraged, quit it and attempt to do another with like results, thus wasting away their life, not accomplishing anything useful. Shorter hours of labor will undoubtedly tend to remedy this condition much to the interest of the general welfare and even to the employer. The employer will be benefited, because men with clear minds and fresh bodies produce more and better work within a given time than it is possible for men to do who are kept overworked all the time. It is within the power of Congress to legislate upon this subject.

III.

1. Legislation should be enacted which would take away the power from judges or courts to issue ex parte injunctions in all strike cases. Where an injunction is issued it is in general, if not always, forbidding acts to be done which are already under the statutes of the States made criminal, and therefore there are ample means for reaching any wrong done against the railroad company by putting the law of the State in operation; but by proceeding by injunction the equity power of the court is substituted for the criminal process provided for by the State, and thus the right of trial by jury guaranteed by the Constitution is subverted.

2. The answer is emphatically that there should be a law greatly modifying and limiting the power of the courts in this direction. The framers of the Constitution, having in view the history of centuries, showing how the rights and liberties of people were disregarded and how they were imprisoned on shallow pretext growing out of malice or intrigue, believed it was absolutely necessary to preserve and afford to everyone likely to be committed to jail, on any charge, the right of trial by jury. Now, when an injunction is issued in a labor strike, it commands certain individuals to refrain from doing a thing which the State law already declares, in most cases, to be criminal. If it is alleged that the injunction is violated, the persons violating it are brought before the very judge who issued it, and while, of course, he does not punish them for the crime alleged to have been committed, he does punish them for disobeying the mandate contained in the injunction, and it is clear that before he can so punish them he must adjudge that they have committed certain acts, which, if true, would be criminal and would also subject them to the penal laws of the State. So he sends them to jail, and they suffer the same punishment as if they were tried and convicted under the penal laws of the State. They may be tried under the penal law, and can not plead such term of imprisonment as once in jeopardy.

But to point out another phase of the question we may suggest that in order to convict the person under the penal laws of the State of doing the acts mentioned in the injunction, the prisoner would have to be found guilty beyond a reasonable doubt. All the strict laws of evidence in criminal cases might be invoked for his protection, but there is nothing, not even a fair preponderance of the evidence which necessarily governs the judge sitting in judgment of the person charged with violating the mandate of the court; so the judge may at once become prosecutor, judge, and jury. The average judge is human, and when it is said that the order which he issued is violated he is very much biased against those who dared to disregard his authority and dignity, and he is very much inclined indeed

to allow his human nature to enter into the judicial determination of the case. Granting injunction in labor cases, where the criminal law of the land is sufficient to meet the exigency, is simply substituting the equity power, which originally was so sparingly exercised by courts of chancery, and which was intended only to afford relief where the law was deficient or inadequate, for that of the criminal law. It subjects one to double punishment for the same act, viz., violating the laws of the State and the mandate of the court. It deprives one of the benefit of the strict rules of evidence of criminal cases, and in short, it violates and contravenes the very spirit and genius of the Constitution, and, therefore, acts of contempt should be limited to those committed in the very presence of the court. All other alleged acts of contempt should be tried by a jury under the rules governing criminal procedure.

3. It is difficult to answer such a question. Should the Attorney-General be prejudiced against labor, and as many of them have been employed by corporations before and during the time of their incumbency of that high office, they certainly would not be very fair toward the employees—throwing the influence of their high office in favor of the corporations might only tend to influence courts all the more against the best interest of the employee. However, if the Attorney-General is fair and unprejudiced, and equally fair to both parties in the controversy, his presence in cases of this kind could not but tend to promote justice, but before he would be useful in such a case it would be absolutely necessary to cause him to cut off all relationship with corporations before engaging in the duties of his office.

IV.

1. A general uniform law should be enacted making all common carriers liable for the negligence of a fellow-servant the same as the master is liable to the employee for his own negligence. This rule is not an injustice upon the master, for he selects, governs, and directs each employee; but as to the employee himself, he has no choice in the selection of his fellow-servant, and usually little, if anything, to do with governing or controlling the action of such fellow-servant, and is very often at the mercy, so far as his safety depends, of the fellow-servant. For these reasons the master should be held responsible.

2. As a general thing the Federal courts do follow the rules laid down by State courts as to the admission of evidence and the administering of State laws respecting personal injuries, and, of course, it is most desirable that the Federal courts when administering the law of any particular State should follow the rules laid down by the highest courts of such State in the same manner that they would follow the rules laid down by the Supreme Court of the United States in administering the Constitution or the laws of the United States.

V.

It is unwise for lawyers, perhaps, on an occasion like this to discuss a law which has been enacted by Congress, but apparently has not in any manner been tested by the courts, and as the law of 1898 has not been in any respects called into question as far as we know, we will not attempt to give any opinion on it.

A. Respecting the feasibility or practicability of compulsory arbitration, we unhesitatingly state that it seems both practicable and feasible. In the first place, corporations are but the creatures of law. They must accept conditions imposed upon them by the State, and if the State should see fit to impose upon each corporation a condition that, on it being given a charter, it should submit to arbitration in matters arising between the corporation and its employees which could not be amicably settled, it would certainly tend to solve a vexed problem. Any corporation which would not accept such a condition should not be given a charter, and the States which have retained the power to amend or modify the charters of any corporation are in as good position to force all existing corporations to accept such a law as those which may be organized hereafter. The general public has a great interest at stake respecting the operation of a railroad, for every contract that is made is based on normal conditions, and a strike occurring may upset all conditions existing at the time contracts were entered into between individuals who have no connection with the railroad as far as managing them or dealing with the employees is concerned, and therefore on account of it being such a great public concern and capable of inflicting so much injury on the public, both the employer and the employee should be compelled to submit to arbitration. Besides, the railroads' interest is growing larger each year, and consequently each year affects the general public to a greater extent; besides, by preventing strikes it would be one method of preserving the peace and general stability of affairs throughout the country as well as preventing the corporations from oppressing the employees, or vice versa.

Yours, truly,

JOHN H. MURPHY.

LIST OF WITNESSES.

| | Page. |
|---|----------|
| Arnold, F. W., grand secretary and treasurer Brotherhood of Locomotive Firemen | 763, 764 |
| Arthur, P. M., grand chief engineer Brotherhood of Locomotive Engineers | 116-128 |
| Bacon, Edward P., representative of the Milwaukee Board of Trade | 417-431 |
| Baker, Charles W., secretary of the Live Stock Exchange, Chicago? | 592 |
| Barry, Frank, secretary of the Millers' National Association | 240-251 |
| Bartlett, William H., grain merchant, Chicago | 392-396 |
| Bird, A. C., general traffic manager Chicago, Milwaukee and St. Paul Railway | 467-480 |
| Blanchard, George R., late commissioner of the former Joint Traffic Association | 618-685 |
| Bookwalter, Joseph, representative of the Kansas City Board of Trade | 570-577 |
| Burke, William, grain merchant, Friend, Nebr. | 465-467 |
| Callaway, Samuel R., president New York Central and Hudson River Railroad Company | 217-240 |
| Carter, Zina R., commission and produce merchant, Chicago | 577-586 |
| Clark, Charles S., secretary Grainers' National Association | 431-435 |
| Clark, E. E., grand chief conductor Order of Railway Conductors | 109-116 |
| Clements, Judson C., member of the Interstate Commerce Commission | 153-161 |
| Counselman, Charles, grain and stock merchant, Chicago | 382-392 |
| Cowen, John K., president Baltimore and Ohio Railroad Company | 302-320 |
| Dickinson, C. W., manufacturer of agricultural implements, La Crosse, Wis. | 547-556 |
| Dousman, Hercules F., grain shipper, Chicago | 353-362 |
| Emerson, C. C., produce dealer, St. Paul, Minn. | 480-485 |
| Eyans, Edgar H., representative of the Indianapolis Board of Trade | 435-441 |
| Fish, Stuyvesant, president Illinois Central Railroad Company | 320-338 |
| Fuller, Chester A., Norfolk, Nebr | 441-446 |
| Furuseth, Andrew, international secretary of the Seamen's Union | 685-709 |
| Gallagher, Augustine, representative of the Merchants' Exchange of St. Louis | 539-547 |
| Greeley, Samuel H., commission merchant, Chicago | 370-382 |
| Hulbert, J. H., farmer and grain dealer, Fontanelle, Iowa | 486-489 |
| Hylland, John J., traffic manager freight bureau, Chicago Board of Trade .. | 351-353 |
| Ingalls, Melville E., president Cleveland, Cincinnati, Chicago, and St. Louis, and Chesapeake and Ohio Railroad companies | 284-302 |
| Johnson, E. R., professor in the University of Pennsylvania | 56-64 |
| Keep, Charles H., secretary Lake Carriers' Association | 709-723 |
| Kelley, N. B., president National Association of Freight Commissioners, freight commissioner Trades' League of Philadelphia | 185-193 |
| Kennard, Alexander A., vice-president Butter and Egg Board, Chicago | 362-370 |
| Kindel, George J., manufacturer, Denver, Colo. | 251-264 |
| Knapp, Martin A., chairman Interstate Commerce Commission | 128-145 |
| Lewis, David J., Cumberland, Md. | 724-757 |
| Mallory, Charles A., chairman railroad committee, Chicago Live Stock Exchange | 586-592 |
| Morton, Paul, second vice-president Atchison, Topeka and Santa Fe Railway Company | 489-503 |
| Moseley, E. A., secretary Interstate Commerce Commission | 7-44 |
| Murphy, John H., attorney at law, Denver, Colo. | 776-780 |
| Musselman, Amos S., president Board of Trade, Grand Rapids, Mich. | 556, 557 |
| Neall, Frank L., shipping merchant, Philadelphia | 161-185 |
| Newcomb, H. T., chief of section of freight rates, division of statistics, United States Department of Agriculture | 95-109 |

| Importance of interests and need of protection..... | Ingalls, 285; |
| Blanchard, 642; Lewis, 726, 731 | |
| Precariousness of investments..... | Lewis, 726, 730 |

810 THE INDUSTRIAL COMMISSION:—TRANSPORTATION.

| | |
|--|---|
| Iowa Development Company: | Page. |
| Referred to | Counselman, 390 |
| Iron mills: | |
| Western, built up by railroad favors | Dickinson, 551 |
| Iron ore: | |
| Lake transportation, volume and method of shipment..... | Keep, 715-717 |
| Rates..... | Keep, 715 |
| Carnegie, transportation | Keep, 714 |
| Japanese: | |
| Sailors | Furusetth, 689 |
| Joint Traffic Association: | |
| Organization and methods | Blanchard, 678 |
| Division of traffic under | Newcomb, 97 |
| Railways and tonnage included | Blanchard, 681 |
| Outside railroads permitted to appear before | Blanchard, 681 |
| Kansas City: | |
| Elevators, capacity and ownership | Bookwalter, 574 |
| Freight rates, low by way of Gulf | Knapp, 133; Vanlandingham, 193 |
| Grain, poor quality of receipts; reasons | Bookwalter, 572 |
| Charges for stopping at | Bookwalter, 570-573 |
| High market for | Bookwalter, 572 |
| Receipts at | Bookwalter, 572, 574 |
| Growth, 1877-1887 | Ripley, 593 |
| Live-stock business | Mallory, 588 |
| Labor department: | |
| Great Britain, views of Royal Commission regarding..... | Moseley, 20 |
| Labor on railways (see also <i>Discharge; Hours; Injunctions; Sailors; Strikes;</i> | |
| <i>Wages</i>): | |
| Accidents. (See <i>Accidents</i> .) | |
| Blacklisting. (See <i>Blacklisting</i> .) | |
| Brotherhoods. (See <i>Labor organizations</i> .) | |
| Carmen. (See <i>Carmen</i> .) | |
| Colored | Sargent, 65; Arthur, 118; Spencer, 266, 267 |
| Conditions generally— | |
| Big Four Railroad | Ingalls, 287, 288 |
| Chicago Great Western Railway | Stickney, 455 |
| Chesapeake and Ohio | Ingalls, 287, 288 |
| Europe | Johnson, 56, 58 |
| Illinois Central | Fish, 325, 328, 333 |
| New York Central | Callaway, 217-221 |
| Southern Railway | Spencer, 264-268 |
| Consolidation of railways, beneficial effects | Sargent, 70 |
| Employers, favors from, generally | Dickinson, 553, 554 |
| Employment— | |
| Amount of, increase; reasons | Sargent, 86 |
| Decrease, 1893-1897 | Fish, 322 |
| Number of employees, by classes | Lewis, 734 |
| Chesapeake and Ohio | Ingalls, 287, 288 |
| Mississippi Valley, special reduction in 1893-1897 | Fish, 322, 328 |
| Employees prefer overtime to more men | Sargent, 87; O'Rourke, 530 |
| Conditions of entering (see also <i>Organizations, Relief departments</i>)— | |
| Physical examination | Clark, 111 |
| Advocated | Wilson, 765; Ronemus, 769 |
| Injustice in certain cases | Arthur, 119 |
| Age limit | Clark, 110, 111; Arthur, 119 |
| Experience, age of | Clark, 112 |
| Chesapeake and Ohio | Ingalls, 287, 288 |
| New York Central | Callaway, 217 |
| Irregularity of, trackmen | Wilson, 46 |
| Responsibility of employees, for aged | Clark, 111 |
| Legislation regarding, deprecated | Walker, 771 |
| Interest, coincident with the interest of railroads | O'Rourke, 525 |
| Protection of interests in legislation as to rates, etc | Ingalls, 285, 296; |
| Blanchard, 642; Ronemus, 771 | |
| Rate cutting, injurious effects on | Sargent, 69; |
| Callaway, 223; Bird, 407; O'Rourke, 526 | |
| Trackmen. (See <i>Trackmen</i> .) | |

| Labor organizations and brotherhoods (see also names of separate orders and brotherhoods, <i>Seamen's Union</i> , etc.): | Page. |
|---|---|
| Aged employees, home for | Sargent, 92 |
| Blacklisting of members, instances | Arthur, 123, 124; Strong, 527 |
| Afraid to oppose | Strong, 525 |
| Subscriptions to suits against | Strong, 525 |
| Benefit funds and insurance— | |
| Description and working | Wilson, 48, 49; Sargent, 91; Arthur, 117; O'Rourke, 526, 527 |
| Insurance department, incorporation | Arthur, 126 |
| Increased privileges regarding, advocated | Arnold, 764 |
| Traveling benefits, Seamen's Union | Furness, 686 |
| Control of members by means of | Moseley, 15 |
| Cost of insurance | Johnson, 57; Sargent, 67, 91; Arthur, 121 |
| Not increasing | Johnson, 58 |
| Character and purposes— | |
| Generally | Sargent, 68 |
| Shut out agitators | O'Rourke, 528 |
| Collective bargaining and its advantages | Moseley, 15 |
| Individual laborer powerless without | Strong, 514 |
| Protective features only recently introduced | Arthur, 122 |
| Existence justifiable | Walker, 774 |
| Trust character of certain railway organizations | Fish, 324, 327 |
| Evils of certain temporary organizations | Fish, 327 |
| Effects— | |
| Beneficial | Wilson, 50-54; Clark, 113; Callaway, 222; Morton, 501 |
| On character, beneficial | Moseley, 15; Arthur, 116, 117; O'Rourke, 528 |
| Interests of employees best secured | Sargent, 94 |
| Incompetent men driven from service | Arthur, 123 |
| Conditions of employment improved | Wilson, 51 |
| Increased reasonableness | Callaway, 222 |
| Strong unions benefit at expense of other employees | Wilson, 52 |
| Employers, attitude toward organizations— | |
| Generally favorable | Wilson, 52; Arthur, 117, 123; Callaway, 221, 222; Murphy, 777 |
| Illinois Central, recognition | Fish, 328, 333 |
| Southern Railway, recognition | Spencer, 266, 268 |
| Satisfactory relations generally | Sargent, 87, 91; Ingalls, 291; O'Rourke, 530 |
| Organizations destroyed by blacklisting leaders | Strong, 516, 524 |
| Antipathy to heads of organizations | Strong, 516 |
| Discriminations against members— | |
| Existence | Sargent, 90, 91; Arthur, 123, 124; Murphy, 777 |
| Denied | Walker, 772 |
| Agreement not to employ is not harmful | Moseley, 14 |
| United States arbitration act of 1898 regarding | Moseley, 8 |
| Legislation prohibiting, advocated | Arnold, 763 |
| Penalties, severer, advocated | Brotherhood officers, 760; Wilson, 765; Ronemus, 768; Murphy, 777 |
| Relief funds, influence in preventing membership | Johnson, 57, 58 |
| Street-car companies, refusal to allow employees to form | Strong, 514 |
| Lake Carriers' Association recognizes | Keep, 710 |
| Coercive measures of brotherhoods deprecated | Arthur, 122, 123 |
| Federation of brotherhoods | Arthur, 122 |
| Immigration, restriction favored by | Clark, 114 |
| Incorporation, discussed | Clark, 116 |
| Deprecated as increasing responsibility of members | Arthur, 126 |
| Laws, influence in obtaining | Arthur, 128 |
| Number of members and strength | Strong, 520 |
| Number and proportion of employees belonging to | Wilson, 48-50; Sargent, 68, 92; Arthur, 118 |
| More members in active service than ever before | O'Rourke, 527 |
| Nonunion men, no interference with | Sargent, 68; Arthur, 118 |
| Refusal to work with not harmful | Moseley, 14 |
| Coercive measures of unions deprecated | Arthur, 122, 123 |
| Relations between brotherhoods | Arthur, 122 |
| Telegraph operators, disadvantage of organization | Ingalls, 291 |
| Strikes, influence in checking | Arthur, 128 |
| Influence in preventing violence | Sargent, 89 |

| Labor organizations and brotherhoods, etc.—Continued. | | Page. |

816 THE INDUSTRIAL COMMISSION: TRANSPORTATION

| | |
|---|--|
| Northern Pacific Railroad: | Page |
| Strike of 1894, causes, injunctions, etc | Moseley, 8, 12; Sargent, 73, 89; Arthur, 119, 120 |
| Norwegians: | |
| Purchase of foreign-built vessels by | Neall, 172, 178, 184 |
| Oats: | |
| Grading by official inspectors disregarded | Clark, 432 |
| Source of, for oatmeal | Bookwalter, 573 |
| Ocean transportation (see also <i>Sailors; Water transportation</i>): | |
| American merchant marine— | |
| Early superiority and large development | Neall, 168, 172 |
| Cause of former superiority | Furusetth, 699 |
| Number and tonnage of vessels | Keep, 713; Neall, 176 |
| Tonnage of transoceanic and proportion of world's total | Neall, 168— 168, 175-184 |
| Proportion to American ocean freights | Neall, 176, 177 |
| List of vessels over 1,000 tons gross register | Neall, 178-183 |
| Coasting vessels unfit for transoceanic traffic | Neall, 167, 168, 181 |
| Cost of running vessels, comparative | Neall, 169, 171; Furusetth, 699 |
| Wages, comparative | Neall, 169, 171; Furusetth, 699 |
| Cost of constructing vessels, relative | Neall, 170 |
| Reasons for higher | Neall, 171 |
| Measures for development, advocated | Kenard, 368 |
| Discriminating duties, ineffective in building up | Neall, 172, 173 |
| Foreign-built vessels, permission to purchase, advocated | Neall, 169, 171, 172, 177 |
| Asiatic seaman | Furusetth, 689 |
| Butter and cheese, rates | Kenard, 367, 368 |
| Coastwise trade— | |
| Vessels must have American register | Neall, 172, 174; Furusetth, 689 |
| Foreign sailors, employment in | Neall, 174, 175; Furusetth, 687, 689 |
| Competition of different parts of the world for vessels | Neall, 164 |
| Flour, rates and condition of transportation | Neall, 163, 165; Barry, 251; Bacon, 426 |
| Effect of rates on foreign shipments | Barry, 244, 245, 249 |
| Grain, relative rates for different classes | Neall, 164, 165 |
| Comparison with flour | Barry, 251 |
| Life-saving apparatus, generally deficient on passenger vessels | Furusetth, 700 |
| New Orleans, conditions regarding | Fish, 329 |
| Norwegians, foreign-built vessels, purchase by | Neall, 172, 178, 184 |
| Ports, different conditions at different | Neall, 161-163 |
| Rates, variations frequent according to demand | Neall, 163, 164 |
| Agreements to maintain, impossible | Neall, 163, 164 |
| Increase, recent | Neall, 162 |
| Railways, through rates with | Neall, 162-164 |
| Time charters, recent large employment | Neall, 168, 169 |
| Tonnage, total of world, estimated | Neall, 166, 167, 176 |
| Net and gross, method of estimation | Neall, 178 |
| Exports and imports, United States | Neall, 176 |
| Tramp steamers, not built in the United States | Neall, 170 |
| Vessels, competitive power not dependent on wages | Furusetth, 699 |
| Inspection by seamen | Furusetth, 692, 701 |
| Labor-saving improvements | Furusetth, 687, 688 |
| Undermanning of vessels | Furusetth, 687, 688, 700, 702 |
| Legal standard advocated | Furusetth, 691 |
| No legal standard except in New Zealand | Furusetth, 687 |
| Officers, public: | |
| Should be ineligible for second consecutive term | Mallory, 587 |
| Salaries, small, for men of highest class | Seligman, 613 |
| Officers, railroad: | |
| Presidents not practical railroad men | Lewis, 740 |
| High salaries of presidents deserved | Seligman, 611 |
| Official Classification Committee (see also <i>Classification</i>): | |
| Composition | Tucker, 558 |
| Omaha: | |
| Growth, 1877-1887 | Ripley, 593 |
| Operating expenses. (See <i>Expenses, railroad.</i>) | |

| 335; Bird, 469; Dickinson, 555; Blanchard, 669 | |

| | Page. |
|---|--|
| Politics, etc.—Continued. | |
| Railways, interference in..... | Ingalls, 293, 295; Lewis, 751 |
| Colorado | Kindel, 258 |
| Pooling (see also <i>Agreements; Traffic associations</i>): | |
| General discussion— | |
| Advocated | Johnson, 62; |
| Newcomb, 97; Knapp, 138–145; Prouty, 150; Clements, 157; Neall, 173; | |
| Kelley, 190, 191; Callaway, 236; Ingalls, 286, 287; Fish, 337; Reagan, | |
| 345; Dousman, 361; Counselman, 391; Bacon, 420, 426; Evans, 441; | |
| Fuller, 445; Bird, 474; Morton, 495; Musselman, 557; Tucker, | |
| 558; Woffindin, 565; Seligman, 614–617; Blanchard, 635–656 | |
| Association necessary as to all great interests..... | Blanchard, 641 |
| Objections discussed..... | Blanchard, 652–656 |
| Competition of different markets necessitates..... | Morton, 499 |
| Deprecated..... | Vanlandingham, 215, 216; |
| Barry, 247; Hyland, 351, 352; Stone, 532, 534; Carter, 585 | |
| Combinations of capital— | |
| Trusts opposed to pooling..... | Newcomb, 103 |
| Necessary to oppose demands of..... | Blanchard, 683, 684 |
| Concentration of business retarded by..... | Ripley, 594 |
| Not similar to pools..... | Blanchard, 645, 646 |
| Competition— | |
| Injurious effects of excessive, justify pooling | Knapp, 138–141; |
| Ingalls, 296; Ripley, 593; Seligman, 615; Blanchard, 635–638, 653 | |
| Continued existence under pools..... | Cowen, 315; |
| Ripley, 593; Blanchard, 644–647 | |
| England, existence under pools..... | Blanchard, 650 |
| Facilities, continued as to..... | Seligman, 616; Blanchard, 644 |
| Competition of producing sections and markets continues ... | Stickney, 463; |
| Blanchard, 653, 654, 656 | |
| Rate cutting checked by ... | Counselman, 391; Musselman, 557; Tucker, 558 |
| Not prevented..... | Vanlandingham, 215; |
| Reagan, 345; Hyland, 352; Stickney, 463 | |
| Water routes, effect of | Blanchard, 653, 655, 656, 683 |
| Competition and monopoly, advantages combined by pools.. | Seligman, 616 |
| Compulsory, not objectionable, but unnecessary..... | Ripley, 597 |
| Consolidation of railways— | |
| Promoted by absence of pooling. Knapp, 141; Kelley, 190; Morton, 492, 496 | |
| Not deferred by pooling..... | Stone, 538 |
| Courts, decision against..... | Stone, 532 |
| Discriminations— | |
| Abolished or diminished by..... | Newcomb, 96; |
| Callaway, 235; Spencer, 280; Ingalls, 286; Counselman, | |
| 390; Bacon, 420; Bird, 474; Morton, 491; Woffindin, 566; | |
| Ripley, 594; Seligman, 616; Blanchard, 644, 676, 683 | |
| Uniform rates impossible without pooling..... | Ripley, 594 |
| Suspicion of, diminished..... | Tucker, 558 |
| Not prevented..... | Vanlandingham, 216; |
| Reagan, 345; Hyland, 352; Greeley, 374; Stone, 535 | |
| Chiefly opposed by those who receive..... | Blanchard, 655 |
| Division of business, methods | Newcomb, 97; Ripley, 596 |
| Character of contract | Blanchard, 677 |
| Basis not necessarily previous traffic..... | Stone, 538, 539 |
| Basis not business of previous year | Ripley, 596 |
| Attempts to influence by rate cutting..... | Vanlandingham, 215; |
| Reagan, 345; Hyland, 352; Ripley, 596 | |
| Tonnage, diversion slight..... | Blanchard, 644, 645 |
| Transfer of earnings, proportion of | Blanchard, 645 |
| Duration of term— | |
| Should be formed for not less than five years | Ripley, 595; |
| Woffindin, 565; Ripley, 595; Blanchard, 683 | |
| Former pools..... | Blanchard, 683 |
| Eastern pools, former, character and working..... | Blanchard, 645, 647, 681, 682 |
| Effects generally— | |
| Beneficial..... | Morton, 491 |
| Expenses of railways reduced..... | Callaway, 238 |
| Breaking of pool, injurious effects | Ripley, 593 |
| Local points benefited | Blanchard, 644 |
| Evil..... | Stone, 532 |

| Pooling, etc.—Continued. | Page. |
|---|---|
| Enforcement, possibility of | Blanchard, 645 |
| Former impossibility | Newcomb, 97; Callaway, 235 |
| Experience of former Eastern pools | Blanchard, 681, 682 |
| Penalties necessary | Woffindin, 566 |
| Foreign countries— | |
| Existence and effects of pooling | Blanchard, 649–652 |
| Exists wherever there is not monopoly | Seligman, 616 |
| Government railroads enter into | Seligman, 616; Blanchard, 640, 651, 652 |
| Belgium, system in | Newcomb, 98 |
| England, system in | Newcomb, 98; Blanchard, 650, 680 |
| France, territorial division of business | Newcomb, 98; Blanchard, 651 |
| Interstate Commerce Commission— | |
| Control advocated | Johnson, 62; |
| Newcomb, 97, 100; Kelley, 190, 192; Knapp, 138, 145; | |
| Prouty, 150; Clements, 157; Neall, 173; Callaway, 236; | |
| Ingalls, 286, 287; Spencer, 280; Reagan, 345; Dousman, 361; | |
| Counselman, 391; Bacon, 420, 426; Evans, 441; Fuller, 445; | |
| Bird, 474; Woffindin, 565; Musselman, 557; Seligman, 616 | |
| Powers, regarding, discussed | Ingalls, 299, 300; |
| Cowen, 314; Morton, 492, 495, 496; Blanchard, 640, 678 | |
| Control, adequate, impossible | Stone, 533; Carter, 585 |
| Maximum rates, fixing, insufficient | Bacon, 421 |
| Misdescription of goods, possibility of checking | Blanchard, 644 |
| Monopoly, impossibility of | Blanchard, 668 |
| Opinions concerning— | |
| Various authorities favorable | Blanchard, 648, 649 |
| General sentiment favorable | Ripley, 593 |
| Commercial bodies, advocated by | Bacon, 426 |
| Milwaukee Chamber of Commerce, favored by | Bacon, 420 |
| Railways, attitude toward | Newcomb, 105; Knapp, 141; Callaway, 238 |
| Illinois Central, attitude toward | Fish, 337 |
| State railroad commissioners, favored by | Blanchard, 649 |
| Interstate Commerce Commission, favored by | Newcomb, 103; |
| Blanchard, 648, 649 | |
| Various authorities, unfavorable | Stone, 532 |
| Opposition to system, sources of | Newcomb, 103 |
| Outside roads, relation to | Morton, 500; Ripley, 595, 597 |
| Experience of earlier pools, regarding | Blanchard, 682 |
| Prohibition prevents publicity | Seligman, 617 |
| Rates (see also <i>Competition</i>)— | |
| Not increased by pools | Newcomb, 96; |
| Callaway, 235; Ripley, 593; Blanchard, 645 | |
| Excessive, impossibility of maintaining | Tucker, 558; Blanchard, 654 |
| Policy of former pools to reduce | Blanchard, 647 |
| Reasonableness, independent of pools | Blanchard, 643 |
| Government aid in maintaining, desirable | Blanchard, 658 |
